Little Rock Railway & Electric Company.—This company has placed a contract with the General Electric Company for a 1,500 kilowatt Curtis steam turbine. D. A. Hegarty is general manager.

Sioux City Traction Company.—This company has purchased additional engines and generators which will increase the capacity of its power plant to 10,200 horsepower. The engines are of the Allis-Chalmers cross-compound type. It is stated that another unit of 1,200 kilowatts capacity will be installed during the coming summer. It is intended to use part of this output for supplying power and light throughout the city. E. L. Kirk, general manager, Sioux City, Ia.

Southern Pacific Company.—On February 7, 1907, this company bought the entire block lying west of Fruitvale avenue, Oakland, Cal., for the sum of \$30,000. The property was purchased by the railroad company as a site for the new power house and car barns which the company will erect in connection with the establishment of an electric line to supersede the steam roads which now accommodate the local travel in that city and Alameda. The company proposes to erect one large power plant at this point for the generation of the electric current for the entire new system. This will require an outlay of half a million dollars.

Personal Mention

Mr. E. M. Kenley has been appointed chief engineer of the Yakima Intervalley Traction Company, of North Yakima, Wash.

Mr. H. A. Currie has been appointed assistant electrical engineer of the New York Central & Hudson River Railroad, succeeding Mr. J. D. Keiley, who was appointed electrical engineer last November.

Mr. S. W. Childs, who as construction superintendent has represented J. G. White & Company in the work of electrifying the Ft. Dodge Des Moines & Southern Railway, is now at Davenport, Ia., where he is in charge of reconstructing the properties of the Tri-City Railway Company.

Mr. George H. Dodge, formerly superintendent of the West Chester Kennett & Wilmington Electric Railway Company, has been elected secretary and treasurer of the Coatesville & Kennett Railway Company, which is building a 16-mile road between Coatesville and Kennett Square, Pa.

Mr. T. W. Ryley has been appointed superintendent of the Groton & Stonington Street Railway of Mystic, Conn., succeeding Mr. J. B. Crawford, who was recently appointed superintendent of the Ft. Wayne & Wabash Valley Traction Company. Mr. Ryley has been assistant to Mr. Crawford.

Mr. Charles Kane, assistant superintendent of the Alton Granite & St. Louis Traction Company, at Alton, Ill., has been appointed assistant superintendent of transportation of the East St. Louis & Suburban Railway, at East St. Louis, Ill. Mr. George Bennett, of Venice, Ill., has been appointed to succeed Mr. Kane at Alton.

Mr. J. F. Scott, formerly superintendent of overhead lines for the Chicago & Milwaukee Electric Railroad Company, has been appointed general superintendent of construction for the same company, with headquarters at Highwood, Ill. Mr. Scott has been working on the company's lines since 1900, when, as a contractor, he began building the Libertyville division of the railway. Later he had charge of the reconstruction of the existing lines and more recently assumed charge of the maintenance of the overhead construction.

Mr. Clyde M. Graves, general manager of the Spokane Traction Company, Spokane, Wash., has been appointed general manager of the Coeur d'Alene & Spokane Railway of Coeur d'Alene, Idaho, also, succeeding Mr. R. F. Blackwell, resigned, to take effect some time in March. Mr. Blackwell, who was one of the original incorporators and builders of the Coeur d'Alene line, and has been general manager of the company since its inception three years ago, leaves to devote his entire time to his lumber interests. Mr. Graves is the son of Mr. Jay P. Graves, president of the Spokane & Inland Empire System.

Obituary.

Louis R. Altimus, chief clerk and assistant auditor of the Chicago Union Traction Company, died on February 9 at his home in Chicago, aged 50 years. For many years prior to coming to Chicago he was associated with the Widener-Elkins street railway interests in Philadelphia. In 1888, at the solicitation of the late Charles T. Yerkes, he became identified with the North Chicago Street Railway systems, with which organization he served until his death.

John I. Beggs on Plans for St. Louis Subway.

John I. Beggs, president of the United Railways of St. Louis and the Milwaukee Electric Railway & Light Company, has given out the following statement of his views of the plans for a subway in St. Louis, for which an enabling act has been introduced into the legislature:

"The intention is to make the bonds payable in 30 years. It seems to me that so short a time would be injurious to the plan. The bonds should be made payable in 50 years. As the lease will run for 50 years, there should be no objection to making the bonds payable in the same period. The construction of the subway will cost about \$2,500,000 per mile. I give this as an approximate figure. I do not see how the operating company could meet the capital and sinking fund requirements in 30 years. The investment would be so great that the annual financial requirements would probably exceed the revenue. St. Louis is not New York. In the metropolis, passengers are carried in one direction. St. Louis spreads out in several directions, and it will be only a few years until it reaches out to the Missouri river. The problem of conducting transportation is more complicated here than in New York, and the complete subway system will be relatively more expensive here, as the trunk lines will not run one way, but in several directions."

Increase of Wages in Oakland, Cal.—On account of the increase in its business, and the increased cost of living, the Oakland Traction Consolidated company, of Oakland, Cal., has announced the following new scale of wages for conductors and motormen: One year or less in service, 30 cents per hour; between one and two years in service, 31 cents per hour; between two and three years in service, 32 cents per hour; between three and four years in service, 33 cents per hour; between four and five years in service, 34 cents per hour; between five and six years in service, 35 cents per hour; between six and seven years in service, 36 cents per hour; between seven and eight years in service, 37 cents per hour; between eight and nine years in service, 38 cents per hour; between nine and ten years in service, 39 cents per hour.

Financial News

Bay Shore Terminal Company.—The property has been purchased at receiver's sale for \$765,000 by E. B. Smith & Co. of Philadelphia, who are said to represent the Norfolk & Portsmouth Traction Company.

Brooklyn Rapid Transit Company.—The reports of the four operating lines for the six months ended December 31, 1906, show total gross earnings of \$9,612,105 as compared with \$9,101,374 for the corresponding period of 1905. The surplus after charges was \$1,137,307, a decrease of \$201,707 from the corresponding period of the previous year.

De Kalb-Sycamore Interurban Traction Company.—At the annual meeting of stockholders on February 2 it was voted to increase the capital stock from \$100,000 to \$1,000,000. It was also decided to authorize a bond issue of \$1,000,000. The De Kalb-Sycamore Electric Company will be absorbed. Officers were elected as follows: J. H. McMichael, president; William Jarvis, vice-president, and John McMichael, secretary and treasurer.

Detroit United Railway Company.—At the annual meeting of stockholders on February 5 the president, J. C. Hutchins, submitted a report for the year 1906 which showed that the mileage was increased from January 1, 1906, to December 31, 1906, 78.6 miles. The total on the latter date, including side and yard tracks, was 620 miles. This was divided as follows:

Detroit United Railway	392,998
Rapid Railway System	127,548
Sandwich Windsor & Amherstburg Railway	25.26
Detroit Monroe & Toledo Short Line Railway	74.35

Total 620.156
The company's rolling stock consists of 830 closed passenger cars; 242 open passenger cars; 212 freight and construction cars; 13 line cars; 36 express cars; 6 miscellaneous cars; 2 locomotives; 2,288 motors and 1,766 trucks.

The following shows the business of the Detroit United railway, the Rapid railway system, the Sandwich Windsor & Amherstburg railway for the years ending December 31, 1905 and 1906, and the Detroit Monroe & Toledo Short Line railway from March 1 to December 31, 1906:

	1906	1905
Gross earnings	\$6,063,182.54	\$5,125,563.01
Operating, including taxes	3,718,621.54	3,041,522.90
Net earnings	\$2,344,561.00	\$2,084,040.11
Other income	58,757.73	44,076.40
Gross income	\$2,403,318.73	\$2,128,116.51
Interest on funded and floating debt:		
Detroit United	\$ 988,806.72	\$ 960,372.39
Rapid Railway	135,050.00	135,050.00
Sandwich Windsor & Am.	18,000.00	17,871.25
Detroit Monroe & Toledo.....	250,000.00
	\$1,243,273.38	\$1,113,293.64
Dividend, Detroit United.....	625,000.00	562,500.00
Charged off for Dep.....	250,000.00
Total deductions	\$2,118,273.38	\$1,675,793.64
Surplus income	\$ 285,045.35	\$ 452,322.87

Passenger and mileage statistics for all the lines were as follows:—

Passenger Statistics.

Revenue passengers	113,011,309
Transfer passengers	32,840,259
Employe passengers	4,939,224
Total passengers	150,790,792
Receipts revenue passenger0507
Receipts per passenger0380

Mileage Statistics.

Car mileage	25,973,526
Earnings per car mile2334
Expenses car mile1432
Net earnings car mile0902

Great Falls (Mont.) Street Railway.—Gross earnings for the year 1906 are reported at \$54,080.25 as compared with \$48,552.40 in 1905.

Lake Shore Electric Railway.—The company has sold \$550,000 short time notes bearing 6 per cent interest and secured by \$800,000 general mortgage 5 per cent bonds. The proceeds will provide for extensions and improvements.

Merrimac Valley Electric Company.—This company has been organized to hold the stocks of the Citizens' Electric Street Railway Company, of Newburyport, Mass., the Salisbury Land & Improvement Company, the Salisbury Beach Improvement Company, the Haverhill & Amesbury Street Railway Company. James F. Shaw is president of the new company and George A. Butman, treasurer.

Owosso (Mich.) & Corunna Electric Co.—It is reported that the company has received an offer for its property from the promoters of the Lansing Owosso & Saginaw Interurban Company.

St. Joseph Valley Traction Company.—This company, operating from Middlebury to Angola, Ind., has given a mortgage to William P. Knickerbocker of Elkhart, trustee, to secure an issue of \$700,000 bonds. The proceeds, it is reported, will be used to meet the cost of extension to Elkhart or Goshen.

Toronto Railway Company.—Gross earnings in 1906 were \$3,109,739.61, as compared with \$2,747,324 in 1905. Operating expenses were \$1,646,515.27, leaving a balance of \$1,463,224.34. William MacKenzie, the president, in presenting the report said that the city received \$7,000 more of the earnings than the stockholders received in dividends.

Twin City Rapid Transit Company (Minneapolis).—Gross earnings for the year 1906 were \$5,644,988.34, an increase of \$885,725.58, or 18.6 per cent. The figures compare as follows:

	1906.	1905.
Receipts.		
Passenger earnings	\$5,592,079.24	\$4,733,334.80
Miscellaneous	52,909.10	25,927.96
Total earnings	\$5,644,988.34	\$4,759,262.76
Expenses.		
Maintenance of way and structure.....	\$ 195,023.55	\$ 143,491.43
Maintenance of equipment.....	240,229.79	203,762.03
Operation of power plants.....	467,264.33	403,574.33
Car service	1,167,998.71	945,783.96
General expenses	354,340.81	251,585.12
Injuries and damages	152,522.43	122,948.45
Insurance	48,000.00	48,000.00
Total operating	\$2,625,379.62	\$2,119,145.32
Net earnings from operation	\$2,019,608.72	\$2,640,117.44
Interest and taxes	1,137,427.77	1,050,797.35
Surplus	\$1,882,180.95	\$1,589,320.09

Surplus from operation.....	719,680.95	497,932.59
Appropriated for renewal funds	482,000.00	240,000.00
Income account, surplus	\$ 237,680.95	\$ 257,932.59

Per cent total operating (including taxes and depreciation) to total earnings... 60.95 58.27
Revenue passengers carried..... 109,194,985 94,666,696
Gross passenger earnings per mile of single track were \$16.-690.78, and per mile of street occupied by track \$30,526.12.

Thomas Lowry, the president, said in his report: "During the boom of 1892, there were started outside of the Minneapolis city limits, two villages for manufacturing purposes, St. Louis Park on the southwest, a distance of 6.1 miles from the city limits, and Robbinsdale on the northwest, a distance of 2.2 miles. Great pressure was brought to bear on our company to make extensions to these suburbs, but instead of doing so, we secured the Minneapolis rights to connect with both villages. We then leased these rights to parties desiring to build, reserving the privilege to purchase whenever we saw fit. We recently concluded that the time had arrived when it would be to our advantage to take them over. Accordingly, we purchased the St. Louis Park line for \$40,000 and the Robbinsdale line for \$30,000. These lines will pay their operating expenses and interest on the investment.

"From the surplus of \$257,932.59 earned in 1905, as shown in the accounts of that year, your directors have appropriated \$100,000 to the renewal fund. During the year 1906 the fund was further increased by the addition of interest on the investments. We estimate the depreciation on the properties of the company for the past year to be \$482,000. During the year there was expended for car replacement and track reconstruction the sum of \$480,783.05. The balance at the credit of the renewal fund now stands at \$590,449.80, of which \$363,500 is invested in bonds."

The following is a statement of extensions and improvements made during the year. They aggregate \$2,648,518.22, and are distributed as follows:

New power	\$1,034,514.22
New shops	201,684.57
Buildings and furnishings	52,754.88
Car equipment	402,815.10
Track and Paving—	
Minneapolis	\$180,274.59
St. Paul—	
Track	\$122,999.32
Selby Tunnel	82,209.37
Suburban	205,208.69
	239,901.94
	625,385.22
New Lines—	
St. Louis park line.....	\$ 40,000
Robbinsdale line	30,000
	70,000.00
Big Island park and boats.....	261,364.23
Total	\$2,648,518.22

Washington Railway & Electric Company.—The report for the year 1906 submitted to congress shows that 41,952,715 passengers were carried. Passenger earnings were \$1,200,786. Receipts from all sources, including income on securities, were \$1,645,396. Operating expenses and fixed charges amounted to \$1,121,776, leaving a balance of \$523,620.

New York Interstate Bridge Commission.—The report of the New York Interstate Bridge Commission to the legislature was made public on February 7. The commission finds that there are two points on Staten island from which a bridge could be built profitably—one from Fort Richmond to Bergen Point, which, with a bridge from Hudson county to Manhattan, would afford all land communication with Staten island, and the other site at the end of the Trans-Staten Island Boulevard at Holland Hook to Elizabethport.

Manufactures and Supplies

ROLLING STOCK.

Atlantic Shore Line, Kennebunkport, Me., is figuring on 15 new cars.

Newell Street Railway, East Liverpool, O., has purchased five additional cars.

Connecticut Valley Street Railway, Greenfield, Mass., will soon purchase 8 new cars.

Worcester Consolidated Street Railway, Worcester, Mass., is figuring on 30 new cars.

Beloit Traction Company, Beloit, Wis., is reported to have placed an order for new cars.

Western Massachusetts Street Railway, Westfield, Mass., is considering the purchase of 8 cars.

Farmington Street Railway, Hartford, Conn., has purchased one car from the Wason Manufacturing Company.

Galesburg & Kewanee Electric Railway, Galesburg, Ill., expects to place orders for three interurban cars for May 1 delivery.

Rockville Broad Brook & East Windsor Street Railway, Hartford, Conn., has placed an order with the Wason Manufacturing Company for 2 cars.

Montreal Street Railway, Montreal, has under construction in its own shops 25 cars of a new type and it is reported will place an order for 20 more for July delivery.

Auburn & Syracuse Electric Railroad, Syracuse, N. Y., has ordered one car for interurban service from the Cincinnati Car Company. It will be 50 feet 6 inches in length over all and be equipped with Baldwin trucks and Westinghouse motor equipments.

Syracuse Lake Shore & Northern Railroad, Syracuse, N. Y., has ordered 7 interurban cars from the Cincinnati Car Company. These cars will have a length over all of 53 feet 6 inches and will be equipped with Westinghouse motor equipments and Baldwin trucks.

Rochester Syracuse & Eastern Railway, Syracuse, N. Y., has placed an order with the G. C. Kuhlman Car Company for two cars for heavy interurban service. They will have a length over all of 53 feet 6 inches, will be equipped with Westinghouse motor equipments and Baldwin trucks and are for delivery next summer.

Ft. Wayne & Wabash Valley Traction Company, Ft. Wayne, Ind., as reported in the Electric Railway Review of January 26, has placed an order for 6 semi-convertible cars for delivery on May 15, 1907. The specifications are as follows:—

- Length of body.....20 ft. 8 in.
- Over vestibule.....30 ft. 1 in.
- Over all.....31 ft. 1 in.
- Width, inside.....8 ft. 5 in.
- Over all.....8 ft. 7 in.
- Height, inside.....8 ft. 2 in.
- Sill to trolley base.....9 ft.
- Track to trolley base.....11 ft. 6 in.
- Body.....Wood
- Underframe.....Wood and steel

- Special Equipment.**
- Brake rigging.....Peacock
 - Couplers.....Builders' double pocket
 - Fenders.....Consolidated
 - Heating system.....Consol. electric
 - Interior finish.....White oak
 - Roofs.....Monitor
 - Seats.....Hale & Kilburn
 - Varnish.....Murphy

Mexico Electric Tramways, Limited, Mexico, Mex., as reported in The Electric Railway Review of January 26, has placed an order with the St. Louis Car Company for 25 closed cars for June and July, 1907, delivery. The details are as follows:

- Seating capacity.....48 persons
- Weight.....4,000 lb.
- Wheel base.....6 ft.
- Length, over all.....43 ft. 8 in.

- Width, over all.....8 ft. 8 in.
- Height, track to trolley base.....12 ft.

- Special Equipment.**
- Air brakes.....Christensen
 - Control system.....General Electric
 - Couplers.....Mexico City standard
 - Destination signs.....Hunter
 - Headlights.....Mosher arc
 - Interior finish.....Mahogany
 - Markers.....Armspear

- Motors, type and number.....G E 87-4
- Seats.....St. Louis—rattan
- Trolley poles and attach.....G E roller bearing
- Trucks.....St. Louis

Milwaukee Electric Railway & Light Company, Milwaukee, Wis., as reported in the Electric Railway Review of January 26, has placed an order with the St. Louis Car Company for 10 closed interurban motor cars of the Milwaukee type for delivery in March. The specifications call for the following details:—

- Seating capacity.....62 persons
- Weight, body.....35,000 lb.
- Total.....85,000 lb.
- Wheel base.....35 ft. 1 in.
- Length, body.....40 ft.
- Over vestibule.....51 ft. 11 in.
- Over all.....53 ft. 5 in.
- Width, inside.....7 ft. 7 3/4 in.
- Over all.....8 ft. 4 in.
- Height, inside.....7 ft. 10 in.
- Sill to trolley base.....8 ft. 4 3/4 in.
- Track to trolley base.....11 ft. 8 3/4 in.
- Body.....Steel
- frame with wood covering
- Underframe.....Steel

- Special Equipment.**
- Bolsters, truck.....Wrought iron
 - Brakeshoes.....Co. standard
 - Center bearings.....Co. standard
 - Curtain material.....Pantasote
 - Dust guards.....Wood
 - Heating system.....Hot water
 - Interior finish.....Quarter oak
 - Journal boxes.....St. Louis
 - Motors.....G. E. No. 605A
 - Roofs.....Monitor
 - Seats.....Hale & Kilburn
 - Side bearings.....St. Louis
 - Trucks.....St. Louis
 - Vestibules.....At both ends

Spokane & Inland Empire, Spokane, Wash., as noted in our issue of February 2, has placed an order with the Seattle Car Manufacturing Company for 250 box cars. These will be 40 feet

in length, will have wooden bodies and are for delivery prior to July 31, 1907. An order has also been placed with the St. Louis Car Company for 15 cars of the St. Louis type, five of which will have Detroit platforms. These are for use by the Spokane Traction Company and will have a seating capacity of 50 persons, will be 29 feet 6 inches over vestibule, 8 feet 6 inches wide over all and will be 12 feet 6 inches high over trolley base. The body will be built of ash, with underframe of steel construction. They will be equipped with National Brake & Electric Company's brakes, Consolidated Car Heating Company's heating system and will have full-ventilated roofs.

SHOPS AND BUILDINGS.

Chicago Union Traction Company.—General Superintendent Robert R. Hertzog has announced that a new car barn will be built on the site of the old barns on North Clark street between Sherman and Dewey places, which were destroyed by fire on January 31.

Indianapolis Columbus & Southern Traction Company.—This company has purchased property in Seymour, Ind., for an interurban station and ticket office.

Oakwood Street Railway (Dayton, O.).—The directors have authorized the extension of the present car house by an addition about 128 by 132 feet. Several alterations will be made and the structure will be fireproofed. H. P. Clegg of Dayton, vice-president and general manager.

TRADE NOTES.

Automatic Electrical Brake Control Company has been incorporated at Frankfort, Ky., with a capital stock of \$200,000.

Buffalo Forge Company has changed the location of its Cleveland office from 311 Citizens building to 618 Citizens building.

General Electric Company, Schenectady, N. Y., will erect a new three-story building at the corner of Calhoun and Clifton streets, Ft. Wayne, Ind., and will equip it with new machinery for making incandescent lamps.

H. B. Stebbins has accepted a position as chief engineer of the Stover Manufacturing Company of Freeport, Ill. Mr. Stebbins has for the past four years been erecting engineer for the Allis-Chalmers Company of Milwaukee.

C. H. Worcester Company, Chicago, dealer in cedar poles and ties, has found it necessary on account of a constantly increasing business to move into larger quarters. The offices are now located in 1708-1712 Tribune building instead of Room 1208.

W. R. Burrows has resigned his position as purchasing agent of the Norfolk & Southern Railway to accept a position as eastern sales agent of the Buda Foundry & Manufacturing Company, with headquarters at the New York office, 26 Cortlandt street.

Augustus Dowdell, eastern railway representative of Valentine & Co., Fisher building, Chicago, died in Philadelphia, Sunday, February 10, of paralysis. He has been connected with the company for over ten years but for the past two years has been in poor health.

David Smith Greer, vice-president and general counsel of the Chicago Railway Equipment Company, Chicago, died on February 9, at Kalamazoo, Mich. He had been suffering for several months from kidney trouble, which finally developed into uraemic poisoning, causing his death.

American Rail Joint Company, Niagara Falls, N. Y., has been incorporated with a capital stock of \$750,000 to manufacture rail joints, rails, angle bars, etc. The incorporators are: Morris Cohn, Jr., Frederick Charmann, Fernum G. Anderson, Arthur Killiaw, Henry Charmann, all of Niagara Falls.

Henry Docker Jackson has removed his office from 4 State street, to room 626, Broad Exchange building, 88 Broad street, Boston, Mass., where he will continue his business as consulting electrical engineer, with special reference to improvement in power plant economy, mill work and power distribution for electric railways and lighting plants.

General Electric Company, Schenectady, N. Y., according to good authority, for the fiscal year ending January 31, 1907, will show earnings to the amount of \$10,800,000, as compared with \$7,319,000 for the fiscal year ending January 31, 1906. It is said that new business is coming in at the rate of \$1,500,000 a week and it is expected that the dividend on the stock of the company will be increased within the next six months.

Allis-Chalmers Company, Milwaukee, Wis., announces that a car load of air brake equipments recently left its West Allis works for shipment. This, its first foreign shipment of airbrakes by the company, marks a new step in its progress. It is stated that 80 per cent of all the electric railways using power brakes of any kind are equipped with Christensen brakes, for which that company now controls the exclusive rights to manufacture.

Standard Asphalt & Rubber Company, with general offices in the First National Bank building, Chicago, is manufacturing on a large scale paving asphalt, asphalt roofing, mineral rubber, insulation, pipe dip and other hydro-carbon products, having a daily capacity of 1,500 barrels. The company claims to have solved with its Sarco pipe dip in connection with electrolysis the problem which confronts all municipalities where there are electric car lines. It is stated that a layer of its insulation one-eighth inch thick will withstand a potential of 12,000 volts. A number of

handsome catalogues have been issued by this company dealing with its hydro-carbon products.

Price Publishing Company, Lima, O., has in course of preparation a new electric railway map of Ohio, Indiana and Michigan, showing all the new lines in operation up to date, with their names, the names of the principal towns, and a table of the population of the towns according to the latest census, arranged alphabetically according to states. The map will be printed on heavy paper with cloth back, 26 by 28 inches, and will be generally similar to the map published by the same company last summer.

Bristol Company, Waterbury, Conn., well known maker of recording instruments, has opened a branch office at 753 Monadnock block, Chicago, in charge of H. P. Dennis, who represents the company in the capacity of western manager. Mr. Dennis is a graduate mechanical engineer and has been connected for several years with the factory at Waterbury. This company makes a specialty of continuous recording instruments including recording thermometers, pressure gauges, recording voltmeters, ammeters and wattmeters.

Griffin Wheel Company, Chicago, is having plans prepared by Harry E. Stevens, Chicago, for a new manufacturing plant at Pullman, Ill. It will consist of a foundry 300 feet square; a machine shop 40 feet high of brick and steel construction; a one-story carpenter shop, 19 by 70 feet; a storé house, five molding sand sheds, five coarse sand sheds and two wood sheds; also several scrap and coal bins and other buildings. All the buildings will have gravel roofs and much new machinery will be needed. It will cost with equipment, about \$1,000,000.

Western Electric Company, Chicago, at the annual meeting of the stockholders held on February 7 made announcement that the sales for the fiscal year ending November 30, 1906, were \$69,245,331 as compared with \$44,145,753.18 in 1905, showing an increase of 56.9 per cent. This increase was due in part to the large expenditures of the Bell telephone companies for new construction. The company has made several additions to its plants, including two to its cable plant at Hawthorne, Ill., the construction at Hawthorne of a switchboard and woodworking factory, now nearing completion, warehouses at Atlanta, Ga., Pittsburg, Pa., and San Francisco, Cal., and additional machinery for the Chicago and New York factories. Early in 1906 the board of directors established a pension fund of \$400,000 for the benefit of superannuated and disabled employes and later in the year \$150,000 was added. In December, 1906, the company had in its employ 26,933 people as compared with 19,704 in December, 1905. The following directors were elected: Charles W. Amory, Adolphus C. Bartlett, Enos M. Barton, Alexander Cochrane, W. Murray Crane, Frederick P. Fish, Henry S. Howe, William R. Patterson, Thomas Sherwin, Harry B. Thayer, Arthur D. Wheeler and Charles Williams, Jr.

Thomas F. Griffin, founder of the Griffin Wheel Company, died on Monday, February 11, at the home of his daughter in Chicago, of pneumonia. His death was preceded by an illness of only 36 hours. Six children survive him, T. A. Griffin, president of the Griffin Wheel Company, Chicago; P. H. Griffin, Buffalo, and four married daughters. Mr. Griffin was born in County Limerick, Ireland, on December 18, 1826, and accordingly was over 80 years of age. Eight years after his birth his family removed to the United States and located at Rochester, N. Y., where Mr. Griffin served his apprenticeship as a molder. In 1848, the firm with which he was connected engaged in the manufacture of wheels under the Washburn patents, which cover the present double plate wheel, now in universal use. In 1873 he removed to Detroit to take charge of the foundry of the Michigan Car Company. He severed his connection with that company shortly afterward and incorporated the Griffin Car Wheel Company. The original plant had a capacity of 18 wheels per day and from this beginning the company's output has grown to 6,000 wheels and plants are located in Boston, Detroit, St. Paul, Kansas City, Denver, Tacoma and Chicago, where there are three.

ADVERTISING LITERATURE.

Ingersoll-Rand Company, 11 Broadway, New York, N. Y.—"Some Economical Applications of Compressed Air in the Cotton Industries" is the title of a pamphlet (Form 410) recently issued by this company.

Locknut It Concern, 515 East Sixty-third St., Chicago.—This concern equips nuts and bolts with a nut-lock and has issued a small pamphlet showing a design of its lock, its method of operation, advantages claimed for it and giving the cost.

Automatic Oil Cup Company, 155 Huron St., Milwaukee, Wis.—This company has published a bulletin describing the Bangs automatic oil cup which is the invention of Mr. E. D. Bangs of Milwaukee. The oil cup is designed to feed oil to journals in exactly the quantity needed. It is simple and compact in mechanical construction, being made entirely of aluminum, brass or iron.

Allis-Chalmers Company, Milwaukee, Wis.—Bulletin No. 1044 deals with the subject of the "H. Ward Leonard System of Multiple Voltage Control for Variable Speed Motors." Complete descriptive matter, together with diagrams and a number of half-tone engravings showing machines driven by Allis-Chalmers motors, operated on the H. Ward Leonard multiple voltage system, are presented. Publication No. 115 is an instruction book entitled "Directions for Erecting Gates Elevators." This is a companion publication to Bulletin No. 1115 which describes the Gates rock and ore breaker. Bulletin No. 1038 describes Allis-Chalmers alternat-

ing current generators and presents a large number of engravings from photographs.

Garvin Machine Company, Spring and Varick Sts., New York, N. Y.—Circulars No. 53 and 54 describe the Garvin Nos. 14 and 15 vertical spindle milling machine and the Garvin No. 2A Universal milling machine, motor driven. Also Garvin Nos. 14 and 15 plain milling machines, motor driven. Engravings of the various types of milling machines are presented together with a general description of them.

National Cellular Steel Company, 27 William street, New York, N. Y.—This company, which is the manufacturer of a new steel fireproof building material for floors, doors, partitions, box cars, etc., of modern fireproof construction has issued an illustrated pamphlet describing its product, which it designates as cellular steel. The western representatives of the company are S. P. Holmes & Co., 250 La Salle St., Chicago.

Arnold Company, 181 La Salle St., Chicago.—A paper entitled "What is an Engineer Constructor" which was presented before the electrical section of the Western Society of Engineers on November 16, 1906, by George A. Damon, managing engineer of the Arnold Company, Chicago, has been reprinted in pamphlet form. An abstract of this paper was presented in the December issue of the Electric Railway Review.

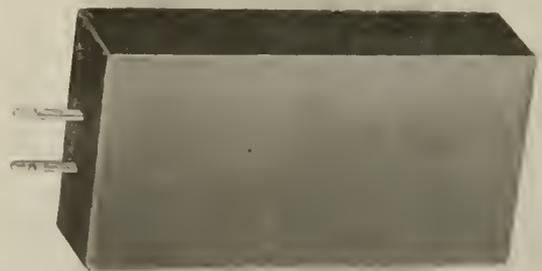

American Blower Company, Detroit, Michigan.—Catalogue No. 206 gives a description of the vertical self-oiling steam engine, designed to fill the demand for a small high speed engine. The catalogue presents engravings from photographs of the various types of engines, together with tables showing sizes, net and gross weights and cost and also a table of horsepowers, and in addition a general description of the points of superiority are briefly indicated and the more important parts of the construction are described in detail. Engravings are also shown of a number of parts.

Buffalo Forge Company, Buffalo, N. Y.—A 4-page pamphlet has just been issued by this company to call attention to the Buffalo air washer. The washer is designed as an adjunct to the Buffalo fan system of heating and ventilating and it is said to remove all dust or smoke from the air entering a ventilating system, to regulate the humidity of the atmosphere in a building and to reduce the temperature in summer over 80 per cent of the initial difference in temperature between the air and the cooling water used. The Buffalo Forge Company also issues a 361-page catalogue of standard size, describing the air washer and humidifier.

CONDENSERS FOR IMPROVING TELEPHONE SERVICE.

Many street railway companies have telephone lines in use for other purposes than dispatching. Some such lines consist of a single metallic circuit on which from 25 to 30 telephones are bridged, the different stations being signaled by means of code rings. It frequently happens that through carelessness the receiver is left off its hook, or after a given station has signaled over the line for a distant station, some one, other than the station desired, "listens in." This puts the secondary of the induction coil and the receiver across the line, forming a shunt which it is impossible to ring past. The receiver offers a resistance of about 70 ohms and the secondary of the induction coil a resistance of about 35 ohms, making the total resistance of the shunt only 105 ohms.

The Kellogg Switchboard & Supply Company, Chicago, to relieve such troubles is promoting the sale of a small ½-micro-farad condenser which may be connected in the secondary circuit of the

Small Condenser for Improving Telephone Service.

telephone in series with the receiver and the secondary of the induction coil. This condenser, known as No. 10, is made of tin-foil and rice paper, like ordinary telephone condensers, and is quite small, its dimensions being 2¾ inches (including terminals) by 1½ by ¾ inches. The manufacturer furnishes this condenser as a part of its telephone sets, or separately. For the latter purpose the Kellogg company furnishes a small brass strap to hold the condenser in the corner of a telephone cabinet.

The condenser acts as follows: The frequency of telephone ringing current as generated by an ordinary hand generator at the usual rate of turning the crank is about 1,000 cycles per min-

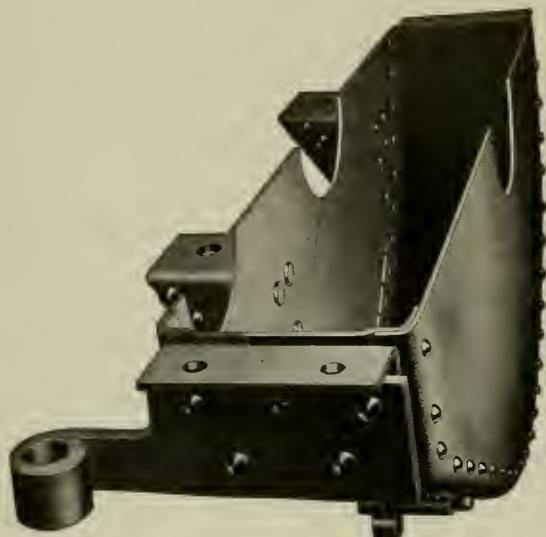

ute. To current of this frequency the condenser offers an impedance of about 10,000 ohms so that when the receiver is down the ringing current is not shunted. On the other hand, the frequency of voice currents is so high that these currents pass through the condenser very readily and the efficiency of the receiving circuit is in no way affected.

LYON SHEET-STEEL GEAR CASES.

The Lyon sheet-steel gear case has proven itself to be a good investment for electric railways. These sheet-steel cases weigh from 75 to 100 pounds less than those of cast iron and therefore reduce the weight on cars from one to four times such amounts, according to the number of motors used. The lightness of this type of case also facilitates the work of handling in repair pits. The criticism has been raised that sheet-steel gear cases were too light, but it is thought that an examination of the accompanying illustration showing the top section of the Lyon sheet-steel gear case will show that the case as a unit is especially strong, being reinforced at points of strain by properly designed brackets.

For some time the demand for these cases has been such that their manufacturer, the Lyon Metallic Manufacturing Company, has been unable to supply the demand of its sales agent, the Electric Service Supplies Company. Recently the manufacturing company's plant has been quadrupled in size and it is now stated that orders for gear cases can be promptly filled.

These sheet-steel gear cases have made such a successful rec-

Lyon Sheet-Steel Gear Case.

ord that the Electric Service Supplies Company offers to send sample cases to those railway companies that desire to have them for 90 days' trial.

THE ANDERSON TIME SWITCH.

The Albert & J. M. Anderson Manufacturing Company, Boston, Mass., has perfected a mechanical time switch that embodies many points of superior merit. Such switches are found to be of much use in many places where it is necessary to open or close electric circuits at definite predetermined hours.

The parts of a first-class time switch are three in number: the switch, the mechanism which opens and closes it; the time-controlling element, which is necessarily a clock of some form.

The Anderson switch mechanism consists of two pivoted arms carrying laminated contacts and arcing contacts after the fashion of approved circuit-breaker construction so that there is no partial or imperfect contact possible. The contact mechanism is housed in a slate enclosure in a separate compartment of the box, and is fireproof. The lower or entering contacts are each separated from the jaws of the switch a distance of over an inch when the switch is open. The circuit is opened horizontally instead of vertically, thereby minimizing the chance of maintaining an arc.

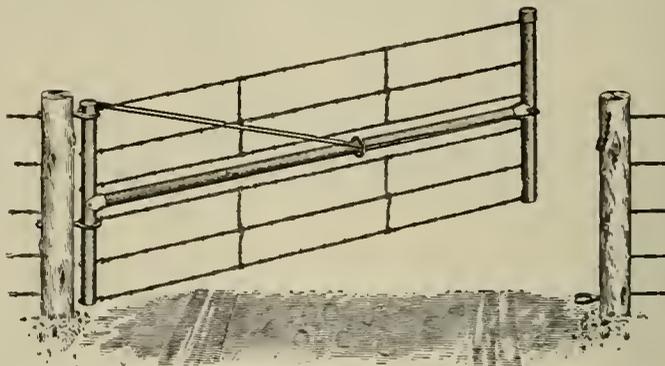

The propelling mechanism consists of a heavy spiral spring, equipped with two trains of gears. One of the spindles of one of these trains is equipped with a crank and connecting rod, the connecting rod being utilized to force the toggle of the switch up or down. A flyer on this train engages with an escapement that permits the crank to make a half revolution at a time. The connecting rod of this crank has a slotted joint with the toggle, so that the parts can have some momentum before they are called upon to do any work, thus rendering the action more certain.

The propelling mechanism is so arranged that it can be set to trip at any hour of the day or night, and by means of an auxiliary dial, graduated to the days of the week, the switch can be set so that it becomes inoperative any day of the week desired.

The apparatus is controlled by a clock of the best manufacture, which can be set and regulated as any ordinary clock, and needs to be wound but once a week. All the parts of the clock and switch are enclosed in a cast iron box, waterproof and dust tight, the door being fitted with a rubber gasket. A Yale lock insures that the switch is out of reach of meddlers.

CLIMAX FARM CROSSING GATES.

The Climax Stock Guard Company, Chicago, Ill., and Canton, O., has recently taken on a line of farm crossing gates which, though embodying the same general principles, are yet made in a variety of forms to adapt them to specific requirements. Some of the styles are illustrated herewith. The gates are not an experiment, but have been used for a number of years on some of

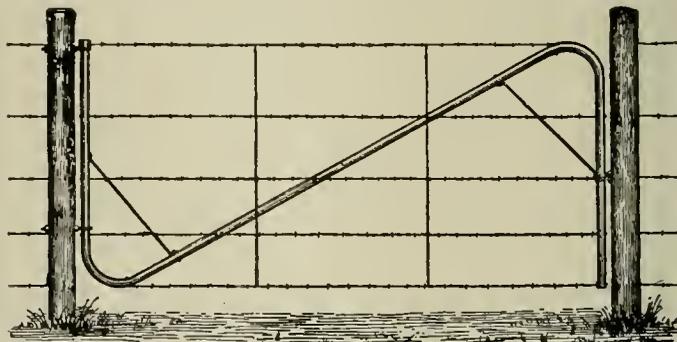

Farm Crossing Gates—Climax No. 1.

the principal railway lines and reports from users have been exceptionally favorable.

The Climax gate, No. 1, is an adjustable swinging gate that can be readily moved up or down at the outer end and at the same time be swung in either direction. The main frame is made of rolled steel tubing which is trussed by means of a cable attached to the inner end of the main frame and by means of a sliding ring to the central tube forming the longitudinal member. The sliding ring connection enables the outer end of the gate to be raised to clear uneven ground or snow and to be easily depressed when the obstruction is cleared. The hinges are made of heavy iron eyebolts encircling the hinge of the main frame.

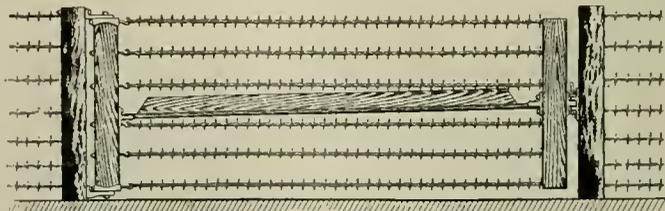

Eureka gate No. 4 has a tubular frame of Z-form with braces

Farm Crossing Gates—Eureka No. 4.

at the angles, and, it is said, will stand a very heavy strain before yielding. There being no lower frame member, there is nothing except the lower wire to catch snow, and the gate therefore serves in winter as well as in summer, and on account of the lightness of the construction the gate is not liable to be affected by the wind. The weight is about 50 pounds and it is stated that gates in service for 20 years have shown no serious deterioration from rust.

The Novelty gate differs from those before described in having a wooden frame composed of three members, the central longitudinal member being hinged to each of the end members. The wires are attached to stretchers at the hinge end for the purpose of tak-

Farm Crossing Gates—Novelty No. 8.

ing up slack and also for adjusting the gate to swing over sloping or uneven ground. The horizontal member is made up of two 2x4-inch pieces spiked together, the edge of one against the side of the other, and all castings are of heavy malleable iron.

All of these gates are made in various sizes and with any desired wiring.

The directors of the Philadelphia Rapid Transit Company have decided to recommend to stockholders the adoption, after a few changes, of the plan suggested by the Retail Merchants' Association for settlement of the traction problem. In his letter to the merchants' association announcing this decision, the president of the company, Mr. John B. Parsons, suggests, as it is generally conceded that a new contract should be entered into with the city, that some determination be reached as to the advisability of action by the legislature, which will give the city undoubted power to act with freedom as to terms. The plan offered by the Trades League was not seriously considered by the directors because it would involve violations of the contracts and leases between the Philadelphia Rapid Transit Company and the 50 or more underlying companies. A new plan containing the modifications which the company believes should be made in the merchants' plan will be submitted soon. The result of the proposed re-adjustment of relations between the company and the city will be the investment of large amounts of capital for improvement of the service. If a satisfactory arrangement is completed, the company believes that new capital can be secured upon fair terms.

The analysis of operations of the South Side Elevated railroad of Chicago for the last 10 years, which was published in the Electric Railway Review of February 9, 1907, showed an increase in expenditure for maintenance of way and structures per mile of structure from \$2,656 for 11 months of 1897 to \$9,110 for the year 1906. At our request Mr. Marcellus Hopkins, the president and general manager of the road, has sent us the following in explanation of the large increase in this item of expense: "The 1897 report showed only 11 months' operation. The railroad was only four years old, and few repairs were required. The South Side Elevated Railroad Company commenced immediately to re-equip the road with electricity, making an

up-to-date road of it. A great many things were added, in the shape of storage batteries, conductor rails, etc., all of which required attention. In addition, there is quite a charge for repairs to buildings. Many of these buildings are tenement houses which, in buying right-of-way for our various branches, were acquired; and for convenience in book-keeping, these, together with storage batteries, etc., are listed under the head of 'maintenance of way and structure.' In 1897 no rails or ties were required. Since then, as the road grows older, these repairs have to be made. The road in 1897 had just been taken out of the hands of the court. It is assumed that the receiver turned over the property in good repair, consequently the repairs for 1897 were light."

Although the chemist is now recognized as an important member of the engineering staff of a large power station, his importance in a small plant has not been properly recognized. It is generally thought that all that is necessary, in localities where the feed water is poor, is to send away a sample, have it analyzed, and then buy a couple barrels of some good boiler compound. In many plants more money is wasted in experimenting with boiler compounds than would be necessary to pay a competent chemist who could direct the proper use of such chemicals and the treatment of the water. Further, when properly looking after the feedwater in plants, the chemist can watch the circulating water as well, and in many instances the cause of pitted and leaky condenser tubes could be ascertained. Testing the coal—which can then be bought under specifications—is another important part of the chemist's work and one which, in most cases, will pay a high rate of interest on the money invested in an expert. The chemist can very materially assist the head stoker by making frequent flue-gas analyses, and by this means determine when the proper combustion is being maintained. An analysis of the ashes also is of value and serves as a check upon the

stoking. There are many other ways in which the chemist can make himself useful and valuable to a small company. There are always oils and many other supplies and materials which are bought under certain specifications and without the chemist the purchaser, in most cases, does not know what he is getting.

The transfer problem in large cities is one of the most troublesome matters with which street railway managements have to deal. It is doubtful if there is ever a time when agitation on the part of the public for more extended transfer facilities is entirely quiescent. The effect of extended transfer privileges upon traffic is a very uncertain affair. The public generally believes that crowding of cars will be diminished by the creation of new transfer points, whereas it often happens that crowding is increased in such cases. The quality, appearance and general comfort of the cars at transfer points are really powerful factors in the situation, and with some properties there is a growing belief that all the cars running on the same general routes should be of the same general design. Otherwise, for example, the public will overcrowd the larger semi-convertible or through cars, leaving the single-truck locals but partially filled.

A recent case in Boston which was heard by the Massachusetts Railroad Commission well illustrates the public idea that extended transfer privileges are certain to relieve crowding. A number of residents of Arlington petitioned the board that an additional transfer station be established at the North Cambridge car house of the Boston Elevated system. It was claimed by the petitioners that there would be less crowding of cars if this were done, as any Arlington passenger, finding his own cars crowded on the Boston side of the North Cambridge car house, could ride to North Cambridge by other lines, changing at the latter point for his destination and continuing his journey in greater comfort. In remonstrance the company pointed out that there are already three points between the business center of Boston and Arlington where passengers traveling via the Back Bay and Harvard Bridge lines may transfer in the same general direction. It was stated that the establishment of a fourth transfer point would be objectionable for the reason that it would tend to increase the crowding of lines already busy. The company recognized that there was no practicable way of keeping local patrons from taking through cars for short riding, but pointed out that the needs of the larger residential districts are a considerable factor in the provision of the frequent service which is given.

The final solution of any transfer scheme acceptable to an operating company and its patrons must rest upon effecting the greatest good for the greatest number. There is no question about this in the minds of transportation experts. Without passing upon the merits of the preceding case, it is nevertheless instructive to note the recurrence of the old problem of local versus through service, and the difficulty of establishing any system of transfers which will satisfy every resident of a given territory. In cases where large and handsome cars of new design tend to become overcrowded by local passengers, about the only positive remedy seems to be the standardization of all the rolling stock possible in a given section of the system. Generally speaking, the elaborate extension of transfer privileges tends to cut down the speed of transit from the beginning to the end of

the journey, on account of the waits for connections and the time consumed in changing cars; it opens the way toward abnormal concentrations of traffic at undesirable times and places, and establishes new loopholes for abuses which annually cost an operating company a considerable loss of revenue.

THE WOODLAWN ACCIDENT ON THE NEW YORK CENTRAL.

It is to be regretted that the initial operation of such a magnificent work as the electrified New York Central terminals should have been attended by the disastrous accident of February 16. Lessons of great value to this and similar projects will be learned from the investigations of the accident, but these are had at the high price of life and property.

The accident to a local train on the electrically-equipped tracks of the New York Central, which caused the death of 21 persons and injury to 140, happened on a $3\frac{1}{2}$ -degree curve near Woodlawn. The investigations are not yet far enough advanced to define the cause, but the general impression is that the train entering the curve at an excessive speed caused the rails to spread.

The track rail on the $3\frac{1}{2}$ -degree curve was elevated $4\frac{1}{2}$ inches, which is quite sufficient for the safety of ordinary rolling equipment moving at the rate of 60 miles an hour, and if the wreck is to be attributed to insufficient super-elevation of the outer rail, the speed must have been far in excess of 60 miles an hour. It is understood that the scheduled speed of the train in the locality of the wreck was 57 miles an hour. The train was delayed six minutes at Mott Haven and it is probable that from that point on a speed in excess of 60 miles was obtained in order to make up time. With the two powerful electric locomotives it is possible to accelerate such a light train more than twice as fast as the best steam locomotives could do it, and it is quite probable that the train entered the curve at a speed much in excess of the safe limits. It does not appear that any limitation had been made on speed and no means were provided for indicating to the motorman how fast he was running. It was a matter of common experience when the old steam engineers were in training for motormen on these electric locomotives that they were deceived as to speeds, and that they were running very much faster than they had thought.

The engineer of maintenance of way testified at the coroner's inquest that one of the rails on the outside of the curve had been sprung sideways and the spikes sheared off.

The third rail was torn up and bent and some reports say that it entered one of the coaches. It has been assumed that the injury to this rail was caused by a broken collector shoe catching under it, and the initial cause of the accident has been attributed to this by some railway officials. The earlier forms of top contact third-rail shoes were supported by cast iron links of such cross section that in event of derangement of the third rail the links would break and free the shoe from the side-bar rather than permit the shoe itself to break and catch on the rail. It would seem hardly probable that this protective principle of design had been neglected with the underrunning shoes. The effects of expansion and contraction frequently disturb the alignment of the third rail and especially on curves, but it is difficult to see, with the underrunning type, and on a curve, how an injured shoe could have done otherwise than throw the rail away from the wheels.

The New York Central has taken the greatest precaution to see that the new electric locomotives would operate safely on curves and on tests they have been operating at speeds of 85 miles an hour on straight track and 78 miles an hour on 2-degree curves, but it is doubtful whether they were justified in allowing motormen to drive this powerful equipment around curves at unlimited speeds as appears to have been the case with the wrecked train.

The center of gravity of these electric locomotives is

unusually low and they have a long rigid wheel-base. It was found in testing them on sharp curves at high speed that they were rather severe on the track, and it will probably be found that greater precautions must be used in their operation than appear to have governed those hauling the wrecked train. The various commissions which are now investigating the accident will doubtless get at the real cause and it will not be sufficient to say that the accident could have been prevented, but the conclusion must be that some one has blundered.

AMOUNT OF MAINTENANCE AND DEPRECIATION CHARGES.

The investigations made by direction of the receivers of the Chicago Union Traction Company, the particulars concerning which are given elsewhere in this issue, should be found of considerable assistance in determining what constitutes a "reasonable charge for depreciation of plant and equipment." In taking up this subject the company's engineers first made a complete inventory of the property and estimated that to provide for depreciation proper, that is, that reduction in value

and depreciation. On reflection it will be evident that these two plans are in no sense antagonistic, but on the contrary are complementary. In no instance can a percentage of gross income be named which will be that needed to provide for these charges, until the amount required has been determined by an investigation such as was made in this case. However, when the depreciation to be reasonably expected has been estimated, and cost of ordinary maintenance has been shown by experience, there are decided advantages in combining the two charges and expressing the total as a percentage of gross income.

First, this method removes all temptation to bicker over what items should be classed as maintenance and what as renewals, or to favor the repair account at the expense of the depreciation reserve.

Secondly, to compute these charges as a certain proportion of gross income is extremely simple, while the other method of determining depreciation if accurately carried out would involve a vast amount of bookkeeping.

Thirdly, to base these charges on earnings apportionments them according to the ability to pay and also in proportion to

*Per cent of capital accounts May 31, 1905, with one-half of additions for succeeding year added.

or usefulness which is not compensated for by current maintenance and repairs, there should be charged annually a sum equal to 6.20 per cent of the original cost of the physical property. A subsequent examination into the same matter was made by independent engineers and accountants, Messrs. Stone & Webster of Boston, and their recommendations were approved by the court having jurisdiction of the property, and have been followed by the receivers for over three years. This second estimate placed the annual depreciation at 5.65 per cent of the original cost of the physical property. Reference to the detailed statements shows that over four-fifths of this difference is due to differences in the estimated life of power plant buildings and of cable-driving machinery. Strong arguments can be advanced in favor of the higher depreciation charges recommended by the company's engineers, especially if consideration be given to the fact that improvement in the art may cause apparatus to be superseded before its usefulness is ended by wear, as was actually the case with this company's cable power stations. The important conclusion to be drawn from the close agreement of the two estimates is that the average life of the physical property of an urban street railway under such general conditions as obtain in Chicago is from 16 to 18 years and that six per cent of the original cost is very nearly the proper annual allowance for depreciation.

It had been the intention to base depreciation charges on the original cost, but on the recommendation of Stone & Webster the court decided that it would be better to set aside a fixed proportion of gross income to pay for both maintenance

the wear and tear which under normal conditions may be expected to increase as the earnings increase.

It is believed that the policy of the Glasgow Corporation Tramways committee in providing reserve funds is regarded by American accountants generally as an ideal toward which all street railways should strive, and therefore comparison of the Chicago Union Traction Company's reserves with those for the Glasgow lines should be of especial interest. The income, mileage, passengers, etc., for these properties (last complete fiscal year) are as follows:

	North Chicago.	West Chicago.	Glasgow.
Gross income	\$3,543,176	\$6,624,368	\$3,997,973
Miles of track operated	95.1	207.3	168.5
Revenue passengers	69,716,881	130,863,648
Total passengers	118,533,806	223,912,157	208,059,833
Total car miles	12,107,494	23,231,597	18,886,910
Total car hours	1,569,392	3,035,625	2,646,512
Income per passenger, cents	2.95	2.96	1.92

In the larger table the maintenance and depreciation charges for the two Chicago companies and for the Glasgow lines have been expressed in a number of different units. Referring to that table, it will be remarked that while the Glasgow lines require 35.24 per cent of gross income for maintenance and depreciation as against an average of 23 per cent for the North Chicago and West Chicago, the corresponding figures per mile of track operated, per total passenger, per car-mile, and per car-hour are so close that their agreement is striking. Conditions are so different in the two cities that no conclusions are ventured as to whether any of these units offer a basis for computing depreciation that would have wide application. Were there available similar data for other com-

panies it would be an easy matter to determine whether the close agreement in the figures shown for these two properties is more than a coincidence. But while some companies publish reports in which the expenditures for maintenance and repairs are separated from other operating charges, and a few show reserves for depreciation and renewals, there are very few which make public all the data needed for such a comparison as that here made between Chicago and Glasgow.

In the new ordinances under which, in all probability, the Chicago street railways will be operated, the minima of the sums to be expended or reserved for maintenance and for depreciation have been fixed at 6 and 8 per cent, respectively, of the gross receipts, but it is specified that the companies shall expend all that may be necessary on these accounts. If these minima, which together amount to only 14 per cent as compared with the 23 per cent (on an average) charged on these accounts during the last three years by the Chicago Union Traction Company, are sufficient for the purposes intended it means, (1) that the plant and equipment of the near future will be about 65 per cent more durable than that heretofore used, (2) that the carrying capacity of an equivalent equipment will be this much greater, (3) that by improvements in operation increases in receipts and reductions in expenses for a given traffic can be effected to make up the difference, or (4) that there may be a happy combination of all three.

There may be some question as to whether these minimum percentages specified will be sufficient, but the transportation committee of the Chicago city council, the representatives of the street railway companies and their advisers who framed these ordinances are deserving of the highest commendation for what has been accomplished in establishing depreciation as an operating expense, and providing that the reserves are to be held in cash. The separation of maintenance and repairs from depreciation and renewals will doubtless make a great deal of work for the board of supervising engineers, but thorough discussions on mooted points and decisions by a disinterested board will go far to develop acceptable definitions and standards and mark the line between the two classes of charges. Also, this recognition of sound principles should go far towards educating the public to demand that the accounting of municipal undertakings be put upon a similar basis.

CONSTANT VOLTAGE FOR CAR LIGHTING.

With the many refinements that are being introduced in the latest types of rolling stock it would seem that more attention might profitably be given to improving interior illumination. The last few years have seen the electric headlight advance until now the manufacturers have for distribution types of arc and incandescent headlights that are quite satisfactory for their various classes of service. Since the time when oil lamps were replaced by 16-candlepower incandescent globes five in series between the trolley and the ground, practically no general advancement has been made in the methods of lighting street car interiors. Very recently, however, high-efficiency incandescent lamps have been adopted for some cars. With these improved lamps carefully disposed about the car the lighting is materially improved, from both the passengers' and managers' standpoints.

In a paper on "Car Lighting" read before the Central Electric Railway Association by Mr. R. C. Taylor of the Indiana Union Traction Company (*Electric Railway Review*, January 26, 1907, page 128), the requirements of the lighting situation as regards interurban roads, which requirements are also applicable to street cars, were stated as follows: "The modern interurban car should have its lighting arrangements so designed as to provide sufficient light at all times to give the passengers an opportunity for reading with comfort." In

this statement especial attention should be called to the requirement that light should be supplied "at all times."

It is obvious that with trolley lines the fluctuating voltage is the undesirable factor which must be overcome, if incandescent lamps supplied from the operating circuit are relied upon, before a continuously well-lighted car can be had. With interurban lines operated by third rail still another factor enters to interrupt the continuous illumination of the car. On nearly all these roads the distance between the collector-shoes on one side of a single car is less than the length of the gap between the ends of the third rail at highway crossings. As cars pass such crossings the current supply to the car is broken. At night this prevents the proper illuminating because the lights go out during the short space of time necessary for the front shoe to reach the rail which it is approaching after the rear shoe has left the other rail.

Mr. Taylor suggests that the obvious remedy for any fluctuation in the potential on trolley lines would be had by inserting in the lighting circuit some form of regulator which would maintain a constant potential on the lighting circuit, irrespective of the fluctuations of voltage on the trolley line. Several suggestions for accomplishing this desirable condition have been advanced, but so far as known none of these have met with very conspicuous success. One such plan utilizes as resistance for the arc headlight a number of lighting circuits and the balance of the resistance for the headlight circuit is obtained by feeding the current through a number of specially designed arc lamps illuminating the interior of the car. Still another method for use on trolley lines with fluctuating voltage includes a regulator in the car which, as the potential falls, short-circuits a number of lamps, thus maintaining a constant voltage on those left burning.

It would seem that the general demand for refinements in car lighting should in the near future bring forth improved apparatus or methods of connection. Mr. Taylor suggests that in the event that no satisfactory regulator is produced to supply the demand for better service, the matter of having a constant potential on the lighting circuits is of sufficient importance to warrant the adoption of an independent motor-generator set for car lighting. In the design of a new car this detail could be very nicely cared for by combining the lighting generator as a part of the air motor-compressor unit. The motor of the set could then be designed to maintain a constant speed under a varying voltage and be of such capacity as to run the air-compressor and a generator supplying the lighting circuits. This generator could be mounted on the motor shaft and no additional bearings or frame would be required. By providing an air-operated clutch which would throw the air pump in and out of service to meet the demands for compressed air, the motor and the generator could be connected to run continuously. The generator would maintain a constant potential on the lighting circuits, when driven at a constant speed by the motor which would also drive the air-compressor when necessary.

It will be noted that with such a unit the potential of the motor, lighting and headlight circuits could be unified and the energy at present dissipated through headlight resistance conserved. Mr. Taylor estimated that with interior lamps of the high efficiency type operating under the uniform conditions as just stated, the net saving in energy per year would be 2,815 kilowatt-hours per car. The suggested arrangement, therefore, presents the pleasing prospect of affording an abundant supply of unvarying illumination for headlight, tail-lights and interior lamps; it also affords an estimated saving of about \$100 per year per interurban car. It is thought that the added expense for variation from the present method of lighting and operating the air-compressor would be about \$100 per car. This, then, would balance the financial items and as a result highly improved car lighting would be obtained.

ANNUAL REPORTS.

Chicago City Railway Company.

The annual report of the Chicago City Railway Company, presented at the meeting of stockholders on February 16, showed gross earnings for the year 1906 of \$7,871,126, an increase as compared with 1905 of \$549,046, or 7.5 per cent. Charges for operating expenses, taxes, depreciation and interest on floating debt were \$6,146,304, an increase of \$503,697, or 8.93 per cent. The president, T. E. Mitten, says that the increase in cost of operation was due largely to the increased volume of business, necessitating more cars and labor, to which were added the heavy track repair account and the increased interest charges on borrowed money. The large sums which are being expended for new cars and the construction of power plants and other buildings made it necessary to borrow money. Mr. Mitten made the following statement regarding improvements:

The 200 cars purchased during 1905 having proved satisfactory, 100 additional cars of the same type were purchased and placed in service.

The use of cable lines and horse cars has been discontinued and all lines of the company are now operated electrically. In order to meet the demand for increased power, occasioned by operating the entire system electrically, marked additions have been made to the substation power plants of the company. The buildings have been enlarged in size and additional machinery installed. The rated capacity of the generating plants and substations combined is now approximately 35,000 horsepower, an increase of 10,000 horsepower.

A new paint shop, with a capacity of 150 cars, has been completed at Seventy-seventh street adjacent to the general repair shops. A modern office building for use as divisional headquarters has also been completed at the same location.

Two new car stations of large capacity and modern equipment are in course of erection. Portions of the track on Twenty-sixth street, Thirty-first street, Forty-third street, Forty-seventh street, Fifty-first street, Sixty-third street, Ashland avenue, Halsted street and Centre avenue have been reconstructed.

The eliminating of grade crossings still continues. This is occasioned by the city ordinances compelling railroads in certain sections to elevate their tracks and to cross the tracks of this company by means of overhead bridges. The expense to this company during the year as a result of this track elevation approximated \$100,000; this expenditure will be reflected later in decreased operating expenses, as faster schedules can be maintained, and the abolition of grade crossing accidents will result.

Material improvements in the fire risk at the several power houses and other buildings of the company have been effected, which have considerably lessened the possibility of loss by fire. These changes have also served to decrease materially the rate of insurance for the current year.

The statements of earnings, operation and equipment compare as follows:

Income Account.			
	1906	1905	Increase
Passenger receipts	\$7,773,446	\$7,240,671	\$532,775
Receipts from other sources	97,680	81,409	16,271

President Palmer C. Ricketts of the Rensselaer Polytechnic Institute has announced that Mrs. Russell Sage has given \$1,000,000 to that institution.

MAINTENANCE AND DEPRECIATION CHARGES OF THE CHICAGO UNION TRACTION COMPANY.

On July 1, 1899, the Chicago Union Traction Company leased the properties of the West Chicago Street Railroad Company and the North Chicago Street Railroad Company, the annual rentals being fixed at the equivalent of 6 per cent upon the outstanding stock of the West Chicago and 12 per cent upon the outstanding stock of the North Chicago. As some of the stock of the two lessor companies was owned by the lessee, these rentals involved annual payments (to others than the lessee company itself) as follows:

On account of West Chicago stock	\$ 599,340
On account of North Chicago stock	710,400
Total	\$1,309,740

The Chicago Union Traction Company met its obligations for three years, but on April 22, 1903, it having become apparent that the demand of the city that all rights claimed by the company under the 99-year act be waived as a preliminary to further franchise negotiations would seriously embarrass the company, a petition for a receivership was filed in the United States circuit court and receivers were appointed by Judge Grosscup for the lessee and the two lessor companies.

Shortly after receivers for these properties were appointed negotiations were begun with the object of modifying the terms of the original leases, and what are known as "the amended leases" were agreed upon and approved by the court, the amended leases becoming effective on September 1, 1903. Under the new leases the lessor companies for five years were to receive all of the net profits from the operation of their respective lines up to amounts equal to 4 per cent on the stock of the West Chicago and 8 per cent on the stock of the North Chicago; after five years (that is, with the year beginning September 1, 1908) the lessor companies were to receive all earnings up to 6 and 12 per cent, respectively, on their stocks, and the lessee guaranteed that the rentals paid would be the equivalent of at least 4 and 8 per cent respectively on the West Chicago and North Chicago stocks.

Section 5 of the amended leases provided that:

There shall be deducted from the gross income of the demised property, in order to ascertain the net earnings, the following items:

(f) A reasonable charge for depreciation of the plant and equipment hereby demised.

Prior to the execution of these amended leases the Chicago Union Traction Company and its predecessors had ignored the question of depreciation. Under the new arrangement, however, this subject required attention and it was determined to treat it in the most scientific manner practicable. As the investigation into this matter proved to be vastly more important than had been anticipated by any of the parties in interest, a full account of the methods pursued and the results obtained will be given.

A complete inventory of the property was prepared as a basis for determining the value on September 1, 1903, depreciation being considered. Each item in the inventory was considered separately and the best judgment of the company's engineers taken on its life and value. By reason of the company's records of original cost and date of purchase being incomplete in some particulars, the same method of arriving at the value could not be followed with all classes of plant and equipment.

In appraising track, it was surveyed section by section and estimates made (1) as to the time to elapse before renewal would be necessary and (2) the cost to replace new according to the old specifications, which was taken as the original cost. Comparison of the record of the date of original construction with the estimate as to date of renewal gave the estimated total life in years. Then the annual charge for depreciation necessary and the then value were computed. It will be observed that this method, while it

gives the property the benefit of the appreciation in value that has occurred because of the rise in cost of materials and labor, also imposes a proportionately greater depreciation charge.

In regard to paving, the original cost was a matter of record and the annual depreciation was based upon an estimate of the number of years each class of paving will last.

Cars were assumed to have a life of 20 years, giving an annual depreciation of 5 per cent of the original cost. An estimate of the number of years each car could still be used was made, and that number of twentieths of the original cost taken as the then value.

In fixing depreciation on buildings other than power houses, 2 per cent was assumed because it is the figure used by the Chicago real estate board.

The property surveyed comprised the plant and equipment for the operation of an aggregate of 302.4 miles of track as follows:

Miles of Track.	Electric.	Cable.	Horse.	Total.
North Side	76.5	17.8	.8	95.1
West Side	170.9	29.8	6.6	207.3
Total.....	247.4	47.6	7.4	302.4

Exception to the allowance for depreciation thus determined having been taken by the stockholders of the lessor companies the court retained Stone & Webster of Boston to report upon the subject, and on September 28, 1904, the following report was submitted to Judge Grosscup:

"In accordance with your request, we have investigated the affairs of the Chicago Union Traction Company so far as they bear on the question of the amount of depreciation on the properties of the North Chicago Street Railroad Company and the West Chicago Street Railroad Company for the year ending September 1, 1904.

"We examined the physical property, investigated the methods of accounting and carefully calculated depreciation based upon the replacement cost, present value and probable life of the different items of the property of the respective companies.

"Owing to the short time that was allowed for this work we necessarily assumed that the inventory and other figures submitted by the company were accurate.

"We believe we have included all the property with the exception of the tunnel belonging to the West Chicago Street Railroad Tunnel Company, the depreciation on which has not been included in the figures given below. We understand the federal government has ordered that the tunnels under the Chicago river be lowered at once. In this case the depreciation on the tunnel will be outside of ordinary operation and a matter which we think should be considered by itself. If you decide it necessary to allow a sum for depreciation on the tunnel, we think a figure of \$7,000 per annum, on the basis of its continuance in use, a reasonable one and this, of course, should be added to the figures submitted in this report.

"In response to your request for a basis on which you can figure depreciation for future years, we would say that our figures show that about 22 per cent of the gross earnings of the North Chicago Street Railroad Company and 24 per cent of the gross earnings of the West Chicago Street Railroad Company should have been reserved for maintenance and depreciation for the year ending September 1, 1904, and we think these figures will be reasonably accurate for future years. If these figures are adopted the process of arriving at the depreciation for each year will be simply to deduct from the percentage of gross earnings above described the amounts expended by the respective companies on maintenance accounts for that year, the remainder so obtained to be carried to a depreciation fund for that year.

"It might seem that a yearly depreciation based upon an arbitrary percentage of gross earnings is not as accurate as a figure based upon an arbitrary percentage of the replacement cost of the property. On consideration it will be seen that in basing depreciation on a single figure of percentage of the total replacement cost of the property there are admitted many variable conditions brought about by changes in the different items of property; that is to say, this year a certain piece of track might be laid with 7-inch rail and the depreciation for this year based upon the replacement cost of the track laid with such rail. During the year, if this track should be relaid with 9-inch girder, it would be necessary to calculate annual depreciation on the replacement cost of the new track.

"In addition to such variations it is necessary to take into consideration the methods used in the accounting department in discriminating between improvements, betterments and maintenance and there is great likelihood of different opinions on this matter from year to year.

"Taking all these things into consideration, our opinion is that depreciation arrived at on a basis of an arbitrary percentage of the gross earnings will be as accurate as depreciation arrived at by means of an arbitrary percentage on the replacement cost of the property. Our experience has been that increasing earnings require additional investment in property and that for a term of years depreciation based on gross earnings increases nearly proportionally to the increase in property.

"From all the above we are of the opinion that a fair amount to be set aside for depreciation and maintenance is 22 per cent of the gross earnings of the North Chicago Street Railroad Company and 24 per cent of the gross earnings of the West Chicago Street Railroad Company.

"The difference in percentages for the two railroads may be accounted for by the greater earning capacity per mile of the North Side lines."

The engineers submitting this report accepted the inventory prepared by the company's engineers, and the principal differences as to depreciation charges are comprised in three items:

(1) The life of power house buildings, estimated by the company at 20 years, was increased to 50 years, reducing the annual depreciation charge by nearly \$31,000.

(2) The life of the cable driving machinery, estimated by the company at 15 to 20 years, was increased to 30 years and the life of electrical machinery, estimated by the company at 15 years, was increased to 20 years, these changes causing a reduction in the annual depreciation charge of over \$43,000.

(3) Small variations in the estimated life of a few pieces of track resulted in a reduction of the company's annual depreciation charge of about \$17,000.

In Table I are shown the estimated life of the various classes of property as fixed by the company and by the independent engineers.

Table I—Estimated Life of Plant and Equipment.

Property.	Life in Years—	
	Company.	S. & W.
Track: Electric (average).....	*12.85	13.86
Cable (average)	*14.53	14.68
Horse (average)	*12.29	12.29
Paving: Granite block.....	15	16
Cobble stone	25	25
Cedar block	6	6
Asphalt	10	10
Brick	7.69	7.69
Trolley wire: No. 0.....	7	7
No. 00.....	10	10
Poles, iron	20	20
Power plant machinery: Cable.....	15 to 20	30
Electric.....	20	50
Power plant machinery: Cable.....	17.5	30
Electric.....	15	20
Cars	20	20
Electric car equipment: Edison.....	10	10
Siemens-Halske ...	10	10
G. E. 800.....	12	12
G. E. 57.....	15	15
Buildings other than power houses.....	50	50
Shop machinery	20	20

*The range in the company's estimate was: Electric, 7 to 20; cable, 11 to 19; horse, 11 to 25.

In Table II are shown summaries of the original cost and of the annual depreciation on each class of property.

The few differences between the two estimates are as follows:

Property.	Reduction Made in Company's Estimate.		
	North.	West.	Total.
Tracks	\$ 8,434.89	\$ 8,428.20	\$16,863.09
Power house, buildings.....	10,821.78	19,986.36	30,808.14
Power house, machinery.....	13,701.95	29,370.66	43,072.61
Sundries	630.00	630.00
Total.....	\$91,373.74

The depreciation charges recommended by the company's engineers were 6.20 per cent of the estimated original cost for both North and West Side lines. In percentages of the gross receipts they were 10.69 for the North Side and 12.30 for the West Side.

The reduction of the total depreciation charge by the

\$91,374 shown in the preceding table changed these percentages to the following:

Percentage of—	North.	West.	All Lines.
Original cost	5.59	5.68	5.65
Gross earnings	9.64	11.26	10.67

Having estimated the proper charges for depreciation, Stone & Webster analyzed the maintenance accounts of the company in order to determine what the total charge on account of maintenance and depreciation should be in terms

Table II—Estimate of Original Costs and Depreciation Charges.

Property.	North.		West.		Annual Depreciation (as adopted).	
	Miles.	Original Cost.	Miles.	Original Cost.	North.	West.
Track:						
Electric	76.5	\$ 883,793	170.9	\$1,985,671	\$ 61,067	\$145,902]

Cedar Block	32.2	166,480	86.0	445,309	27,747	74,218
Asphalt	4.6	56,498	2.7	32,441	5,650	3,244
Brick	1.9	17,280	2.2	19,440	2,246	2,527
Trolley wire		16,837		39,985	2,288	5,053
Poles		156,527		322,434	7,826	16,122
Power plant buildings:						
Electric		112,476		124,760	2,250	2,495
Cable		248,250		541,452	4,965	10,829
Power plant machinery:						
Electric		357,749		644,644	17,887	32,232
Cable		447,000		661,000	14,900	22,033
Cars		891,322		1,962,230	44,566	98,111
Electric car equipment		191,495		408,205	15,929	33,419
Tools, machinery		21,068		17,816	963	891
Buildings and improvements		612,825		1,358,820	12,347	27,176
Total		\$5,506,367		\$11,039,795	\$308,053	\$626,905

of gross receipts. The conclusion reached was that there should be expended or reserved for the year ending August 31, 1904, on account of maintenance and depreciation 21.77 per cent (taken as 22 per cent) of the gross earnings of the North Side lines and 23.70 per cent (taken as 24 per cent) of the gross earnings of the West Side lines.

However opinions may differ as to the estimate to place

sense of experience with railway power plants 50 years old, the estimate of 20 years is to be preferred rather than the one of 50 years.

In Table III are shown abstracts of the income and expense accounts of the Chicago Union Traction Company for the fiscal years ending August 31, 1904, 1905 and 1906. In this table is also shown an abstract of the similar accounts of the Chicago Consolidated Traction Company for the same period; this is a matter of interest in this connection as the Union Traction lines have to carry the deficit of the Consolidated.

In Table IV are exhibited the summaries of the depreciation and maintenance charges of the North and West Side lines for the same three fiscal years. It will be observed from Table III that when the balance available for depreciation and rentals has been less than the accepted depreciation charge no deficit was shown. In Table IV the amounts of these deficits on account of what may be called "accrued depreciation" are shown and also the total of these deficits to date of report for each company, and for the two combined. Under the original leases this total deficit of \$910,000 for the three years would have been increased to \$4,839,330, had depreciation been considered and the rentals accrued upon charged.

The percentages of gross receipts recommended in the report quoted, 22 per cent for the North Chicago and 24 per cent for the South Chicago, are to cover (1) maintenance and repairs, and (2) depreciation and renewals. In determining the amount to be charged for "Depreciation" the process is as follows: To "Gross Earnings from Operation" is added "Total Miscellaneous Income." The named proportion of this sum (22 or 24 per cent) is then taken for maintenance and depreciation. The maintenance is found by adding the two items "Maintenance of Way and Structures" and "Maintenance of Equipment" (see Table III). This sum subtracted from the named proportion of total gross income gives the amount to be charged for "Depreciation" reserve.

So much for the past and present policy of the Chicago Union Traction Company and the receivers in giving consideration to depreciation.

The future policy has been prescribed in the new traction ordinances passed by the Chicago city council on Feb-

on the life of cable power house machinery, considered theoretically, the fact that these plants have (since the appraisal) been abandoned after an average service of only 16 years shows that, practically, having in view the hazard of supersession the company's estimate of 15 to 20 years on cable machinery was more nearly correct than the revised estimate of 30 years. In regard to power house buildings, in the ab-

February 4, 1907, and passed over the mayor's veto on February 11, 1907, and which are to be submitted to the voters at the city election to be held on April 2 next. In these provisions for maintenance, repairs, renewals and depreciation are included as follows:

(a) After the expiration of the three-year period of reconstruction and re-equipment during which the so-called "Im-

mediate rehabilitation" of the property is to be carried out, the companies are required:

(1) To maintain the property in first-class condition, by "making from time to time such expenditures thereon for maintenance, repairs and renewals as may be necessary or appropriate to give to the public first-class street railway service in all respects."

(2) To expend for maintenance and repairs during each and every year at least a sum equal to six per cent of the gross receipts for the particular year. If this amount is not thus expended, at the end of the year the unexpended balance is to be deposited with one or more banks or trust companies for the purpose of being used whenever necessary for such maintenance and repairs.

(3) To deposit with one or more depositories, on or before the fifth day of each and every month of each and every year, a sum equal to eight per cent of the gross receipts,

PROPOSED CHICAGO-ST. LOUIS LINE OF THE ILLINOIS TRACTION SYSTEM.

President William B. McKinley of the Illinois Traction Company has announced that plans have been decided upon for the construction at once of the much-talked-of electric railway to connect St. Louis and Chicago. Of this distance, 130 miles, or approximately half, is now in operation, between East St. Louis and Lincoln, Ill.

From Lincoln the line will be extended this summer north to Mackinaw in Tazewell county, intersecting at that point with the line from Bloomington to Peoria, which is now nearly completed. From Mackinaw the line will be extended northeastward through Washington and Eureka, in Woodford county to Minonk, in Woodford county; thence north to Streator and Ottawa. Franchises in both Streator and Ottawa were obtained last summer under the charter of the

which shall constitute "a reserve fund for taking care of renewals and depreciation" for the preceding month. Payments from this fund for the purpose of renewals may be made on the written certificate of the "Board of Supervising Engineers." This board is to determine from time to time what particular items shall be considered as renewals and what as maintenance and repairs.

(b) It is stipulated that the amounts expended or reserved, six per cent of gross earnings for maintenance and repairs, and eight per cent for renewals and depreciation, are minima, and that the companies' obligations to expend all that may be necessary on these accounts are in no wise limited or lessened by reason of these percentages being named.

(c) The amounts expended or reserved for maintenance, repairs, renewals and depreciation shall be considered a part of the operating expenses. In event of the sale of the property to the city or its licensee, the amount of the reserve funds, or due to be deposited therein, shall become the property of the purchaser.

A Wells-Fargo Express Company car recently began operating over the Columbus Delaware & Marion Railway, making two trips daily between Columbus and Marion, where it connects with the Erie Railroad, over which the express company operates. The Wells-Fargo company entered into a contract with the Columbus Delaware & Marion several months ago for this service and the express matter has been handled by the company on its regular freight and combination cars.

The first sleeping cars operated on an electric line in Illinois were operated over the line of the Illinois Traction System the night of February 14, 1907, one car leaving East St. Louis for Decatur, and the other leaving Decatur for East St. Louis. The two cars are duplicates and equipped with 10 sections, 20 berths. There is the usual smoking room for men and a dressing room for women. Instead of curtains the berths are separated by pulling up from the floor a partition built on the plan of the roller top of a desk.

Peoria Streator & Ottawa Railway, both franchises stipulating that the line should be completed between the two towns by October 1, 1908. From Ottawa eastward to Seneca the Illinois Valley Railway, controlled by the same interests as the Illinois Traction Company, is now in operation, thus obviating the necessity of building.

Beyond Seneca the direction of the line has not yet been determined, two alternative routes being presented, one to Yorkville and the other to Joliet. By building the line from Seneca to Yorkville it would be possible to connect with the line of the Aurora Elgin & Chicago Railway, which operates cars hourly into the center of Chicago in 2 hours and 25 minutes running time. A line from Seneca to Joliet could connect with the Chicago & Joliet Electric Railway, whose cars run on an hourly schedule from Joliet to the city limits of Chicago at Forty-Eighth street in 1 hour and 25 minutes running time, connecting with the Archer avenue line of the Chicago City Railway Company.

It is planned to build the sections from Lincoln to Mackinaw, from Streator to Ottawa and from Seneca to either Yorkville or Joliet this summer, and to close up the gap between Streator and Mackinaw during 1908, with a branch from Eureka to Peoria. By that time it is expected that the company's proposed bridge across the Mississippi river at East St. Louis will be completed, giving an entrance to St. Louis. Franchise negotiations for a terminal line into the heart of the city are now pending.

Thus if present plans are carried out it will be possible by the close of 1908 to travel by electric railway between the two great cities of the middle west over a system whose branches cover a large part of the state. The line is now in operation from East St. Louis to Bloomington, with limited trains and sleeping cars as far as Decatur. A line from Champaign to Danville and Ridge Farm has been in operation for several years and construction between Decatur and Champaign is progressing rapidly. Surveys are being made for a line from Springfield to Jacksonville.

NEW POWER STATION OF THE ILLINOIS TRACTION SYSTEM AT PEORIA, ILL.

BY C. S. JOHNSON.

After absorbing the street railway interests at Peoria, Ill., and arranging to extend its interurban railway system into Peoria, the Illinois Traction System found it advisable to increase the generating capacity at Peoria.

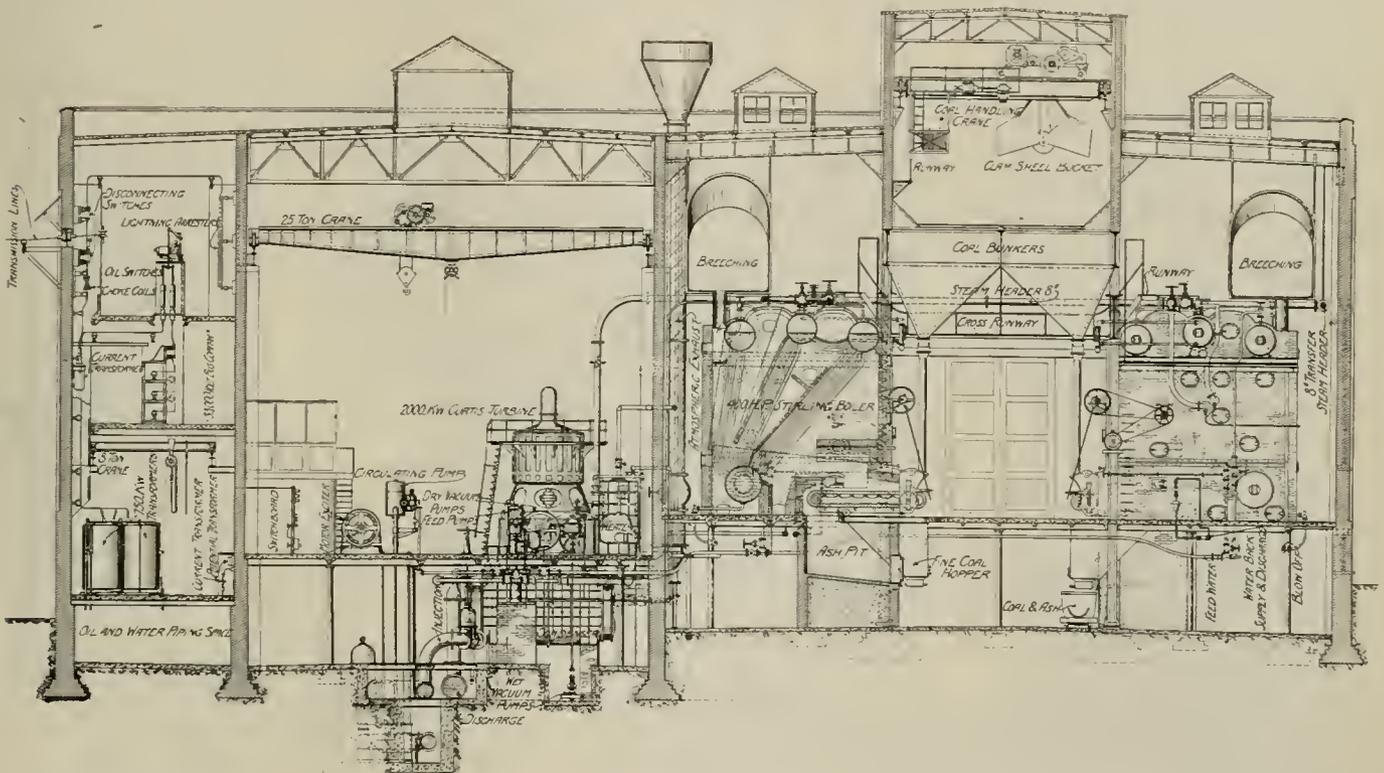

The old generating station contains horizontal fire-tube hand-fired boilers, non-condensing engines and 550-volt direct-current generators; all belt driven excepting one 400-kilowatt generator. The station has a total capacity of about one thousand kilowatts. The new power station as contemplated is to have an ultimate rated capacity of 8,000 kilowatts. Mr. John A. Radford, Chicago, Ill., is consulting engineer in charge of the station design and construction.

The site chosen for the new station is 180 feet by 171 feet 6 inches, and about five hundred feet from the Illinois river.

and to make a complete shut down of the station unnecessary in case of accident to any part the machinery, boilers and piping, in so far as advisable, are arranged according to the "unit plan."

The building is of fireproof construction. Steel is used wherever desirable. All walls except those of the coal and ash pit are brick, laid in cement mortar. All brick used is vitrified paving brick (paving block size). The exterior surfaces and the faces of the walls in the turbine room are laid in red mortar. The floors are steel-beam and concrete-arch construction, the spans and size of beams being carefully selected for the probable loadings in different parts of the station. The roof is reinforced cinder concrete covered with tar paper and gravel. All skylights are $\frac{1}{4}$ inch thick "rough" transparent wire-glass.

All of the high-voltage electrical apparatus and connections are placed in what is practically a separate building, there being only one door leading from the main station into

Peoria Power Station, Illinois Traction System—Vertical Section through Boiler House, Turbine Room and High-Tension Compartments.

It immediately adjoins the approach to the new steel bridge which the Illinois Traction System is building across the Illinois river. The site is at the corner of Walnut and Water streets, near the center of the city and in the same city block with the old power station. When the new plant is in satisfactory operation the old station will be dismantled and the site used for an interurban passenger station.

Arrangement of Building.

In connection with the selection of apparatus and the design of the station the operating engineers' work was given due consideration. All operating apparatus, except the boilers and coal-handling machinery, are controlled from the turbine-room floor and the arrangement is such that ordinarily one engineer on watch may attend to two turbines and the auxiliary machinery, including the condenser equipment, feed pumps, feed-water heater and step-bearing pumps. The excitors are so located that they may be under the care of the switchboard attendant. No apparatus in the turbine room is so located that the engineer's regular duties will require him to leave the turbine-room floor.

In order to facilitate repairs and inspection of apparatus

the high-voltage apparatus section. The busbar compartment room and oil switch room are entered by stairs from the transformer room.

Coal and Ash Handling Facilities.

In providing coal handling facilities advantage was taken of the elevation at which the bridge approach crosses the property, a 300-ton coal pit being placed beneath the bridge approach and the contemplated switch track. The relative location of the tracks and station building may be seen by reference to the accompanying plan.

The Illinois Traction System will haul practically all the coal used, direct from the mines in its own dump-bottom cars which will unload into this coal pit. A traveling bridge crane, carrying a 108-cubic-foot clamshell bucket, built by the Case Manufacturing Company, Columbus, O., and having a capacity of 50 tons of coal per hour, is provided for hoisting and carrying coal to the coal bunkers over the boilers and for handling ashes. The operating speeds of this crane are: Hoist, 80 feet per minute; bridge travel, 400 feet per minute, and trolley travel 150 feet per minute.

The crane is equipped with General Electric 325-volt

direct-current crane motors, a 25-horsepower motor for closing and opening the bucket, a 50-horsepower motor for holding and hoisting the bucket; a 15-horsepower motor for traveling the bridge, and a 5-horsepower motor for traveling the trolley. The choice of voltage will be explained later. The crane is equipped throughout with cut gears and all high-speed gears are enclosed in dust-proof cases. All bearings are large, self-oiling and removable. The load-brake is made extra large in view of the severe service. The crane is controlled from a cage built under the crane-bridge structure.

Interlocking devices are installed so that the crane cannot run over the main track except when the trolley wire is raised out of the way of the bucket and when the blocks on the main track are set.

The "fine coal" which falls unburned, through the chain grates, is caught in two reinforced concrete hoppers built under each grate and beneath the boiler-room floor. These hoppers are provided with cast-iron valves. The sides of the hoppers are so sloped as to dump the coal into coal cars which run in front of the ash pits. The slope of the sides is also chosen so as not to interfere with the ash-pit doors. The ashes are

of the way so as not to interfere with lowering the clamshell bucket into the ash and fine-coal pits.

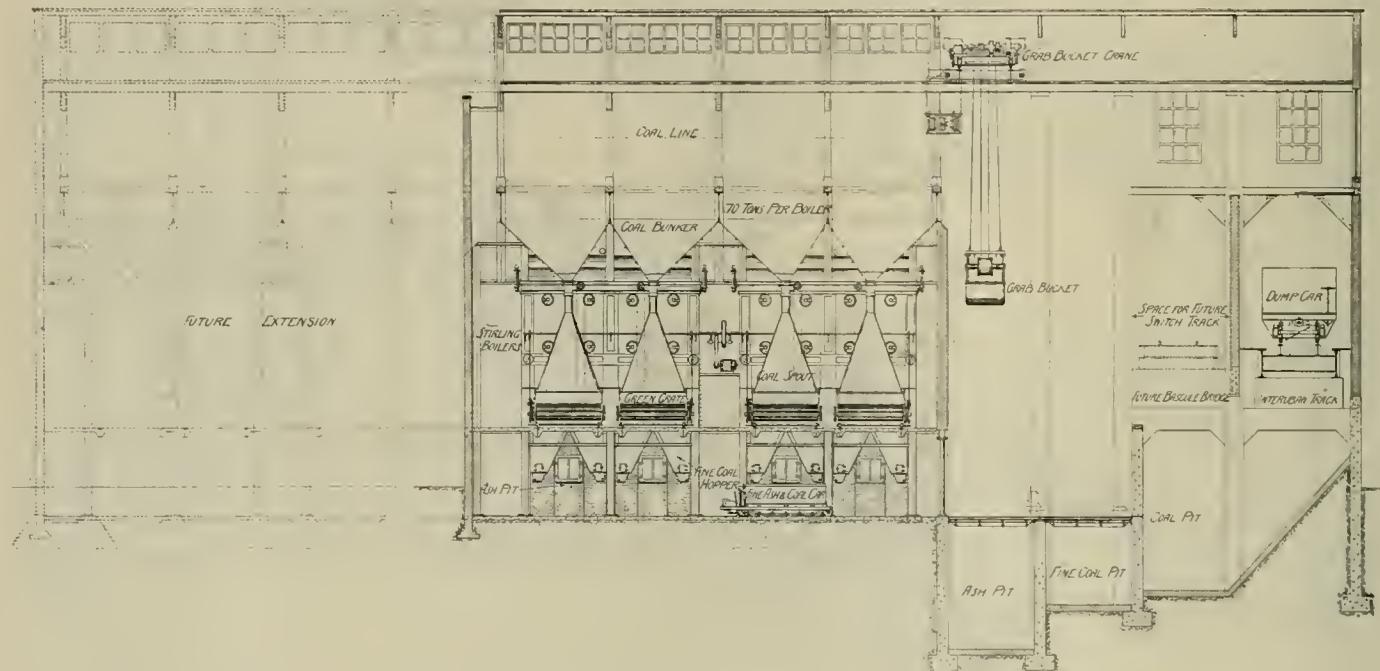

Until such time as the station is extended the coaling will be done from the interurban track shown on the plan, and between 12 p. m. and 5 a. m., when no interurban cars are running.

When the station is extended it is expected that it will be necessary to build the contemplated switch track which will be used only for coaling purposes. This track will pass directly over the 300-ton coal pit on a small bascule bridge which will be opened when coal is being removed from the pit with the clamshell bucket.

Boiler Equipment.

The boiler equipment consists of eight 400-horsepower Stirling water-tube boilers. Four of these boilers, opposite the second turbine, are equipped with Foster superheaters for 100 degrees F. superheat. These superheaters are located in the second flame-pass and thus are not exposed to the gases at the initial temperature.

The boilers and superheaters are designed for 200 pounds working pressure; the actual working pressure is 180 pounds.

Peoria Power Station, Illinois Traction System—Section Through Boiler Firing Space showing Coal-Handling Facilities.

caught in large ash pits built of brick and with walls independent of the boiler settings. The ashes are raked from the ash pits to the fine coal and ash cars.

A 75-ton ash-storage pit is provided into which the cars loaded with ashes are dumped. The ashes are allowed to accumulate in this pit until such time as is most desirable for removing them from the station. The ashes are transferred from the 75-ton ash pit to the interurban coal cars by the grab-bucket crane.

A 35-ton fine-coal storage pit is provided into which the cars loaded with fine coal are dumped. Fine coal is allowed to collect in this pit until such time as is most desirable for transferring it with the grab-bucket crane to the bunkers over the boilers.

One of the illustrations shows the construction of the cars used for handling the fine coal and ashes. These cars were designed especially for this service. A 5-horsepower 125-volt direct-current Westinghouse crane motor with reduction gearing is used to propel the car. Current is fed to the motor by means of two contact shoes sliding on two trolley wires. The trolley wires are surrounded with steel hoods and placed along the sides of the track. The car track over the fine coal and ash pits is hinged and may be thrown out

At first, only four boilers will be equipped with superheaters, so that practical running tests for determining the value of superheated steam may be made. It will be noted that the steam piping is so arranged that turbine No. 2 is supplied with saturated steam while turbine No. 1 is supplied with superheated steam and that each turbine may be operated independently.

The furnaces are equipped with chain grates furnished by the Green Engineering Company, Chicago.

Turbine Units.

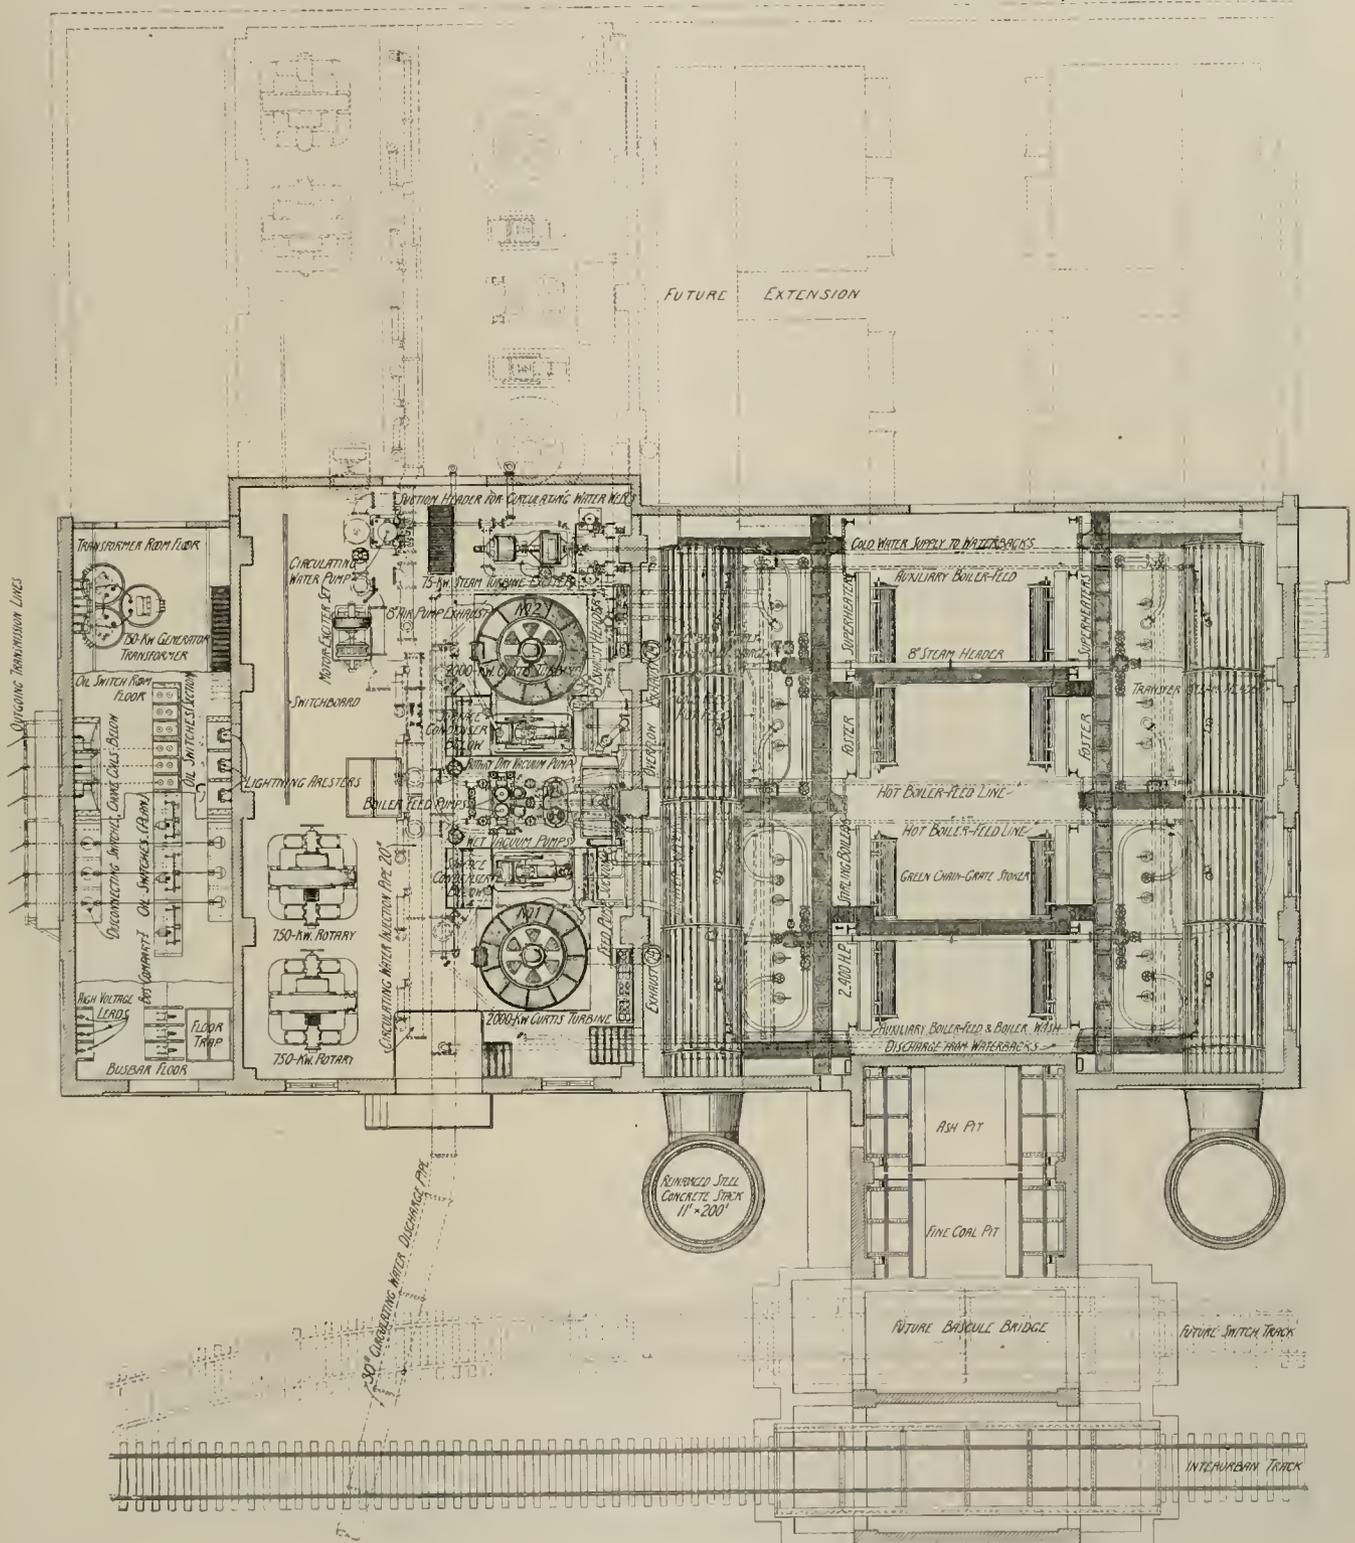

The main generating units are 2,000-kilowatt Curtis turbo-alternators, 25-cycle, 2,300-volt, 3-phase. The turbines are equipped with hydraulically operated governor gears. The step bearings require 800 pounds oil pressure. The turbines were placed with the exhaust bases below the turbine-room floor and the atmospheric exhaust and condenser connections are made in the basement. It will be noticed from the general plan that the first and second turbines are arranged right and left hand and that the same arrangement is contemplated for the third and fourth turbines.

The condensers are located in the basement and are entirely covered over, but there are floor traps so that an entire condenser or any of its parts may be handled by the turbine-

room crane. The condensers, dry-vacuum pump and wet-vacuum pumps were furnished by the Wheeler Condenser & Engineering Company.

The condenser has 8,000 square feet of cooling surface consisting of 1-inch brass tubes 13 feet long. The con-

and air reliefs are provided for the pumps. The pumps are placed in a pit five feet below the bottom of the condensers and the motors are located on the turbine-room floor. The wet-vacuum pumps discharge into the reheating tubes and from them directly into the feed-water heater (not through the reg-

Peoria Power Station, Illinois Traction System—Plan of Station Showing Contemplated Extensions.

densers are arranged with reheaters designed to raise the temperature of the condensed steam to within five degrees of the exhaust temperature.

The wet-vacuum pumps are of the vertical-shaft motor-driven centrifugal type with 125-volt direct-current motors operating at 800 revolutions per minute. Water-sealed glands

ulating valve). The dry-vacuum pumps are placed directly above the condensers on a steel and concrete framework. The air pumps discharge into a dry air pump discharge header and to the atmosphere.

Cooling water for the condensers is obtained from the coarse gravel strata under the station property. Thirteen

wells eight inches in diameter and extending down about 40 feet below the surface of the ground supply the water. These wells are spaced approximately ten feet apart and are all connected to an 18-inch suction header. A vertical direct-acting pump with its water-end placed within 10 feet of the low water line and its steam end on the turbine-room floor, is used for lifting the water from the wells and discharging it into the condensers. This pump has a capacity of 4,300 gallons per minute at 40 single strokes. The size of the pump is 20 by 36 by 24 inches. It was furnished by Dean Brothers Steam Pump Works, Indianapolis, Ind. A motor-driven centrifugal pump will be installed to operate in parallel with and as an auxiliary for this pump.

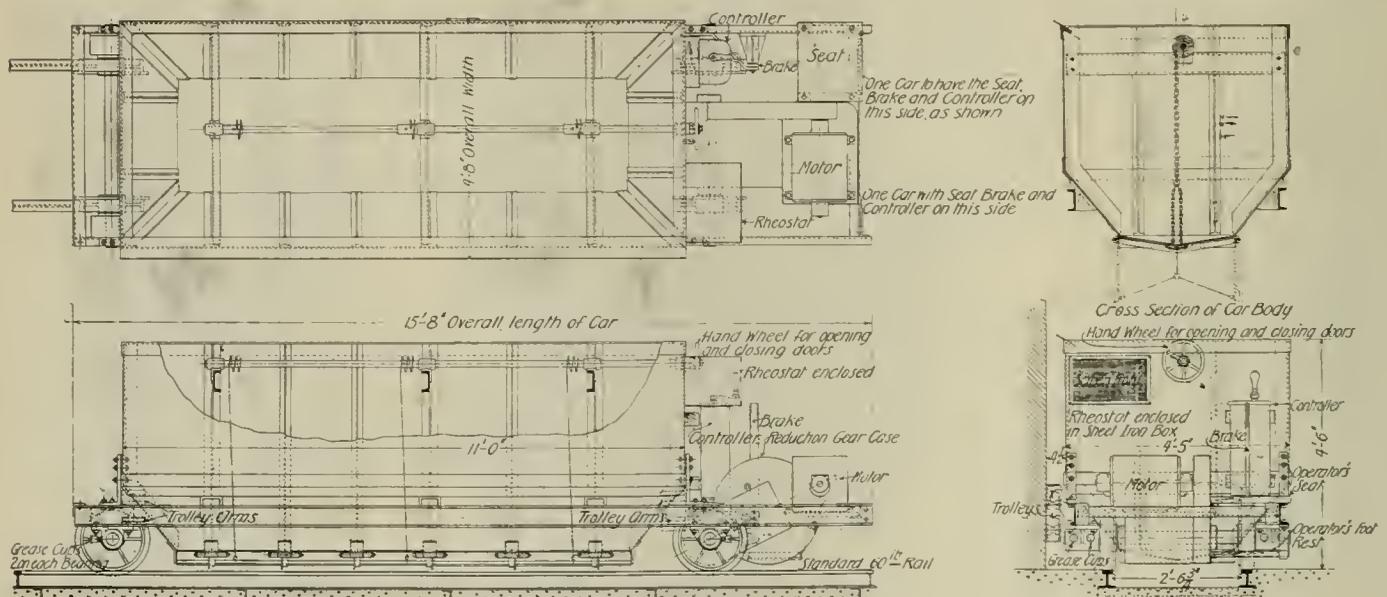

By installing one steam-driven and one motor-driven pump the exhaust steam supply for heating the feed-water may be regulated to balance the demands, by shifting the load on the pumps. The overflow water from the condensers is discharged through a 30-inch cast iron pipe to the river. All circulating-water pipe within the station building, including the suction header, is placed in an open trench and is thus readily accessible for repairs at any time. This trench is covered with an oak floor. The water obtained from these

The open feed-water heater is of 4,000-horsepower capacity furnished by A. Sorge, Jr., Chicago. Two 10 by 16 by 24 inch vertical simplex Dean pumps are installed for house service.

High Pressure Steam Piping.

The arrangement of high-pressure steam piping is similar to the electrical bus connections in some modern electric plants. Each turbine is connected to a small header to which four boilers are also connected. These headers are in turn connected to a transfer header so that all turbines and boilers may be operated interconnected or they may be operated as separate units. This arrangement dispenses with the usual special fittings required for steam headers and keeps the size of the piping at the minimum.

Steam for the feed pumps, dry-vacuum pumps and step-bearing pumps is taken from the same header as the steam for the corresponding turbine. Steam for the turbo-exciter, house pumps and circulating pump is taken from the header for unit No. 2, and when the station is extended will have an alternate connection to the header of unit No. 3. These auxiliaries are common to the entire station, but any or all may be stopped for repairs and the station still kept

Power Station, Illinois Traction System—Plan, Section and Elevation of Coal and Ash Car.

wells it is expected will never be warmer than 54 degrees F., and will be nearly uniform in temperature for the entire year. If water were taken from the river it would be as warm as 80 degrees F. at times. It is thus seen that a great saving in water pumped (over fifty per cent) is effected by obtaining circulating water from the wells. The circulating water piping is arranged with a view to taking part of the water required for the completed station from the river in case the wells are found inadequate.

Feed Pumps.

The feed pumps comprise two 14 by 10 by 24-inch simplex vertical pumps furnished by Dean Brothers Steam Pump Works, Indianapolis. These are mounted "back to back" on a common base-plate. This gives the most compact arrangement and straight-forward suction and discharge connections. The water-ends of the pumps are placed below the turbine-room floor and the steam ends above. They are placed near the center of the turbine room where they may be seen from nearly all locations in the room.

Duplicate sets of feed lines are installed, one set to be used as the hot feed and the other as an auxiliary feed and pressure wash line. The feed lines are arranged on the unit plan corresponding to the steam connections.

in operation. All high-pressure steam and feed-water as well as the blow-off lines consists of extra heavy pipe and fittings. The valves and fittings for the steam piping are semi-steel. The high-pressure piping was installed by M. H. Crane Estate, Cincinnati, O.

For the oiling system of the step bearings, governors and steadying bearings of the turbines the General Electric Company furnished two 12-gallon per minute, 800-pound pressure outside end-packed pumps and a 400-gallon filter, together with the necessary haffles, etc. A 30-gallon accumulator will be installed in connection with the oiling piping.

Electrical Equipment.

All the electrical equipment except the 33,000-volt transformers was furnished by the General Electric Company. The generator pressure is 2,300 volts and the bus pressure 33,000 volts, at which pressure current is transmitted to the substations. The generators are permanently connected to three 750-kilowatt single-phase oil-insulated, water-cooled 2,300-33,000-volt transformers connected delta on both high and low-voltage sides. In the 33,000-volt leads of these transformers are the generator switches.

The local street railway current supply will be taken from two 6-phase, 25-cycle, 650-volt, 750-kilowatt rotary con-

verters provided with reactance coils for voltage regulation. These machines are started from the alternating current side by one-third and two-thirds voltage taps.

Current for the rotary converters is taken from the 33,000-volt bus through an oil switch and stepped down to 400 volts, 6-phase by three single-phase, oil-insulated, water-cooled transformers. The transformers for the generators and the rotary converters were furnished by the Westinghouse Electric & Manufacturing Company.

The motor-driven exciter set consists of a 75-kilowatt, 125-volt generator and a 3-phase, 25-cycle, 2,080-volt, 110-horsepower induction motor. Current for the induction motor of the exciter set is stepped down from 33,000 volts to 2,080 volts. The induction motor is started from half-voltage taps.

All 33,000-volt bus wires, oil-switch leads, transformer and lightning arrester taps are installed in brick or concrete compartments for mechanical and fire protection. The oil switches are the General Electric Company's motor-operated type H-3.

It will be noted from the illustrations that the single-phase transformers are arranged in a "mechanical delta." This arrangement was selected as it makes the electrical connections the most simple and occupies less space than other arrangements.

The switchboard consists of General Electric Company's standard panels and instruments. A Tirrell regulator is provided for voltage regulation.

In selecting current for the coal handling crane, it was considered inadvisable to use as high pressure as the direct-current railway feeders, 650 volts, which would at times be as high as 750 volts. If 125-volt current were used it meant the installation of large exciters, especially for this service. A moderate voltage was obtained by installing a set of balancing coils in connection with the rotary converters to obtain a neutral so that current from one side of the rotary converters may be used for the coal-handling crane service.

Two 3-phase, 33,000-volt transmission lines are provided for carrying current to the various sub-stations. Locations are provided for two additional transmission lines in the first half of the station. Twenty 500,000-circular mil feeders are provided for the local direct-current railway system supply.

The completed station will cover 2.36 square feet of ground surface and will contain 135 cubic feet per kilowatt rated generating capacity. No deductions are made for the 3,000-kilowatt capacity substation equipment which may be installed in the station.

ELECTRIC ARC HEADLIGHTS.

BY P. LINDEMAN.

Undoubtedly many of the derailments and accidents on the high-speed interurban railways are due to faulty or poorly adjusted headlights. Further, much of the wear and tear of the controllers, motors and braking apparatus is directly traceable to the application of the emergency stop and the reversal of motors. This is the result of backing up for passengers missed because the motorman did not have sufficient light to see the signals in time.

In many cases the fault is not with the headlight, but simply because the lamp is not hung on the car in a vertical position. Other reasons, however, also cause the light to be sent in the wrong direction, among which are the faulty adjustment of the carbons and burning away of the position carbons. The effect of the latter causes will be readily understood by recalling the well-known principle of the parabolic reflector, i. e., parallel rays are emitted when the source of light is at the focus. If, however, the source is not at the focus, the rays are no longer concentrated and their direction is changed. If the arc comes too near the bottom the rays are directed upward; if too near the top the

rays will illuminate only a small portion of the track directly in front of the car. The light is further diffused and diminished by the enclosing globe and the deposit of carbon on it.

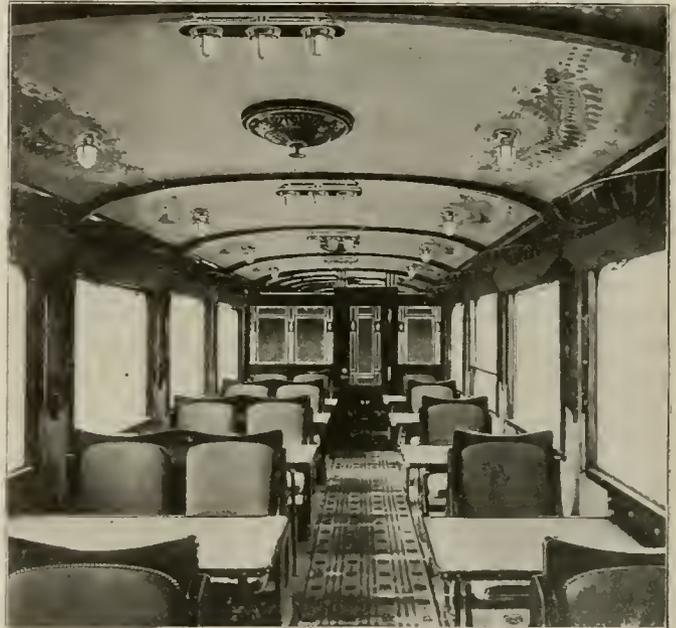

From what has been said it is evident that arc headlights should be fitted with an automatic feed for regulating the size of the arc and its position with respect to the reflector. A more uniform position of the arc will also be assured if the positive carbon is made larger than the negative.

DINING CAR, MONTREUX-BERNESE OBERLAND ELECTRIC RAILWAY.

BY DR. ALFRED GRADENWITZ.

The Montreux-Bernese Oberland Electric Railway is believed to be the first European electric railway to operate a dining car.

The car, which was built by Messrs. Ringhoffer, of Smichow, Austria, is a narrow-gauge car running on two 4-wheel bogies. The frames of the bogies are made of pressed steel and are well braced and connected by substantial transverse girders and suitable angle pieces; they are carried on axle bearings by means of ordinary supporting springs. The

Dining Car for Montreux-Bernese Railway—Interior View.

jack made of flat iron on which the car body rests by means of a ball pivot and rotary friction surfaces is supported on both sides by extensive inverted longitudinal springs arranged outside of the frame plates and the deflections of which are applied externally to the frame.

The substantial underframe is made entirely of steel and is fitted with central buffers. The car body is designed for 30 passengers.

The tables are bolted to frames fastened to the sides of the car, and the chairs are fixed to the floor, the seats being arranged to hinge upwards. The seats and backs are upholstered with white horse hair and gray lamb leather. The chairs and tables are finished in dark-stained polished mahogany, while all visible wooden parts are likewise made of mahogany treated in the same way.

The panels of the side walls are filled in partly with gray gold-decorated lamb leather and partly with metal reliefs. The broad windows have metal frames the apparent weight of which is reduced and which are readily lowered by convenient lifting devices. The ceiling is coated with painted cloth and is divided into several panels containing

electric lamps and two fans. The basket-shaped luggage-carriers are fitted above the windows; the blinds located underneath have vertical guiding rods.

Heating is effected by electric radiators situated below the seats. Close to the dining room are the pantry and kitchen, the latter containing a range. Two ice tanks are provided.

The corridor and entrances are finished partly with Chinese paper and partly with polished mahogany lining.

Dining Car for Montreux-Bernese Railway.

The car has an automatic vacuum brake in addition to a handbrake operated from the platform.

LOW FARE CONTROVERSY IN MINNEAPOLIS.

The Minneapolis Street Railway Company has been granted a temporary injunction restraining the city of Minneapolis from putting into effect the six-for-a-quarter fare ordinance passed by the city council on February 9. The injunction also prohibits the publishing of the ordinance. The city officials are ordered to appear in court on March 2 and show cause why the injunction should not be continued.

An interesting part of the bill of complaint follows:

It is petitioned that the city and its officials be perpetually enjoined, restrained and prohibited from publishing or completing the publication of said ordinance, and also from putting said ordinance into effect, and from instituting or authorizing any suits against the street railway company, conductors or employees, or to compel the company, its conductors or employees to accept less than 5-cent fares or to sell tickets as therein provided at the rate of six for 25 cents, and from making complaint for violation of said ordinance or any part of it, and from bringing any suit for the purpose of vacating the charter or from annulling the existence of the company as a corporation, or for the forfeiture of any of its privileges or franchises, because of the violation of said ordinance, passed on February 9, 1907.

The company alleges that the city in its charter has no power to fix and regulate the rate of fare, except as provided in the original charter granted to the street railway company in 1875, which fixed the rate of fare at 5 cents. The company further declares that an attempt to enforce the ordinance would lead to personal conflict between passengers and conductors.

It is declared further by the company that the ordinance is in violation of the constitution of the United States, and if enforced will take the company's property rights without due process of law.

The federal court was appealed to because the company is organized under New Jersey laws, and is not a Minnesota corporation.

With regard to the situation the company has issued a public statement, in abstract, as follows:

Our franchise contracts with the city of Minneapolis give us the legal right to collect a 5-cent fare. From 1875 to 1889 the Minneapolis Street Railway Company was operating its system by animal power. At that time electricity began to be talked of as a motive power for street railways, and during the year 1889 considerable agitation arose in the city with reference to changing from animal to electric power.

Forced into Costly Experiments.

We urged upon the council the need of further investigation of the use of electric power as applied to street railways before

spending so much money in making the change, and asked that the matter be delayed for a year in order that more thorough tests and development in this new power might be made. The council, however, insisted that the company should begin at once to change its system, and should within two years not only convert all existing lines, but also build numerous additional lines and operate the same by electricity.

The company finally agreed to this, and at once began making the change. The system which we then installed was the best known at that time, and after making the change we operated with some difficulty for a period of about seven years. This first change was a very expensive matter for the company.

In the meantime the development in electrical equipment changed to such an extent that we found the system we had installed so imperfect and inadequate that we found it necessary to rebuild and reconstruct our entire system. This we did without request from the council or public discussion or complaint. Today none of the first equipment and hardly five per cent of the trackage first built is in use. In addition to these changes, we have also built new power houses and stations, and have equipped these, as well as the entire system, with the most approved and modern appliances.

In making these changes and in bringing our system to its present standard, we have expended vast sums of money. All this has been done at a time when labor and material have been steadily advancing. We have endeavored to establish and maintain the highest character of service and equipment, and we believe that in no other city is the service or equipment of a higher order and in no other city a transfer system more liberal.

Comparisons Unfair.

Comparisons have been made on the rate of fare charged here as against that charged in other cities. This is hardly a reasonable comparison, considering the widely different existing conditions. In the item of fuel alone there is a difference of \$1.10 a ton in the freight rate between Minneapolis and Chicago. Buffalo, Cleveland and other lake points have the advantage over us on coal rates of not less than \$1.50 a ton. Climatic conditions in Minneapolis are such as do not prevail in most cities throughout the country, and it is necessary for us to make extensive provisions each year for the handling of snow and ice. Our cars are heated with hot water and not with stoves, as in so many cities, are provided with storm sash and double floors and are comfortable in all weather.

Practically every item entering into the construction, maintenance and operation of the system is today at the highest point ever known.

Rail, which ten years ago cost \$22.55 per ton f. o. b. Minneapolis, is today \$41.60 per ton. Ties, which cost 32 cents each, now cost 72 cents each. Iron poles, which cost \$9.50, now cost \$19 each. Copper, which cost 12 to 13 cents a pound, is now 28 cents a pound. Common labor, which was \$1.50 a day, is now \$2 a day.

We believe that the high standard of equipment which we are endeavoring to maintain is a strong advertisement for the city. No other system in the country operates as uniformly high grade or better-looking equipment, nor takes more care to provide clean, comfortable and safe transportation. We have employed every known device for the comfort and safety of passengers to make our service pre-eminent. Our tracks are unusually heavy and well built and our cars, built by the laboring men of Minneapolis and St. Paul, are of the most modern and expensive construction.

Nowhere in the world are the street railway trainmen provided with such modern appliances to insure them comfort in their work as in the twin cities. Our power houses and other buildings are built of the best materials and prove attractive wherever they are placed. In short, we have not spent money with a niggardly hand, and no limit within reason has been placed on the cost of any improvement, in tracks, cars or buildings, to make our system the very best in the United States, and one of which any Minneapolitan may well be proud.

Area as a Factor.

The area covered by our lines, approximately 55 square miles inside the corporate limits of the city with a population of 270,000, is very much in excess of that of most cities of equal size throughout the country.

Baltimore, with a population of 650,000, has an area of 30 square miles.

Cleveland, with a population of 465,000, has an area of 41 square miles.

Milwaukee, with a population of over 300,000, has an area of 23 square miles.

Detroit, with over 300,000, has 36 square miles.

Cincinnati, with 400,000 population, has 43 miles.

Louisville, with 338,000, has 20.5 miles.

Kansas City, with 200,000, has 26 square miles.

Indianapolis, with 215,000, has 30 square miles.

Thus it can be readily seen that with the proportionately larger area of Minneapolis, the operating cost per passenger carried must be materially increased over the more closely settled and congested cities mentioned.

Our company has always worked for the benefit of Minneapolis in a broad and enterprising way, and has always shown a desire to aid in the city's development.

Taking all this into consideration, and with our intention to maintain a high standard of equipment and service, and with the liberal transfer privileges which obtain here, we do not believe that any street railway company can maintain such service and equipment on a fare of less than five cents.

INTERVIEWING ACCIDENT WITNESSES.

BY F. W. JOHNSON, CLAIM AGENT, THE CONSOLIDATED RAILWAY COMPANY, BRIDGEPORT, CONN.

The writer recently was afforded the pleasure and opportunity of studying at close range the internal workings of the claim and accident departments of admittedly one of the best organized and equipped street railway systems of the east.

As a whole, the organization and methods of the claim department of this particular company could but arouse the admiration of one interested in this branch of railroading. In many directions the company had radically departed from the moss-covered traditions so generally recognized and implicitly followed in accident work. Precedent had been thrown to the winds, and modern, wide-awake, up-to-date methods of getting results in accident work had been adopted. That their enterprise was founded upon good business principles was ably demonstrated by the remarkably satisfactory progress which they had experienced during the past few years.

Method of Interviewing.

To the writer's surprise, however, in sharp contrast to their marked progress in other respects, it appeared that the advancement had not extended to the methods employed in obtaining interviews with witnesses to accidents, or more properly speaking, to the obtaining of evidence relating to these accidents. The company still clung to the antiquated practice of having its investigators secure verbal statements from witnesses, of their knowledge of the mishap under investigation, and then allowing these investigators to afterward reduce to writing their recollection or understanding of the facts of the accident as set forth by the witnesses in these verbal interviews. These reports were then turned in to the office as representing the evidence secured in the investigation of the accident.

Replying to a question as to whether they considered this method of securing evidence to accidents as being entirely satisfactory—or as being preferable to the obtaining of evidence in the form of written statements, taken down in the immediate presence of the witness and then read to him, or by him, after which he affixed his signature as indicative of the accuracy of the facts therein set forth—it was admitted that the scheme was far from satisfactory; also, that the company would be much in favor of the written, signed statement, were it not for the insurmountable obstacles which precluded the possibility of its being used to advantage in their particular territory.

While admitting that they had never put the written, signed-statement method to an actual test in their work, they nevertheless clung to the opinion that it was not feasible in their work, assigning as their reasons for this belief their conviction that people generally would not affix their signatures to statements concerning accidents of which they were witnesses; and secondly, that they did not believe that people would grant their representatives the time required for the giving of written statements. They had found by experience that the average person would readily spare the company's representative six or eight minutes for the giving of a verbal interview, but doubted whether these same people would stand for an extra two or three minutes in time necessary for the taking of a written statement.

Still, they could not say that their present method of securing evidence was entirely satisfactory. Time and time again in the past had evidence obtained in this way proved inaccurate and unreliable. Amazing uncertainties and startling contradictions had repeatedly developed at critical stages in the preparation and trial of cases in court, to the bewilderment of the company's trial attorneys; and likewise

to the consternation of the company itself, when juries reported the results of their deliberations.

Cases were cited in which important witnesses about whom the company had constructed its defense had suddenly developed startling lapses of memory, or an equally wonderful recollection concerning facts of which no mention appeared in the interviews submitted by the investigator who had worked up the evidence in the case. The company generally had its own private opinion as to the causes which may have prompted the sudden reversal of form upon the part of these witnesses, but as the nature of these dark suspicions was not admissible as evidence, the jury perforce remained in blissful ignorance of their existence, and the slaughter of company funds went merrily on, as of old.

Witnesses had stoutly denied ever having made any such statements as those attributed to them in the written reports filed by the investigators, which reports had been relied upon by the company as being accurate accounts of the facts as detailed by these witnesses. Many a case had "gone on the rocks," because important company witnesses had insisted upon testifying in direct contradiction to the facts as set forth in the investigator's report, and upon which the company had relied for a defense of the action.

In practically every instance the investigator had insisted, of course, that he had correctly reported the conversation with the witness, while the witness as emphatically denied this. Meanwhile, supposedly strong witnesses for the defense turned out to be equally powerful factors in furthering the interests of the plaintiff.

Responding to a query as to whether it was not probable that such a method of securing evidence tended directly to foster and to encourage this unfortunate state of affairs, it was admitted that possibly such was the case. But immediately the opinion was again advanced that it was the belief of that company that the average witness would balk when it came to giving written, signed interviews regarding accidents.

The argument is unanswerable. One method is admittedly faulty and unsatisfactory. The other method, which is giving entire satisfaction on scores of roads, large and small, is condemned without being afforded the opportunity of a trial. If a concern itself has not the determination to take down in writing the evidence of a witness, it may be assumed that the witness will not, of his own volition, insist upon this procedure.

Objectors to Signed Statements.

Experience would seem to indicate that the two objections to the taking of written, signed statements in accident work, as advanced by this company, are but creations of the imagination. There are, of course, people who will hesitate to affix their signatures to instruments of this character. Broadly speaking, they may be classified under three headings: First, the ignorant, who instinctively fear being tricked into signing away all of their earthly belongings and hence look with much suspicion upon all documents which require their signatures. Second, the man who has ever made it a life rule never to sign anything which he could possibly avoid, well remembering how his great-grandfather once backed a note for \$70 for a slick chap, and then got stung. Third, the claimant or his friends and acquaintances, who likewise fear that in signing any paper, whatever its form or purport, they may be working injury to the cause of the claimant.

For the grafter who refuses to either give or sign any statement unless he is to receive pay for so doing, we make no provision, preferring to treat his kind with the contempt which they so heartily merit.

It has been conclusively shown, however, that the average witness, aside from those as described, if quoted accu-

rately and fairly, will, in the great majority of cases, willingly affix his signature to the statement. Of those who hesitate or are reluctant, many are speedily won over by a brief, plausible explanation of the advisability of their so doing.

Consideration of the Personnel.

But, mark you, there is one point in particular, in connection with the success or failure of this method of securing evidence, to which we may be pardoned for directing especial attention. Its importance should not be overlooked, nor its value underestimated.

Many a witness will absolutely decline to give a written statement, much less to sign one, for reasons similar to those which actuated you in turning down that chap who called upon you the other morning in an effort to interest you in an investment with which he was connected. His proposition may have been all right—certain it was that he seemed to have good people back of it, but somehow or other there was an indefinite, vague, inexplicable something wrong somewhere. You didn't attempt to analyze the trouble, whatever it was, for the very reason that you were prejudiced against the scheme from the very moment that that fellow opened his mouth to address you.

Possibly if we were to offer the suggestion that it was something about the man himself that influenced you more than anything else against the project, it might prove to be the correct solution of your indifference to his mission. Now that you recall the chap, you do recollect that he approached you upon the matter in an uncertain, hesitating manner that plainly denoted a lack of self-confidence. He lacked ginger, life, energy, confidence, and instinctively you mentally classed him among the dead ones—a man whom you could easily turn down—and as you were very busy at the time, you did turn him down and gave no further thought to the matter.

Picture to yourself, if you will, that same chap in the guise of an accident investigator for the local trolley company, calling upon you for the purpose of securing from you a statement of your knowledge concerning a recent mishap upon its lines. Isn't it a fact that his success or failure in securing the desired evidence will depend very largely, if not wholly, upon the manner in which he approaches you, and consequently upon the impression that he is able to make upon you? If he is loud and coarse, is over-confident to the point almost of impertinence, is meek and humble and thus easily side-tracked, or lacking in self-confidence, has a poor address or is ill-kempt in appearance, will not any or all of these things count against his chances for success with you?

Oftentimes we don't quite like to admit this. Now that we get to thinking it over, our sympathy instinctively comes to the surface, and we try to persuade ourselves that the very fact that the poor devil had the appearance of being up against the world rather would count in his favor in our decision to grant him an interview. Yes, it sounds well, but there's nothing to it. When your private secretary bobs in to announce a man waiting to see you, and in response to your query as to who he is, what his business is and what he looks like, you get the information that he's an odd-looking stick, your decision is, "Tell him I'm very busy this morning." And he goes his way, because he didn't have the appearance and the address necessary to gain results.

While on the other hand, if this investigator is neat and clean in appearance, gentlemanly in manner, self-confident, brief and to the point, in short, the successful young business man of today, his chances for success in gaining that interview are, I assume, much greater. The difference in the ability of different investigators to secure written, signed statements may often be explained by so simple a test as the foregoing.

It is, therefore, of importance that careful consideration should be given to the personnel of the force employed in

this work if the greatest possible measure of success is to attend their efforts.

Time Required for Making Statements.

With respect to the matter of time required for witnesses to give written statements, it would seem that this obstacle could demand serious consideration nowhere outside of the largest of our cities. Just why it should require very much more time to jot down the facts on paper than to discuss the affair without taking notes, the writer does not understand. If it requires from six to eight minutes to converse with a witness in the securing of a verbal statement, it should require but a minute or two longer to jot down that same story in black and white, and with another minute allowed the witness in which to read it through and to sign it, we have an instrument which is of incalculably greater value than a statement possibly could be when obtained under the old method.

The single fact that many railway companies operating in our large cities are daily making use of the written, signed statement in accident work would seem to indicate that not only is this method possible, but also extremely feasible in cities of whatever size.

While it unquestionably is true that in the larger cities the tension is greater, it nevertheless is somewhat difficult to understand just what the relative difference can be between conditions in a very large city and those in the city of more moderate size, when an issue of so comparatively small importance is at stake as would appear to be involved in the question of the difference in time required to take written statements in place of verbal ones.

Can it be argued, for instance, that the inhabitants of a city of 500,000 can spare, on an average, approximately ten minutes to the investigator of trolley accidents, while the people of an adjoining city of 1,000,000 inhabitants can devote but seven minutes to the same task, the alleged difference being due primarily to the difference in the size of the two cities? Rather, would just the reverse seem to be true, for nowhere in the world do people devote so much time to the pursuit of pleasure, of ease, and of idleness as in the very largest of our cities.

The objection raised to the written statement, in the form of time, is a "man of straw," which has served a long and honorable career and is entitled to be laid at rest with full military honors.

Value of Statements over Signatures.

The concern which goes into court the possessor of statements made by its witnesses soon after the occurrence of the accident and while the facts must necessarily have been clearly in mind, which statements were taken down in the presence of the witnesses, practically at their dictation, read by them and afterward signed as indicative of their accuracy, unquestionably has a tremendous advantage over the railway company which comes into court with evidence secured under the old method, well knowing that it is distinctly within the power of its unprincipled opponents to set the case of the defendant company tottering upon its foundations by means too often resorted to, and generally characterized as "the bringing of 'influence' to bear upon important witnesses for the defense, who may be open to reason and to conviction."

In other words, one company has its witnesses well under control, while the other has not. This advantage is strongly demonstrated in what may be termed the "stability of witnesses." Having made a written, signed statement detailing his knowledge of an accident, the average witness feels considerably less inclined to flippantly contradict himself upon important features of the issue, knowing only too well that in the event of his so doing he would immediately

be confronted with the aforesaid document, bearing his signature as a mark of genuineness.

It is quite possible, of course, that a witness may even then attempt to jump the bars. But for every one who would still attempt to escape the obligations thus imposed, an even hundred will remain within the fold because of this very restriction. Whatever inducements may afterward be offered them, or whatever private opinions they may afterward form, experience has shown that they will be scrupulously careful, when it comes to contradicting themselves by testifying at variance to that signed statement.

Furthermore, the signed statement is a most powerful factor in establishing the real facts—the exact truth regarding the manner in which an accident really happened. Immediately after the occurrence of an accident witnesses will invariably tell the truth, the whole truth, and nothing but the truth, in describing the affair as they saw it. Months afterwards, their story oftentimes begins to warp most woefully, frequently the result of influence brought to bear in favor of the plaintiff, or to the satisfaction of some personal grievance entertained by the witness against the defendant company.

Another leading advantage that may be cited briefly is the reassuring confidence regarding exact facts, which a witness feels in testifying concerning an accident that happened some months or years ago, the minor details of which would now be hazy in his mind, but for the opportunity afforded him of refreshing his memory by reading through the statement made by him at the time, and while the facts were clear in his mind. Best of all, he never doubts or questions its accuracy, for at the bottom of the statement appears his own signature. Thus better witnesses and better results in the courts.

We should not leave this phase of the situation without calling attention to the tremendous advantage afforded a concern by these written, signed statements in still another direction.

I refer to the powerfully destructive weapon which is thus placed within the grasp of the company's trial attorney when he has to contend with the viciously unprincipled witness who, having given a signed statement of his knowledge of the accident, afterwards attempts, for reasons best known to himself, to change his testimony in its essential features. Possibly he develops into a hostile witness and is in a position to work irreparable harm to the company's interests.

Witnesses are either with you or against you. There is no middle course. Neither side knowingly puts on the stand witnesses hostile to its own interests, nor is either side clouding its contention by putting on dead-wood—witnesses who neither benefit nor weaken the case. Each side is sturdily engaged in building up its own theory of the cause of the accident, while endeavoring to crush like efforts on the part of its opponent. Therefore, if a witness unexpectedly turns on you, after having given you the true facts, over his own signature, and instead of standing by the truth develops into a backslider in favor of the plaintiff, it is distinctly within your power to literally crush him in so far as his evidence could possibly be of any material assistance to the other side.

Either he deliberately lied at the time of the giving of the signed statement, or else he is lying now. He cannot possibly be right in both directions. It affords a foundation for the strong presumption that his testimony is entirely unreliable, and consequently of no value to either side. In his statement, made the day following the accident, he was positive that "the woman stepped off of the car before it had come to a stop." In three different places and in three different ways did he distinctly reiterate this fact, in the body of the aforesaid statement. Now, two years afterwards, despite this signed statement made while the facts must

necessarily have been clear in his mind, he distinctly recalls having seen the conductor deliberately start the car while the passenger was in the act of alighting. Basking in the warmth of the reassuring smiles of the plaintiff, and of the plaintiff's counsel, he grows emphatic in his positiveness of the accuracy of this latter version of the manner in which the accident had happened. This very positiveness, corroborated by the square-toed contradictions as set forth in the signed statement, plainly expose the shallow purposes of the slippery witness and can but work to the destruction of his value as a witness.

If he won't help you by telling the truth, you place it beyond his power to harm you.

It is well that the subscribing witness himself should read the statement through before signing it. Or if this is impracticable, it is well to have the witness follow the statement through with his own eyes, as it is read to him by the investigator, before he signs it. This method, flanked by the signature of a disinterested party to that of the subscribing witness, very materially reduces the possibility of a witness afterwards claiming that he did not understand the meaning or intent of the paper which he was asked to sign.

Right here, we should again observe that, as in the case of the investigator, the possibilities for advantage to be thus gained with the written statement, in court, will depend directly upon the caliber of the attorney making use of it. While the practice of the courts of different states differs widely, it nevertheless will be found that wherever admissible the aggressive, fighting attorney will obtain gratifying results where the meek, over-cautious trial attorney will fail wretchedly. Nerve and determination are strong helps.

With stable, reliable evidence, an attorney is enabled to figure out the probable outcome of a case with far greater certainty than could possibly be done with the flimsy, wobbly evidence secured under the old method.

Preparation of the Investigation.

In considering the matter of the written, signed statement, it might be well at this point to dwell briefly upon the means to be furnished the investigator, for the securing of the statement. A little careful preparation in advance will doubtless greatly enhance the possibilities for success to be derived from this method of securing evidence. Careful thought may profitably be devoted to the form and style to be followed by the investigators in the taking of statements, as well as to the style or manner of book or paper in which or upon which the statement is to be written.

Blanks Used.

With the great majority of companies with which the writer is more or less familiar, it seems to have been the custom to give but little if any thought to this particular feature of the work. Some of them appear to have confined their efforts chiefly to the securing of the most inexpensive paper possible, whatever its form, style or adaptability for the work in hand. Others supply their investigators with blank forms of various styles, the majority of them being in sheet form similar in appearance to the paper used in their office correspondence. While this latter form answers the purpose fairly well when used in the taking of statements in the office, it nevertheless is inconvenient and unsatisfactory for the investigator to carry around with him in the daily course of business. It is not adapted for outside work.

Still other concerns supply books of various forms, styles and dimensions, the average being somewhat of the style commonly known as stenographic notebooks. These certainly are preferable to the former styles, as the investigator is able to carry them in his pocket, while the board covers afford him something solid upon which to write when he is forced to take statements under disadvantages.

The various leaves of these books, thus used in the tak-

ing of a statement, are detached, pinned together, the subscribing witness having affixed his signature at the bottom of the statement, on the last page, and the entire report is turned in to the office as the evidence of that particular witness.

Experience with various types of books of this sort has shown that they leave much to be desired. Several serious objections will readily occur to mind, but probably by far the most important of them is one which has repeatedly been advanced in the past, when statements of this character, covering several pages and with the signature upon the last page, have been introduced into court for the purpose of refuting the testimony of a witness who has seen fit to radically change his account of the accident—that is, the statement has been tampered with—that certain facts are set forth in the body of the statement, on the third and fourth pages, we will say, which facts were not there when the statement was originally read and signed by the witness in question and that he never made any such statement or statements as those objected to as being spurious, and which now appear as part of his statement, the last page of which bears his signature, which signature he recognizes as his own.

Here we have the written, signed statement of this witness, setting forth what we believe to be the real facts in the controversy. For some reason he has seen fit to reverse his story, and in spite of the signed statement, he gayly over-rides it, meanwhile casting a dark cloud of suspicion upon the methods employed by the company in the gathering of evidence.

The inference to be conveyed to the jury is, of course, to the effect that this unscrupulous corporation has deliberately substituted one or more leaves in the body of this statement and in the handwriting of the investigator who took the statement, said substituted leaves containing matter advantageous to its own interests, and which leaves were not originally a part of the statement when it was read and signed by the witness.

This bait, temptingly placed before the jury, generally appeals to them so strongly, that they hasten to swallow it, hook and all. Apparently, written, signed statements taken in this form are not worth the paper that they are written upon, if witnesses start to wriggle out of their facts.

The suggestion is advanced that this defect is readily overcome by having the witness sign his name at the bottom of each page of the statement. This would do away with the possibility of the claim of substituted leaves. Granted, but if you take very short statements, covering not over two or three pages at the most, and if your investigators secure detailed statements, you doubtless would encounter many witnesses who would draw the line at signing their name from six to ten times, on as many different pages.

Suggested Blank Form.

It is quite possible that a form of witness blank with which the writer has been experimenting for the past two years and which is designed primarily to checkmate the possibility of a claim of substitution of evidence in the body of a statement, may prove of interest, and possibly of assistance to others similarly engaged in claim and accident work.

In addition to doing away with the possibility of the claim of fraud in the statement of a witness, the blank itself affords a quick, convenient, uniform and permanent means of reducing to writing the evidence of witnesses to accidents.

Briefly, the blank may be described as follows: Dimensions, 28 inches in length by 5½ inches in width.

Material, white paper of good quality, with surface suitable for rapid work with a pen. No. 1 writing paper has given good satisfaction

The blank reproduced herewith, beginning just below

the printed form at the top, is ruled to the bottom of the sheet, upon one side, and spaced one-quarter inch. It is folded three times, beginning at a point 7 inches from the top, again 7 inches below the first fold, and so on down; not unlike the form used by some of the steam railroads in their 500-mile mileage books. If folded correctly, this gives a single sheet of paper, 28 inches in length, so folded as to present a blank form 7 by 5½ inches with the printed form upon the top or first page, ready for immediate use.

Thus, in taking a statement, the investigator has no leaves to turn, he simply keeps on writing on one side of a single sheet of paper and extending the paper as he needs it. The object in folding the paper as described is to put it into convenient form for the investigator to slip into his coat pocket when doing outside work.

Experience with the use of this blank has demonstrated, among other things, the following:

One sheet is generally sufficient for the detailed statement of the average witness.

The blank affords a convenient means for obtaining the entire statement of a witness, upon one side of a single sheet of paper, at the bottom of which appears the signa-

CONNECTICUT RAILWAY & LIGHTING CO.
STATEMENT OF ACCIDENT.

CASE No. _____

Name _____ Date _____

Address _____

Business Address: _____

Referring to accident of _____ 190____, I herewith
make the following voluntary statement:

Blank for Recording Accident Statements.

ture of the witness, which may in turn be witnessed by a disinterested party, and then flanked by the signature of the investigator.

Even very long statements rarely require over two sheets, thus requiring but two signatures on the part of the subscribing witness.

The occasional claim of fraud has become a memory of the past.

It affords opportunity for the oath and seal of the notary public to appear directly beneath and upon the same sheet of paper as the signature of the witness.

The blank is convenient in form to be carried by the investigator, and is equally adapted for office work.

The case number upon each statement practically prevents the possibility of evidence going astray from its proper case.

The addition of the business address furnishes a good clue in running down in after years witnesses on court cases of whom you may temporarily have lost track.

By running a line of perforation across the top of the blank, it is readily converted into book form of the interchangeable-leaf type, thus assisting investigators with the board cover as a writing surface, if so desired. It will doubtless be found, however, that eight or ten of these sheets will, of themselves, afford sufficient stiffness for writing, being of fairly good weight when thus taken together.

ASH-HANDLING BUSINESS OF THE BROOKLYN RAPID TRANSIT COMPANY.

That street railway companies are sometimes in a position to produce revenue by applying managerial sagacity to opportunities aside from those of carrying passengers is illustrated in the case of the Brooklyn Rapid Transit Com-

pany, which has an arrangement with the city authorities of Brooklyn for taking charge of the city ashes and street sweepings.

employment of additional men, all contributing to an increase in the cost of disposing of the city's refuse. In 1901 the American Railway Traffic Company was organized as a subsidiary corporation of the Brooklyn Rapid Transit Company, for the purpose of erecting convenient ash receiving stations and of disposing of the ashes and street sweepings received at these points at the price of 35 cents

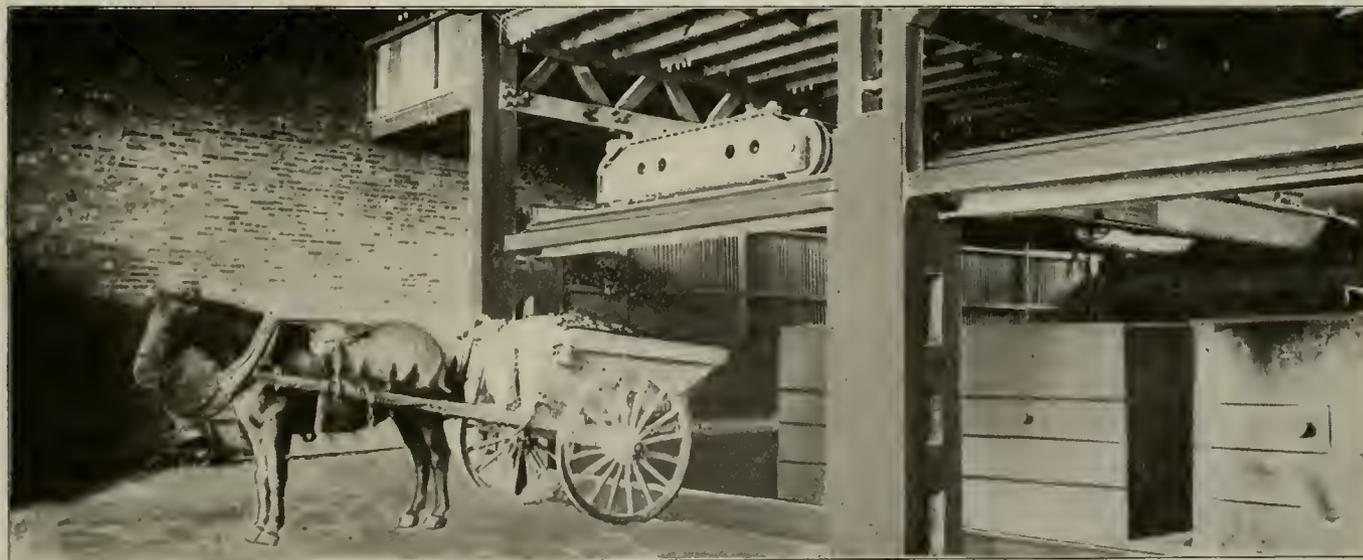

Ash-Handling by the Brooklyn Rapid Transit Company—General View of Receiving Station.

Formerly the city hauled its ashes to dump scows on the river front and to dumping grounds located from one to eight miles from the points of collection, paying in the latter cases from 10 to 15 cents a load for the privilege of dumping, in addition to the cost of the haul. The objection of the

per cubic yard. Thirteen temporary ash stations were built adjacent to surface lines, so located that the maximum dump cart haul should be one mile and the average haul about three-fourths of a mile. From these stations the ashes were conveyed in heavy steel buckets on flat cars to outlying marsh lands and there used as fill, the company receiving a consideration from the owners of these marsh lands.

This business assumed proportions that made it advis-

Ash-Handling by the Brooklyn Rapid Transit Company—Interior View of Receiving Station.

able to erect ash stations of more permanent construction and the company has this year rebuilt three of its stations, at a cost of about \$25,000 each. One is located at the corner of Ralph and Atlantic avenues, Brooklyn, one in Bergen street and the third in Herkimer street. Engravings from photographs of the first station are presented herewith. The

beach resorts to the scow dumping plan and the rapid filling of available dumping grounds within a reasonable distance from collection points, made it necessary for the city to begin to seek for more remote dumping places, which would have involved the maintenance of a large additional number of horses and carts, with the attendant risk of loss, and the

buildings are of simple but substantial construction, are practically fireproof and kept as clean as possible. The exterior is of pressed brick, the cabin without being assigned to the checker for the city street cleaning department. One door is for exit and the other for entrance for the carts, which back on the paved floor within and discharge into the heavy metal buckets. These buckets are then conveyed by electric traveling crane to the waiting flat cars which enter the structure through the low-level entrance at the right.

It is possible to handle 60 carts an hour in these stations and 45 carts have been handled under pressure in a half hour. Inasmuch as such a delivery of ashes is far beyond the necessities or facilities of the street cleaning department, the stations are probably adequate for all time. The flat cars used in this service carry four heavy steel buckets, each bucket having a capacity of five carts, of two cubic yards per cart. Each carload is therefore 40 cubic yards, representing an income of \$14 per load. The American Railway Traffic Company has 25 of these cars in service. This subsidiary company owns the ash stations and the flat cars and hires its own employes.

In the matter of power consumption, the burden is distributed widely over the surface lines and not more than 20 cars are receiving current at one time, five cars at least being always employed in receiving ashes or depositing them at the dumps. The company is now taking out an average of 125 carloads every 24 hours, the cars being operated as far as practicable at night. At the dumps the equipment for unloading consists of one crane and three A-frame derricks with booms.

PHILADELPHIA RAPID TRANSIT DIRECTORS APPROVE MERCHANTS' PLAN.

John B. Parsons, the president of the Philadelphia Rapid Transit Company, has sent a letter to Morris B. Clothier, the president of the Retail Merchants' Association, announcing that the plan submitted by that association for the solution of the traction problem will, with the exception of a few clauses, be unanimously recommended by the directors of the company to the stockholders for adoption. In his letter Mr. Parsons says:

"If your plan is adopted, it will prevent for all time any evils which may come from over-capitalization of franchises granted by the city, and if, in the development of these franchises, large profits accrue, the city will be an equal sharer after the investor has received a legal return for his money.

"Your plan will restore confidence and permit the raising of capital on fair terms for much needed improvements. A feature to which we have yielded acquiescence only after considerable doubt as to its fairness and feasibility is the sinking fund provision with respect to the \$30,000,000 of capital of the Rapid Transit company. We think the company is making a most liberal concession when it contracts to give up at the end of 50 years for actual cost franchises which it holds in perpetuity, and which, it believes, will then be worth many times the cost of the property.

"To add the condition that the company shall set aside, out of its own receipts, the money to provide for the purchase, seems to us unfair to both parties—to the Rapid Transit company in that it is deprived of its earnings, and to the citizens in that charges are placed on this generation for benefits to be enjoyed wholly by the next. Your suggestion that the sinking fund feature should be applied to all further issues of securities is, in our opinion, not feasible and will, we believe, defeat the most important object of your whole plan—the attraction of large amounts of capital. A sinking fund is a device for paying for all improvements and extensions out of the earnings, and if the burden thus placed upon the property is greater than it can stand, its securities will not be attractive and money cannot be raised on them.

"We fully believe that the growth of the city will require a very large expenditure of new capital and that to attempt to work out at this time the details of the manner of raising it might defeat the very end you have in view. We are content to leave this matter in the hands of the city for future adjustment as occasion may arise, agreeing on our

part to permit no new issues of securities or increase in the fixed charges without the express consent of the city."

Mr. Parsons has also sent a letter to Mahlon N. Kline, president of the Trades League, which submitted a plan in opposition to the merchants' plan. In this letter Mr. Parsons points out that the suggestions made by the Trades League are applicable not to the Rapid Transit company, but to the 50 or more underlying companies which make up the system. These companies, Mr. Parsons says, are not controlled by the Philadelphia Rapid Transit Company, "except as lessees and upon the payment of fixed rentals." He adds:

"They are owned by other stockholders, numbering all told 20,324, of whom 2,991 are trustees, executors and guardians. If you think that part of the plan which proposes the scaling of the values held by this large body of citizens is legal or feasible, you will have to address your demands to the companies affected. We, as a contracting party, are bound by our contract and neither wish nor have the power to evade our obligations.

"We cannot give away the property of our underlying companies because it does not belong to us, but with respect to our own property, we will agree to give the city the right to purchase it at cost at the end of 50 years, giving the city, in the meantime, one-half of the profits of operation after paying legal interest on our actual investment, and further providing out of the earnings a sinking fund sufficient to enable the city to pay the amount now invested in the property. In other words, we are giving to the city one-half of the profits for 50 years and the property itself at the end of that time.

"The granting of free transfers is not an improvement in the service, but a reduction in fare. The average rate of fare in Philadelphia has been steadily reduced. In 1876 it was 7 cents for a single fare and 9 cents for an exchange ticket. No such thing as a free transfer was known. In 1886 it was 6 cents for a single fare and 9 cents for an exchange ticket, with no free transfers. In 1896 it was 5 cents for a single fare and 8 cents for an exchange ticket, with no transfers. To-day the average fare received for each rider is 3.68 cents, and 12.81 per cent ride on free transfers. The average length of run of our cars to-day is over 6½ miles, so that the average rate of fare is only about ½ cent per mile.

"On the other side of the ledger, the wages paid platform men have risen as follows: 1886, 12 cents per hour; 1896, 16 2-3 cents per hour; and 1906, 21 cents per hour. Copper, rails, electrical machinery, labor and all materials and supplies have practically doubled in cost in the past 13 years, since the trolley lines were installed."

A plan which will embody the changes considered advisable will be drawn up by the company. Mr. Parsons advises that before it is too late some determination should be reached as to the advisability of action by the state legislature.

The Trades League has replied to the letter of Mr. Parsons. The league refuses to accept the suggestion of Mr. Parsons that its street railway committee confer with the merchants' association. As the league could not favor the merchants' plan its officers think such a conference would be a waste of time.

Electric Tramways in Japan.

The first electric tramway built in Japan was a line eight miles in length opened in Kyoto in 1895. Since then other cities have in succession constructed electric tramways as convenient means of communication for short distances, so that there are now 18 electric tramway companies, with an aggregate capital of nearly twenty million dollars, whose lines already opened total 130 miles, with 82 miles in addition under construction. Most of the railways, however, have been built recently, and do not yet report very profitable business. That the profits will be large, however, is clearly shown by the fact that the electric tramways of Tokyo already pay annual dividends of not less than 10 per cent.

The milk-handling business of the Aurora Elgin & Chicago Railway has increased from an average of 290 cans per day during January, 1906, to an average of 425 cans per day during the same month of this year.

WILL PRESENT FACTS TO LEGISLATURE.

Representatives of about sixty electric railway companies of Pennsylvania met at Philadelphia on February 15 and formed the Temporary Street Railway Association, the object of which is to present facts to the legislature in regard to proposed legislation affecting electric railways, particularly a bill to increase the tax rate on electric railway property and another authorizing electric railways to carry freight. Subcommittees have been appointed to consider the various bills. It is stated that such action is at the request of members of the legislature. W. E. Harrington, president of the Pottsville Union Traction Company and manager of the Eastern Pennsylvania Railways Company, who has been elected chairman of the association, outlined its purpose as follows:

"We propose to present facts to the legislature to demonstrate conclusively that much of the proposed legislation would not only be detrimental to the interests of the many electric roads in Pennsylvania, but would work hardship to the general public—especially the investing public—as well. The

increase the tax on capital stock from five to ten mills, being an increase of 100 per cent on that item, would also work an increase of from 18 to 20 per cent in taxation.

"As to the bill enabling local municipalities to impose tax on all real and personal property of electric railways located in such municipalities, the passage thereof would result in bankrupting a large portion of the electric railways in Pennsylvania. The annual gross earnings of the average interurban road equal about 14 per cent of the actual cost of building and equipping the same.

"Therefore, assuming that local municipalities could assess the property of railway companies at the cost value thereof and impose the average municipal tax, it can be not far from 1 per cent of such value, and in some instances as high as 1½ to 2 per cent. The result based on 1 per cent average tax rate would be the imposition of a tax on such railways equal to slightly over 7 per cent of the gross earnings."

A PLOW CAR FOR STREET SURFACING.

The novel plow car shown in the accompanying illustration was built in the shops of the Denver City Tramway Company. This car is found to save a large amount of hand labor when it is desired to make true or cut down the surface of a dirt street between or adjacent to car tracks. The essential parts consist of a row of cutting points which

Denver City Tramway Car for Street Surfacing

freight trolley bill should be passed by all means. This is the only state in the east which now prohibits the carrying of freight by this means, and it is high time that the interests of the shippers are looked after in Pennsylvania, as well as elsewhere."

Attorney Hampton L. Carson has been retained to examine the provisions of the bills and to assist in drafting substitutes for some of the provisions. A letter has been prepared and addressed to each member of the legislature giving some figures showing the proportion of taxes paid to earnings.

The letter reads:

"For the fiscal year ending June 30, 1905, as shown by the report of the Bureau of Railways, Department of Internal Affairs, 115 street railway companies reported to the bureau, of which only 23 paid dividends.

"The reports also show that the interest on funded and other debt for the same year amounted to \$3,100,582.

"Taxes amounted to \$1,670,648, while dividends paid were only \$705,798, the tax being a little more than one-half the interest charge and more than double the dividends paid.

"Eliminating the cities of the first class, we find that the tax paid by the remaining companies was more than 7½ per cent of the net earnings from operation before deducting taxes, interest and other capital charges, and was about one-half the dividends paid, this change in ratio to dividend being accounted for by the fact that the two operating companies in the cities of the first class paid no dividends during that year. The bill adding one mill to the tax on capital stock, loans and gross receipts being, in fact, an increase of 20 per cent on stock, 25 per cent on loans and 12½ per cent on gross earnings, would work an increase in taxation in the aggregate of from 18 to 20 per cent; the bill to

loosen the dirt in the street so that it can readily be shoveled and a smooth surface obtained for macadamizing.

As may be seen by reference to the engraving the plow points are supported by an iron framework hung between the trucks on the underside of an ordinary flat car. The floor structure of the car is reinforced by wooden trusses above the outside sills.

The frame holding the several plow points is pivoted so that when in operation the points may be adjusted with a lever, which is supported above the car floor. By varying the height of the lever the points are made to cut the surface of the street to any desired depth from 1 to 4 or 5 inches. The framework holding the plowing parts is also supported on transverse guides so that the points may be moved at right angles to the car, and thus dress the surface of the street on either side of the track or between the rails.

In operation the car is drawn by an ordinary motor-equipped work car. The plow car is loaded with scrap iron so that the points will take a firm hold in a solidly packed street surface.

It is stated that the Delaware & Hudson Company has undertaken the securing of accurate data on which to base a decision as to the advisability of electrifying its line between Wilkesbarre and Carbondale, Pa.

PIPING AND POWER STATION SYSTEMS.—XXX.

BY W. L. MORRIS, M. E.

The screen guides are made of cast iron with lugs to key them into the concrete. The screen frames are made of angle irons of heavy section. Such screens should be made of copper wire, not of brass, as brass wire will not stand the sharp bends necessary in screens of fine mesh. A much cheaper screen can be made of iron wire, but the life of such screens is so short that there is no economy in their use.

It will be seen from the illustration that there is a large settling chamber between the screen compartment and the mouth of the intake to permit sand, etc., to settle. It will also be noted that the height of the waterway is such that at low water there is a space of three feet between the surface of the water and the top of the intake. The floor space over the settling chamber is necessary for the cleaning of screens. Sufficient room has been left between the tiers of screens to permit dropping a brush or rake between them to remove leaves, etc., without removing the screen. The warm water discharge from the condenser is not shown in these illustrations. It consists of a line of 12-inch pipe extended to the intake and carried alongside of the intake waterway and outside of the screen-house, discharging through the bank retaining wall at about low-water level.

Spread footings were not required for this screen-house as the foundation rested on rock. Had the bottom been of sand, the bottom of the intake foundation would have been concrete of a considerably greater thickness and possibly reinforced with iron bars. In case of fine sand, which is liable to wash, the footing should be protected and anchored to avoid shifting in case of freshets or floating ice. Figure 251-(11-13) shows the projected footing loaded with heavy stone carefully piled around the screen-house. The footings should be projected in front as well as at the sides and placed sufficiently low that they can be loaded with stone. By finishing the banks and bottom of the intake in this manner much less difficulty will be experienced from sand, etc., being washed in.

If it is necessary to build the intake house near an old dock, filled-in banks or similar location where a firm bottom for foundations cannot be secured, it may be found advisable to use piles and build the top of the piles into the concrete as shown in Figure 252-(11-14). The concrete bottom should be put in at the same time as the walls and the

concrete around the piles, thus giving a footing over the entire surface as well as on the piles. To further increase the stability of this structure, the spread footings shown in Figure 251 may be used, but this necessitates more complicated forms for the concrete. The forms for Figure 252 can be placed in the water after the ground has been removed around the piles and the concrete built up without pumping the water out. The outside forms rest on the bottom and the inside forms are supported on the piles. Better concrete work can be made in this way than by pump-

ing the water from the center, thus causing it to wash through the fresh concrete.

In constructing intake waterways there should be no passage between the water supply and the screen chamber which is not easily accessible. This detail, however, is frequently neglected and in nearly every case without good reason. A water conduit from the center of the stream to the screen-box is shown by the full lines in Figure 253-(11-15). The waterway shown at A is very objectionable as it is sure to clog and cause trouble. If there is not a rapid flow at the intake then it is advisable to place the screen compartment and intake either at the point shown dotted in the center of the waterway with a runway leading to it or at the screen-box, and cut away the banks so that the water will flow directly into the screen compartment as shown in the illustration. If the source of supply is a stream which carries leaves and floating debris, the screen-house or box should not be set into the banks of the stream unless some provision is made to carry off the floating material. The most desirable location for the screen-house is to place it so that the front face is on the same line as the stream and not recessed in the bank, as ice and logs will then accumulate in the entrance space. Neither should the screen-house project into the stream unless it is well protected, as it is liable to be injured in times of flood by floating ice and logs.

Where cooling ponds are used for reducing the temperature of the condensing water, a screen-house such as that shown dotted in Figure 253-(11-15) would be suitable, as it would take water from the center of the pond where it is

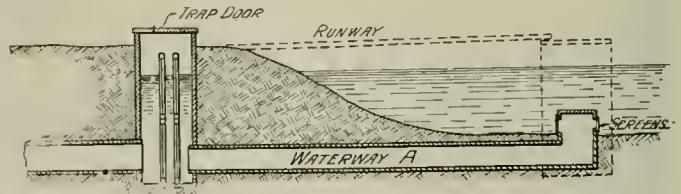

Figure 253-(11-15).

deepest and coolest. Little difficulty would be experienced from leaves, etc. Many installations such as this are operated without an intake crib or screen, the opening into the crib being located well below the surface of the water.

There are many suburban power stations being operated non-condensing that could be very readily operated with a cooling pond and condenser. Cooling ponds can ordinarily be constructed for about one dollar per boiler horsepower, not including waterways, etc. This would make the cost of a 1,000-horsepower engine plant using 15 pounds of steam per engine horsepower, about \$500, or 50 cents per engine horsepower in excess of that where a natural water supply is available.

Cooling towers are frequently used for this service, but these cost at least \$3.00 per engine horsepower, including the foundations, fan-drive, etc. Not only are they more expensive to install, but are much more expensive to operate, owing to the fact that the circulating water must be elevated to the top of the tower. This is usually about 30 feet, and the entire head is lost in dripping over the cooling surfaces. To this loss must be added the power required for driving the blast fans in those types which do not have a natural circulation of air. Cooling towers generally have less than one square foot of cooling surface per pound of steam, the average cooling surface being .7 square foot per horsepower. Cooling ponds should be as large as conditions will permit; not that smaller ponds would not be sufficient to maintain the desired vacuum, but because of the quantity of water which must be circulated if the temperature is high. As an increase in the amount of circulating water increases the amount of power lost, the money thus wasted would more

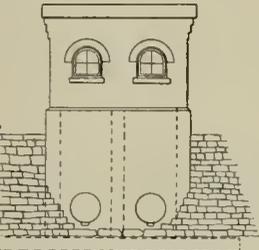

Figure 251-(11-13).

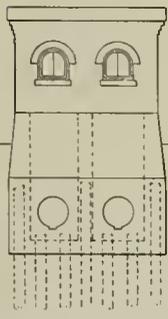

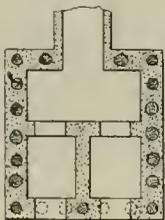

Figure 252-(11-14).

than equal the interest on the investment for a pond of larger dimensions.

This is illustrated by a central station which was condensing about 25,000 pounds of steam per hour and had a pond, the cooling surface of which was 35,000 square feet, or, 1.4 square feet of pond surface per pound of steam. The difference in temperature of the water entering and leaving the condenser was about 25 degrees, thus requiring about 40 pounds of circulating water per pound of steam condensed.

By increasing the cooling surface so that only 20 pounds of cooling water is required, there results a saving of not less than 1 per cent of the power which the engine delivers. If the plant runs 10 hours a day this will amount to 36.5 horsepower hours per year, per horsepower of the engine, representing a yearly saving of 36½ cents per horsepower, or 12 per cent interest on \$3.00 per engine horsepower invested. This would be sufficient to pay the interest on the cost of a pond having 7.8 square feet per horsepower of the engine capacity. That is, however, more than is generally required and five square feet of surface per pound of steam condensed is sufficient and there would be little gained by increasing the investment for a larger pond. If five square feet of cooling surface is provided per pound of steam, a plant having 1,000 horsepower using 15 pounds of steam per horsepower per hour would require a pond having an area of 75,000 square feet, or one about 312 feet in diameter.

There are very few cases of suburban plants where sufficient ground for a pond cannot be obtained, though it may be necessary to locate the pond a considerable distance from the plant.

The fact that a plant is at a considerable elevation above the water supply, whether it is stream or cooling pond, does

The most serious difficulty to be overcome in such installations is the construction of the intake, discharge and condenser well. This will, however, depend upon the condition of the soil and can probably be accomplished by placing the waterway in trenches until the depth becomes excessive and then tunnel the remainder of the distance to the well. The circulating pump and heater pump would be located entirely under water and would therefore not require

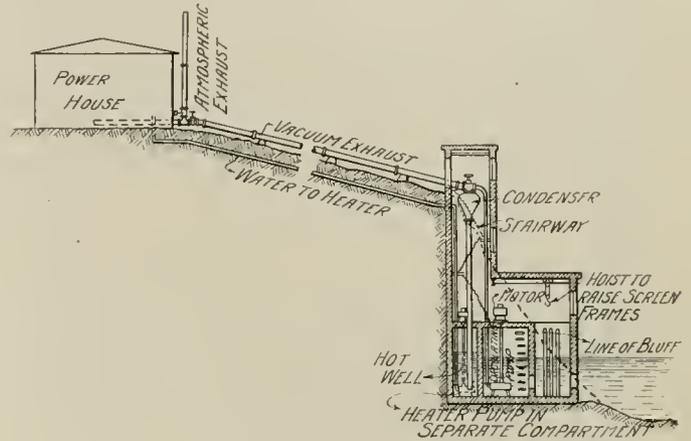

Figure 255-(11-17).

stuffing boxes where the shaft passes through the case. In fact the suction may be taken in the center through both the top and the bottom of the impeller case. The only parts requiring attention would be the shaft journals, and, as the shaft exerts such a slight pressure on the bearings and would generally be lubricated with grease, the care required would be insignificant. The motors would be placed above the engine-room floor, free from heat, vapor, etc., where they could readily be looked after by the operator.

In case the water supply is below a high steep bluff, the condenser shaft could be cut in the face of the bluff and the screen-house built in the cut as shown in Figure 255-(11-17). A rather long exhaust main would then be necessary, the only objection, however, being the increased cost of the line. The fact that the exhaust main would be exposed to the atmosphere would be an advantage as it then would aid in condensing the steam. The expansion and contraction could easily be cared for by allowing the condenser bowl to move freely with the pipe, the tail-pipe being sufficiently long, so that considerable travel, possibly a foot or more, could be taken care of. The water to the heater would, in this case, require being well insulated to prevent freezing. The condenser building and screen-house, etc., should be built of concrete throughout, the walls being about eight inches thick. A reinforced concrete roof and a metal stairway from the ground down to the screen and motor-floor level should be installed. The motors in this installation should each have a switch at the switchboard and each motor should have a separate wattmeter or ammeter so that any variations or unusual conditions can be detected from the power station.

At least once during each watch the engineer on duty should make a careful inspection of the motors, condenser, etc. This duty would in no way be a hardship upon the operator and with this amount of attention no trouble should arise because of the motors being out of his sight. There are many motors in daily use which may be only a few feet from the operator, but are so situated that they are entirely out of view for possibly a day or more at a time.

The wires from the station to the condenser tower should be carried in some form of insulated underground conduit, thereby avoiding any possibility of trouble from lightning. It will be noted that the power house shown in Figure 255 may be located at a considerable height above the condenser allowing the exhaust pipe to run down-hill to the condenser.

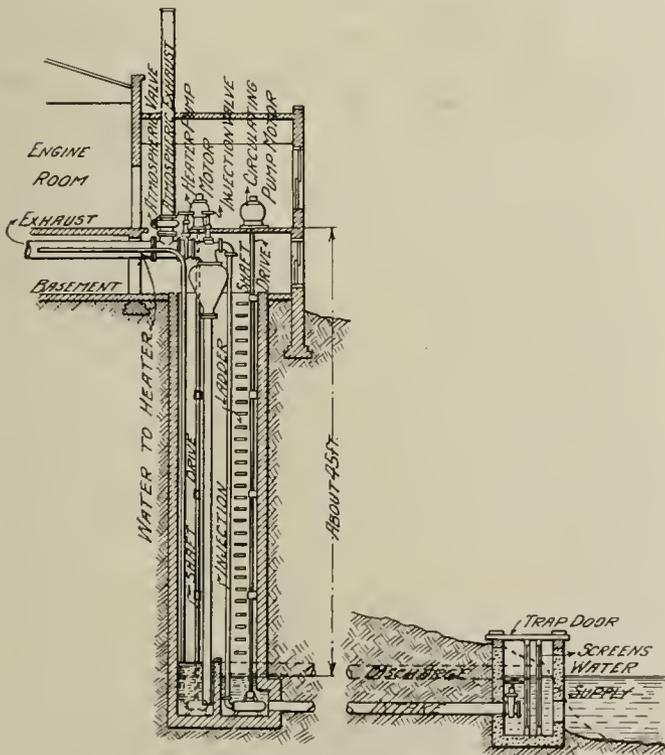

Figure 254-(11-16).

not prevent installing a condenser plant successfully. An elevated jet-condenser is admirably suited for such a layout as shown in Figure 254-(11-16). This is, in many respects, a more plausible arrangement than to run the exhaust up to the condenser bowl located at a higher elevation. The safest arrangement is to have the exhaust drain into the condenser as shown in Figure 254-(11-16), but the conditions are generally such that it cannot be so arranged.

This distance may be 100 feet or more in which case this is about the only simple and practical method of installing a condenser where the water lies so far below the power plant.

Another method, one which would be more complex, is to locate the jet condenser or surface condenser in the power house in the usual manner and raise the water to the condenser. The fall of the water from the power house to the level of the source of supply may be utilized by means of a Pelton waterwheel or other similar device. The waterwheel, electric motor and a turbine pump for raising the injection water being all mounted on the same shaft, the motor would only have to supply the power necessary to overcome the friction in the pipes, loss of head in the condenser and the loss due to the inefficiency of the pump and water motor. Instead of running the exhaust and heater supply pipes from the power station to the condenser house, it would then be necessary to run the circulating water line from the source to the power house.

Whichever plan of supplying the water to the condenser is employed, the water used for condensing should not be raised to a high elevation and the available head thus created be allowed to waste. For instance, a surface condenser may be placed, say, 32 feet above the surface of the water supply, and if all the joints are water tight no loss will be occasioned by raising the water to this elevation and allowing the discharge to fall from this height, provided that the entire section of the pipe from the pump back to the discharge is airtight. The power required to raise water above 32 feet would be lost or wasted in this case, as the limit of height of a water column that the atmosphere will support is 32 feet. To utilize any additional head, some device such as a Pelton wheel or turbine waterwheel would be necessary, as previously described.

The most efficient method of supplying circulating water would be to run the exhaust down to the condenser rather than to raise water more than 32 feet to a surface condenser, or any amount whatever to a jet condenser. The most economical location for a jet condenser of the elevated type is with the overflow as little as possible above the surface of the water supply as it will enable the condenser to discharge its water. This condition is ordinarily obtained by locating the overflow from the condenser at extreme high-water level, allowing the water in the hot-well to raise a foot or so during short intervals.

(To be Continued.)

Welfare Work of the Brooklyn Rapid Transit Company.

An interesting experiment in the Brooklyn Rapid Transit Company welfare work among its employes at the large operating points is about to be inaugurated at East New York, where the company is building an employes' restaurant, to be run by the Employes' Benefit Association on a profit-sharing basis. The restaurant adjoins the clubhouse on Jamaica avenue, and its dining-room, adjacent to the lounging room of the clubhouse, will be pleasant and sunny. The modern kitchen is within easy access. The place will be open night and day and will be run upon strictly temperance lines, though smoking will be permitted.

The success of the Brooklyn Rapid Transit Company in providing for its employes in this way has been so pronounced as to incur the criticism of keepers of saloons that formerly were frequented by hundreds of the company's employes and the railroad officials are well satisfied with the result. The company began its work of combating the tendency of the men to visit the saloons and dance halls by establishing a sandwich and coffee stand in a small building at Culver terminal. This has developed into a place where men can avail themselves of a varied menu at reasonable prices, and the restaurant at East New York will be founded on the experience at Culver Beach. The profit idea is absolutely eliminated, and the food is better and more reasonable than can be had at the public restaurant. Several of the Brooklyn Rapid Transit's newest car barns have been designed with provision for luncheon facilities for the men, and if the idea proves successful at East New York it will undoubtedly be rapidly extended to other terminals.

RECENT ELECTRIC RAILWAY LEGAL DECISIONS.

BY J. L. ROSENBERGER, LL. B.

DEFECTIVELY FASTENED GRAB-IRON ON TOP OF CAR.

McIsaac v. South Jersey Gas Electric & Traction Co. (N. J. Sup.), 64 Atl. Rep. 976. Nov. 14, 1906.

Where it appeared, on the plaintiff's proofs, that the grab-iron upon the top of a trolley car, which the plaintiff, a line or repair man, was required to use, was faultily constructed, in that the screws which held it were too small; and that it was also defective, in that wood into which it was fastened was rotten, the supreme court of New Jersey holds that the court could not nonsuit the plaintiff.

OBLIGATIONS OF ORIGINAL STATUTE APPLY TO EXTENSION AUTHORIZED BY AMENDMENT—DUTY TO KEEP SPACE INSIDE AND OUTSIDE OF RAILS IN GOOD ORDER AND REPAIR MAY REQUIRE LAYING GRANITE BLOCK PAVEMENT.

Mayor, etc., of City of New York v. Harlem Bridge Morrisania & Fordham Railway Co. (N. Y.), 78 N. E. Rep. 1072. November 13, 1906.

As the amendatory statute which permitted the defendant to construct its tracks in a certain street contained no provision on the subject of repairs or repaving it was argued that it was exempt as to such extension from the obligations contained in the provisions of the original act upon that subject. But the court of appeals of New York does not agree with this contention. It thinks it very clear that when the defendant was authorized to construct the extension by an amendment of a section of the original act such extension was subject to the obligations contained in such original act.

Subsequently the municipal authorities entered into a contract for the paving of the street with granite block pavement, the street having had no complete or actual pavement, but being substantially a dirt road. The court holds that, under the circumstances, the original statute referred to requiring the company to keep the space inside and outside its rails "in good and proper order and repair," it could be required by the city to lay a granite block pavement.

The question of what shall constitute keeping a pavement in the tracks of a railroad company in good order and repair, the court says, is to be determined somewhat at least by reference to existing and surrounding conditions, and in the court's judgment it would be altogether too narrow a view to hold that where a municipality had for sufficient reason decided to pave a street with asphalt or other new pavement a railroad might discharge its obligations to keep its part of the street in good order and repair by merely patching up a dirt road or some species of pavement which had become antiquated and out of condition and which was entirely different from that adopted in the remainder of the street.

ADMISSIBILITY IN CASE OF COLLISION WITH HOSE WAGON OF ORDINANCES GIVING SUCH WAGONS AND CARS RESPECTIVELY RIGHT OF WAY.

McBride v. Des Moines City Railway Co. (Ia.), 109 N. W. Rep. 618. Nov. 13, 1906.

This action was to recover for the death of a fireman caused by the collision of a hose wagon with an electric car. Sections of two city ordinances were offered in evidence; one, giving fire engines, hose carriages, etc., the right of way while going to fires; the other, giving the defendant's cars the right of way over teams or vehicles in the street. The supreme court of Iowa holds that the first was properly admitted in evidence as bearing on the question of the duty of the motorman to assume that the hose wagon would not be stopped for the purpose of allowing the car to pass by in front of it, but that, on the other hand, the driver of the hose wagon would proceed on the theory that he had the

prior right at the crossing. While the ordinance did not require a higher degree of care on the part of the motor-man with reference to the fireman on the hose wagon than with reference to any other person, it would charge the motor-man with knowledge of a fact very material in determining whether he exercised the care required under the circumstances. But the section of the ordinance relating to the operation of the defendant's cars and giving them the right of way as to teams or vehicles on the street was properly rejected, because it had no application to the case of a hose wagon belonging to the fire department. The fire department ordinance was later in enactment than the street car ordinance, and its provisions would control as to the specific subject matter referred to therein. Besides, the specific provisions of the ordinance as to the engines and carriages of the fire department constituted exceptions to the general provisions relating to teams and vehicles, as the provisions of a statute or ordinance as to a specific subject matter will prevail over general provisions which, but for the specific provision on the same subject, would have covered the subject matter of the latter.

LIABILITY FOR INJURY TO PASSENGER EXTENDING ARM OUT OF WINDOW OF ELECTRIC CAR—RUNNING CARS ON TRACKS CLOSE TOGETHER—CONTRIBUTORY NEGLIGENCE.

Interurban Railway & Terminal Co. et al. v. Hancock (Ohio), 78 N. E. Rep. 964. October 16, 1906.

Smith v. St. Louis Transit Co. (Mo. App.) 97 S. W. Rep. 215. May 22, 1906. Rehearing denied October 2, 1906.

In the Ohio case the supreme court of Ohio asks whether, assuming that the rule respecting the conduct of a passenger on a steam car is to forbid his extending his arm out of the car window without himself assuming the risk of injury, there should be a different rule applied to a passenger on an interurban electric car. It is of opinion that there should not be. It says that as such cars are now operated throughout the country they run at a rapid rate. Their construction ordinarily, if not necessarily, involves the maintenance near the tracks of poles and barriers of various kinds. Cars running in opposite directions, as well on switches as where there is a double track, are often necessarily run near together. There is, perhaps, more necessity for locating tracks near together inside of municipalities than in the open country, and upon narrow streets it often happens that the company is required to lay the rails at less distance apart than they would prefer to place them, because of crowded conditions and the requirements of the municipal authorities. To say that, as a rule of law, a passenger on such a car may be heedlessly negligent, exposing his person to needless danger, and visit the consequences on the interurban company upon showing negligence on its part, appears to this court to be without reason. Nor is it supported by authority. On the contrary, the generally recognized rule is that the passenger cannot cast upon the carrier responsibility for an event which, except for his own contributing negligence, would not have happened.

The supreme court of Ohio further holds that, in an action against an interurban electric railway company for injury to a passenger by reason of his arm being struck by a car passing upon an adjoining track, it was not error for the court to instruct the jury that if they found that there were four iron bars extending horizontally across the window of the car, equally distant from each other, the top one approximately 12 inches from the window sill, and that the plaintiff while sitting in the car permitted his arm, or any part thereof, to extend or project out beyond or over the rods, and that said act directly contributed to the accident, the plaintiff would be guilty of contributory negligence and could not recover damages.

But in the Missouri case the St. Louis court of appeals holds that if the space between the defendant's tracks was

so narrow as to allow its cars to rub or bump together when passing each other, as the plaintiff's evidence showed they did, the presumption was that the tracks were negligently constructed and maintained, and the jury would be authorized to find the defendant guilty of negligence in operating cars over said tracks. The question of whether or not the plaintiff was guilty of contributory negligence was for the jury to determine, under all the facts and circumstances in evidence.

CAR AND CONTROLLER EXACTLY LIKE ONES IN QUESTION MAY BE INSPECTED BY JURY—RULE FORBIDDING PASSENGERS STANDING ON FRONT PLATFORM IS REASONABLE AND ONE MAY BE EJECTED FOR VIOLATING IT EVEN IF HE CANNOT GET A SEAT—PASSENGER HAS NO RIGHT TO RIDE ON ANY PARTICULAR CAR WHEN SEVERAL OFFER SAME ACCOMMODATIONS.

Dobbins v. Little Rock Railway & Electric Co. (Ark.), 95 S. W. Rep. 794. May 14, 1906.

This was an action for an alleged wrongful ejection from an electric car. One of the questions involved was as to whether or not a moving of the controller by the plaintiff was accidental, as claimed by him, or intentional, as claimed by the defendant. The supreme court of Arkansas holds that there was no error in permitting the inspection of a car and the controller thereon by the jury, the testimony showing that all the controllers on the summer cars were "built exactly alike;" that the "controllers were the same—the same mechanism." It says that the court adopted the best method of giving the jury an idea of the working of the controller. It would not have been improper to have had the controller itself, or one "exactly like it," exhibited before the jury, and to have explained to them the effect of moving same. A fortiori (by a stronger reason) it was not improper to have such a controller examined on the car. This was practicable, and certainly gave the jury the clearest idea obtainable as to how the controller could be moved and the effect thereof on the movement of the car. It would the better enable the jury to determine a pertinent question in the case, namely, the one above stated.

The supreme court also approves, as a correct declaration of law, of an instruction containing the statement: "A regulation forbidding passengers to stand upon the front platform is a reasonable and proper one. It is the duty of a passenger who is standing on the platform to go inside the car when requested so to do by a person having charge of the car, and if there is standing room inside, although there are no vacant seats; and if a passenger refuses to comply with such request, when there is room inside the car which can conveniently be reached, the servants of the company may lawfully eject him from the car."

But if there were several of the defendant's cars standing at the station waiting to be loaded with passengers returning from a picnic, and while so waiting the plaintiff entered one of the cars, became involved in a controversy with the conductor thereof, then, without having paid fare on the car, voluntarily left it to go upon the street where the conductor was standing in order to maintain his contention, when the conductor informed him that he could not ride on his car, directing him to take passage on another car, the court holds that the plaintiff was not denied the right to ride upon the defendant's car, and was not, therefore, ejected therefrom. It says that where there is a train of cars for passengers, all of equal and sufficient accommodation, a passenger has no right to insist upon riding upon any particular car. The disposal of passengers upon the cars (conforming with statute as to separate races) must rest with the company, and, so long as its conduct in this respect is not arbitrary, capricious, unreasonable, and discriminatory, it incurs no liability to a passenger who refuses to conform to its requirements.

News of the Week

Legislation Affecting Electric Railways.

Kansas.—A bill introduced by Representative Gordon of Wyandotte provides that persons for whom seats in street cars cannot be found may ride for a 2-cent fare, and that cars must stop for passengers unless there is a car within two blocks going to the same destination.

Nebraska.—A bill to allow street railway companies to acquire and own interurban railways has been recommended by the senate in committee of the whole. A bill has been introduced to prohibit street or other railways to own interurban railways.

New York.—A bill has been introduced in the state legislature providing for the abolition of grade crossings of railroads and electric railroads. A bill introduced by Assemblyman Frisbie of Schenectady authorizes the governor to appoint as special police officers conductors and motormen on interurban roads.

Pennsylvania.—Several bills have been introduced in the legislature to increase the tax rate on electric railway capital stock and physical property.

Texas.—The house committee on private corporations has reported favorably a senate bill giving to interurban railways the right of eminent domain.

General Harries on 3-Cent Fares.

At a hearing on February 13 before the district committee of the national house of representatives on the bill introduced by Representative Madden of Illinois providing for lower street-car fares and universal transfers in the District of Columbia, Gen. George H. Harries, president of the Washington Railway & Electric Company, made the following statements:

"These bills providing cheaper fares and universal transfers are objectionable from every standpoint. That is, with the exception of the standpoint of the man who wants something for nothing. The street car companies of this city have done more in the way of giving transfers than those of any other city in the country. Indeed, the suggestion of universal transfers is absolutely new, for there never has been a case where one company was compelled to carry passengers of another company free. That the transfers would be reciprocal does not disturb the fact that passengers would have to be carried cheaper by both of the companies exchanging transfers. I am satisfied that the courts would not uphold any law providing for reciprocal transfers, if passed."

Discussing the cost of construction, General Harries said that the overhead trolley system costs \$45,000 per mile, including equipment, while the average cost of construction and equipment of the underground system used in the district is \$132,000. He argued that the companies would not be able to carry passengers for less than the present fare.

"A 3-cent fare," he said, "means a 3-cent service, with 3-cent cars and 3-cent employees. The committee might as well face that proposition right now."

Chicago Traction Developments.

The plans for the reorganization of the Chicago Union Traction Company and its subsidiary companies and their absorption by the new Chicago Railways Company are being formulated. The reorganization will be subject to the acceptance and approval by voters of the ordinance. According to the terms of the ordinance, the reorganization plan must be approved by P. S. Grosscup, judge of the United States circuit court at Chicago, and Professor John C. Gray of Harvard University.

A campaign which will be thorough will be undertaken to secure a favorable vote on the Chicago railways and the Chicago City railway ordinances at the April election.

A joint committee which has been formed representing the Chicago Commercial Association and the Chicago Real Estate Board has called a meeting of representatives of the principal clubs and labor organizations in the city for February 26, when a central non-partisan citizens' committee will be formed "to conduct a campaign of education as to what these ordinances mean to the welfare and prosperity of the public, hoping thereby to secure their adoption by the people."

Owing to the traction issue and to the fact that the mayor who is to be elected will be chosen for four years instead of two years, as in former elections, the approaching campaign will be a vigorous one. Fred A. Busse, the postmaster at Chicago, will probably be the Republican candidate for mayor. The republican platform will urge that the traction ordinances be approved.

The board of election commissioners has decided to reject the emergency referendum petition, which contained three clauses—one providing for a vote on the question of accepting the ordinances, the other providing for rejection of the ordinances and immediate municipal ownership, and the third for repeal of the Sunday blue law of 1845. In announcing their decision the election commissioners made the following statement:

"The objection which has been raised to this petition—that of its validity because it contains more than one question of public policy—never before has been argued before this board. From a careful reading of the statute relating to questions of public policy we find nothing that warrants more than one question being upon one and the same petition, but we do find some things that lead us to believe the intention of the legislature was that only one question should be contained in a single petition."

The result of this decision is that voters will have placed be-

fore them the one issue of acceptance or rejection of the ordinances which was embodied in the public policy petition. The legality of that petition has not been questioned before the board of election commissioners.

Mr. Shonts on New York Rapid Transit.

Mr. Theodore P. Shonts, who on March 4 next will assume his duties as president of the Interborough-Metropolitan Company, of New York, in an address before the Iowa Society of New York on February 15, said concerning the plans of that company:

"Two problems now confront us. The first, and the one pressing for immediate solution, is to devise ways and means, even though necessarily of a temporary character, which will give relief from the aggravations of the existing congestion. To this problem we will give our instant and best attention.

"The second, and the broader one, is to prepare plans looking to the future comprehensive enough to provide adequate facilities for the next 50 years of the city's growth, and on a scale liberal enough to give it better transportation than is furnished the people of any other city in the world.

"This plan should safeguard the rights of the traveling public, the rights of the city, and the rights of the stockholders of the transit companies. My own idea is that the people and the shareholders should be partners in the benefit to be derived from the execution of such a plan.

"I am convinced that the construction and operation of a transportation system along the lines herein indicated will effect a better understanding between the people who pay the fares, the governmental authorities, and the shareholders—the three parties primarily interested in the best solution of the problem before us.

"I hope within a reasonable time to submit to the proper authorities for a full and fair and frank discussion a proposition drawn on the lines I have indicated, with the conviction that an agreement will be reached which will be satisfactory to the municipal authorities, to ourselves, and to every fair-minded and thoughtful citizen."

Wreck on the New York Central Electrified Line.

On February 16 the White Plains and Brewster express on the New York and Harlem division of the New York Central, over which trains have been operated regularly by electricity since February 13, was wrecked at 6:40 p. m. as a result of the train leaving the rail on a curve of three degrees and five minutes at Two Hundred and Fifth street. The coaches were dragged on the road-bed until they toppled over on their sides. The loss of life was great, the persons killed now numbering 21 and the injured 153. A coroner's jury began its hearings on February 19 and the state railroad commission has made an investigation. From the evidence in hand it appears that the train consisted of five of the company's wooden coaches, drawn by two 96-ton electric locomotives, operated by multiple-unit control from the forward cab. The train left the Grand Central station on schedule time at 6:13 p. m. and was due to arrive at North White Plains at 7:02, a distance of 23.99 miles, in 49 minutes.

The electric power is used from the Grand Central station to Wakefield, 15.56 miles, the schedule time being 27 minutes. The schedule of the train was the same as that under which the trains have been operated by steam on this division since November 25 last. The train in question was six minutes late at Mott Haven Junction, on account of the movement of other trains at that point. Between Mott Haven and the scene of the wreck on the curve beyond the Bronx Park are two towers from which reports are made, one at Melrose and one at Bronx Park. These stations are 2.98 miles apart and the schedule speed for this distance is three minutes, or about 57 miles per hour. It developed that the engines are not equipped with any speed-recording device, and that although the motorman had a watch, he had not consulted it at any time during the run. The speed records therefore depend upon the reports of the operators at Melrose and Bronx Park, but it was explained by Ira A. McCormick, general superintendent electrical division, that because the operators do not take account of any time less than a minute, the speed could not be accurately determined; he stated that the train was due to arrive at the Bronx Park station at 6:38, but he could not tell exactly when it did arrive there.

The scene of the wreck was between Fordham and Williams Bridge, which are 1.63 miles apart, the schedule time being two minutes. The Bronx Park station lies between Fordham and Williams Bridge, and at Bronx Park there is a crossing of tracks, making it necessary for motormen to shut off power and slow down. It was shown, therefore, that the maintenance of the regular schedule might require a greater speed than shown in the schedule between Bronx Park station and Williams Bridge in order to overcome the delay at the Bronx track crossing. In the opinion of F. E. Williamson, assistant superintendent of the Harlem division, who it happened was riding in the cab with E. R. Rogers, the motorman, scheduled speed was not being maintained prior to the disaster.

As the train was passing under the north end of Woodlawn bridge the motorman felt a jar or jerk, which seemed to come from one of the coaches, but it was not sufficient to cause him to shut off the power. A moment later he saw a bright flash of light and then shut off the power quickly and applied the brakes. He then knew that the train had left the rails.

From an examination of the track made by R. S. Bailliet, engineer maintenance of way of the Harlem division, it appeared that the pressure on the outer rail displaced a section of the rail, at a point just above Woodlawn Bridge. This was five inches out of place on the northern end and about one inch out of line on the southern end. On the west side of the outer rail all the spikes but one were sheared off clean. The rail on this division

is 100-pound section and the elevation of the outer rail at this curve is $4\frac{1}{4}$ inches.

As to the use of two locomotives it was explained that on the right side of one of the locomotives assigned to that run two of the four underrunning contact shoes were broken. Another engine had two contact shoes missing on the opposite side and it was decided to work the two engines together under multiple-unit control, it being necessary to have shoes on both sides to obtain contact at switches, where the third rail is on the side of the track opposite that on which most of the third rail is installed. After the accident it appeared that all of the shoes on the right side of the first engine were torn off and one of the rear two on the left side was also torn off. On the second engine all the shoes on both sides were torn off.

When the accident occurred a break in the third rail caused the current to be shut off from the section and no serious fire broke out. Immediately after the accident the motorman sent his helper ahead with a flag while he ran to a telephone and notified the power house, so that the entire current was shut off shortly after the disaster. From the examination of the two locomotives the state railroad commissioners concluded that these left the track first and that the cars followed, and not that the last car left the track and pulled the others after it, as was at first reported. It was found that on the forward engine both wheels of the rear truck were on the track and that on the second engine the wheels of the fore truck were on the track and all the other wheels were off. An examination of the five cars by the commission showed that they were not nearly so much damaged as the result of the wreck in loss of life would appear to indicate. Only two of them were in extremely bad condition, having their seats twisted and demolished and their windows broken, but even these were not crushed so that they cannot be quite readily repaired. The other cars were in a better condition. One of them had only two windows broken and the seats in two of them were not disarranged.

Rapid Transit Affairs in New York.

Because of objections by the Interborough Company to some of the clauses in the form of contract which has been drawn for the new Lexington avenue subway the rapid transit commission was unable at its meeting on Thursday, February 14, to adopt the contract and specifications. The commission postponed action for a week. One of the objections was to the clause permitting the commission to order changes to be made in the rolling stock and to supervise generally the operating of the trains in the new subway. It was asserted that this provision would really give the right to the city to operate the tunnel without regard to any rights of the lessee, and it was suggested that it should be left to the courts to decide if changes ordered by the commission were reasonable or not. Another suggestion was that the contractor should pay rental only for the parts of the tunnel actually under operation. George L. Rives, counsel for the commission, advised that, instead of allowing the contractor to pay a rental on a basis of trackage in operation, pending the final completion of the subway, the contractor should pay rental on the amounts of all bonds which had then been issued for the city. Corporation Counsel Ellison desired that the contract shall contain a stipulation that none but United States citizens shall be employed by the contractor and that preference shall be given to citizens of New York over those of other states in employing men.

Before taking up the new contract the board voted to disregard the protests of the Broadway and Fifth avenue merchants against building the Broadway section of the tunnel near the surface by the "cut and cover" method. The commission also decided to retain in the specifications the alternate route which permits a subway under Lexington avenue north of Forty-second street only, by means of a spur connecting this subway with the present tunnel at Forty-second street. At the hearing the previous week residents of Harlem and The Bronx urged the commission to eliminate the spur from its plans so that only bids for an independent subway running from the Harlem river to the Battery could be received.

The board granted permission to the Pennsylvania Railroad to build parts of its tunnels under Thirty-second and Thirty-third streets from Madison to Seventh avenues by means of the open excavation. The property owners have withdrawn objections to the opening of the streets.

The form of contract for the building of the subway loop to join the terminals of the Williamsburg and Brooklyn bridges has been drafted. A public hearing will be held upon it on February 28. It is provided that the loop must be finished within 21 months and the use of the "cut and cover" method is permitted.

The board granted a franchise to the New York Connecting Railroad, which is to connect the Pennsylvania and the New York New Haven & Hartford, for freight transfer purposes, crossing by a bridge over Hellgate. The contract permits the substitution of electricity for steam after three years.

E. P. Bryan, vice-president of the Rapid Transit Subway Construction Company, which built the present subway, has written to the commission an intimation that the company will shortly send in a bill amounting to approximately \$5,000,000 for extra work in connection with the subway contract. The principal items are for the ventilating system, conduits for wiring about six miles of additional track, and the lengthening of the station platforms.

Ontario Railway Board Orders Street Railroads to Use Fenders.—After an investigation and experiments by its representative experts, the Ontario railway board has ordered the street railroad in Toronto to equip all its cars with the Jenkins automatic fender,

which it asserts is the most satisfactory and reliable fender it has experimented with.

Ask for Lower Fares.—The Grand Rapids (Mich.) city council has passed a resolution requesting the Grand Rapids Railway Company to sell six tickets for a quarter; also seven tickets for a quarter to be used before 8 a. m. and between 5 and 6:30 p. m.

American Institute of Electrical Engineers in Its New Home.—The American Institute of Electrical Engineers, which has been located at 95 Liberty street, has moved to its new quarters in the new Engineers' building, at No. 33 West Twenty-ninth street, New York.

Southwestern Electrical & Gas Association.—President H. S. Cooper, Galveston, Tex., announces that the executive committee has decided to hold the next annual convention of the association at San Antonio, Tex., on May 14, 15 and 16. The details have not yet been arranged.

Cincinnati Cars Being Equipped with Vestibules.—The Cincinnati Traction Company is equipping its cars with an enclosed and heated vestibule for the comfort of the motormen, in compliance with a law for the violation of which several of the company's officials were recently indicted.

Petition for Reduced Fare.—State Senator Henry Lockney, of Waukesha, Wis., has filed with the Wisconsin railroad commission a petition for a lower fare from Milwaukee to Waukesha, on the cars of the Milwaukee Electric Railway & Light Company. The round-trip rate is now 50 cents.

Combination Reported.—A merger involving "all the traction lines in the eastern part of Indiana and the southwestern part of Ohio" is said to be under way. According to the report the promoters plan to include not only the traction companies in the large cities in the territory involved, but also the interurban lines.

Philadelphia Elevated Inspected by Invited Guests.—On February 17 a party of officials and invited guests inspected the terminals and track of the Market Street Elevated road. A motor train took the party over the entire road. Though the officials state the road is entirely ready for immediate operation, no definite date of opening to the public has been announced.

Low Fares in District of Columbia.—The national house of representatives on February 11 in committee of the whole approved by a vote of 80 to 55 an amendment requiring all street railways in the District of Columbia to issue eight tickets for 25 cents and to adopt a 4-cent cash fare. Subsequently when the committee had reported to the house, the amendment was defeated by a vote of 54 to 61. The subject was introduced by Representative James of Kentucky, who offered it as an amendment to a bill permitting the Baltimore & Washington Transit Company to enter the District. The entire matter was postponed for two weeks.

Device to Stop Runaway Cars.—The New Jersey & Hudson River Railway has adopted an unusual stopping device for the steep places on the Palisades along the Hudson. The cars descend the cliffs in a zigzag course at an average grade of 7 per cent. In the event of a car running away a siding track, with the switch point always in direct connection with the main track, serves to draw off the car. The rails of this siding are always buried in sand. The friction between the sand and the wheels, of course, brings the runaway at once to a stop. On each side of the switch rail is built a trough, which holds the sand. The rail is covered to a depth of $2\frac{1}{2}$ inches. Numerous tests have proved the efficiency of the apparatus. The device should be of value in saving property and lives.

Accountants' Association Question Box.—Elmer M. White, secretary of the American Street and Interurban Railway Accountants' Association, in the association circular No. 45 announces that the executive committee has decided to continue the "Question Box," believing that it can be made of very great service to the members, but has decided to try a different course from that previously used. The following is the plan adopted for this year:

- 1—All questions are to be edited before being submitted to the members.
- 2—All answers are to be edited before being printed and sent out to the members.
- 3—Only such questions and answers as are of general interest, or upon which additional information is desired, are to be taken up in the convention.

Transfers Good in Two Directions.—The appellate term of the supreme court of New York on February 13 by a vote of two to one decided, in a suit brought by P. C. Kelly against the New York City Railway that, after riding in one direction after payment of fare, a passenger is entitled to a transfer carrying him to his destination, even though it be on a car going in the opposite direction. Two of the justices held that the law requires the company to give a passenger a transfer, when he has paid five cents, from the place of embarkation to his destination, and that the company is not justified in refusing a transfer to a passenger desiring to continue his journey to the point of destination on a line not running in the same longitudinal direction. The prevailing opinion sustains the proposition that the law requires the company to furnish to a passenger a continuous trip between any two points for one fare. Kelly sued in the municipal court for \$50 damages and, when that court decided for the company, he appealed to the appellate term. On account of the dissenting opinion of Justice MacLean the company will be allowed to appeal to the court of appeals. In his dissenting opinion Justice MacLean says: "The phrase 'continuous trip' or 'continuous passage,' made familiar by all railroad tickets, not excursions, is too well

understood to be distorted into an endless journey, to and fro, around and around, the livelong day or night or both, as some might be fain to make out, because of having home housings too hot or too cold, or because of having no housings at all."

Western Railway Club.—A regular monthly meeting of this organization was held in the Auditorium Hotel on Tuesday evening, February 19, 1907. Mr. James Lyman, manager of the engineering department of the General Electric Company, presented an interesting paper on "The Anatomy of a Railway Motor and Control Equipment" which he illustrated by a number of experiments and numerous lantern slides. Some of the latter were of especial interest as they showed the progress which is being made on the work at the New York Central terminal. Some of the other slides presented showed views of the "G.E.-6000" locomotive on its trial trips, as well as sections and views taken in the shop during construction. This is the type of locomotive used by the New York Central.

Right to Handle Freight in Terre Haute.—The city of Terre Haute, Ind., has appealed from the decision of Judge Fortune rendered on February 8, 1907, in the case of the city against the Terre Haute Traction & Light Company, in which Judge Fortune found for the defendant company. The case arose because the traction company used Wabash avenue for the transportation of freight, which it is claimed by the city is against the provisions of the company's franchise. Judge Fortune's decision is based upon the fact that the traction company paid the city \$78,000 and also made improvements to the extent of \$500,000, and further a liberal consideration for its franchise, which permits it "to take, transfer and convey persons and property for hire and tolls." The court's opinion of these clauses is that freight may rightfully be considered property.

Surprise Tests on Lake Shore Electric Railway.—General Manager F. J. Stout of the Lake Shore Electric Railway has stated that surprise tests made on his road to ascertain if the train crews were observing rules in regard to crossings have shown remarkable faithfulness on the part of the men. Mr. Stout said: "Although similar tests have been made at other crossings on our line, a majority of the hundred and more secret tests that have been made by our officials during the past two years have been made at what is known as Elyria waterworks crossing, just west of Lorain, where a Nickel Plate switch crosses our main line. Although an engine crosses our track at this switch but once or twice a month, and a white light is displayed almost constantly there every night, not once have the officials been able to catch a car crew running across without first stopping and the conductor going ahead to see if the track is clear. Our rules concerning crossings are very strict, and we have yet to learn of any employe violating them."

Service Investigation in Milwaukee.—The Wisconsin railway commission has begun its investigation of the case of the city of Milwaukee against the Milwaukee Electric Railway & Light and the Milwaukee Light Heat & Traction companies. John I. Beggs, president and general manager of the company, has thus far been the only witness on the stand, his testimony touching on the complaints made regarding the Howell avenue line service. The examination of Mr. Beggs is being conducted by John Barnes of Rhinelander, chairman of the commission. It is the intention of the commission to take up the charges of overcrowding of cars, poor passenger service and the eventual reduction in the rates. Mr. Beggs also defended the companies in regard to the 7½-cent fare from Milwaukee to Wauwatosa, claiming that under the conditions of the franchises the companies could charge 10 cents, and only make the 7½-cent fare as an accommodation to commuters. The people have been asking the commission to compel the companies to make a straight 5-cent fare.

Committee on Interurban Accounts.—Secretary Elmer M. White of the American Street and Interurban Railway Accountants' Association, has issued a circular letter announcing the appointment by President C. L. S. Tingley of a committee supplemental to the committee on Standard Classifications of Accounts of the association. This committee, as previously announced by the Electric Railway Review, consists of the following members: William H. Forse, Jr., assistant treasurer Indiana Union Traction Company, Anderson, Ind. (Chairman); A. B. Bierck, auditor Long Island Electric Companies, 263 Fifth avenue, New York; A. C. Henry, auditor Lake Shore Railway Company, Norwalk, O. The purpose of the supplemental committee is to formulate a classification of accounts suitable for the use of interurban electric railways. The committee is desirous of securing an expression from each member and suggestions, gleaned from past experience, that will enable them to provide a classification which will meet the requirements of interurban construction and operation. To this end members of the association are requested to forward immediately to Mr. Forse replies, together with any criticisms or suggestions, to the following questions, with respect to construction as well as operating accounts:

Do you use the standard system of electric railway accounting approved by this association?

In what respect do you modify same, if at all?

Do you think it advisable to add new accounts and what ones do you recommend?

Do you recommend any change in the position of accounts under the general headings?

Do you use subsidiary accounts?

Have you made any use of the classification prescribed by the Interstate Commerce Commission for the use of steam railways?

What is your interurban mileage?

Construction News

FRANCHISES.

Cleveland, O.—Application for a franchise through Warren county has been made by the Cleveland & Sharon Electric Railway Company through its president, F. B. Morgan of Cleveland, and its attorney, F. C. Willard. It is stated that the right of way will follow practically the same route from Middlefield to Brookfield on the outskirts of Sharon, Pa., as was granted to the Cleveland & Sharon Traction Company five years ago. The road will be constructed on private right of way nine-tenths of the way and from Middlefield to Cleveland it is said an entirely new line will be built. Several bridges will be built; one over the Grand river in Bloomfield, a long trestle over the Mosquito Creek valley near Kenilworth and two bridges over the Pymatuning river at Kinsman and Orangeville. It is stated that the Eldenbel Construction Company of New York, which has the contract for the construction and equipment of the road, will increase its capital from \$2,500,000 to \$3,000,000 in order to care for the additional expense of erecting these bridges.

Columbus, Ind.—The city council has granted the Indianapolis Columbus & Southern Traction Company a franchise on Madison avenue for the extension to Seymour, Md., now under construction.

Defiance, O.—The bid of the Indiana Columbus & Eastern Traction Company for a franchise in Defiance has been submitted to the finance committee. The bid was accompanied by a \$5,000 check as a guarantee that the line will be built. It is stated that the work of electrifying the old Columbus & Lake Michigan steam road will be started early in the spring. The extension to Bellefontaine is now under way and it is stated that plans for a passenger station at Defiance are being considered.

Elyria, O.—The Cleveland & Southwestern Traction Company has applied for a 25-year franchise to lay additional tracks over the loop line east of the river and north of the Lake Shore & Michigan Southern Railroad; also for the extension of the existing franchises of the company to a period co-existent with the limit of the new franchise.

Los Angeles, Cal.—The city council has granted three franchises in connection with the proposed new subway: two to the Los Angeles-Pacific Railway Company for a double-track line and grade in Flower and Hill streets and Vermont avenue; the other to the Los Angeles Railway Company for an extension of its Mont Vista line to Eagle Rock.

Marion, Ind.—The Marion & Logansport Traction Company has received a franchise from the board of county commissioners for the operation of its line in Grant county.

Murphysboro, Ill.—The Southern Illinois Transit Company, which proposes to build an interurban line connecting Carbondale, Murphysboro, Carterville, Herrin, Johnson City and other points in southern Illinois, has been granted a 20-year franchise in Murphysboro. The company must begin construction within 90 days; must have the road completed from the courthouse to Carbondale within one year; at least \$5,000 must be spent on construction between Murphysboro and Carbondale by July 1, 1907.

Nicholasville, Ky.—The Central Kentucky Traction Company has been granted a franchise to build an interurban line from Lexington to Nicholasville. Construction work is to be begun within 18 months and the road completed within three years.

Norwalk, O.—The Cleveland & Indianapolis Interurban Railway, which proposes to build an electric line between Cleveland, O., and Indianapolis, Ind., has applied for a franchise on certain streets of the city through C. F. Jackson of Norwalk and J. Y. Todd of Toledo, O.

Prosser, Wash.—A franchise has been granted to the Prosser Traction Company to build 1½ miles of road northwest of Prosser to connect with the North Coast Railroad; also to the Columbia river on the south to connect with a road from Priest Rapids which will be built by the Hanford Irrigation Company.

Vina, Cal.—The Northern Electric Company, Chico, Cal., has applied for a franchise to build an electric line the entire length of Railroad avenue. The line will carry passengers, freight, mail and express and will parallel the Southern Pacific for a part of the way.

Vincennes, Ind.—An ordinance renewing the franchise of the Vincennes Washington & Eastern Traction Company has just been passed. The line will enter the city at the north end of Sixth street, south on Sixth to Hart, north on Hart to Second and south on Third to Willow street. The interurban portion of the road will be built from Vincennes eastward through Fritchton, Wheatland, Montgomery and Logoootee. It is stated that assurances have been given that the work of building the line will be started as early in the spring as weather will permit. W. H. Schott of Chicago is interested.

Waco, Tex.—A franchise has been granted to the Buckeye Transit Company to build an electric line from the city limits to City Hall square, two miles. This is part of an interurban line which will connect Waco, Morresville, Marlin and Temple, Tex., about 50 miles.

Winterset, Ia.—The Des Moines Winterset & Creston Electric Railway Company at a special election held for the purpose on February 12 was granted a franchise for the operation of its line

in Winterset. It is stated that the American Electric Railroad, which is projecting a line from Council Bluffs east through Winterset, will also ask for a franchise with the promise to begin construction work in the spring.

Weatherford, Tex.—Col. G. M. Bowie of this city, representing New York capitalists, has been granted a franchise for an electric line in Weatherford which must be completed and in operation by February 1, 1908.

RECENT INCORPORATIONS.

Corpus Christi Street Railway.—This company has been organized to build a street railway in Corpus Christi, from the Alta Vista to the San Antonio & Aransas Pass depot. Capital stock \$25,000. Directors: W. G. Blake, G. R. Scott, G. W. Grimm, A. E. Born and E. B. Cole.

Reading Afterthought & Northeastern Railway.—Incorporated in Iowa with a capital stock of \$150,000, with headquarters at Cedar Rapids. Incorporators, C. E. Henderson and others.

Seattle-Chelan-Spokane Railway.—Incorporated in Washington to build an electric railway. Capital stock, \$17,000,000. Trustees, Charles M. Meeker and G. L. Stevens, 50 Broadway, New York; Mark F. Mendenhall and John W. Fry, Spokane; P. P. Carroll, Francis M. Carroll, Charles & Barron, C. M. Cochran, Elliot Colburn, and E. Wright, Snohomish, Wash.; E. E. Congdon, Butte, Mont. Offices at Spokane, Snohomish and New York City.

Toledo & Columbus Railway.—This company, which was incorporated in 1905, has filed amended articles of incorporation with the secretary of state at Columbus for the purpose of building and operating a railroad with electricity or other motive power with terminals at Toledo and Columbus.

Toronto, Can.—The Toronto Elevated Railway Company, which proposes to build and operate elevated railways in and adjacent to Toronto, has applied for a charter. M. J. Adams, J. H. McKnight, S. R. Wickson and J. M. Sinclair, all of Toronto, are interested.

TRACK AND ROADWAY.

Boston Elevated Railway.—The Massachusetts railroad commission has authorized the route of the proposed extension of the Boston subway system from the Park street station to the Cambridge bridge over the Charles river. Beginning at the Park street station the subway is to pass under the northwest corner of the Common, under Beacon street, under a corner of the State House grounds, passing by the left of the State House and under Joy, Mt. Vernon, Pinckney, Myrtle, Revere, West Cedar and Grove streets at an angle.

Capital Circuit Traction Company.—This company, which intends to build a belt traction line around the city of Indianapolis, announces that the work of surveying has been completed and that work is now progressing satisfactorily on the profile maps. It further is announced that 50-year franchises have been obtained through five towns and the seven county seats through which the road is to operate—Noblesville, Lebanon, Danville, Martinsville, Franklin, Greenfield and Shelbyville.

Chicago & Milwaukee Electric Railway.—Plans have been submitted to and approved by the Milwaukee board of public works for the company's lines in Milwaukee, on Grove and Scott streets and First avenue, and it is stated that construction work will begin at an early date.

Chicago Lake Shore & South Bend Railway.—The Illinois Central Railroad is now building under the charter of the Kensington & Eastern Railway a line from Kensington, Ill., southeasterly to Hammond and Gary, Ind., which will connect at Hammond with the line of the Chicago Lake Shore & South Bend, now being built from South Bend, and on which 16 miles of track has been laid, from South Bend to New Carlisle. The Kensington & Eastern will be double track and the electric road will use one track from Hammond to Kensington. At the latter point five acres of land have been purchased for terminal purposes. J. B. Hanna of Cleveland is president.

Cleveland Alliance & Mahoning Valley Railway.—J. W. Holcomb, Cleveland, O., writes that this company proposes to build an electric railway from Cleveland to Ravenna and Alliance, O., with a branch from Ravenna to Warren, a total of 80 miles. Twenty miles of steam railroad track, from Ravenna to Newton Falls, has been purchased from the Baltimore & Ohio and will be electrified. David Morison, Cleveland, O. president; B. M. Friuk, Salem, O., chief engineer; F. E. Townsend treasurer; C. E. Morley, secretary. Headquarters, 310-11 Electric building, Cleveland, O.

Burley, Idaho.—The commissioners of Cassia county, Idaho, have granted a charter to W. D. Kenyon, Paul R. Kartzke, J. C. Rogers, I. G. Hale and T. B. Lee to build a line of railway from the south bank of the Snake river at Burley to Oakley, 25 miles. The cost of building and equipping the road is estimated at \$100,000 and the scheme is to be financed by Idaho capital.

Dallas Consolidated Electric Railway.—The double-tracking of the Haskell avenue line has been completed. Work is to start at once on the double-tracking of the South Belt line and others. E. T. Moore, general superintendent, Dallas, Tex.

Enid City Railway.—C. H. Bosler, president, Enid, Okla., writes that construction is now in progress on a city line for Enid, six miles long which is to be completed and in operation by

May 1, 1907. The overhead construction is of the span-wire type. Direct current will be used. Power is to be purchased. Construction is in progress on a car barn and repair shop to be erected complete by May 1. The construction is being done by the company under the direction of Mr. Bosler, who is also president of the Lebanon & Franklin Traction Company, Dayton, O., and of the Tulsa Street Railway, Tulsa, I. T. J. R. Yarbrough of Enid is chief engineer.

Ft. Wayne & South Bend Railway.—A contract has been let to the Indiana & Illinois Construction Company for the construction of this road from Ft. Wayne to South Bend, Ind., for which, it is stated, most of the right of way has been secured. The construction company, of which Gen. A. B. Nettleton of Chicago is president, was organized for the purpose of building this road. The road will be built on a private right of way, as far as possible, and it is intended to handle freight. G. A. Wulcup of Chicago, president.

Halifax & Suburban Electric Company.—A company has been organized in Halifax, N. S., with this title for the purpose of constructing an electric railway from Halifax through Rockingham, Bedford and Sackville to Waverley, N. S. The company, it is stated, has secured the charter of the Bedford Electric Company, which was incorporated by the Nova Scotia legislature in 1903, with power to construct an electric railway within the territory named. The promoter is H. E. Harding, of St. John, N. B., who is said to have interested United States capital in the project, and the Halifax directors of the company are G. E. Boak, ex-Mayor Kefe and W. Chisholm.

Helena & Butte Electric Railway.—It is stated that \$240,000 has been subscribed for the purpose of building an electric railway from Helena to Butte, Mont., and that a company will be incorporated under the above name in a few days.

Illinois Traction Company.—The work of surveying the line from Springfield to Jacksonville, Ill., which is to be built this year, has been commenced. A belt line around the city of Springfield is also being surveyed. It is stated that the construction work this year will be done by the company and not by contractors, as heretofore.

Indianapolis & Louisville Traction Company.—John E. Greeley of Jeffersonville, Ind., first vice-president, has announced that by July 1 cars may be run from Indianapolis, Ind., to Louisville, Ky. The Indianapolis Columbus & Southern Traction Company is completing the section between Columbus and Seymour. The Indianapolis & Louisville is building from Seymour to Sellersburg and has completed tracklaying from Seymour to Scottsburg. The Louisville & Southern Indiana Traction Company is completing the section between Sellersburg and Louisville. Mr. Greeley said that cars would be in operation between Indianapolis and Scottsburg by May 1. John C. C. Mayo, of Paintsville, Ky., is president.

Ithaca & Seneca Falls Interurban Railroad.—An official report from J. N. Hammond, secretary, Seneca Falls, N. Y., states that this company, recently incorporated, proposes to build an electric railway from Ithaca to Seneca Falls, N. Y., 43 miles, the route for which has been surveyed. Contracts are to be let for the entire construction and equipment. Jacob Rothschild, Ithaca, N. Y., is president; F. M. Bush of Ithaca is treasurer.

Kentucky Central Traction Railroad.—G. J. Lampton of Louisville, Ky., is promoting an electric railway from Bowling Green to Louisville, and it is stated that a company with the above title will be incorporated at an early date and the building of the first section, from Elizabethtown to West Point, commenced. As soon as this line is completed it is planned to build from Elizabethtown to Bowling Green.

Kokomo Marion & Western Traction Company.—It is reported that this company has decided to begin work at once on an extension from Kokomo, through Russiaville, Forest, Michigantown, Frankfort and Crawfordsville to Terre Haute, Ind. T. C. McReynolds, manager, Kokomo, Ind.

Lewiston & Southeastern Electric Railway.—Contracts have been let to Schofield & Co. of Philadelphia for building this company's proposed line from Lewiston, Idaho, south via Westlake to Grangeville, with a branch from Westlake east to Ilo and thence south to Nezperce, a total of 135 miles. Considerable grading has been done. W. P. Wood, chief engineer, Lewiston, Idaho.

Lynchburg Traction & Light Company.—We are officially advised that there is no foundation for the report that this company proposes to build an extension from Lynchburg, Va., to a connection with the Tidewater Railway at Claytor's Ford bridge, and that it is not at this time interested in any such project.

Mansfield Southern Traction Company.—Vice-President Thomas W. Latham of Cleveland stated recently that this company, which proposes to build from Mansfield to Mt. Vernon, O., has expended \$20,000 in surveys and securing right of way, and that construction will begin at an early date.

Mesaba Traction Company.—We are officially advised that this company proposes to build an electric railway from Biwabik to Hibbing, Minn., 40 miles via McKinley, Sparta, Eveleth, Virginia, Mt. Iron, Bull and Chisholm. Surveying is in progress from Mt. Iron to Hibbing 18 miles, with 10 miles, as far as Sparta, completed. Grading is to begin June 1, and contracts are to be let in April. F. B. Myers of Biwabik is president; T. McGilvray, Duluth, chief engineer.

Missoula, Mont.—It is reported that C. A. Jakways of Ovanda,

Mont., is promoting an electric railway from Great Falls to Missoula, via Lincoln, Ovanda and Bonner.

Mineral Wells, Tex.—Surveys have been made for a line from Mineral Wells to Lakewood Park, under the direction of Cicero Smith and E. E. Lisknue.

National City & Otay Railroad.—This company, which operates a steam road, is equipping about 10 miles of its line between San Diego and Chula Vista, Cal., for electrical operation. H. N. Savage, of National City, Cal., chief engineer.

Nauvoo, Ill.—C. W. Lucas is promoting an electric railway from Nauvoo to Carthage and Hamilton, Hancock county, Ill.

New York Auburn & Lansing Railroad.—The Auburn Construction Company of Auburn, N. Y., has completed the grading on this line from Auburn via Fleming, Scipio, Venice, Genoa and Lansing to Ithaca, N. Y., 35 miles. Track has been laid from Auburn to Genoa, 20 miles.

Northern Texas Traction Company.—The second survey for the route of the interurban railway between Ft. Worth and Cleburne, Tex., which is to be built by Stone & Webster of Boston, has been commenced and it is stated that construction work will begin in a short time. H. T. Edgar, manager, Ft. Worth, Tex.

Northwestern Elevated Railroad (Chicago).—The work on the Ravenswood extension is progressing so rapidly that it is stated the line should be ready for operation by May 1. All of the structural steel is in place, the four miles having been completed in a little more than a year. Rails have been laid from a junction with the main line at Clark street to the western terminus at Kimball avenue, northeast of Irving Park. The station walls are up and most of the buildings are roofed.

Omaha & Council Bluffs Street Railway.—It is reported that this company has ordered 1,300 tons of rails to be used in various extensions, including several city lines, a line to the School for the Deaf, and possibly a line from Plattsmouth to Ft. Crook. W. A. Smith, general manager, Omaha, Neb.

Omaha Lincoln & Beatrice Railway.—E. C. Hurd, chief engineer, Lincoln, Neb., writes that this company's line from Omaha to Lincoln, Neb., 56 miles, should be finished this year. It is now in operation between Lincoln and Bethany Heights, 6 miles. The route includes Papillion, Springfield, Ashland, Greenwood, Waverly, Bethany Heights, University Place and Lincoln. Grading is completed from South Omaha to Sarpy City, 3 miles, and grading on the remainder of the line will begin in March. Harvey Musser, of Akron, O., is president.

Richmond, Ind.—Local promoters of the proposed traction line between this city and Hamilton, O., say that plans have been sufficiently matured to begin active preparation for the work. Details in connection with the right of way will be taken up at once. A number of farmers already have conferred with the promoters in an effort to have the road pass near their homes. It is said that arrangements have been made whereby the road can gain entrance to Cincinnati through lines already in operation.

Roodhouse-Virden Railway.—C. W. Payne of Roodhouse, Ill., and H. C. Simon of Virden, Ill., will soon begin securing right of way for an electric line between these towns.

Sandy Valley Railway.—R. H. Phillips, manager and chief engineer, Washington, D. C., writes that this company's line will extend from Chevy Chase Lake, Md., the northern terminus of the line of the Capital Traction Company of Washington, D. C., to Ellicott City, Md., the western terminus of the line of the United Railways & Electric Company of Baltimore, Md. The route is 28 miles long and includes Kensington, Wheaton, Norbeck, Olney, Sandy Spring, Ashton, Highland and Clarksville. The Kensington Railway, which has a line in operation from Chevy Chase Lake to Kensington, 2½ miles, has been purchased. Preliminary surveys have been completed and the final survey has been made for three miles out of Kensington. Grading is to begin in April, and will be done by the company. The road will be built on a private right of way and 70-pound rails will be used. Charles F. Brooke, president, Sandy Spring, Md. Headquarters, 1140 H street, Washington, D. C.

Schuylkill Valley Traction Company.—It is reported that plans have been completed for the extension of this company's line from Ringing Rocks to Boyertown, Pa., via Gilbertsville, which will complete the line from Philadelphia to Reading. The work will include several steel bridges with concrete foundations. F. A. Lyson, chief engineer, Reading, Pa.

Shore Line Electric Railway.—This company, which has been organized in Connecticut with \$1,000,000 capital stock, proposes to build an electric railway from Stony Creek to Saybrook, Conn., along the shore of Long Island Sound, to Centerbrook and Ivorytown on the Connecticut river. It is stated that 70-pound rails and ties have been ordered and that a contract is to be let at once for the grading, so that work may be started at once at Ivorytown. Much of the right of way has been secured and some of the required franchises have been granted. The route includes, besides the towns mentioned, Sachem's Head, Guilford, East River, Madison, Clinton, Grove Beach, Westbrook and Essex. B. P. Learned of New London, Conn., president; Frank W. Allen, also of New London, treasurer.

Spokane & Big Bend Railway.—W. H. Plummer, president, Spokane, Wash., writes that this company proposes to build an electric line from Spokane to Crystal City, Wash., 70 miles, via Coulee

Center, Reardan, Davenport, Loraine and Egypt. Surveys have been completed and the right of way is being cleared between Spokane and Reardan. Grading is to begin in 90 days and contracts are to be let in 30 days. T. C. Austin, Spokane, chief engineer.

Spokane, Wash.—C. A. Barron, general superintendent, announces that the Seattle-Chelan-Spokane Company, incorporated for \$12,000,000; the Snohomish Valley Railway Company, \$2,500,000, and the Puyallup Valley Northern Rapid Transit Company, \$3,000,000, will build an electric road from Spokane to the Sound, 450 miles, to be completed in 1909. Contracts for part of the work have been awarded. Mr. Barron says the bonds for the Snohomish line have been sold.

Stroudsburg & Wind Gap Street Railway.—This company, composed of citizens of Bethlehem, Nazareth and Stroudsburg, Pa., proposes to build an electric road from Wind Gap to Saylorville, Pa., which will complete the connection between Philadelphia and Delaware Water Gap. A power plant will be built at Pen Argyl. J. B. Williams, Stroudsburg, president.

Toledo Railways & Light Company.—It is announced that this company has contracted for relaying eight miles of track on its lines in Toledo.

United Railways.—Plans have been completed for beginning work on the Front street line in Portland, Ore., and within a week it is promised construction will be started. L. B. Wickersham has been appointed chief engineer, and is now arranging the preliminaries. Men are at work curving rail and preparing other materials so that when work is started it will not be delayed by these operations. The plan of Chief Engineer Wickersham is to start full crews of men at work on both the north and south ends of the Front street line, at the terminal yards in North Portland and on Hood and Moody streets in South Portland. It is planned to lay 114-pound girder or grooved rail along the entire line within the city limits. The rail is seven inches high and is laid on a subgrade of concrete.

West Jersey & Seashore Railroad.—It is reported that this company, which recently electrified its line between Camden and Atlantic City, N. J., is clearing the right of way preparatory to constructing two additional tracks. The road is now double track.

Western New York & Pennsylvania Traction Company.—This company, which recently acquired the Bradford (Pa.) Electric Street Railway and the Olean (N. Y.) Street Railway, is said to be preparing to build a new electric line between Bradford, Pa., and Carrollton, N. Y., to connect at Carrollton with another line between Olean and Salamanca. It is announced that practically all of the right of way has been obtained. It is possible that a line will be built from Salamanca to Little Valley, Cattaraugus county, New York.

POWER HOUSES AND SUBSTATIONS.

Birmingham Railway Light & Power Company.—This company it is announced is about to enlarge its power plant on Powell avenue between Eighteenth and Nineteenth streets, Birmingham. The plans have been completed and the appropriation has been made for these additions. The plans call for an increase of 6,600 horsepower in the boiler plant, and the installation of one 2,000-kilowatt railway generator and a 750-kilowatt lighting generator of the General Electric Company's manufacture. M. A. Groover, Birmingham, chief engineer power station.

Elmira Water, Light & Railroad Company.—A 1,500-kilowatt Curtis turbine is to be installed for this company during the coming summer, at its power station at Elmira, N. Y., and provision is being made for the addition of another 1,500-kilowatt turbine to provide for the rapidly increasing business. To make room for the new machinery it is stated it will be necessary to dispose of about \$75,000 worth of machinery at a great sacrifice. George W. Reynolds, Elmira, N. Y., engineer power station.

Hattiesburg Street Railway.—It is stated that contracts will be let next month for building and equipping a power house for the proposed street railway system in Hattiesburg, Miss. H. A. Camp, president.

Huntsville Railway Light & Power Company.—It is reported that this company has decided to increase the capacity of its power plant at Huntsville, Ala., by the purchase of \$30,000 to \$40,000 worth of new equipment. Francis N. Lawton, Huntsville, general manager.

Portland Railway Light & Power Company.—It is stated that this company's new power plant at Cazadero, Ore., will be in operation some time this week. The equipment includes three turbines of 5,000 hp. capacity and the plant is designed for an ultimate capacity of 25,000 hp.

Roanoke Railway & Electric Company.—This company has announced that it will spend \$225,000 to erect a modern power house capable of supplying about 3,000 horsepower. The new plant is to be built on property which the company recently bought from the Norfolk & Western Railway Company. It is thought that the new plant will be of sufficient capacity to meet the demands of the lighting and power loads as well as furnish power for the street cars. In addition to the \$225,000 which the company is to spend on the power plant, it will also spend about \$18,000 on improvements to its street railway facilities. It is expected to have the plant in operation by midsummer.

Personal Mention

Mr. L. S. Kirker, who has been manager for the City & Elm Grove Railway Company of Wheeling, W. Va., for a number of years, has resigned.

Mr. E. L. Schmock has resigned as auditor of the Kokomo Marion & Western Traction Company, Kokomo, Ind., to become assistant secretary of the Cleveland Painesville & Eastern Railroad, with headquarters at Willoughby, O.

Mr. H. R. Goshorn has been appointed general claim agent of the Philadelphia Rapid Transit Company to succeed Mr. S. L. Rhoades, who resigned some time ago to become general supervisor of claims of the Casualty Company of America.

Mr. George H. Hoyle has resigned his position as chief engineer of the Berkshire Street Railway Company, Pittsfield, Mass., to engage in similar work in the eastern part of the state. Mr. Hoyle will be succeeded by Mr. H. B. Webber, of Boston.

Mr. J. W. Smith, formerly manager of the Electric Traction Company, of Philadelphia, Pa., has been appointed general manager of the City & Elm Grove Railroad, of Wheeling, W. Va., to succeed Mr. L. S. Kirker, resigned on account of ill health.

Mr. Walter W. Wheatly has resigned as president and general manager of the Mexico Electric Tramways, Limited of Mexico City, Mex. Mr. Wheatly was formerly connected with the Brooklyn Rapid Transit Company and the Public Service Corporation of New Jersey.

Mr. John Flood, who has served for 16 years as superintendent and assistant superintendent of the Steubenville (O.) Traction Company, has resigned to accept the superintendency of the Tri-State Traction Company, which operates a line from Steubenville to Wellsburg, W. Va.

Mr. Charles E. Thomas, for the past two years master mechanic of the Berkshire and Hoosac Valley Street Railway companies of Pittsfield and North Adams, Mass., has resigned his position, effective on February 16, to become superintendent of rolling stock for the New York City Railway Company.

Mr. Frank R. Henry, auditor United Railways Company of St. Louis, has been appointed editor of the question box of the Accountants' Association, and members should promptly send their questions to him. The secretary suggests that in writing questions care should be taken to make them full and clear, and if necessary, in order to do so, illustrate the question.

Mr. J. R. Curtis, formerly general superintendent of the Cleveland Painesville & Ashtabula Railroad Company, Geneva, O., has resigned to become superintendent of construction of the new Cleveland Alliance & Mahoning Valley Railway Company, which is building a road connecting Cleveland, Alliance, Warren and other points in the Mahoning valley.

Mr. J. H. Pardee has resigned as general manager of the Rochester & Eastern Rapid Railway, at Canandaigua, N. Y., to become manager of the railway operating department of J. G. White & Co., of New York. Since 1898 Mr. Pardee has been manager of the Rochester & Eastern, the Canandaigua Gas Light Company and the Ontario Light & Traction Company. Since last fall he has been secretary of the Street Railway Association of the State of New York.

Mr. A. G. Maish, formerly superintendent of the Des Moines City Railway Company, has been selected to fill the position of assistant general manager, an office recently created for the purpose of allowing the general manager, Mr. G. B. Hippee, to devote more of his time to the enlarging of the interurban properties. Mr. W. G. Owens, superintendent of way and structures, who has been associated with the company for the past 15 years, will succeed Mr. Maish as superintendent of the operating, maintenance and construction departments. Mr. Owen's successor has not as yet been named.

Mr. P. P. Crafts, for the past three years general manager of the Iowa & Illinois Railway, Clinton, Ia., has resigned his position to become, on April 1, general manager of the electric department of the Ft. Dodge Des Moines & Southern Railway, with headquarters at Des Moines. This is the new name for the old Newton & Northwestern steam road which is being electrified for interurban service. For six years, including his successful management of the Illinois & Iowa Railway, Mr. Crafts has been identified with the street railway systems of the middle west, a portion of that time having been spent at Saginaw, Mich., with the same interests that now control the Ft. Dodge Des Moines & Southern. Previous to this period he served in various managing and engineering positions with the Stone & Webster syndicate in Boston. He is also vice-president of the Iowa Street and Interurban Railway Association.

Mr. Ernest Gonzenbach, vice-president and general manager of the Sheboygan (Wis.) Light Power & Railway Company, has added to his duties those of general manager of the Greenshore (N. C.) Electric Company. The latter company operates a system of street railway lines and electric lighting, gas and city pumping plants in the thriving city of Greenshore, N. C. Mr. Gonzenbach is now the active manager of both properties and divides his time in accordance with the needs of the situations. Two years ago when he assumed the management of the Sheboygan Light Power & Railway Company there existed unusual political and operating

conditions opposing the best interests of the property. These conditions have since been radically changed and during the two years in which Mr. Gonzenbach has had charge of the Sheboygan property the gross receipts have increased about 25 per cent and the net receipts more than 100 per cent.

Mr. F. W. Brooks, assistant general manager of the Detroit United Railway, Detroit, Mich., has been appointed general manager, to succeed Mr. J. C. Hutchins, who has held the office of president and general manager and who will continue hereafter only as president. Mr. Brooks has been connected with the Illinois Central, Queen & Crescent and Texas Pacific railroads and has been connected with the Detroit street railways since 1895, when he became general manager of the Rapid Railway. When the Rapid Railway was taken over by the Detroit United Railway a few years ago he was appointed assistant general manager.

Mr. Albert H. Stanley, general manager of the street railway department of the Public Service Corporation of New Jersey, has tendered his resignation to accept the position of general manager of the United Underground Electric Railways Company of Lon-

Albert H. Stanley.

don, England, effective on April 1. The latter company is largely owned by American capital, the firm of Speyer & Co., New York, and the Old Colony Trust Company of Boston being large holders, and it is the belief of these interests that the London Underground Electric Railways properties will benefit largely from the experience of an executive who is thoroughly familiar with American street railway practice. The ability and record of Mr. Stanley make him an ideal official for this position. Mr. Stanley was born in Derby, England, and came to this country 27 years ago. He is 34 years of age. He started in street railway service 17 years ago as a clerk in one of the sub-offices or car stables of the Detroit United Railway Company, when it was a horse-car line. Mr. Stanley worked up through every department of the company and was placed in charge of the property as superintendent in January, 1901. He remained in this position until October 1, 1903, when he was invited to assume charge of the street railway department of the Public Service Corporation, as assistant general manager. Four months later, on February 1, 1904, he was made general superintendent of the railway department in charge of both operation and construction. It has been largely through the efforts of Mr. Stanley that the properties comprising the Public Service Corporation have been unified into the present effective system. The numerous lines have been brought into a harmonious system, subject to standard practices, and with definite standards of equipment, etc. Since 1903 the company has purchased 560 cars, has built shops having a capacity of 2,000 cars and has 150 cars under construction. Seventy-six miles of track and 23 miles of extensions have been built, giving the system a total mileage of 560 miles, which produces a revenue of \$10,000,000 yearly. In speaking of Mr. Stanley's resignation Mr. Thomas N. McCarter, president of the Public Service Corporation, said: "It is with the very greatest regret that the officials of Public Service have learned of Mr. Stanley's intention to leave us. He has put in here approximately three years and a half of indefatigable labor, and has been more than any other individual charged with the responsibility of the complete rehabilitation of the railway department of the Public Service, with results that are rapidly beginning to manifest themselves. He has earned the respect and admiration of us all. He leaves us to take up, if possible, even a more troublesome task, and takes with him our best wishes and affection. No one has been chosen yet to succeed him."

Pennsylvania Railroad and Electric Roads.

Regarding the bills introduced in the Pennsylvania legislature by Senator Campbell, which were mentioned in the Electric Railway Review of February 16, 1907, the Philadelphia Ledger says: "It was believed in this city, Harrisburg and Pittsburg, that the bills were in the interest of the Pennsylvania railroad or its allies. The movement seems to be following in a measure that of the New Haven road in New England and the Erie in New York state. Several men told why the Pennsylvania would be extremely anxious to have an amicable understanding with—or what would be better, a financial interest in—all the electric railways that stretch across the state. Two of the most important facts pointed out as bearing on the case are the immense amount of money borrowed by the Pennsylvania in the last few years and the appointment of a commission to go to Europe to study the use of motors in railway operation. The commission, which returned two weeks ago, will, it is understood, make a favorable report on the use of motors for suburban traffic."

Financial News

Baton Rouge (La.) Electric & Gas Company.—Control of this company has been purchased by Stone & Webster of Boston and the following new officers have been elected: C. D. Wyman, president; A. K. Todd, secretary; A. S. Pratt, treasurer; J. B. Leonard, assistant secretary and assistant treasurer. According to its last statement the company has outstanding \$80,000 capital stock and \$34,000 bonds.

Columbus Delaware & Marion Railway.—The company will increase its capital stock from \$2,500,000 to \$5,000,000. The purpose is to extend the line eventually to Cleveland.

Dallas (Tex.) Consolidated Electric Street Railway.—An ordinance has been passed by the city council of Dallas, and is now before the Texas legislature, to permit the consolidation of the three Dallas companies—the Dallas Consolidated Electric Street railway, the Metropolitan Electric Street railway and the Rapid Transit railway. The companies, together with the Dallas Electric Light & Power Company, are controlled by the Dallas Electric Corporation.

Detroit Jackson & Chicago Railway Company.—This company, which recently acquired the Detroit Ypsilanti & Ann Arbor Railway for the Detroit United railway, has given a trust deed to the Security Trust Company of Detroit, to secure an issue of \$4,000,000 bonds, which will be applied as follows:
 To pay outstanding bonds already issued\$1,610,000
 To retire bonds authorized, but not issued..... 990,000
 To pay to stockholders of the Detr. Ypsilanti & Ann Arbor 805,000
 For improvements, extensions, etc. 595,000

Detroit United Railway.—The \$2,000,000 of 5 per cent, 3-year collateral trust notes, of which mention was made in the Electric Railway Review of February 9, are dated February 15, 1907, and are secured by a deposit of the following collateral: \$1,000,000 Detroit & Port Huron Shore Line preferred stock; \$1,899,200 Detroit & Port Huron Shore Line common stock; \$125,000 Detroit & Port Huron Shore Line first mortgage 5 per cent bonds; \$100,000 Detroit & Lake St. Clair first mortgage 5 per cent bonds; \$1,400,000 Detroit United Railway consolidated 4½ per cent bonds.

Henderson (Ky.) City Railway Company.—The property owned by this company was sold at receiver's sale in Henderson on February 18 to C. A. Hirsch, president of the Fifth National Bank of Cincinnati, for \$80,000.

Hudson & Manhattan Railroad.—This company, which is building the McAduo tunnels and is to operate electric lines under the North river from Jersey City and Hoboken to Manhattan island, has filed a mortgage for \$100,000,000. It has been estimated that the cost of constructing the tunnels and establishing terminals in New York and New Jersey, together with the construction and equipment of the new roads, will be about \$60,000,000.

Indiana Union Traction Company, Anderson, Ind.—For the year 1906 gross earnings were \$1,943,101, as compared with \$1,522,229 in the previous year, an increase of \$420,872. The statement with a comparison follows:

	1906.	1905.
Gross earnings	\$1,943,101	\$1,522,229
Operating expenses	995,266	796,590
Net earnings	\$ 947,835	\$ 725,639
Interest and taxes.....	680,818	556,062
Net income in excess of taxes and interest on underlying bonds.....	\$ 267,017	\$ 169,577
Dividends on stocks of Union Traction Company of Indiana and Muncie Hartford & Fort Wayne Railway Company and interest on Indiana Union Traction Company bonds	151,514
Dividend on Union Traction Company of Indiana preferred stock and interest on Indiana Union Traction Company bonds.....	100,000
Net income—surplus	\$ 115,503	\$ 69,577

Indianapolis & Louisville Traction Company.—This company, which is building a road between Seymour, Ind., and Sellersburg, Ind., to form a part of the line from Jeffersonville, Ind., to Indianapolis, has elected the following directors: W. L. Lyons and John E. Greeley of Louisville; Alexander C. Thompson of Pittsburg; John C. C. Mayo of Paintsville, Ky.; William E. English of Indianapolis; H. H. Bechtel of Cincinnati; G. S. Speer, Samuel Adams and A. S. True of Chicago. The directors elected the following officers: John C. Mayo, president; John E. Greeley, first vice-president; Alexander C. Thompson, second vice-president; W. L. Lyons, treasurer; Samuel Adams, secretary. The capitalization of the company is as follows: Common stock, \$2,500,000; preferred stock, \$500,000; first-mortgage bonds, \$1,250,000.

Interborough Rapid Transit Company of New York.—An issue of \$10,000,000 5 per cent 3-year notes, to be dated March 1, 1907, has been sold to William A. Read & Co. of New York and Lee, Higginson & Co. of Boston. The proceeds will be used to pay off the floating debt and to provide for new construction on the Brooklyn extension and for the development of trolley lines on Long Island. August Belmont, chairman of the board of directors of the Interborough-Metropolitan company, says it is expected that the Brooklyn extension will be ready for operation not later than July 1. When the extension is completed the company will have invested in this construction \$6,000,000 more than the amounts payable by the city on account of such construction, and as the

rental payable to the city is based upon the actual expenditure for the construction of the road, the company will receive the benefit of a reduction in rental equal to the interest on the amount of its own investment in this construction. Mr. Belmont adds that the investment of the company in the New York & Queens County railway, the New York & Long Island Traction Company and the Long Island Electric railway amounts to about \$4,500,000. He says the management has under consideration a comprehensive scheme for financing the Long Island properties which will repay to the treasury of the Interborough Rapid Transit Company the amounts advanced. Mr. Belmont concludes by saying that the Interborough Rapid Transit Company expects that at maturity of the new notes, if not before, the indebtedness can be refunded on terms more favorable than are possible at present. —The gross earnings of the system, including the subway and Manhattan divisions, for the quarter and the six months ended December 31, show large gains over the corresponding periods of the previous year. The reports compare as follows:

	1906.	1905.	Increase.
Quarter ended December 31—			
Gross earnings	\$ 5,815,232	\$5,181,602	\$ 633,630
Operating expenses	2,365,166	2,137,354	227,812
Net earnings	\$ 3,450,066	\$3,044,248	\$ 405,818
Other income	194,656	225,792	*31,136
Total income	\$ 3,644,722	\$3,270,040	\$ 374,682
Fixed charges	2,472,906	2,306,759	166,147
Surplus	\$ 1,171,816	\$ 963,281	\$ 208,535
Six months ended December 31—			
Gross earnings	\$10,307,252	\$9,086,699	\$1,220,553
Expenses	4,497,464	4,204,801	392,663
Net earnings	\$ 5,809,788	\$4,981,898	\$ 827,890
Other income	343,728	385,634	*41,906
Total income	\$ 6,153,516	\$5,367,532	\$ 785,984
Charges	4,704,114	4,294,431	409,683
Surplus	\$ 1,449,402	\$1,073,101	\$ 376,301
*Decrease.			

Manila Suburban Railways Company.—An issue of \$2,500,000 5 per cent 40-year bonds has been authorized. The bonds are guaranteed, principal and interest, by the Manila Electric Railway & Lighting Corporation, which controls the electric railway, light and power system of Manila. The Suburban company will construct and operate suburban lines which will connect with the larger system, and will furnish lines and power in the outlying districts. The bonds were offered to the public at 92½.

Municipal Traction Company and Forest City Railway, Cleveland.—Leopold Einstein, vice-president of the Depositors' Savings & Trust Company, and R. A. Brown have retired as directors. They were succeeded by Francis E. Wright, president of the Bollinger & Riley Company, and Charles F. Seelbach, secretary and treasurer of the Forest City Foundry Company and vice-president of the Lincoln Savings Bank.

New York City Railway.—The report for the year ended December 31, 1906, shows gross earnings of \$17,636,707, an increase over 1905 of \$616,674, or 3.6 per cent. Owing to a reduction in operating expenses, the increase in net earnings was \$709,711. The deficit after the payment of charges was \$2,097,104 as compared with \$2,555,268, a decrease of \$458,164. The statement for the year, with comparisons, is as follows:

	1906	1905	1904
Gross earnings	\$17,636,707	\$17,020,033	\$16,994,285
Expenses	9,558,287	9,651,324	9,320,321
Net earnings	\$8,078,420	\$7,368,709	\$7,673,964
Other income	1,172,264	1,261,681	1,177,576
Total income	\$9,250,684	\$8,630,390	\$8,851,540
Charges	11,347,788	11,185,658	10,751,136
Deficit	\$2,097,104	\$2,555,268	\$1,899,596

In the quarter ended December 31, the gross earnings amounted to \$4,552,656, as compared with \$4,453,875, while the deficit was \$607,722 as compared with \$515,631.

The general balance sheet as of December 31 last shows assets of \$37,649,297, as compared with \$31,896,215 a year previous. Cash on hand increased from \$220,300 to \$1,091,710, while the profit and loss deficit increased from \$5,566,555 to \$7,697,744, and loans and bills payable increased from \$5,200,000 to \$9,550,000.

United Railways Company of St. Louis.—Earnings in January, 1907, compared with the corresponding month of last year as follows:

	1907.	1906.	Increase.
Gross earnings	\$826,337	\$781,788	\$44,549
Operating expenses	577,870	491,368	86,502
Net earnings	\$248,467	\$290,420	*\$41,953
Charges	231,541	232,051	*514
Surplus	\$ 16,926	\$ 58,365	*\$41,439
*Decrease.			

Waverly Sayre & Athens Traction Company, Waverly, N. Y.—It is reported that negotiations are in progress for the purchase or control of this company by the Erie Railroad Company. The Erie is said to be the owner of the Elmira Corning & Waverly electric road which will parallel for a long distance the Erie right of way between those three places. The Waverly Sayre & Athens is to be extended to Binghamton. With this extension the two roads would have a through line from Corning to Binghamton, N. Y., with a branch from Waverly to Athens, Pa.

Manufactures and Supplies

ROLLING STOCK.

Oregon Electric Railway, Portland, Ore., has ordered 12 heavy passenger coaches.

Chicago Lake Shore & South Bend Railway, South Bend, Ind., has placed an order for 25 interurban cars.

Lima & Toledo Traction Company, Lima, O., is reported to have placed an order for 12 interurban cars.

Boston & Northern Street Railway, Boston, has ordered 27 double-truck cars from the J. G. Brill Company.

Camden Interstate Railway, Huntington, W. Va., has ordered 5 new cars from the G. C. Kuhlman Car Company.

Albany & Hudson Railroad, Hudson, N. Y., has ordered 2 double-truck cars from the Wason Manufacturing Company.

Northern Ohio Traction & Light Company, Akron, O., will soon receive from the G. C. Kuhlman Car Company 10 new convertible cars, 45 feet in length.

Beloit Traction Company, Beloit, Wis., has ordered six 22-foot closed cars and will place an order this fall for four open cars for delivery in the spring of 1908.

Shawinigan Falls Terminal Railway, Shawinigan Falls, Que., has placed an order with the Canadian General Electric Company for one 600-horsepower electric locomotive.

Pittsfield Electric Street Railway, Pittsfield, Mass., has placed an order with the Wason Manufacturing Company for 1 passenger car and with the Russel Car & Snow Plow Company for 1 snow plow.

Illinois Traction System, Champaign, Ill., is reported to have placed an order with the Danville Car Company for 6 electric locomotives, 12 cars for city service, 30 interurban cars and 20 express trailers.

Springfield Street Railway, Springfield, Mass., has placed an order with the Wason Manufacturing Company for 5 double-truck closed cars and ten 14-bench double-truck open cars. The closed cars will be 30 feet in length.

Montreal Street Railway, Montreal, Que., as reported in the Electric Railway Review of February 16, is building 25 pay-as-you-enter type cars in its own shops and in addition to these 100 of the same type are under contract with other car builders.

Wausau Street Railway, Wausau, Wis., has purchased through the Knox Engineering Company, Chicago, three cars for city service to be built by the Cincinnati Car Company. This item appeared incorrectly in our issue of February 9 as the Warsaw Street Railway.

Galesburg & Kewanee Electric Railway, Kewanee, Ill., has ordered 3 single-truck Brill semi-convertible cars from the G. C. Kuhlman Car Company. These cars will be 31 feet 4 inches in length over all, will be equipped with cross seats, Brill 21-E trucks and GE-80 double motor equipments.

Worcester Consolidated Street Railway, Worcester, Mass., was reported in the Electric Railway Review of February 16, as being in the market for new cars. An order has been placed with the J. G. Brill Company for ten 15-bench open cars and 15 closed cars 30 feet in length. They will have Brill trucks. An order has also been placed with the Wason Manufacturing Company for 1 snow plow.

South Chicago City Railway, Chicago, has purchased from the Indianapolis & Cincinnati Traction Company four interurban cars each equipped with four motors of 50 horsepower and is building in its own shops 11 compartment cars for heavy city use, to be equipped with GE motors and Taylor trucks. The company is also constructing 10 cars in its shops, which are being built by the splicing together of two open trailer cars.

Chicago Electric Traction Company, Chicago, has ordered 15 single-end semi-convertible compartment cars for interurban service from the G. C. Kuhlman Car Company, 10 of which are for delivery before May 20 and 5 prior to June 15. They will be 45 feet 6 inches in length over all, will have a seating capacity of 52 persons, thirteen windows on each side, the smoking compartment taking in four windows. The rear platform will be 6 feet, 6 inches long and the front platform which is enclosed for the exclusive use of the motorman will be 5 feet long. A speaking tube runs from the motorman's cab to the platform in the rear. The cars will be equipped with stationary seats, Magann storage air brakes, Brill trucks, 4 GE-80 motors to each car, Monarch deck roof, steam coach hood in front and destination signs of colored glass.

Indianapolis Columbus & Southern Traction Company, Columbus, Ind., placed an order the latter part of last year for three interurban cars with the Niles Car & Manufacturing Company. An order was also placed with the same company for eight interurban passenger cars and two freight cars for the Indianapolis & Louisville Traction Company, now under construction between Jeffersonville and Seymour, Ind. The passenger cars are single end cars, 50 feet in length over all, with main compartment, smoking compartment and baggage room heated with the Peter Smith heating system and equipped with Baldwin trucks. The freight cars are of the standard interurban type, 50 feet in length over

all, will be equipped with Baldwin trucks, General Electric 600 and 1,200-volt motors, air brakes, train control and will be heated with soft coal burners.

SHOPS AND BUILDINGS.

Indiana Union Traction Company.—The car houses of the Muncie-Hartford City division at Bluffton, Ind., were destroyed by fire recently. The loss is estimated at \$18,000, with \$11,000 insurance.

Spokane & Inland Railway.—Excavations are being made for an \$18,000 freight depot at Palouse, Wash., which will consist of a main building 60 by 60 feet and a freight shed 36 by 100 feet.

TRADE NOTES.

H. W. Johns-Manville Company, New York, has removed its Boston office from 77-79 Pearl street to 59 High street.

F. P. Harrison Electric & Manufacturing Company, New York, reports a large shipment of Deltabeston fields and coils to the Pacific Electric Railway Company at Los Angeles, Cal.

H. F. Vogel Contracting & Railway Supply Company, Rialto building, St. Louis, dealer in general supplies and sales agent for the Danville Car Company, is now the exclusive selling agent for the Anderson-Smith arc headlight.

Standard Electric & Chemical Company, Chicago, has been incorporated with a capital of \$10,000 to manufacture and deal in electrical and chemical specialties. The incorporators are: George E. Fuller, George Dierssen and Herbert Green.

D & W Fuse Company, Providence, R. I., has recently awarded a contract for a new foundry building which will be erected at an early date. Owing to the company's increasing business it was thought advisable to construct a new foundry.

John F. Allen, 370-372 Gerard avenue, New York, has just shipped two additional riveters to the American Car & Foundry Company and two have been shipped to the Atchison Topeka & Santa Fe Railroad for use at its Topeka, Kan., shops.

Chicago Pneumatic Tool Company, Chicago, following its established practice of maintaining stores in the larger cities of the United States for the purpose of exhibiting its tools in operation, has opened a store at 820 Arch street, Philadelphia, Pa.

Stone & Webster Engineering Corporation, 84 State street, Boston, engineers and contractors of electrical properties, has retained Converse D. Marsh of the Bates Advertising Agency, New York, as advertising advisory counsel for the corporation.

Dagg Boiler Equipment Company, New York, has been incorporated with a capital stock of \$50,000 to build roads, railway light and power plants, etc. Incorporators: Bond S. Neff and Arthur D. V. Lyons, both of New York, and Everett M. Corner, of New Rochelle, N. Y.

Universal Portland Cement Company, Chicago and Pittsburg, announces the appointment of F. T. Bentley as western traffic manager with headquarters at the Rookery, Chicago, and L. C. Bihler as eastern traffic manager with offices in the Carnegie building, Pittsburg.

Garford Company, Elyria, O., has just shipped a carload of Shelby trolley poles, for which it is general agent, to San Francisco for use upon the new cars of the United Railroads of that city. The company also has orders booked for another carload for shipment to the Pacific coast.

American Conduit Manufacturing Company, Pittsburg, has recently completed improvements to its factory which will largely increase its output of rigid iron conduit. Several changes have been made in order to keep pace with its steadily growing business and demand for its product.

Dodge & Day, Philadelphia, have been commissioned by the Denison Manufacturing Company of South Farmington, Mass., to make a report on its power requirements in its factory; also have been retained by the Royal Motor Car Company of Cleveland, O., as advisory engineers for its new plant.

New Era Manufacturing Company, Kalamazoo, Mich., is putting upon the market "Phosphoro Bronze" which is a new bronze mixture claimed to be an ideal metal for locomotive and car journal bearings. The formula for this bronze will be mailed to railway officials and others interested upon request.

E. D. Hindman, formerly with Elmer P. Morris Company, New York, has joined the sales force in the railway department of the Stuart-Howland Company of Boston. Most of his time will be spent in New York city and his attention will be devoted to the territory of New York, Pennsylvania and New Jersey.

O. A. Stranahan recently resigned his position as sales manager of the Allis-Chalmers Company, Milwaukee, and has acquired an interest in the Electrical Installation Company, Chicago, where he has been elected a director of the company and will have an active part hereafter in the company's affairs.

Underfeed Stoker Company of America, Chicago, has recently received, an order from the Chicago & Milwaukee Electric Railway for 24 Jones stokers to equip eight 600-horsepower Babcock & Wilcox boilers installed in its new power station at Waukegan, Ill. This is the fourth order the company has received from this road and makes a total of 37 Jones stokers ordered since January, 1903. A second order has also been received from the Campana Alemana Transatlantica De Electricidad, Buenos Aires, Argentine

Republic, S. A., for 45 Jones stokers to equip its various power stations in that city. This order is the result of a trial order for three stokers installed in its station at Montevideo by G. F. Kelley, erecting engineer of the Underfeed Stoker Company of America.

Southern Immigration Bureau, 144 East Seventh street, New York, furnishes laborers to all sections of the western and southern states, as well as throughout the country. The company possesses special facilities for handling this line of business and will furnish laborers in any number and of whatever nationality required.

Electrical Installation Company, Monadnock block, Chicago, at its annual meeting elected as its president C. H. Kimball of Muskegon, Mich., who was formerly vice-president, and O. A. Stranahan of Milwaukee, a director of the company. The company now has 185 miles of electric railway under contract in Indiana.

F. P. Harrison Electric & Manufacturing Company has found it necessary, owing to a large and increasing demand for the Cow-Boy brand Deltaheston armature and field coils manufactured by it, to increase the capacity of its factory. A large brick bake oven building, having a capacity of 15,000 field coils, has just been completed.

Ridgway Dynamo & Engine Company, Ridgway, Pa., has completed a large addition to its works and is now putting it into service. The addition is a one-story steel structure, 200 feet in length and 65 feet wide, with solid brick walls and slate roof. The building will be used as an erecting shop and storage warehouse for finished machinery.

Berger Manufacturing Company, Canton, O., is making provision in its new sheet mills for the production of a special quality of sheets for electrical purposes. As this company owns and operates its own steel plant in addition to its twelve-mill sheet plant it can control the quality of sheet bars, thus insuring a soft sheet with a low hysteretic constant.

Genuine Bangor Slate Company, Easton, Pa., maker of genuine Bangor roofing slate and other slate products, announces that considerable interest is being taken in its slate roofs by electric railway companies. The company claims a roof manufactured by it will outlast the building and is entirely free from expense for repairs, the slate also acting as a good insulation against electricity.

Stuart-Howland Company, Boston, Mass., reports a very large volume of business in its electric railway supply department. During the month of January last the business was greater than that of the whole year 1905. It has been found necessary to add a new salesman to this department to keep pace with the growing business. This company makes a specialty of armature and field coils, commutators, segments and overhead line material.

Lorain Steel Company, Philadelphia, Pa., has awarded to W. J. Rose & Sons, of Johnstown, Pa., the contract for the erection of a new one-story building 376 by 400 feet and to cost approximately \$200,000. The building will be constructed of steel and be fireproof. Upon the completion of the addition, the plants for the manufacture of switches, signals and electric appliances used on street railways will be placed in it. Work will begin at an early date.

Chicago Pneumatic Tool Company, Chicago, at a meeting of the stockholders held in Chicago on February 18, re-elected all of the retiring directors, which are as follows: A. W. Maconochie, James C. Taite, Charles M. Schwab, J. R. McGinley, J. W. Duntley, W. O. Duntley and W. A. Mitchell. The company has recently purchased the buildings of the Franklin Machine & Tool Company of Franklin, Pa., at a cost of \$200,000, which will be used in connection with the air compressor plant.

Sterling-Meaker Company, Newark, N. J., announces that its business for 1906 was more than 50 per cent greater than for the preceding year and that on January 1 the company had unfilled orders to the amount of \$30,000 notwithstanding the fact that they were employing twice as many men as a year ago. The company is a well known manufacturer of the Sterling safety brake, the Giant brake, the Sterling fender, the Sterling trolley base, the Berg fender and the Sterling sand box.

American Blower Company, Detroit, Mich., announces that a large addition to its steel plate fan shop is about completed and will be ready for operation in about thirty days; also that the company's architects are at work upon plans for a large addition to its power plant and to its engine construction department. The new type of vertical self-oiling engine which this company has put upon the market has met with such success that in order to meet the demand an entire re-arrangement of its plant was necessary.

Standard Motor Truck Company, Pittsburg, has appointed George W. Evans & Co. of Seattle, Wash., its northwestern agents for the territory comprising the states of Washington, Oregon, Idaho, Montana and British Columbia and Alberta, Can. The company has also recently received orders for the following equipment: 200 swing bolster maximum traction trucks of the 0-45 type for the Brooklyn Rapid Transit Company; 200 of its 1-50 type for city and suburban use for the Boston Elevated Railway; 100 short wheel base outside hung motor of the 0-50 type for the Detroit United Railway; also several large orders for the Consolidated Railway of New Haven, Dartmouth & Westport Street Railway, Boston & Worcester Street Railway, Oklahoma City Railway Company, York Street Railway and other small orders aggregating

over 900 trucks for which the company has received orders during the last three months.

Green Engineering Company, Chicago, in order to handle its steadily increasing business, purchased last year nine acres of ground in East Chicago upon which the company has erected a new shop, approximately 740 by 130 feet, embracing a large foundry, machine shop, warehouse, pattern shop and power house. The buildings are of all-steel construction with concrete side walls and tile roofing, making them practically fireproof. The company has also constructed 1,200 feet of switch track on each side of its plant.

McIntire-Marshall Construction Company, Park building, Pittsburgh, will build an addition to its plant at Carnegie, Pa., for use as a rivet shop. The building will be 84 feet wide at the main span, the total length to be 154 feet 8 inches. Provision is made for four 5-ton longitudinal crane runways together with additional runways to carry riveting machines. The plant at Carnegie was purchased in June, 1905, from the American Structural Steel Company and since its operation under its present management has shown an increased output.

Charles M. Higgins & Co., manufacturers of the well-known Higgins' drawing inks, have increased their business during the past year over one-third of the year previous. The general use not only in this country but throughout the world of their drawing inks, mucilage and paste is increasing steadily. Some time ago the company opened a store at 11 Farringdon avenue, London, E. C., as a distributing depot for their line in England. The Chicago office of the company is in the Fisher building, the main office and factory being located in Brooklyn, N. Y.

J. P. Sjöberg & Co., 533 West Thirty-second street, New York, N. Y., have recently delivered to the New York City Railway Company 600 of their new patent sliding-sash vestibules, and these have been installed on the New York city cars. The vestibule affords thorough protection to the motorman and in no way obstructs his view. The Brooklyn Rapid Transit Company of Brooklyn, N. Y., has adopted this vestibule as standard on all of its cars and has recently placed an order for 400 vestibules, which completes the contract for equipping the whole system.

J. G. Brill Company, Philadelphia, is reported to have announced that the plan for the reorganization of its company, which has been under way for some time, has been accomplished. The capital stock has been increased from \$600,000, to \$10,000,000, part of which has been taken by the three other companies associated with it, namely, G. C. Kuhlman Car Company, American Car Company and the John Stephenson Company. It is stated that negotiations are under way for the equipping of another car-building company in the east. James Rawle, formerly secretary of the company, has been elected president to succeed Martin G. Brill, who died some months ago. No changes in the operation of the different plants will be made at this time under the new management.

B. F. Sturtevant Company, Boston, reports the sale of its generating sets to the Richard Borden Manufacturing Company, Fall River, Mass., Eastern Brass & Machine Works, Easton, Pa., Roughsedge & Ramsey, Prince Albert, Sask., Can., and the Bowker Construction Company, New York City; also the large manufacturing plants which have been equipped with its heating and ventilating system: Reeves & Co., Columbus, Ind., National Tube Company, McKeesport, Pa., Graton & Knight Manufacturing Company, Worcester, Mass., and the Canadian Pacific Railway, Toronto Junction, Ont. The company has also made the following sales for its new type of high pressure rotary blowers: General Fire Extinguisher Company, Atlanta, Ga., Rivett Lathe Company, Brighton, Mass., J. B. Clark Manufacturing Company, Rockford, Ill., and the Winchester Repeating Arms Company of New Haven, Conn.

H. W. Johns-Manville Company, 100 William street, New York, held its annual convention of its many branch managers and department managers during the last week in January at the New York office of the company. Representatives of the various branches and factories were present, making the meeting not only profitable but interesting. Within the past few months the company has opened new branch offices at New Orleans, La., Dallas, Tex., and Baltimore, Md., making sixteen branch offices throughout the United States in addition to its local representatives at various points. The company has recently opened a branch office at 214 Main street, Buffalo, N. Y., in charge of George A. Schmidt, who has been connected with the company for a number of years. B. F. Boscoe has been appointed assistant manager of this branch and will make his headquarters at Rochester, N. Y. Harry V. Patton will also be associated with the new Buffalo branch.

D. E. Baxter & Co., Incorporated, railroad contractor, 27 William street, New York, which has the contract for the construction and equipment of the Charleston & Summerville Electric Railway, from Charleston to Summerville, S. C., has placed orders for 3,150 tons of 70-pound rails, 850 kegs of railroad spikes and 12 switches, delivery to be made in the early part of May. The construction of this road is progressing rapidly, the contractor having two large forces at work from both ends to the center. The fireproof concrete power house building in which will be installed the Snow gas engines, generators and electrical appliances for operating this road will be commenced immediately. The overhead construction will be for single-phase transmission, with 120-foot spans, No. 000 hard drawn, grooved copper trolley wire. As the president of the road is anxious to complete it as soon as possible to take care of the summer travel the contractor is increasing its forces that this may be accomplished. It has been assured by the Snow Manufacturing Company that the delivery of

machinery will be prompt. A spur will be run from the main line to the new Charleston navy yard, thus affording the United States government easy transportation for its men to and from work. A majority of these men either reside in Charlestown or Summerville and are now compelled to take a circuitous route. The weather has been such that no delay has been experienced, the contractor not having lost a day since work began in November, 1906.

G. Drouve Company, Bridgeport, Conn., has secured an order to install the Lovell sash-operating device at the New York Central railroad shops at White Plains and Harmon, N. Y. The installation includes apparatus to operate the sash in the inspection, locomotive, car and machine shops and comprises 4,400 feet of the operating device. The company is completing an Anti-Pluvius skylight installation for the Pond Machine Tool Company on its new shop addition. The Anti-Pluvius skylight is water-tight, weather-proof and non-deteriorating, and is erected by the unit system of construction, without putty or cement. The company makes a special bid for large contracts, having only recently finished the skylighting of the Delaware Lackawanna & Western Railway Hoboken terminal train shed, 125,000 square feet of skylight being used on this work. A strong claim made by the company is that it guarantees positive immunity from leakage and condensation, as also from breakage of glass (excepting from strictly external causes).

Pressed Steel Car Company, Pittsburg, at the annual meeting of its stockholders held in Jersey City on February 20, re-elected the retiring directors and made public its financial report for the fiscal year ending December 31, 1906. The report shows that the surplus after deducting the dividends on the preferred stock was equal to 17.25 per cent on the common stock, but no dividends were declared on the common stock because the management desired to increase the working capital and strengthen its position. The income account of the year together with the general balance sheet is as follows:

	1906.	1905.
Net earnings	\$3,381,884	\$1,106,901
Depreciation, etc.....	350,000	175,000
Balance	\$3,031,884	\$ 931,901
Preferred dividends.....	875,000	875,000
Balance	\$2,156,884	\$ 56,901
Common dividends.....
Surplus	\$2,156,884	\$ 56,901

ADVERTISING LITERATURE.

Genuine Bangor Slate Company, Easton, Pa.—“Slate and Its Uses” is the title of a handsomely executed and instructive pamphlet designed to be convincing in its array of facts and arguments in favor of slate as compared with other materials used for roofing purposes. The claim that the company is the largest producer of slate in the country is not likely to be disputed, nor, after reading this book, does there seem any argument except that of less first cost with which to controvert the claims for slate. The various chapters set forth what a genuine Bangor slate roof will and will not do, its service and qualities in comparison with roofs of tin, steel, shingles, tile and compositions of tar, asphalt, asbestos, gravel, etc., with quotations from various authorities in support of the points made. The pamphlet is beautifully illustrated from photographs of buildings—residences, churches, factories, government institutions—showing clearly the attractive effect produced by the use of slate roofing and in themselves suggestive of the unquestioned durable character of the material.

HOMER COMMUTATORS.

An excellent example of the trend of the modern idea of specialization is illustrated in the manufacture of commutators by the Homer Commutator Company, Cleveland, Ohio. In this case not only does the company devote itself exclusively to the manufacture of high-grade commutators, but each man who operates one of the machines designed especially for the manufacture of commutators is a specialist in the operation of his

particular machine. Some of the men now employed have been with this company since it first began the manufacture of commutators. The result of this specialization is more perfect workmanship which, combined with the best of material, assures a product of the highest type.

An exact fit between the shell and the commutator bars is an important point to be observed in the manufacture of a commutator, because if the fit is not perfect the commutator will not remain tight; and further, the expansion and contraction from heating when in operation will cause it to warp, resulting in serious sparking and in a very short life for both commutator and brushes. This company has given special attention to perfecting methods of securing the perfect fit so desirable and necessary to avoid the disastrous effects above mentioned, and it is prepared to manufacture high-grade commutators of any style in all sizes from the smallest used on a fan motor to that of the largest direct-current generator.

BLAKE TUBE FLUX.

There are many reasons why it is advantageous to have soldering flux placed on the market in such a form that it will remain clean and yet easily be applied to the surfaces to be joined. With soldering paste contained in the usual form of boxes there are the disadvantages that if the box is not kept covered at all times the paste becomes dirty, and for this reason part of it may be wasted; with the soldering flux in covered boxes it is necessary for the linemen or whoever may use it to apply the flux with some sort of brush or dauber. This practice is not only unhandy but is wasteful of the material. To obviate these disadvantages and effect a saving for the user of soldering flux, the Blake Signal

Blake Tube Flux—Method of Application.

& Manufacturing Company, 246 Summer street, Boston, has placed on the market the “Blake Tube Flux.”

As will be noted by the accompanying illustrations, this tube is of the customary collapsible form and has a tapering spout through which the soldering flux is applied directly to the surfaces where it is needed. The flux contained in these tubes was formerly known by the trade name of “Climax.” The manufacturer states, however, that the tube and flux have been much improved. The new product is said to have many advantages over the ordinary flux, among which are the following: It is an insulating material, non-corrosive, and is enclosed in tubes so that it may conveniently and economically be applied as desired. It would seem that soldering flux enclosed in such tubes would form a very useful part of a workman’s kit.

Special attention is called to the aluminum spout, which material will permit of contact with a soldering iron without melting

Blake Tube Flux—Collapsible Tube.

and thus closing the outlet for the flux. The collapsible tubes are made of heavier metal than before and are coated with tin both inside and out. This coating prevents the tube from being torn or damaged. Reference to the illustration showing the method of applying the paste in soldering armature leads to commutator segments will make plain the convenience of the Blake Tube Flux for the use of the shop man or lineman.

DEVELOPMENTS IN THE ORGANIZATION OF THE OHIO BRASS COMPANY.

In order to better serve its rapidly increasing trade, the Ohio Brass Company has recently made arrangements for the establishment of two new branch offices and has made several additions to the personnel of its home office. These new branch offices will be located at St. Louis, Mo., and Atlanta, Ga., and will carry an ample stock of standard materials for quick shipments, which will be selected to fulfil the requirements peculiar to their respective territories. The establishment of these offices will enable the company to take care of its trade in the southwestern and southeastern territories more efficiently than ever, and will greatly facilitate prompt filling of orders.

The St. Louis office will be located at 10 North Fourth street and will be ready for business on March 1. This date will mark the termination of the Ohio Brass Company’s arrangements with the Watts & Uthoff Supply Company, which has acted as sales agent in that territory for several years past. The office will be

under the management of E. C. Brown, who, for many years, has been actively identified with the electric railway trade and will be assisted in the office by N. W. Biggart, who has been transferred from the home office for that purpose. Traveling salesmen will be added to this office as soon as its organization has been completed, and customers in the St. Louis territory will now be even better served than heretofore.

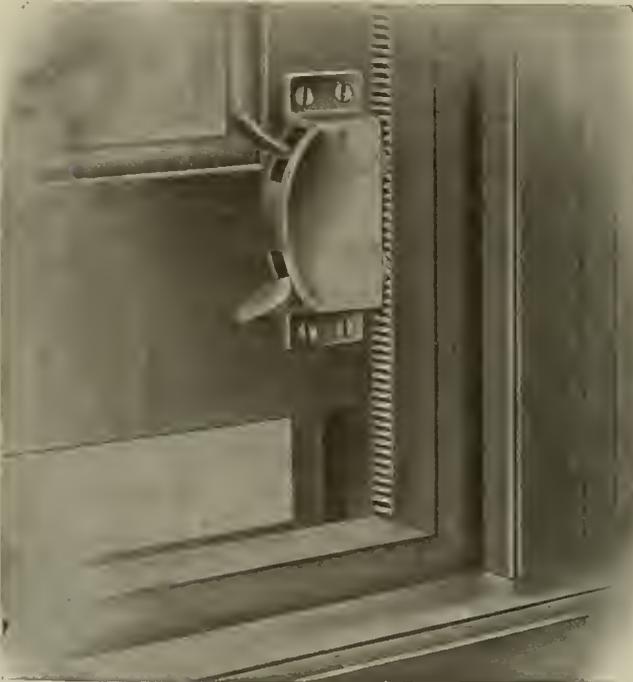

The new branch office at Atlanta, Ga., will be ready for business on March 15 and will be under the management of J. E. Slimp. R. L. Courtney will assist Mr. Slimp in the office and a staff of traveling salesmen will be organized as soon as the office is formally opened. Mr. Slimp needs no introduction to his many friends in the southeastern territory, who will doubtless be pleased to learn that in his new capacity as sales manager of this office he will be in a position to keep in closer touch with them than heretofore.

The Atlanta office will be located in the Peters building, room 308, corner of Wall and Peachtree streets. The warerooms will be in the same building and sufficient stock will be carried to fill all rush orders.

Several acquisitions have recently been made to the home office force at Mansfield. These additions are made necessary by the rapidly increasing volume of business, consequent to the completion of the Ohio Brass Company's new factory buildings, and are as follows: J. F. Little is assistant in the line material division of the railway sales department. He was formerly connected with the sales department of the Western Electric Company in Chicago. C. C. Beck has assumed the position of commercial engineer, having been previously assistant superintendent of the Ideal Electric Company. C. V. Marks is personal assistant to the secretary. H. C. Moran is assistant in the rail bond department, having been previously connected with the Western Electric Company. A. W. Campbell is assistant in the office of the vice-president. H. W. Young, formerly with the Cutler-Hammer Manufacturing Company of Milwaukee, Wis., is assistant in the advertising department.

THE NATIONAL WINDOW FIXTURES.

The National Lock Washer Company of Newark, N. J., which manufactures a complete line of curtain fixtures, also has upon the market a number of window fixtures. These include a sash balance roller and attachments for lifting a window, a sash lock with ratch-

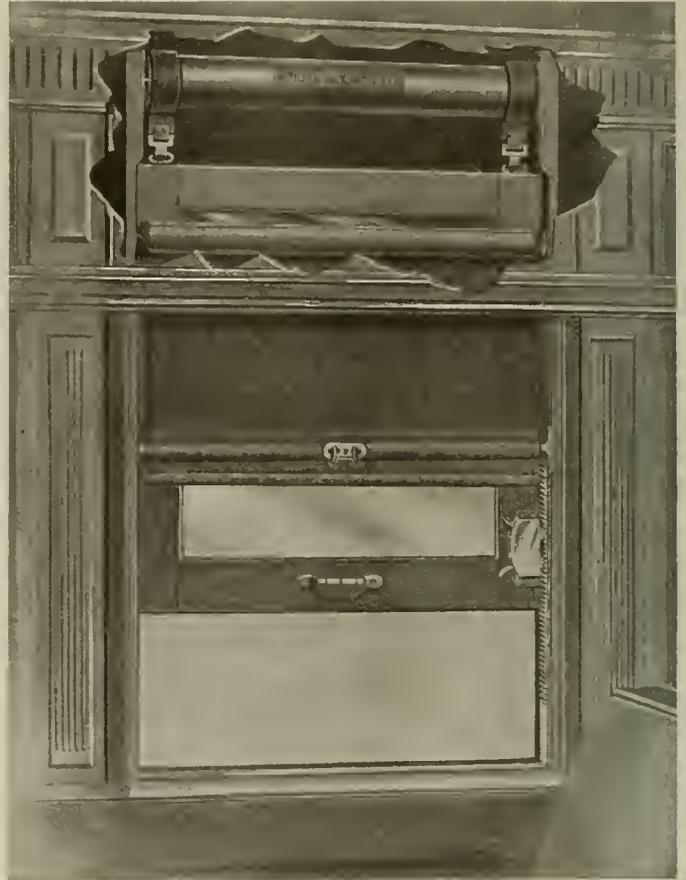

National Sash Lock.

et strip and screws for locking a window at any desired height and sash springs comprising four face and two edge springs for making a window dust and draft proof. The company believes that by the proper application of these devices, it will be possible for even a child to raise or lower with ease the heaviest car sash in wet or dry weather, and that when the window is closed it will be practically dust and draft proof. The fixtures do not necessarily have to be used together, but the combination makes the window arrangement serviceable and effective.

The National sash lock is designed to hold and positively lock the window sash at any height and to prevent rattling. A feature taken into consideration in planning its construction was to make it possible to place the window loosely in the frame, so that the sash could be easily raised and lowered. The lock is operated by simply pressing and releasing levers which are so arranged that raising the lower lever unlocks the upper, but a reversal of the process has no effect on the lower lever, an arrangement, the pur-

pose of which is to give the operator complete control of the weight of the sash.

The National sash balance is a specially made spring roller, held in brackets placed out of sight at the highest part of the sash slide. The roller is held to the sash by two belts, one at each end of the roller. These belts are connected with the roller by brass straps locked in the roller groove, and the lower ends connected to the sash by hooks secured to the belting by brass straps. These hooks fit into eyes screwed into the top of the sash, so as to make the sash readily removable. The screw eyes are made with a special thread that it is believed will sustain many times the

National Sash Balance Roller and Attachments.

weight required. They can also be raised or lowered one or more turns to equalize the belt on each side. If stronger tension is required, one belt at a time can be unhooked and passed around the roller. If less tension is required the belt can be unhooked and one turn taken off, making it unnecessary to move the roller in order to regulate or adjust it. The wearing parts are all of sheet brass. Under ordinary conditions the tension of the balance roller is said to lift all but about three pounds of the weight of the sash.

RECORDING FARE REGISTERS.

The Recording Fare Register Company of New Haven, Conn., is offering two new styles of fare registers designated as types-F and G.

The aim in the design of these registers has been to reduce the number of working parts and springs. To accomplish this end, gearing alone has been employed in the construction of the internal mechanism of these registers.

The enclosing cases are of seamless drawn cartridge brass, finished in antique copper. The face dials are of steel, enameled any color desired, or to match the car finish. Large plain numbers which can be easily read at a distance are used for the trip and total figures.

The "set back" is entirely automatic, the knob returning to position instantly upon the cancellation of the trip or changing of the direction indicator.

A printed record is made by the type-G register, giving the direction, trip number and a total statement for each trip. Type-F is of exactly the same construction as type-G, with the exception that it does not have a record-printing mechanism.

Both of these registers can be fitted with a "not-set" indicator, which requires an extra push of the knob to unlock the register after canceling a trip or changing the direction. This avoids the possibility of fares being registered while the conductor is off the car.

Type-G.

In a decision rendered on February 19 by Smith McPherson, judge of the United States circuit court at Des Moines, Ia.,

Perpetual Franchise Is Upheld.

the contention of the Des Moines City Railway Company that its franchise is perpetual is upheld. Judge McPherson holds that notwithstanding the claim of the city that all rights which were granted under the ordinance of 1866 expired in 1898, the city since the latter date has repeatedly recognized the validity of the franchise. The court rules that only the monopoly feature of the franchise expired in 1898. In the decision the court states that attempts to violate contracts are one of the evils of municipal governments of the day. The court shows that the Des Moines city council, desiring to aid in building up the city, granted a franchise when Des Moines had about 6,000 people, and that the system was maintained for 14 years with an expenditure of \$200,000 and no profits; and that when profits were in sight the council granted rights to other companies and litigation commenced. Although the company's contentions are upheld in a broad way, the court calls attention to the fact that the company is under a continual obligation to furnish adequate and efficient service. The attorney for the city announces that the case will be appealed to the United States supreme court.

Cleveland's mayor is at work again, and according to his views 3-cent fares are only a step in the right direction. The goal is no fare at all; that is, no fare that the street-car-rider will know that he pays, it is all to be added to taxation. Mr. Johnson is quoted as follows: "What I really want is free street cars. Eventually I hope to see them as free to the passengers as the air they breathe. Street cars ought to be as free as elevators. A proper system of taxation would support street car lines without burden to the workingman, who could choose his home where he would,

No-Fare Street Car Systems.

and congested districts would disappear." It is difficult to treat with patience this suggestion that it would not burden any workingman to have the cost of urban transportation for the public added to his taxes or the taxes paid by his landlord or the storekeeper with whom he deals.

Many power plant operators seem to think that if a good engineer is employed for their plants everything has been done that is necessary to assure economical results. This, unfortunately, is not the case unless the engineer in charge realizes the value of good firing. Far more economical results could be obtained from the average

High-Class Men in the Boiler Room.

plant if the same amount of thought and care were given to the operation of the boilers as is generally given to the engines. To accomplish economical results it is necessary to employ a competent man who has made a study of the different methods of firing and knows how to handle a given grade of coal to obtain the best results under any given conditions. This man should be given absolute charge of the boiler room and not be subject to the engineer's orders, which, in most instances, would directly oppose the proper course to be pursued. Experience is not the only way by which to judge whether or not a man is qualified for such a position. A sound theoretical knowledge of the laws of combustion, coal and the steam boiler are absolutely essential. An instance of what can be done by such a man, even in a small plant, is illustrated by a case which lately came to our notice. The boilers in the plant, to which reference has been made, are fitted with mechanical stokers and were in charge of an expert recommended by the stoker manufacturer. Before the "theoretical stoker" took charge of the plant the coal consumption was 65 tons per day and the town had threatened the management with lawsuits because of the smoke nuisance. Under the scientific management the coal consumption was reduced 12 tons per day and hardly a trace of

smoke was visible. The saving in coal was about thirty dollars a day, omitting the reduced cost for carting ashes. The expenses incurred about seven dollars, leaving a net saving of twenty dollars per day. It should be remembered that it is the brains and not the muscle that reduces the coal bills.

In power plants of the hydro-electric type where a standpipe equipment is installed to prevent damage from water hammer, considerable trouble is likely to be encountered from the freezing of the relief column of water unless special measures are taken to heat the pipe interior in cold weather. It has been found by experience

Preventing the Freezing of Standpipes.

that the surging of the water in the pipe seldom exceeds 18 inches, which is not enough of a movement to prevent the water from freezing against the sides of the pipe, and in case of long continued cold weather this is likely to cause injury to the standpipe by bursting it, to say nothing of the danger to the main pipe line and water wheels. An ingenious temporary method of preventing freezing was recently tried successfully in a plant where ice was forming rapidly on the inside of a standpipe 110 feet high and 5 feet inside diameter. Immediate action was necessary, for there was no time for anything but emergency methods. Fifty 50-candlepower incandescent lamps were connected in a loose circuit and lowered into the pipe from the top. The current was then turned on and the heat from the lighted lamps cleared out the ice in a short time. As a permanent arrangement the standpipe was surrounded by a double air chamber made of matched boards lined with tar paper and sealed at the top. In the bottom of the chamber were installed 14 simplex car heaters of 600 watts capacity each, and in the top was mounted a 2,500-watt coil on a circular wooden float, the diameter of the upper heating coil being about 42 inches. The coil rises and falls with the surging of the water, and is prevented from being thrown out by being fastened in at the top of the pipe with No. 6 steel wires. This scheme has been found thoroughly effective and it has the advantages of being exceedingly flexible, efficient and readily controlled from remote points.

The breakage of window glass on interurban cars sometimes becomes so frequent that a management's special attention is called to the matter, and it at once becomes important to reduce the record. Aside from the expense of replacing the old lights and the ever-present possibility of damage suits, it sometimes happens that connecting roads will not receive a car with a single broken pane, the result being that the car must be taken off the line and suffer a total loss of earning capacity while these trivial repairs are made.

Glass Breakage on Interurban Cars.

High-speed cars seem to suffer more from glass breaking than equipments making moderate schedules, and the excessive vibration of windows is no doubt a predisposing cause. Rough track, minor collisions with teams or other vehicles, carelessness of passengers and other causes readily suggest themselves, but perhaps the point in the car which suffers most heavily is the front vestibule. Too rapid dropping of windows by motormen is a frequent cause of breaks, and again, the contact of the car with a foreign body like a large bird flying through the air or with a broken guard wire hanging in an unsuspected position is often sufficient to make trouble. Progressive roads use the unbroken or unshattered pieces of glass from such windows in headlights, gauge dials and other places, but the actual cost of a break is so far beyond any second-hand economy in materials that rigid rules enforcing careful handling of windows by employes should be the procedure. The use of window stops, double catches to prevent dropping too suddenly, and in some cases double windows, all help to mitigate the trouble. Many breaks cannot be helped, but when the reports begin to come in with

great frequency, it is well to look into both the operating and the constructive ends of the matter. It may pay in some cases where the speeds are very high to use plate glass in the front vestibule windows.

ECONOMY IN MOTOR REPAIRS.

Throughout the entire range of electric railway shop practice there is no more important work than the speedy, economical and reliable repairing of motor armatures, commutators and field coils. In many shops the organization of labor, equipment and material in the painting, carpentry and truck departments is better than that of the armature or motor repairing room. The work of motor maintenance deserves the most careful study; it is, when properly done, as complicated a business as can be found in any average industrial plant. There is no place on the road where inferior work will so quickly be rewarded by equipment failures as in the winding of armatures and fields, and it is doubtful if there is any part of the shop where the use of labor-saving methods pays higher interest on their cost.

Even in small shops it pays to provide first-class transportation facilities in all directions. Time is often lost and physical strength wasted in transferring armatures from the pits or truck inspection tracks to the lathes and winding cradles of the motor-repair department. The majority of railway motor armatures are not larger than an ordinary nail keg in bulk, but their actual weight of from four or five hundred to a thousand pounds needs to be impressed on any management which hesitates to spend money for overhead travelers and hoists on the large scale which the promptest and most efficient work demands. Hand trucks are essential in the winding room, but a complete overhead single-rail crane system, with lateral and possibly diagonal branches is worth all that it costs in the expedition of production which it makes possible.

In any large motor-repairing department the variety of work and the number of employes needed to push it through quickly are too great to justify anything but a liberal policy with respect to the arrangement of the men and machinery. At every point where the work can be done by an automatic machine there is little doubt that it will pay to install it, provided the demand for the machine's service is somewhere near continuous.

Sometimes the mistake is made of buying expensive equipment for only occasional operation, the result being that the fixed charges are altogether too high in proportion to the work turned out. Improved machinery with special guarantees of economy generally costs a good deal of money, especially in its early days on the market, when the expense of development and designing has to be recouped by the manufacturers. Simple, home-made devices may be less efficient in their operation, but for intermittent service it will usually cost less to run them than to pay the total annual charges on elaborate appliances.

It is as important that work be carried progressively through the winding room of a repair shop as that processes shall be continuous in a large factory. The orderly arrangement of spare parts and general supplies is often conspicuously absent in the work of such shops, and the resulting delay and friction are too patent to require emphasis. The motor-drive has now been almost universally applied to the equipment of the winding room, but there is still room for the use of more efficient types of motors, with a wider range of speed-control. Confusion too frequently exists in the wiring for insulation and resistance tests; circuits are seldom properly labeled, even when carrying dangerous voltages. The testing out of armature coils, commutator bars and field resistances offers an attractive field for the installation of special lamp resistances, instrument connections and adjustments, and in some of the more progressive winding rooms

these testing circuits are carried along the walls and columns with taps and plug connections at convenient points so that the work of the armature and field winders can be tested in progress.

In the operation of large winding departments there is a much wider field of activity for the individual worker than in many other kinds of shop practice. The replacing of armature coils, for example, calls for selective intelligence of a high order. The work is routine production as a whole, but in the carrying out of its details the steps are so varied that there is a chance for much loss of time to creep in if coils, insulating supplies, tools, wedges, etc., are not arranged in an orderly way. The personal characteristics of the winder largely determine the time required to finish the particular armature in hand, and this is so chiefly because of the high percentage of hand work which obtains. Systematic processes involving the specializing of the different jobs are desirable for the best results. In a large motor-repair department it is generally profitable to keep one or more men busy at commutator turning, or other lathe jobs, while others rewind fields and armatures, test coils and commutators, repair brush-holders, etc. Too often the lighting of winding rooms is inferior in quality; unshaded incandescents hung about in disorderly festoons give a bad illumination of specific areas, and as a result the quality of work at night suffers badly.

No feature of the work of motor repairs is too small to deserve consideration—the larger the force employed, the more essential it becomes to see that each particular job shall be done in the quickest and best way. The supply of compressed air throughout the department for cleaning, the installation of electric hoists for regular service and also for operation in place of pneumatic hoists at times when the load is too small to make it good economy to operate a large compressor, the use of special abrading and taping apparatus in stripping and rewinding coils, multiple dipping and drying in the ovens all count in securing economical repairs.

INTERURBAN TROLLEY BREAKS.

The breaking of a trolley wire on a long interurban line is such an annoyance that every reasonable means of avoiding it ought to be planned. Careful inspection of the wire as it comes from the reel is one of the first things to look after, for experience has shown a marked tendency of trolley copper to break at the points where small chips, nicks and other flaws exist. With the ordinary methods of suspension considerable bending strain is put upon the trolley wire just as it enters and leaves the ear by a fast running trolley wheel, for the upward pressure at the point of contact is sufficient to strike quite a sharp blow in case the wire hangs unevenly. It is a serious question if grooved trolley wire is not inferior to round copper for high speed interurban service.

The use of catenary suspension commends itself for a large share of new high-speed work, and the feasibility and strength of this method of hanging trolley wire is widely appreciated. For the best results the distance between suspension points needs to be chosen with care. Established interurban roads often cannot readily change over to catenary suspension for the reason that if their pole lines are already crowded with high-tension circuits, feeders, telephone and signal wires, the extra height needed for the catenary messenger wire is scarcely available without bringing the low-tension conductor too near the high voltage line. The use of heavier ears and hangers, and the maintenance of first-class alignment in the trolley seem to be about the only remedies for too frequent breaks, provided the original wire is inspected thoroughly.

On an interurban line it is usually out of the question to repair breaks by a tower wagon drawn by horses. Sometimes the motorman and conductor of an approaching car can make a temporary hitch to a tree or pole by using an in-

sulated pair of tongs or a wooden come-along with a coil of rope attached and which can be carried on each car, without much space being occupied. In other cases an emergency crew can proceed to the spot by regular car, arrangement being made to carry their light repair ladders on the roof. When a road can afford to do so, a special repair car with a tower attachment which can be operated quickly by one or two men is a great convenience, particularly if it is equipped with powerful motors and plenty of tools and supplies. In purely urban service there is not much of a field for an electrically driven tower car, but on long interurban lines it is fast coming to be a necessity.

SECTIONALIZING CAR HOUSE WIRING.

The common practice in the wiring of car houses is to tie all circuits of the same potential together. Trolley wires over parallel pit or storage tracks, auxiliary power circuits leading to inspection quarters and small shops, heater lines and lighting leads are generally so interconnected that there is no possibility of separating them so as to leave some of the lines alive and others dead. Of course, on the equipment side of the switches everything may be cut off readily, but on the supply side flexibility has seldom been sacrificed to protective convenience.

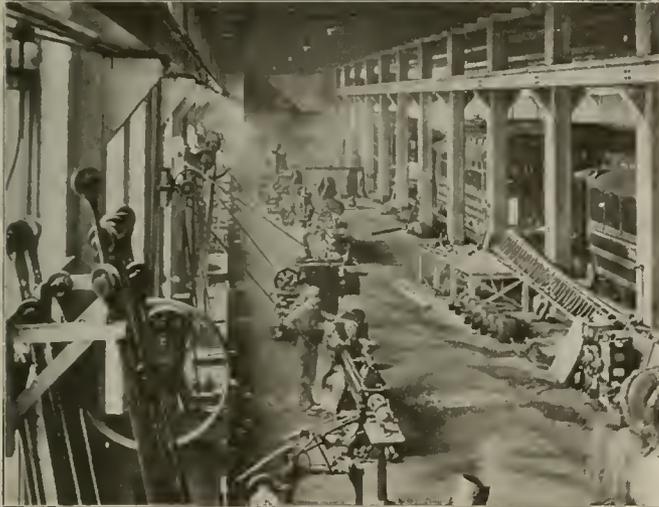

It is obviously attractive to be able to tap a 600-volt circuit at any point where current is temporarily or permanently needed, but from the standpoint of fire risk a more generous use of switches at such places would unquestionably be a good thing. Most operating companies have pretty definite rules in effect that trolley poles must not be allowed to remain against the wire on cars standing in the car house, but it is a fact that the rule is a hard one to enforce at all times. A good many fires have resulted from this cause, and a recent blaze which practically wiped out a car house full of rolling stock was attributed to the combination of an unchecked snow plow heater equipment which was evidently left accidentally in circuit with the trolley against the wire.

Considering these points it is certainly worth while to think seriously about sectionalizing car house wiring in such a way that when a track in the house is covered with stored cars on which no work is being done the trolley above can be cut out and killed. Section insulators are cheap enough, and the cost of controlling all the trolley wires in a given section of the car house from a single point by single-pole knife switches mounted on a suitable panel would be slight in proportion to the additional insurance thus afforded against fire loss. It would also be a comparatively easy matter to install a home-made automatic alarm which could be cut in circuit at night to ring a bell or light a series of red incandescent lamps in case any part of the car equipments on the storage tracks should be accidentally or carelessly left in complete circuit.

The wiring of old car houses, especially if shops are connected with the buildings, is seldom all that might be desired in the way of arrangement, even though it may satisfy the insurance requirements. Pit lighting circuits, testing lines, motor and lighting wires can profitably be controlled from a common central point and waste of current prevented by installing pilot lamps or even a simple magnetic needle indicator to show when the circuits are alive. Electric sand drying apparatus often consuming several kilowatts has to be left in circuit for long periods each day, and if no indicator in the shape of a lamp is inserted in the lead wires to the resistance coils, the tendency is to leave the current on longer than is necessary. It should be easy to trace the wiring in any car house or shop, regardless of the type's being open or enclosed in conduit. Special switches can be desirable at individual pieces of machinery or at particular points where a large number of lamps have to be cut in and out at the same time. Definite and regular arrangement tends toward safety and economy.

200-ton wheel-press is also provided for pressing on commutators and removing armature shafts from the laminations. Armatures are raised and lowered between the machine shop and the winding room through a trap door in the floor, by means of block and tackle. Later it is intended to do this work with an electric hoist.

One of the accompanying illustrations shows the winding stands, hoist and carriage used for handling armatures.

inch T-rails are used over the pits. These are supported every 6 feet and at a height of 3 feet 11 inches above the pit floor by 6-inch cast-iron pipes filled with sand and set in concrete. At the top of each pipe a casting, 7 by 10 inches, is provided with four holes for anchor-bolts which hold the rail to the pipe. Provision is also made, by means of a 5 by 5-inch lug cast on the outside and near the top of each post, for stringers on which it is intended to lay plank walks be-

New Shops and Car Storage at Nashville—Interior of Carpenter Shop.

The armature repairs are simplified to a great extent by the comparatively uniform types of motor equipment, there being four types, namely, G. E. 800, 1,000, 67 and 57.

Car Storage House.

The building occupied by the car house is divided longitudinally into five bays, each 35 feet wide, by the reinforced concrete pillars, 14 by 14 inches in cross section, which sup-

port the roof. These stringers act as tie-rods for steadying the rails of each pit. The pit tracks are laid with 11-foot centers.

At either end of the building concrete floors extend from the ends of the pits to the curbing on the property line of the street. These floors and the floors of the pits as well as the tracks are sloped to the north and the west, affording an

New Shops and Car Storage at Nashville—Interior of Paint Shop.

port the roof. Each bay contains 607.5 lineal feet of pit track, making a total of 3,037.5 lineal feet of pit track in the building. This apartment is separated from the machine shop by a firewall.

In developing the pit details many original features were adopted. The floors and end walls of the pits, like the floors throughout the building, are of concrete construction. Seven-

effective drainage and a means for clearing the sheds of cars in case of fire. Sewer traps are located at convenient points about the building.

On account of the usually mild climate that prevails in Nashville, it was not thought necessary to enclose the entrances to the car house. The roof of the building, however, is extended 12 feet 6 inches beyond the building line

proper on the Third and Fourth avenue sides. This projection prevents rain and snow from driving under the roof. Fifty-four wired-glass skylights admit a generous amount of light for the day inspection work.

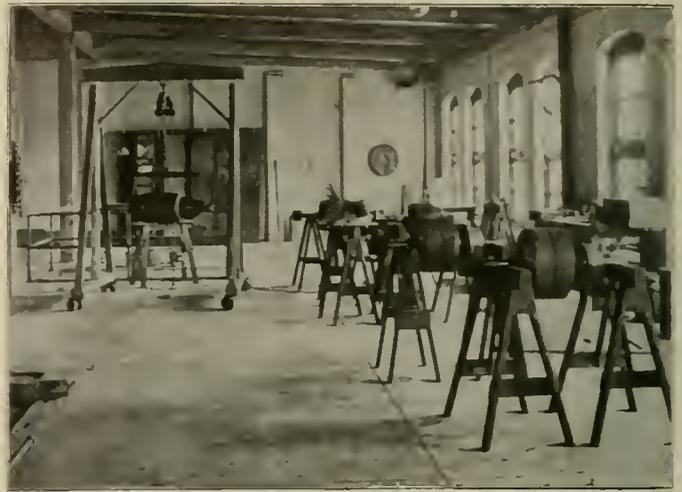

This building was designed for the night storage of all

made in the company's shops. As is shown in the illustration, neatly designed drying racks are placed about the room.

In the carpenter shop separate alternating-current General Electric induction motors are used to drive each machine. The following woodworking machines, supplied by

products and for emergency car-body repairs. When it is necessary to set the mortising, planing or shaping machines for any class of work, it has been found economical to work up quantities of stock and keep such supplies on the mezza-

the arrangement of tracks and special work leading to the various departments. At either end of the car house a main switch-track was laid, from which lead all the house tracks. By this means, switching of cars can be carried on without interfering with cars operating on the main tracks passing the buildings on Third and Fourth avenues. Tracks leading from the repair pits to the carpenter and paint shops enable cars to be shifted without delay between these departments.

All the offices and enclosed shops of the new buildings are heated by hot water supplied by a No. 3 Mercer boiler, which is located in the basement of the main building. Mr. George W. Swint is master mechanic in charge.

The New Tunnel for the Metropolitan Street Railway Company of Kansas City.

Plans recently were submitted by the Metropolitan Street Railway Company, Kansas City, Mo., asking the board of public works to permit the construction of a tunnel and viaduct from Broadway to Mulberry street. If the plans are accepted the company will begin the construction of the tunnel and viaduct at once, it being expected that work can be begun on March 15, 1907, and the tunnel and viaduct completed by January 1, 1908. The principal object of the new plans are in reality simply to eliminate the last cable road in the city. The new viaduct and tunnel are necessary to reduce the grade as electric cars would not be able to climb the 13¼ per cent grade on the route formerly followed by the cable road. The only feasible way which could be found to get over the bluff at Twelfth street and down into the bottoms on the other side of the hill is by the plan proposed.

The plans show an open cut extending 120 feet from Broadway and from this point a tunnel extending 3,600 feet to within 150 feet of Mulberry street, the objective point on the opposite side of the bluff. The grade as far as Mulberry street will be 5½ per cent and from there it will increase to 7 per cent. In order to avoid an excessive grade

New Shops and Car Storage at Nashville—Fourth Avenue Structure with Projecting Roof and Doors.

nine floor ready for immediate use. As many of the company's cars are of one type and the parts interchangeable, this can be done advantageously.

On property adjoining the carpenter shop is the company's lumber yard, where quantities of seasoned lumber are stored.

In designing the new buildings much attention was given

the viaduct will be built in the form of the letter "S," and will intersect the face of the bluff at about the same elevation as the present viaduct, but instead of climbing the face of the bluff as formerly, it will enter the tunnel at that point. The viaduct will have a double path for foot passengers from Mulberry street to the entrance to the tunnel on the bluff.

MILWAUKEE SERVICE INVESTIGATED BY WISCONSIN RAILROAD COMMISSION.

At the conclusion of its session on February 27 the Wisconsin state railroad commission, which has been hearing the evidence in the case of the city of Milwaukee against the Milwaukee Electric Railway & Light and the Milwaukee Light Heat & Traction companies, adjourned until March 19. John T. Kelly, the city attorney, announced that with the exception of a little additional testimony the city has completed its case. Mr. Kelly declared that the service which is maintained now is adequate and satisfactory and that if it is continued no further complaints will be made. It is to ask questions regarding the permanency of the present service that he desires to call witnesses on behalf of the companies. The companies will furnish to the city attorney such information as he requests to aid him in completing his argument to the commission.

T. A. Clancy, the chief of the fire department, was introduced by the city to testify regarding collisions with electric cars during the last seven years. The city attorney said that the object of this testimony was to show the need of air brakes on the cars.

At the hearing on February 20 C. M. Black, general manager of the Kansas City Railway & Light Company, gave some interesting testimony. After an investigation of conditions in Milwaukee, Mr. Black testified that the cars were not crowded for a run exceeding two miles, and that the standing loads were not carried to exceed $1\frac{1}{4}$ or $1\frac{1}{2}$ miles.

One of the attorneys for the Milwaukee company said that evidence would be introduced showing that the Milwaukee system operates 176 cars during the day and during the rush hours puts on 191 extra cars. There are 120 miles of single track in Milwaukee. Mr. Black expressed the opinion that this number of extra cars in use during rush hours was larger than could be found anywhere else in the country. When Mr. Black was asked if he thought better service could be given in Milwaukee during the rush hours he said that owing to the difficulty of getting trainmen he did not see how it would be possible. He added that all the street railways in the country had been confronted with the same problem during the last 10 years and had found it difficult to furnish men with enough continuous hours of labor to satisfy them. It was very difficult to get men to run extra cars for one or two hours.

Mr. Black stated that he had observed street car conditions in Cleveland, Philadelphia, Washington and many other cities and could say freely that there was less crowding in Milwaukee in rush hours than in any of the other cities with the exception of Washington. During non-rush hours Mr. Black said he did not see a single car containing more persons than seats.

The actual expense of operation of one car for an hour or an hour and a half, Mr. Black said, without allowances for depreciation or maintenance, would be \$5, whereas the earnings of one car would be not over \$4. If transfers were given, the actual earnings would be less than \$4. Mr. Black said that no company would contract to operate a car into the city and back to the barns for an hour and a half for \$5 a day because it would lose on the contract. Mr. Black said that the Kansas City company is unable during the rush hours to collect all the fares and that it would be glad to spend money on any plan which would improve the situation. The Kansas City company has 225 miles of single track and operates 515 cars during the busy hours, Mr. Black testified.

In speaking of the relations of electric railway companies with their employes Mr. Black said that rigid discipline is absolutely essential and that many men will not submit to it. While many men may be qualified in other

ways for the service they may be hasty in temper or slow in reporting for work, causing disarrangements of the schedules. Owing to the fact that men object to irregularity in their hours of work and rest, street railway companies have peculiar difficulties to hamper them in obtaining labor.

When the question of brakes was brought up Mr. Black stated that Milwaukee is level compared with Kansas City. In the latter city both the air brakes and hand brakes are used on cars; air brakes on cars weighing 40,000 pounds or over. Mr. Black had examined the hand brakes used in Milwaukee and believed that no advantage would be gained by using air brakes there. In Kansas City, he said, in spite of rigid inspection, there are accidents when air brakes are relied on. Mr. Black expressed the opinion that air brakes make motormen more venturesome and that new employes would have more accidents while learning to operate air brakes than when they were learning to use hand brakes. As to the comfort of the occupants of the car, he said, there would be little difference between the effect of air brakes and hand brakes if the mechanism of the hand-brakes is in good order and the motormen are skilled. Mr. Black said the condensation in pipes might freeze in Milwaukee and the air brakes fail.

As to whether it is better to run all cars to the center of the city and around a loop, returning over the same route, or to run them through from one side of the city to the other, as is the custom in Milwaukee, Mr. Black said he favored the Milwaukee system because it necessitated the use of fewer transfers and caused less congestion and delay at the intersection of lines.

R. A. Leussler, secretary of the Omaha & Council Bluffs Street Railway Company, was one of the experts who testified on behalf of the companies. He said that it is difficult to maintain discipline among extra men. His observations in Milwaukee satisfied him that the hand brakes were efficient there. Mr. Leussler stated that in Omaha the cars are equipped with air brakes, but that hand brakes are installed also as a matter of precaution.

William O. Wood, assistant general superintendent of the Brooklyn Rapid Transit Company, testified that he inspected the traffic in Milwaukee at all rush hours of the day, including the theater traffic, within what he termed the congested district, 1-3 miles from the center of the city. In speaking of the traffic during non-rush hours, Mr. Wood said: "It is more than sufficient—an extravagant service." He thought that it would be impossible to increase the number of cars at rush hours because of the lack of men and because the character of the work causes a division of hours of labor, which is a hardship on the employes. Mr. Wood said:

I believe that the air brakes cannot be recommended as better than the hand brakes, which are safer. Motormen with air brakes rely upon their maximum efficiency and use them to the limit. When the air brakes fail the time is too short to apply hand brakes. The traffic in Milwaukee is very dense about 6 o'clock. I do not believe any good purpose would be served if additional cars were put on. They would delay the service and people would not wait, but would pile on the first car.

In reply to a question, Mr. Wood said he did not think it unreasonable to make a man wait 10 minutes for a car on a light line. He testified that on one evening ten persons crowded on a car who should not have done so, though they were told that another car was following.

J. T. Funk, superintendent of the Louisville Railway Company, stated that in Milwaukee more cars were run in proportion to the people carried than in any other place with which he was familiar. He testified that he never saw a large crowd handled in better manner than the theater crowd in the evening before his testimony was given. While on some cars there were heavy loads, these would not have been avoided by the use of additional cars, as the tendency of people is to crowd on cars rather than to wait. In his opinion an increase in the number of cars

would not be an advantage to the traveling public because it would cause congestion at busy points. He preferred hand brakes to air brakes, and, considering the speed of the cars, said that hand brakes were efficient in Milwaukee. He pronounced the air brakes a failure in Louisville, as their use had permitted costly accidents.

George Kuemmerlein, Jr., assistant superintendent of transportation of the Milwaukee Electric Railway & Light, testified that the company would rather have 75 people in a car than 90. "With 42 sitting down and 30 standing inside the car," he said, "the conductor can collect the fares without difficulty. Our supervisors keep us informed as to the traffic and we put on cars or take them off according to conditions."

John I. Beggs, president of the Milwaukee companies, appeared before the railroad commission on February 19. In answer to the statement from Lynn S. Pease, representing the citizens of Wauwatosa, that the highest figure which he had noticed of persons boarding any one car was 212. Mr. Beggs said that it would be impossible to get that number of people on one car. When the statement of Mr. Pease was analyzed it appeared that 212 fares had been taken, which Mr. Beggs showed was a different matter. The collection of as many as 212 fares on one car was exceptional, Mr. Beggs said. In reply to a question as to what he considered a crowded car, Mr. Beggs said:

A maximum load at any one time would be a number of passengers standing equal to the number seated; that would be about 90 passengers. That is an extreme load; it is seldom realized. The seating capacity of a Wells street car is 42 in winter and 44 in summer. We could not crowd more people on than that, but they crowd themselves on; we prefer to keep them off. I have not yet been able to find a lawyer who would assure us that we would be justified in using force to keep people off our cars. I hold that such a load as I have named is not an unreasonable condition. If passengers crowded on as they do in New York we would be carrying 150 passengers to the car. Milwaukee does not know what crowded cars are. If you will supply a penalty which we can enforce upon passengers who crowd upon a car that is loaded unduly we shall see that it is enforced, and that within a reasonable time cars are furnished for the people left over.

In reply to the question whether he would approve the issue of such an order by the railroad commission, Mr. Beggs said that he would, and added: "I hope that the commission in time will be clothed with sufficient power to apply such a penalty."

Mr. Beggs, in continuing with the evidence, said that the plan to supply conductors with commutation tickets for Wauwatosa so that they might be purchased readily by passengers was impracticable as the conductors who carried Wauwatosa tickets would also have to carry tickets for all other suburban and interurban lines and that a safe would be required to hold all the tickets.

The complaint on which the present investigation by the railroad commission was based states that while residents of Wauwatosa pay two fares, passenger on the Howell avenue line to Tippecanoe ride for a single fare. In explanation of the discrepancy, Mr. Beggs said:

Tippecanoe is a sore point. The line was built on a \$40,000 bonus before I assumed the management. We have held to one fare because it was one of the conditions, and we always stick to our agreements. The line does not pay for the conductors and motormen. I once offered the people their \$40,000 if they would agree to let us abandon the line.

The Manhattan Railway Company of New York, now leased to the Interborough Rapid Transit Company, is installing a new safety device on the controllers of the elevated trains, which it is expected will materially reduce the chances for accidents and enforce strict attention to business on the part of the motormen. The new device, which is an addition to the functions of the "dead man's handle," is so arranged that it will be necessary for the motorman to keep his hand on the controller when coasting as well as when the power is on. The cars are being equipped with the new improvement at a rate of about five cars per day.

BOSTON & MAINE WANTS CONWAY (MASS.) ELECTRIC RAILWAY.

Dr. John B. Laidley, secretary and manager of the Conway (Mass.) Electric Street Railway Company, appeared before the committee on railways of the Massachusetts legislature on February 20 to urge the passage of the bill allowing the Fitchburg railroad to buy control of the Conway company. The objection was raised that the bill would give the Boston & Maine, which controls the Fitchburg, an opening wedge so that it might secure control of many electric railway companies along its lines. Dr. Laidley did not see how the bill would allow this. The attitude of the Boston & Maine, as he understood it from Lucius Tuttle, the president, was that that company wanted to acquire the Conway company in order to have the electric power and power rights which it controls. Dr. Laidley understood that the Boston & Maine wanted to use more electric power in the Deerfield yards.

Dr. Laidley gave a history of the Conway company. Before the steam railways were built Conway, he said, was prosperous and well populated, but as Conway was not on the line of any of the roads it declined after they were built. In the ten years previous to 1894 Conway lost more than 400 of its population. The townspeople tried three times to induce the steam railways to build a branch, but after surveys had been made the plans were abandoned because the railways did not believe they would get sufficient business to pay them for the cost of construction. In 1894 the Conway people secured from the legislature a special charter allowing them to build an electric railway for freight, as well as passengers; and to run freight cars through the town streets and build sidings leading to the stores and mills. This privilege was secured because the Conway people proved to the legislature that the situation was unique, and that Conway, in order to maintain itself, needed all the privileges obtainable.

As there are only 1,300 people to give passenger business on six miles of railway between South river station on the Fitchburg division of the Boston & Maine and Conway, it was necessary to depend on freight for much of the revenue, and the Conway company has been able to come out only about even. Dr. Laidley said that the company earned last year, even with the officials giving their time, about \$4,000 over operating expenses, and this sum was required for interest charges. The company has never paid a dividend.

By acquiring private land the Conway company, in 1896, secured the right to enter the town of Deerfield, and later it secured the right to sell power to a private company organized by Dr. Laidley to furnish electric light and power in Conway. The line, Dr. Laidley said, has 78 curves and grades as high as 8 per cent. The road uses a combination car for passengers and light express and mails; but also hauls small freight cars which have a capacity of eight to 10 tons of coal and six to eight tons of grain. These cars are switched directly to the doors of the mills and stores.

When he was asked how the Boston & Maine could operate the electric railway more profitably than could the Conway company, Dr. Laidley replied that the Boston & Maine could borrow at rates sufficiently low to save enough money to make the difference between a deficit and a surplus; moreover, he said the Boston & Maine could develop the power rights now owned by the company in the South river, and could find a market for all the power that could be developed.

Dr. Laidley showed that the railway had benefited Conway by reducing the cost of delivering freight and express and by inducing new factories to locate there, preventing by this means the population from moving away. In the five years after the railway was built the town added 200 to its population. The railway had been operated for 12 years without an accident. If the Boston & Maine acquired the property, Dr. Laidley thought the track and roadway would be kept in better condition; the property could be taxed instead of having its taxes lessened, and the indebtedness of \$100,000 could be handled to better advantage.

DISPATCHING CARS BY TELEPHONE, DENVER CITY TRAMWAY.

BY S. W. CANTRIL, SUPERINTENDENT.

The system of operating street cars by telephone from a central station was introduced in Denver a little more than 17 years ago. The idea originated in the mind of Mr. Charles K. Durbin, then superintendent of the Denver Tramway Company. At that time the lines were operated, for the most part, by cable. This method was prompted, no doubt, by motives of economy, as it was believed that the few cars then owned by the company could be operated by one man through the use of telephones and the wages of numerous starters thus saved.

Although the apparatus and switchboard used at that time were of the crudest kind and have since given way to the up-to-date appliances provided by the local telephone

The dispatcher's office is located in a company building situated in a most convenient place at the central loop. Here also are the headquarters of the superintendent, company's surgeon, overhead line department, wrecking crew and general repairmen, with all of which the dispatcher has direct connection by telephone.

Usefulness in Time of Fire.

The dispatcher also receives all city fire alarms, and the company thereby is enabled to learn the location of fires as soon as the fire department. Being in close touch with the working force mentioned above, the dispatcher at once reports the location of a fire to the proper officials, together with any information that may have come to him from trainmen in close proximity. If there is danger that cars may be blocked by lines of hose, the crew of the hose-bridge wagon is ordered to the scene. This wagon is constructed for carrying a number of bridges, and as the wrecking de-

Dispatching Cars by Telephone—Office of Dispatcher, Denver City Tramway.

company, the principles of directing the movements of cars by telephone have changed but little. With a small beginning of 5 lines, which have since grown to 30, the telephone seems fully as adequate to meet the requirements as it was at first. Naturally, some of the methods originally employed have been modified in the light of later experience, and the telephone lines extended and multiplied as new track was built, old lines carried farther into growing residence districts, and the car service increased to meet the demands of Denver's rapidly increasing population.

General Arrangement of System.

The lines of the Denver City Tramway Company are particularly well adapted to being handled by a dispatcher. In the business center of the city and adjoining each other are two small loops, which mark the down-town terminal of nearly all the lines. A few long cross-town lines pass through the city within one block of each other, and there is but one line which is two blocks distant. The tracks are so connected, however, that the cars of any isolated line may be run into the central loops, if necessary, and other cars put in their places.

partment is conducted on similar lines to those of a fire station, a quick hitch is made so that by the time hose is laid across the tracks the bridges are on the ground and cars soon are running as usual.

An Aid to Operation.

The telephone dispatching system affords the superintendent the greatest facility for keeping in touch with every detail of the operation of cars. If an accident occurs, the particulars are at once communicated to the dispatcher, either through a regular reporting station or the most convenient telephone in a residence or business house along the line, and no time is lost in summoning the necessary officials, city ambulance or wrecking crew. Should a car become fully or partially disabled, the crew immediately notifies the dispatcher, giving the nature of the trouble. Being fully acquainted with the situation, the dispatcher arranges to have necessary repairs made when the car reaches the central loop, and, if expedient, to take the car off the line and fill the space with one of the emergency cars at his command.

The flexibility of the car service and the rapidity with

which the dispatcher is enabled to adjust the headway of any line are the strongest points in favor of the telephone system. In every city the condition of travel demands the addition of extra cars or trippers on most lines, at certain periods of the day. In the morning, for instance, the riding is chiefly toward the business center and the extra cars, as far as possible, take their places and are spaced from the outer terminal, each extra running between two regular cars. In the afternoon the condition is reversed, and the regulars are held back at the outer terminals to make places for the extra cars which are sent out from the center of the city, thus maintaining an even headway throughout. As the extra cars are withdrawn from the line, the dispatcher again equalizes the spaces as fast as cars are reported at the terminal and no confusion results. Any congestion of the cars of a line caused by accident or blockade is adjusted in the same manner, speedily and without difficulty.

Another advantage of the telephone dispatching system is, that it enables the superintendent to keep in close touch with the conditions of travel after the evening rush and theater patrons are properly cared for. At this time of day the dispatcher begins to retrench the service and sends cars to the car houses as they can be spared without interfering with traffic. The Denver City Tramway Company has a regular method of "pulling-down" the lines at night, but if the dispatcher finds that the travel is such as to demand increased service, he may hold a full quota of cars on one or more lines and, if necessary, use cars which are not needed on other lines. In this way, through the agency of but one man who is enabled to keep fully alive to the needs of patrons on all lines, the service is reduced to a minimum.

Method of Dispatching.

As to the method of dispatching cars by telephone, a brief description may be of some interest. The dispatching circuits are operated similarly to a party line, each circuit having from two to four reporting telephones of different car lines. Care is taken not to place two busy telephones on the same circuit.

A train-sheet 26 by 24 inches in size, with spaces for car numbers of all lines and ruled spaces opposite for their leaving time from the reporting stations, is fastened to the desk in front of the dispatcher. On long lines, where cars are reported at each terminal, the car numbers are duplicated for each reporting station. After a car has been switched at the end of a line, the conductor calls the dispatcher from a telephone placed in a convenient receptacle. He tells the dispatcher the number of his car and the name of the line upon which he is running. Aided by his familiarity with the running time and his experience in making quick computations, the dispatcher announces without hesitation the proper leaving time of the car. The conductor then repeats the time given by the dispatcher to make sure that he heard aright, receives the dispatcher's "O. K." if correct, and prepares to depart as directed. At the same time the dispatcher records on the train-sheet, opposite the car number, the time of leaving. The running time of all lines and the time allowed for running between given points along the line are published for the benefit of all trainmen. As soon, therefore, as the motorman receives the leaving time at one terminal from the dispatcher and the conductor, he knows at what time his car is due at the other terminal and just when his car should pass the "time points" along the route.

Utility of the Train-Sheet.

At the end of the day the train-sheets show the time at which each car left the terminals of the line or lines upon which it ran. This record proves a valuable one in many ways, especially when it is necessary to gather information concerning an alleged accident. The dispatcher's train-sheets also are valuable for use in the auditing department. For

Annotations:

- ☑ Indicates car to be pulled off.
- Indicates time car was not on.
- Indicates parking space occupied.
- Indicates car taking space at different depots.
- Indicates car taking space at post office hour end of line.
- Indicates time car was changed.
- Small figures are time given when car numbers are not on extra.
- All characters explained in manual.
- ☐ appear in red ink on original train sheet.

Dispatching Cars by Telephone—Portion of Train-Sheet Exhibiting Dispatcher's Records for Several City Lines. (Original 24 by 26 inches.)

instance when cars are taken off the line the conductor receives orders from the dispatcher, giving the leaving time of such car "to the house." Knowing the time allowance from the terminal to the car house the conductor computes, by means of a printed wage-schedule furnished him by the company, the exact amount of his and the motorman's wages and pays both out of the car receipts. This unique and economical plan of paying wages has been used with great success by the Denver City Tramway Company for the past 18 years. With the dispatcher's sheet before him, together with the trip-reports of the conductor showing the time the car was "signed in" and "out" of the house, the auditor has no difficulty in ascertaining the exact length of time a car has been in service, and it becomes an easy matter to verify the work of conductors.

When lines are running smoothly a dispatcher will answer from 10 to 15 calls per minute and can handle from 150 to 175 cars. If, however, something occurs to interfere with the service on one or more lines, which demands more than ordinary attention, he is unable to do full justice to more than 125 cars.

Dispatching on Interurban Lines.

The company's interurban lines also are operated by use of the telephone system, but are in charge of a separate dispatcher. On account of the fact that these lines are single-track, the traffic being divided between passenger, freight, work and special trains, the responsibility of the dispatcher is much greater although the calls he answers are few in comparison with those of the city lines.

Reporting stations are placed at every siding, the color of the telephone box indicating whether or not it is a regular reporting place, or only to be used when running under special orders. The wiring of the offices of the city and interurban dispatchers is so arranged that the interurban office may, in busy times, relieve the city dispatcher, by taking charge of one or more lines. At about midnight the interurban office is closed and the night city dispatcher assumes the duty of running the owl cars and the interurban freight trains.

One Operating Center.

The night dispatcher acts as an intelligent watchman over the entire system. He is authorized to call out such officials, foremen or repairmen as he may deem necessary for the best interests of the service. He is at all times alive to the weather conditions. Should a storm arise, with danger of blockade from snow, he notifies division superintendents and sees to it that the crews of snow plows and sweepers are called. He also calls the roadmaster, who provides the necessary trackmen to keep the switches and crossings free of snow. If the condition of the rails is bad and there is danger that the first cars may be late in getting to their destinations, the dispatcher arranges to have them leave the car-houses a few minutes earlier so that the patrons may suffer no inconvenience.

At pleasure resorts and other places where the travel becomes very congested and somewhat erratic, the efficiency of the dispatching system is greatly augmented by the presence of an inspector or other official of the company, who, being directly on the ground, can attend to the proper loading and unloading of passengers, and keep the dispatcher informed as to the needs of the service. In this way extra cars may be hurried out to bring in the crowds, or they may be diverted to other lines as the travel decreases.

There are 1,614 street cars operated in Great Britain, by other than electric power. There are now more than 400 miles of electrically operated railway track in Great Britain and a total mileage of electrically operated tramway track of 3,362.

EMPLOYEES' RECORDS OF THE MEMPHIS STREET RAILWAY COMPANY.

An interesting and novel method of handling accident reports is in use on the lines operated by the Memphis Street

many accidents that occur during the year. Believing that an early and thorough investigation into the cause of accidents, trivial and otherwise, places the claim agent in a better position to defend the company's interests, attention has been

ting obsolete ones, the Turner ordinance was placed in such code as a live ordinance and one of present binding force.

The city council has directed new lines to be built since 1898, and since that date 30 miles have been built at great cost, and by so doing the city construed the ordinance as the company now contends, and the city ought to be and is stopped from denying the contract, tearing up the tracks or declaring the company a trespasser. The complainant owns the tracks built by the Turner company and its successor, and by conveyances of record owns the franchises as well, which were assignable.

The fact that the life of complainant as a corporation is limited to a term of years is not decisive, because it has the right under our general corporation laws to renewal. And if it had not, its assets, including the franchise asset, belong to the stockholders subject to the rights of its mortgage and general creditors. In 1866 there was no specific statutory authority for granting permission to occupy the streets with the street car lines. Des Moines had then but about 6,000 people, and it was about as large as any other city of the state. But Dr. Turner and others had confidence in its growth. And the then city council desired to aid in building up the city, by enabling people to reside beyond the business district. So that the ordinance was enacted under a statute giving general control only over the streets. The system was thus inaugurated, and carried on for 14 years, with an expenditure of \$200,000, and no profits. Then when profits were in sight, the council granted rights to other companies and the litigation commenced.

Many cases of the highest authority are called to my attention, to emphasize the undoubted and most familiar rule, that a public grant must be given the construction most favorable to the public, when it is susceptible of two or more constructions. But neither statutes nor ordinances are to be frittered away by construction. Like contracts, they are to be held up by the four corners, examined and given a fair construction. Let it be kept in mind, that for what appeared sufficient reasons, the legislature has from time to time limited the time of several municipal utility corporations and their rights to the streets. But not so with the street railway lines.

And let it be kept in mind that to prevent the ordinance from being void by creating perpetual monopoly that the monopoly feature was limited to 30 years of time, now expired.

Questions of rates, or transfers, or taxation are not involved. Nor are questions as to the efficiency of service, that which interests the people more than all else in connection with a street railway system. And with efficient service, and reasonable rates, the people are content. And with these in mind the legislature was content, not to allow the monopoly for all time, but to allow one company in common with all others to have a continuing franchise. And when it fails to furnish such service the remedy is plain.

But in the meantime there is a contract that must be observed by the city.

In discussing the decision N. T. Guernsey, general counsel for the company, said:

As I analyze it the propositions established are the following:

(a) That the federal courts have jurisdiction to hear and determine the controversy.

(b) That under the statutes of the state the city had the power to grant a perpetual right.

(c) That the 30 years' limitation in the Turner ordinance applied only to the exclusive right to operate by animal power, which expired January 1, 1898.

(d) That under the Turner ordinance as amended the company has a contract granting it a perpetual, but not exclusive, right to maintain and operate its tracks.

While the opinion of Judge McPherson unequivocally recognizes the perpetual right of the company, he is careful to call attention to the fact that out of this right arises the obligation on the part of the company to furnish adequate and efficient service. In other words, it is not a right which can be exercised to the detriment of the public, but which must be exercised for its benefit.

Terminal Station in Milwaukee.

President A. C. Frost of the Chicago & Milwaukee Electric Railroad appeared before the joint committee on judiciary and railroads of the Milwaukee city council on February 27 and stated that the company had taken a 99-year lease of the property on Second and Wells streets and will erect a terminal station at that point, to cost \$200,000. The announcement was made in connection with an application for a change in the company's franchise to give access to the new station. Mr. Frost stated that the building will be four stories in height and in addition to space for cars and waiting rooms will contain the offices of the company. Provision is to be made for cleaning the cars after each trip. Tracklaying on the line is now completed to within 12 miles of the southern limits of the city. It is planned to have cars running into the south side of the city by September 1. The time when cars will enter the business district depends on the completion of the Sixth street viaduct.

SAND-SUPPLY CAR AT KNOXVILLE.

The illustration herewith shown was made from a photograph of the interior of a sand-supply car used by the Knoxville (Tenn.) Railway & Light Company for sanding the track during bad weather and for replenishing its supply in the sand boxes of the regular cars.

The company's car barn, where the sand drier is located, is far removed from the transfer station and the main arteries of travel and as a result it is seldom that a regular car gets to the barns before completing its day's schedule. Inasmuch as many of the car routes are hilly and the conditions of the tracks necessitate the free use of sand it was found necessary to devise a means of supplying the cars with sand during the day. This sand-supply car was accordingly fitted up to meet the requirements.

The car is one of the type of single-truck equipments formerly used on the system. Along both sides of the interior of the car bins about three feet high and having a capac-

Sand Supply Car, Knoxville, Tenn.

ity of five cubic yards of sand have been provided. Leading from each of these bins, at a point midway from each end, is a sand pipe which conveys the sand from the hopper to the rails of the track. The flow of the sand is regulated by cut-off valves which are worked by levers located inside of the car. In addition to these track leads there are four plug taps, one being located at each corner of the car.

Once each day the car is run over the sections of slippery track throughout the city, after which it is sent to the main waiting station, where all cars stop. When it is necessary to replenish the sand-supply boxes on the regular cars the plug taps are opened and by the use of pails the sand boxes are filled. The top of the car is provided with racks and running boards which make it possible in case of trouble to press the car into service as a tower car in repairing the overhead lines.

While taking a curve near Portage, O., on February 23, a southbound car on the Toledo & Interurban Railway left the rails and turned completely over, injuring the eight passengers and the conductor and motorman. The accident is said to have been caused by spreading rails. The car was completely wrecked.

DEVELOPMENT OF THE OKLAHOMA CITY RAILWAY COMPANY.

As an example of the remarkable growth of the electric railway industry, the phenomenal development of the Oklahoma City Railway Company since the opening of its line February 8, 1903, is most interesting. At that time the company operated five miles of track and four cars. It now operates 45 cars on 30 miles of local track and 10 cars are under construction. There is further under construction at present an interurban system which when completed will have a total length of more than 150 miles within a 35-mile radius of Oklahoma City.

The Oklahoma City Railway Company was organized entirely by local men and only a small part of the capital is owned by outside interests. Though the line has heretofore changed hands, the officials are and have been in every instance residents of Oklahoma City who have been interested in the development of their city, many of them since the opening of the territory. In 1903 there were two main lines of 2½ miles each traversing the two principal streets of the city. These lines remained in operation until about two years ago, when the company passed into the hands of the present management. Since then besides maintaining the existing lines new lines have been opened and the system improved in accordance with modern ideas. At North Oklahoma City it is proposed to connect with an interurban line running to Guthrie, the route having been surveyed and partly graded.

The company under its present management recently formulated a plan to construct a line running 31 miles north to Guthrie, another 35 miles south to Purcell, one 28 miles west to El Reno and finally a 40-mile line east to Shawnee.

A novel scheme was adopted in order to make possible the proposed interurban lines. This consisted in buying a large tract of land which was partly turned into a pleasure park and partly into a residential park. The land surrounding the park has been divided into building lots, part of which have been sold, and the money from these sales has been used to build Belle Isle park and build about 10 miles of interurban track.

Belle Isle park covers an area of about 300 acres of magnificent land admirably suited for park purposes. There has been constructed in the park an artificial lake of 225 acres and the remainder of the park will be left as a forest. To form the lake, it was necessary to construct a dam 30 feet high and 250 feet long and a spillway to permit the overflow of water during rainy periods. The dam will be 30 feet wide at the crest and will accommodate two public roadways and a double track. This park when completed will have no amusement features other than boating and bathing as it is necessary to make it as attractive as possible in a quiet way because of the residential surroundings. It is estimated that the park has cost \$250,000 to build.

The first effort to make the extensive interurban system a reality was the securing of a private right of way at each of the terminal points. The lines have all been surveyed and grading has been practically completed on the Guthrie division and will soon be begun on the remaining divisions. The Guthrie division represents the most modern type of roadbed; though the grading for the most part has been through a level country a number of ridges were encountered, necessitating a series of cuts and concrete bridges. The bridges are an example of the liberal and substantial manner in which this work is being carried out, most of the bridges being built to accommodate a double track with a public roadway on each side. A public roadway has also been built alongside the track over most of the right of way. About 10 miles of this line is now practically completed, this portion extending as far as Belle Isle park. The El Reno, Purcell and Shawnee divisions have been surveyed as before stated

and grading will be begun on these within the next few months. The population of the territory traversed by this network of interurbans will be approximately 150,000.

The city track construction will be standard gauge, and rails of Shanghai section embedded in concrete will be employed. A 12 by 24-inch continuous concrete girder will extend under each rail, the two concrete girders being joined by a 6-inch concrete slab in which the steel channel cross-ties set on 4-foot centers will be embedded. The rails are embedded 3 inches in the 12 by 24-inch continuous concrete girders, thus leaving the exposed rail but 4¼ inches above the roadbed. The rails, it will thus be seen, are supported, not only by the ties and the concrete girders, but on the entire surface between the tracks as well. This construction, though expensive to install, should make a very fine roadbed well adapted for high-speed work and should repay its cost in durability and the reduced liability to derailment and accidents.

The total bonded indebtedness of the Oklahoma Railway Company is \$650,000. Since the present management has taken charge of the property no dividends have been declared as all the available money and earnings have been used on improvements and the construction of the interurban system.

IMPROVEMENTS AT MOBILE, ALA.

Important changes were made in the properties of the Mobile Light & Railroad Company during the year 1906. Chief among these changes was the separation of the railway from the lighting interests and the sale of the latter in August to the Mobile Electric Company.

The sale included the transfer of all the power plant lighting units, the transmission lines, city franchises (so far as the same refer to the furnishing of current for lighting purposes), and all contracts and obligations of the electric department. Though this leaves the Mobile Light & Railroad Company exclusively a railroad company the old name will be retained. Since the sale was consummated the officials have devoted their entire attention to the development of the railway interests and, as is shown by the statement of earnings recently issued gratifying results have been obtained. During the year 1905 the gross earnings of the railway department were \$411,692.86, and in 1906, \$516,614.98, an increase of \$104,922.12 for the year.

The work of rebuilding the 46 miles of track throughout the city is now in progress and as soon as the 1,100 tons of steel, now on hand, is laid the reconstruction work will be completed. In the paved streets 92-pound girder rails have been used, and in the streets not paved 70-pound T-rails have been adopted as a standard. For supporting the girder rails a concrete stringer is used.

In this construction creosoted ties, spaced 10 feet apart, center to center, are laid in the prevailing sand substrata. Between these ties is laid a concrete stringer 9 inches deep, 16 inches wide at the bottom and 18 inches wide at the top. The rail is set on this stringer, after which the concrete is extended three inches above the base line of the rail, where it joins with the foundation of concrete laid for the asphalt pavement. This stringer is usually built under contract by the pavement contractor, and the concrete is mixed in the same proportion and at the same time as that for the pavement foundation. The rails are tied together every seven feet by steel tie rods. This form of construction has been in use for several months and so far has given satisfactory results.

The new work planned by the company for the present year includes the construction of about five miles of new track, the erection of two car storage barns and the building of a large summer and winter resort hotel at a point three miles from Mobile on the shores of Mobile bay. The street railway lines will be extended to this hotel and an effort will be made to make it one of the popular resorts of the south.

emplary service is rewarded by promotion, as herein referred to.

A bulletin bearing the names of the conductors and motormen to whom demerit marks have been given, and the reason for the same, is posted in the employe's room at the barns every Saturday. In addition to this a bulletin of the ten divisions, the men entitled to the various runs and the changes that have been made through the discharge or reduction in rank of trainmen is posted. These bulletins are watched for with interest and have come to be important factors in the system of operation.

Discipline reports are filed with the records of employes which are kept in the office of the company. The report forms which are shown herewith are comprehensive and contain the more common abuses for which it is found necessary to discipline trainmen.

The operating department of this railway is always in close touch with the men in charge of its cars and keeps them informed of the existing conditions. Once each month the superintendent gives employes an informal talk on the progress made toward furnishing the public with better service and on prevailing undesirable practices among the men.

DOUBLE-LIFT BRIDGE OF ILLINOIS TRACTION SYSTEM, AT PEORIA, ILL.

An interesting bridge is being built by the Illinois Traction System across the Illinois river at Peoria. The approach is an earth embankment supported by concrete retaining walls. The length of this approach is 145 feet. The steel structure is carried on deck-plate girders alongside of the new power house, described in last week's issue, and on through plate-girders over a number of railroad tracks to the pier at the west bank of the river. These girders are supported on concrete piers and steel bents. The grade of the approach on the Peoria side is 3.88 per cent. Above the railroad tracks the grade is level and it then descends to the west river pier on a grade of .65 per cent. The clearance of the girders above the railroad tracks is about 23 feet.

The main part of the bridge across the river consists of four riveted through-truss spans 142 feet, 10-inch center to center of piers and a bascule span of the "roll type" 173 feet in length from center to center of back piers. The grade on this portion of the bridge is 2 per cent, descending to the east.

The river piers are all built of concrete masonry, reinforced with corrugated iron rods of the Johnson pattern. Piers 1 and 6 rest on piles driven down to solid rock. Piers 2, 3 and 5 in the channel were built directly on the rock, the excavations having been made inside of cofferdams constructed of steel sheet piling. The river piers are 5 feet thick under the belt, 20 feet between shoulders and have semicircular ends. The side batter of the piers is $\frac{3}{4}$ inch per foot. The bascule span furnishes a clear opening of 125 feet. It is of the deck type, and has two leaves, the length of the span being 141 feet center to center of bearings when closed.

This bridge is built for an assumed continuous load of cars 45 feet long, each car weighing 75 tons. This is much greater than the present interurban load and corresponds to a train of 100,000-pound coal cars in regular railroad service.

The substructure was completed under contract by MacArthur Brothers Company, Chicago. The superstructure was manufactured and is being erected by the Strobel Steel Construction Company, Chicago. It is believed that when completed the bridge will be found very satisfactory in operation and of more than sufficient strength to carry any future load. We are indebted to H. C. Hoagland, electrical and mechanical engineer, Illinois Traction System, for the preceding description.

FAMILY TALKS.

Mr. J. W. Brown, superintendent of transportation of the West Penn Railways Company, Connellsville, Pa., is introducing a novel method of keeping the car employes of this company informed as to their department. This consists of a series of "family talks," issued weekly. These "talks" are couched in everyday language and the names of motormen and conductors are given where their actions deserve commendation and omitted where there has been an infraction of the rules. The idea, however, is to show that the actions, both good and bad, of the platform men are noticed at all times. One of this series of "family talks" follows:

Most of the boys are still keeping their eyes on the gun and it shows in our not having had any serious accidents lately. Some fellows are still being careless about little things, and we won't get in the blue-ribbon class till some few men either brace up and play ball or else graduate from the service. I think it's going to be a case of brace up; we don't want to lose any of the family. Watch out for these women that take sudden notions about getting on or off the car. Be ready to keep them from causing you to make out an accident report and your company to pay out a lot of damage money. No use to get mad and talk about them either; tell them courteously that it's dangerous to act in the way they just did and perhaps an occasional one will remember it and be more cautious the next time.

Davy Flick and John Battenfield turned in a good report of a little trouble with a mule at Keystone Tipple the other day; try and get more addresses the next time. Davy; you were long on witnesses but a trifle shy on streets and numbers.

George Rankin and Chris Vardell had one of those notionate female cases last week where a woman did not decide to get on the car till after it had started. Sorry it happened, but a good report helped some, seven witnesses with their addresses.

Bob Sharpe and Howard Shaner had some trouble with 312 the other evening and were derailed at Smith's Switch. The boys made a good report, nine witnesses and their addresses.

Harry Ford and Jim Mayfield made a good report on a horse scaring at West Overton the other day; ten names, but a bit shy on addresses.

Two motormen and two conductors running out of one of the coke region towns last week sat up nearly one entire night playing poker; they were not playing on the premises of the company, but do you think that a man is in good shape to take out a run the next day who sat up all night in a poker game? Doesn't look good, does it? Better drop that for your own sake as well as ours; we can remedy the trouble as far as we are concerned but the effect on yourself is bad. Costs too much to live these days to throw it away on poker games.

Saw Shanaberger helping people on and off his car in a businesslike way the other day; special attention to some old ladies. Some fellows get this wrong end to and think it should be special attention to good-looking young girls.

Now, all aboard for good work during the holiday season. Heaps of go carts, big bundles, hobby horses and all sorts of things to delay a conductor and make a motorman fidgety, but don't forget that your wives, your mothers or sweethearts are also shopping and you would not want them to be treated discourteously by anyone just because they had a lot of packages. Let's keep in a good humor.

Yours truly,

J. W. BROWN.

Electrification of Main Lines of Railway.

The Prussian minister of railways has, according to the Cologne Gazette, long had under his consideration a scheme for the use of electricity on certain main lines of railway, and the question of its adoption has now been answered in the affirmative. In the first instance an experiment will be carried out on the section of rail between Kiel and Altona, a distance of 62 miles, and it will depend on the results of this test whether the system will be introduced on still greater lengths of railway. The electrification of this line from Altona to Kiel will not only apply to the passenger traffic, but all the goods traffic also will be worked by electricity. This will be done in order to prove whether in the present state of electro-technical development it is possible to arrange for handling the whole of the traffic on a railway over which many trains are run with the entire suppression of steam traction. The necessary preliminary steps for carrying out this work have already been put in hand, and it is therefore possible that the electric working of this railway may be commenced during the course of the present year.—Railway Times (London).

THE USE OF CONTACTORS WITH PLATFORM CONTROL.

One of the most valuable operating advantages of the multiple-unit control systems now in service is found in the removal of heavy current breaks from the car platforms. The short-circuiting of controllers, opening of circuit breakers and the blowing of large fuses in close proximity to timid passengers are fertile causes of damage suits on account of alleged fright or actual injury resulting from loss of self control. It seems almost impossible to teach the general public that the operation of automatic open circuiting devices and even the occurrence of controller grounds are almost invariably incidents capable of doing no harm to passengers who remain quietly in their seats. For this reason many cars have been equipped with multiple-unit control, even on roads where the likelihood of train operation is exceedingly remote.

A comparatively recent step forward in ordinary car-

forward, the main circuit is closed automatically by the relay switch in the base of the controller, and the cutting out of resistance and series-parallel combination changes are effected in the usual manner.

The circuit breaker tripping coils in the platform hoods do away with the necessity of an ordinary open circuiting automatic switch at these points. The supply of the current to the contactor solenoids is cut off whenever the main current in the tripping coils exceeds a predetermined limit. These tripping coils can be as readily reset by hand as an ordinary circuit breaker, and the contactors cannot be operated until both tripping coil switches are closed. The main contactors are placed in series to increase their positiveness of action. The rheostats are located beneath the car as usual, and the wiring can be readily carried in armored conduits. The main hand-operated switches in the vestibules are used only to cut the current supply off the car for definite intervals. The auxiliary contactor-solenoid circuit is energized

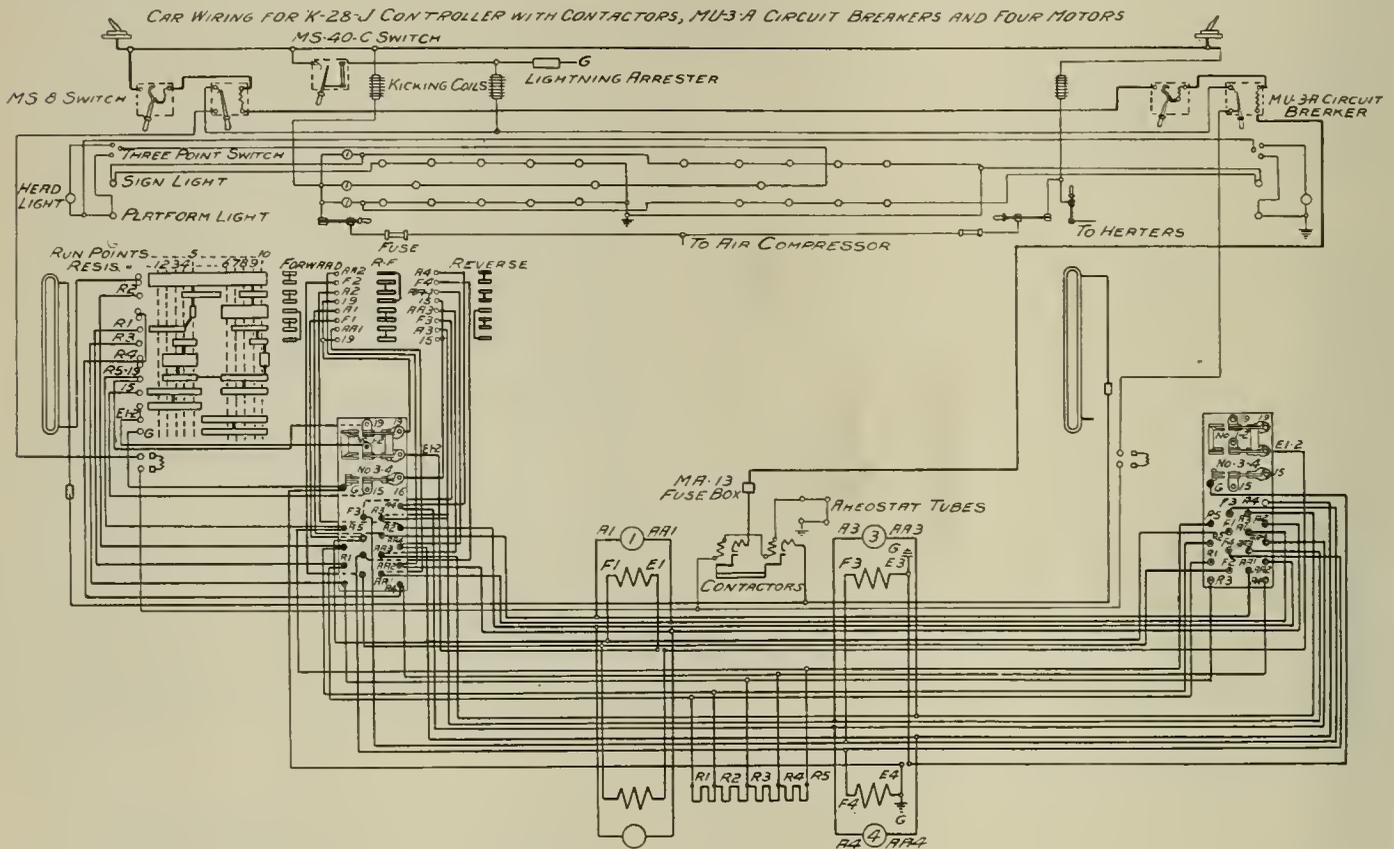

Diagram Showing Car Wiring with Multiple-Unit Contactors In Series with Cylindrical Controller on Car Platform.

control methods is illustrated herewith, the object of the designers being to adapt the contactor system of opening the main circuit beneath the car to ordinary hand controller equipments, without going to the expense of fully adopting multiple-unit control. In the drawing shown, the connections are given for a General Electric K28 controller modified so as to remove the main opening and closing of the trolley circuit from the platforms. The circuits are for four motors, and the auxiliary car lighting and heating connections are included in the sketch.

In this arrangement the trolley current cannot enter the platform controllers until it passes through two manually operated main switches and two circuit breaker tripping coils in the platform hoods, through a main fuse beneath the car and two contactors in series, also located beneath the car. In the bottom of each controller is a mechanically operated auxiliary contact, which, when closed, energizes the solenoids of the contactors and brings trolley potential to the platform controllers. When the platform controller handle is turned

beyond the tripping coil switch by a connection with the lighting and heater supply circuits.

There is no feature of this method of control which permits the operation of cars in multiple unit trains, but it has the advantage of simplicity and does not require the same technical skill in maintenance as does the more complex train control. Thus far it has not been fitted with automatic accelerating devices, but there is a prospect that this will soon be done. Experience with this method of hand control shows that with the independent contactors large currents can be handled with greater safety and certainty than was possible with the drum-type of controller alone; for a wider air-gap and stronger magnetic blow-out are provided, and the contacts of the independent switches open more quickly than is feasible with the revolving drum controller.

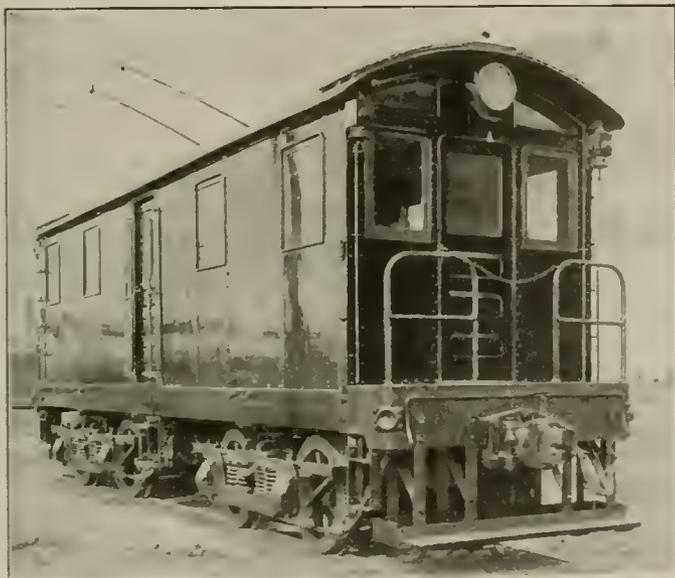

Favorable results have attended the use of the combined contactor and cylindrical control in Milwaukee, Baltimore, on the Atlantic Shore Line, and on other roads, and have demonstrated a field of large usefulness for it. Any controller of

the K-type can be fitted with the equipment and the entire cost of the work where a large number of cars are to be changed over should not greatly exceed \$200 per car. A feature of some convenience in the wiring is the possibility of cutting out two motors on the same truck, instead of one motor on each truck, when the installation is made new.

NEW ELECTRIC LOCOMOTIVE FOR THE BROOKLYN RAPID TRANSIT COMPANY.

The Brooklyn Rapid Transit Company has just completed at its Thirty-ninth street shops an electric locomotive, which was built entirely for switching service in South Brooklyn, where the terminal business of the company is showing a rapid increase.

This locomotive, of which an engraving from a photograph is presented herewith, is of all-steel construction and was designed by the mechanical department of the Brooklyn Rapid Transit Company. The locomotive has a weight of 57 tons, which makes it too heavy for use on any of the elevated structures, but the switching work on the old steam franchise roads in South Brooklyn will keep the locomotive well employed. The locomotive will haul 20 loaded standard box

New Electric Locomotive for the Brooklyn Rapid Transit Company.

cars or gondolas. The motive power consists of four Westinghouse 50-B motors, each of 150 h. p. There are two independent Westinghouse multiple unit control sets, a controller head, and an air controller being located at each end of the locomotive. It also has a combined straight and automatic air brake equipment of the Westinghouse E T-type. The body, which as stated is of all-steel construction, is 31 feet long over the buffers and 7 feet 3 inches wide over the sheathing. The distance from the top of the rail to the top of the trolley stand is 13 feet 1 inch and the height inside is 7 feet 10½ inches. The floor of the locomotive is framed with 18 heavy iron bars 6 inches wide and 2¼ inches thick, extending the full length of the body, giving it rigidity. The sides and roof are built of steel bars and angles covered with No. 10 steel sheathing. The roof is further covered with ½-inch white-wood and finished with No. 6 cotton duck. The power is taken by two standard elevated trolley stands. The locomotive is carried on two 4-wheel trucks, built by the Baldwin Locomotive Works. These are spaced 16 feet center to center. Each truck has a wheelbase of 5 feet 10 inches and 37-inch wheels. The locomotive has a deep-throated air whistle and head-lights of 50 c. p. at each end. Swinging doors afford access to a shallow end platform while sliding doors have

been built upon each side of the locomotive. The interior is painted green and the exterior black, with Brooklyn Rapid Transit standard lettering in aluminum.

New Viaduct for the Metropolitan Street Railway.

The recent opening of the new 1¾-mile intercity viaduct between Kansas City, Mo., and Kansas City, Kan., on Sunday, February 24, marks the final step in the construction of one of the most complete traction systems in the country. By its use the unsatisfactory conditions due to the congestion of traffic on the Fifth street line of the Metropolitan Street Railway will be greatly relieved if not entirely eliminated and the running time between the two cities considerably reduced.

The new tracks of the Metropolitan Street Railway are laid with 86-pound T-rails on ties embedded in concrete and center-pole construction only is used.

Eleven cars of the heavy double-truck type, transferred from some of the other lines of the company, are now operated over the viaduct division and 15 additional cars have been ordered for this service. The new route is from Eighteenth street and Minnesota avenue in Kansas City, Kan., to Fifteenth and Main streets, Kansas City, Mo. In Kansas City, Mo., the cars operate from the viaduct up Fifth street to Delaware avenue and from there south to Fifteenth and Main streets, at which point they are switched for the return trip.

The cars are operated on a 5-minute headway from 6 a. m. till 7 p. m. From 7 o'clock until midnight a 10-minute headway will be maintained and from midnight on cars will be run every 15 minutes. As there are no grade crossings the danger from accidents due to collision is reduced to a minimum; the running time also is shortened 12 minutes and passengers now can make the round trip in less than an hour.

The viaduct is said to have cost more than any other project of its kind in the United States. It was financed and built by the Kansas City Viaduct & Terminal Company, an organization composed of eastern capitalists, and represents an outlay of nearly \$1,500,000.

DIRECTORY OF ELECTRIC RAILWAY ASSOCIATIONS.

American Street and Interurban Railway Association. Secretary, Bernard V. Swenson, 60 Wall street, New York.

American Street and Interurban Railway Accountants' Association. Secretary, Elmer M. White, assistant treasurer Birmingham Railway Light & Power Company, Birmingham, Ala.

American Street and Interurban Railway Engineering Association. Secretary, S. Walter Mower, general manager Southwestern Traction Company, London, Ont.

American Street and Interurban Railway Claim Agents' Association. Secretary, B. B. Davis, claim agent Columbus Railway & Light Company, Columbus, O.

American Street and Interurban Railway Manufacturers' Association. Secretary, George B. Keegan, 2321 Park Row building, New York, N. Y.

Canadian Street Railway Association. Secretary, Allan H. Royce, president Toronto Suburban Railway, Toronto, Ont.

Central Electric Railway Association. Secretary W. F. Millholland, secretary and treasurer Indianapolis Traction & Terminal Company, Indianapolis, Ind.

Colorado Electric Light Power & Railway Association. Secretary, John F. Dostal, Denver Gas & Electric Company, Denver, Colo.

Iowa Street and Interurban Railway Association. Secretary, L. D. Mathes, general manager Union Electric Company, Dubuque, Ia. Next meeting, Clinton, Ia., April 19 and 20.

Massachusetts Street Railway Association. Secretary, Charles S. Clark, 70 Kilby street, Boston, Mass. Meetings held in Boston on second Wednesday of each month, except July and August.

Northwestern Electrical Association. Secretary, R. N. Kimball, Kenosha, Wis. Annual meeting, Milwaukee, Wis., January, 1908.

New England Street Railway Club. Secretary, John J. Lane, 12 Pearl street, Boston, Mass. Meetings held on fourth Thursday of every month.

Pennsylvania Street Railway Association. Secretary, Charles H. Smith, superintendent Lebanon Valley Street Railway, Lebanon, Pa.

Southwestern Electrical & Gas Association. Secretary, R. B. Stichter. Annual meeting, San Antonio, Tex., May 14 15 and 16.

Street Railway Association of the State of New York. Secretary, J. H. Pardee, general manager Rochester & Eastern Rapid Railway, Canandaigua, N. Y.

PIPING AND POWER STATION SYSTEMS.—XXXI.

BY W. L. MORRIS, M. E.

Discharge from Condenser.

The elevation of the discharge waterway from an elevated jet condenser should be determined by the location of the hot-well overflow, but for surface condensers the water should be discharged at the same elevation as it is taken, whether the water supply is at high or low water. A surface condenser can and should be operated without any perceptible loss of head in the circulating water, other than that caused by the friction of the water in the pipe, condenser tubes, etc.

An elevated jet condenser necessitates two losses of head: First, that due to the difference in weight between the solid cold water in the injection column and that flowing through the condenser and tail pipes. The other loss is due to the fact that the condenser would be located in relation to extreme high water, and would ordinarily be operated at a lower level, necessitating a loss of power due to the quantity of water used and raised from the level of the water supply to the level of the overflow. These combined losses of head will be about 10 feet in case the water is being pumped from 4 feet below the high-water level.

A surface condenser would not have these losses, but a loss of head is occasioned which does not exist in the jet condenser. This loss of head is occasioned by the circuitous and restricted path of the cooling water through the small condenser tubes. The loss may be more or less than that of the jet condenser, depending upon the cleanliness of the condenser tubes, but this alone is too slight an advantage to be a deciding factor in selecting the type of condenser to be used.

The jet type is the most economical condenser if suction instead of pressure pumps are employed such as are used with the elevated types. There are, however, many objectionable features in the suction jet condenser that cannot be eliminated unless the condensing chamber is elevated. Figure 256-(I 2-1) shows a jet condenser of this type arranged to secure the greatest efficiency possible and at the same time be fairly reliable. The unfortunate feature of this arrangement is that efficiency must be sacrificed to insure uninterrupted operation. To secure the greatest possible efficiency with this device, it is necessary to make the distance, A, such that a column of water of that height would be the equivalent of a column of mercury whose height is equal to the vacuum which it is intended to maintain. This would necessitate A being 28 feet for a 25-inch vacuum. It would also be necessary for the discharge to be carried down into the discharge waterway, the water in which is as nearly as possible at the same elevation as the intake or supply water. If this type of condenser could be operated and constructed in this manner it would be working under exactly similar conditions, and have the same efficiency as a condenser of the elevated type.

The atmospheric pressure in the type shown in Figure 256-(I2-1) would support the water-leg A, and the pump would simply have to overcome the difference in weight of the two

columns. The elevated-jet type of condenser has its discharge leg (tail-pipe) of length A, and as this is a longer column than the vacuum will support, a pump is used to counterbalance the difference between the injection and discharge legs. To secure the same economy for the condenser shown in Figure 256 as could be obtained with the elevated jet type, it is necessary to install it in the manner stated. This, however, is impracticable for two distinct reasons: One because the pump would not be able to lift water 28 feet, and the other because the moment the vacuum drops below 25 inches the water would fail to flow into the condenser and the entire vacuum would be lost. One is a difficulty met in starting the condenser, the other in regular operation. The less the distance A, the more certain is the operation. Many condensers of this type are in operation with the lift A, as great as 16 feet and with a vacuum as low as 14 inches.

In order to start a condenser with such a high lift it is necessary to use a "false injection," that is, a water supply delivered to the injection pipe under pressure as shown at b, in Figure 256. In this case a foot-valve must be provided at the lower end of the injection pipe and a gauge attached at the top of the line to show when the vacuum has raised the water into the condenser from the intake. The false injection is used only until a sufficient vacuum has been formed in the condenser bowl to raise the water from the intake. Another method of supplying a false injection is through a separate line and sprayer fitted in the bowl as shown by dotted lines at c. This avoids the necessity of a foot-valve and the attendant losses by friction in the flow of the water.

This type of condenser, it will be noted, has a much lower efficiency than the elevated type. Even if the lift A is made as great as 16 feet, there is a loss of head of 12 feet over that of the elevated type, making a total of about eighteen feet including the loss through the condenser bowl. This loss would be but six feet in the elevated condenser, or in other words, only one-third the power would be required for handling the circulating water, assuming the pumps to be of the same type and make. If the discharge connection from the condenser is in any way open to the atmosphere at the upper end as at d, in Figure 256, then the loss of head will be still greater, possibly the full 28 feet. In this case the power required would be four and a half times that of the elevated type. The discharge from the pumps should be kept perfectly air-tight as this line is carrying air and water from the pump the same as the tail-pipe on the elevated type. If it were possible to discharge the water at a much lower elevation than the intake then the pump could be entirely dispensed with and the water would flow through the condenser and maintain the vacuum, becoming in operation a device similar to the elevated condenser.

The discharge would in this case have to be at least 34 feet long and the distance from the surface of the intake to the surface of the discharge water must not be less than 24 feet. This also is true of the elevated jet condenser, except that the latter will operate with a smaller difference between the water levels, as far as starting up is concerned, but would require the same difference in the water levels as the suction type if operated without the pump when the vacuum has dropped to 14 inches.

Another important advantage in the use of the elevated type of condenser over the suction jet condenser is in the style of pumping machinery which can be used. In the case of the suction jet condenser the pump must handle a much larger volume per horsepower, as it not only has to pump the water, but the air which was contained in it as well. As this air has expanded from atmospheric pressure to the pressure in the condenser, the total volume to be handled by the pump is about eight times the volume of the injection water alone. Further, the class of work which the suction pump must do is very severe, both on the pump and the valves, owing to

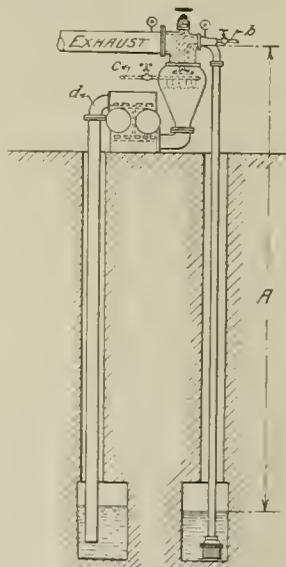

Figure 256-(I2-1).

the shock which is caused when water and air are handled together in one pump. As the pump for the elevated condenser handles only water and that at a low pressure, the centrifugal pump is admirably suited for this class of service. It can be operated very economically either from a pulley on a jack shaft or direct-connected to an electric motor. The power required for the water-ends of the two types of pump is nearly the same when the same work must be done by each.

The steam required to drive a steam pump is generally many times that required by centrifugal pumps if driven by the main engines. The steam pump would require more than 100 pounds of steam per horsepower per hour while the main generating unit would probably use less than 20 pounds per horsepower per hour. Hence, the steam required for operating centrifugal pumps would be from one-fifth to one-fourth that required by the steam pump.

If there is an insufficient supply of auxiliary exhaust steam for heating the feedwater it would be more economical to run the condenser pump by steam. The reason for this is evident, as a pound of steam for the main engine would contain 1.100 British thermal units, while the pound of steam used in the pump would require but 50 British thermal units. This will be the difference between the heat in a pound of steam at boiler pressure and a pound at atmospheric pressure, as the remainder of the heat is returned to the boiler in the feedwater.

In determining the form of drive to be employed for auxiliary machinery, the ability of the plant to utilize the exhaust steam must be considered. In the ideal steam plant the highest economy is obtained when the exhaust from the steam driven auxiliaries is just equal to the steam that the feedwater will condense. The efficiency of these machines is then as great as possible, for all the heat which is not converted into work is returned to the boiler. All the auxiliaries in such a plant which furnish exhaust steam in excess of that required to heat the feedwater should be run condensing so as to require the least amount of steam per horsepower developed. The general belief that as many machines as possible should be run condensing is incorrect. The greatest economy is secured when only a sufficient number of the engines are run condensing to supply just enough steam for heating the feedwater.

The hotwell is necessary for the successful operation of the elevated jet condenser, as it provides a seal to keep the tail-pipe filled and prevent the access of air to it, which otherwise would reduce the vacuum obtainable. In figure 220 there was shown a satisfactory method of taking feedwater without disturbing the water in the hotwell. Figure 221 showed a pump box such as would be used with a suction pump jet condenser or a surface condenser. With such apparatus there is no necessity for a hotwell or water seal. A pump box would not be required for a surface condenser, as the feed could be taken from the condenser chamber as shown in Figures 226 and 228. The most satisfactory arrangement for the pump box shown in Figure 221 is to place it in the discharge waterway at the lower end of the discharge for such installations as shown in Figure 256, and allow the feed pump to raise the water out of its compartment. As previously stated there should be no opening to the atmosphere at the upper end of the discharge, shown at d, in Figure 256 (I2-1), to accommodate a pump box above the floor.

It is true that the feed pump must raise the water higher when the pump box is placed at the discharge waterway, but it should be remembered that the feedwater is only about 3 per cent of the condenser water, and it is therefore more economical to raise 3 per cent the additional height rather than to raise the 97 per cent.

(To be Continued.)

RECENT ELECTRIC RAILWAY LEGAL DECISIONS.

BY J. L. ROSENBERGER, LL. B.

LIABILITY FOR INJURIES TO PASSENGER LEAVING CAR TOO SOON THROUGH WRONG CALLING OF STREET—NO LEGAL DUTY TO SEEK SHELTER AT HOUSES—ILLNESS FROM EXPOSURE TO WEATHER—BURDEN OF PROOF.

Georgia Railway & Electric Co. v. McAllister (Ga.), 54 S. E. Rep. 957. Aug. 13, 1906.

The negligent conduct of a street-car conductor in calling a street crossing before his car had arrived at the street announced, thereby inducing a lady passenger to alight, at night and during a severe rainstorm, at a strange place remote from her destination, the supreme court of Georgia holds, is to be regarded as the proximate cause of injuries sustained by reason of her slipping and falling upon a curbstone which she was unable to see, because of the darkness, while endeavoring with due care to make her way homeward along a street with which she was unfamiliar.

The passenger was under no legal duty to apply for shelter at houses in the vicinity of the place where she was induced to alight from the car, rather than attempt to reach her destination on foot over a highway which was in a reasonably safe condition for travel by pedestrians.

If she could not by the exercise of ordinary care have discovered that she was invited by the conductor to disembark at a point short of her destination, she was entitled to recover damages because of illness brought about by exposure to the weather after leaving the car; the burden being upon her to show that her illness was caused by such exposure, rather than by other causes for which the defendant company was not responsible.

In such case, no presumption of negligence is raised by law against the defendant from the bare fact that the plaintiff sustained an injury, and the burden rests upon the plaintiff to prove the allegations of fact upon which she relies for a recovery.

INJURY TO PASSENGER FROM MISSILE THROWN AT MOTORMAN—NO PRESUMPTION OF NEGLIGENCE—EVIDENCE OF PRIOR SPORADIC ATTACKS INADMISSIBLE.

Woas v. St. Louis Transit Co. (Mo.), 96 S. W. Rep. 1017. Oct. 17, 1906.

The plaintiff testified that while sitting on the second seat from the front of a car he saw a man standing in the middle of the street with something in his hand, making violent motions towards the car. The next he knew he was on an operating table with a doctor taking glass and broken bones out of his face. A policeman testified to having seen some person throw something at a car. The supreme court of Missouri, division No. 2, holds that a demurrer to the evidence was correctly sustained as the plaintiff wholly failed to bring himself within any rule of law which would render the defendant liable for the assault of the person made upon its motorman.

It is clear in this case, the court says, that the burden of showing negligence was upon the plaintiff, and that the presumption of negligence which arises in favor of the passenger traveling on a train from the mere fact of an accident has no application to a case like this. Such a presumption only arises where the injury can be reasonably attributed to some defect in track, cars, or machinery or the movement of the train, or the conduct of the servants in charge thereof.

Furthermore, the court holds that there was no error in excluding certain evidence offered by the plaintiff to show that prior to the date of the accident certain persons had thrown missiles at the defendant's cars on account of their failure to stop and allow passengers to board the cars, as the questions asked would have permitted the witnesses to

have told of sporadic cases of the throwing of missiles at the cars during a period extending over years prior to said date. It gives as reasons that the testimony referred to was entirely too indefinite as to time, and that it did not purport to show any such state of affairs as to bring home notice to the defendant of any danger to the plaintiff of the assault by which he was injured.

TOILET ROOMS AND WATER TANKS REQUIRED—PLACES FOR SALE OF TICKETS—FARE LIMITED BY THAT ON LINE BUILT OR PURCHASED.

West Bloomfield Township v. Detroit United Railway Co. (Mich.), 109 N. W. Rep. 258. Oct. 29, 1906.

Cars having no toilet rooms or water tanks, the supreme court of Michigan holds, do not meet the requirements of a franchise of being of modern design and supplied with suitable appliances for a suburban railway to insure the comfort and convenience of passengers.

Placing on sale near its terminus, in a drug store in the city of Pontiac, family tickets for which its franchise provided, the court further holds was not a compliance by the company with its contract that family tickets should be sold by it from any point in the township of West Bloomfield to and in the city of Pontiac, and vice versa. It says that it was not contemplated that the citizens of Bloomfield should go to Pontiac to buy tickets. Everyone had a right to purchase a family ticket at the place where he had a right to board the cars with his family for passage. These roads do not have ticket offices stationed through the country. They do their business on the cars, and, wherever passengers have a right to take the cars, there they have the right under the franchise to purchase these tickets.

A provision in the franchise that "the rate of fare from any point in said township to the city of Detroit, and vice versa, shall at no time exceed the rate then charged by the company from Pontiac to Detroit, and vice versa," the court holds referred to the company mentioned in the franchise, but it included any line which the company or its assignee might at any time build or purchase. It says that if the company had built another line from Pontiac to Detroit it could not have charged a higher rate over the old line than it did over the new. The terms of the franchise must be construed strictly against the company. When it purchased the Detroit & Pontiac line it became a line of the company. The rate charged from Pontiac to Detroit over that line is now 25 cents. The company can charge no more over the other line of its road. It cannot thus destroy the competition for which the township in fact contracted.

COMPANY NOT LIABLE FOR INJURY TO PASSENGER FROM COMING INTO CONTACT WITH TROLLEY POLE WHEN CHANGING SEAT ON OPEN CAR WITH ASSENT OF CONDUCTOR—NO DUTY TO WARN PASSENGERS OF ORDINARY DANGERS FROM TROLLEY POLES OR PILLARS OF ELEVATED RAILWAYS.

Tietz v. International Railway Co. (N. Y.), 78 N. E. Rep. 1083. November 13, 1906.

A passenger of large proportions on an open electric car in swinging out to take another seat came into contact with a trolley pole. The proof was that the distance between the grab handles on the outside of the upright stanchions of the car and the trolley pole was 21 or 22 inches. The court of appeals of New York does not think that in the simple assent of the conductor to the proposal of the plaintiff to change his seat there was any assurance on the part of the conductor that it would be safe for the passenger to do so without the exercise of due care on his part in executing the necessary movement. Nor does it think that under the circumstances the railway company should be held responsible for the failure of the conductor to warn the passenger.

The court concedes the correctness of the general proposition that if the company had created a danger it was its

duty to warn its passengers against that danger, but under the theory on which this case was submitted to the jury the company had not created any danger in the proper sense of that term. Doubtless the presence of trolley poles is dangerous to any one riding on a car who may come in contact with them. So, also, there are dangers in the operation of every steam railroad, but these dangers are inherent in the operation of the roads and do not fall within the rule stated. If there was anything exceptional in the proximity to the track of the trolley poles or any other obstruction it would have been the duty of the conductor to warn the plaintiff of its existence, but the court cannot see that it was his duty to warn the passenger of a danger which is merely an ordinary incident of such railroad travel.

Take the case, the court says, of the trolley roads which run under the elevated railroads in the city of New York. It cannot be that it is the duty of the conductor to warn every passenger of the presence of the pillars of the elevated railroad, nor can he be expected for this purpose to distinguish between residents of the city accustomed to travel on the road and passengers who are strangers.

JUDICIAL NOTICE TAKEN THAT STREET RAILWAY COMPANY IS CARRIER OF PASSENGERS—OWNERSHIP OF CAR IMMATERIAL—SUFFICIENT IDENTIFICATION OF CAR AS ONE USED FOR PASSENGERS—ALLEGATION AS TO BEING A PASSENGER ENOUGH—NOT NECESSARY TO SHOW THAT COMPANY OWED DUTY—SUFFICIENT SHOWING AS TO EMPLOYEES.

Indianapolis Street Railway Co. v. Ray (Ind.) 78 N. E. Rep. 978. October 24, 1906.

The principal object of the legislature in authorizing, and of corporations in constructing, street railways, the supreme court of Indiana says, is the carriage of passengers. It is so recognized by statute and is a matter of such common knowledge that the courts will take notice that a company organized and operating a street railway under the laws of this state is a carrier of passengers.

This was an action to recover damages for injuries sustained by the plaintiff Ray in alighting. The court says that the defendant was operating the particular street railway, and, if the plaintiff was a passenger on "one of the cars of that road," that is, used in the operation of that road, it made no difference whether the car belonged to the defendant or not.

Again, the court says that here was a car provided with electric signals to be sounded by passengers to announce their desire to get off, a car known as a summer or open car—one with seats running across the car from side to side, and with a running board to assist passengers in getting on or off the car. This was a sufficient identification of the car as one used for passengers.

As to the objection that it was not alleged that the plaintiff paid or offered to pay fare, or that she had a pass, or was on the car by contract, invitation or consent of the defendant, the court says that it was alleged that she was a passenger on the car. This averment required her to prove that she had complied with the conditions that constituted her a passenger. How she became a passenger was evidentiary.

Nor was it necessary to show that the defendant owed the plaintiff a legal duty. The plaintiff was a passenger, and, being a passenger, the defendant owed her a duty. Moreover, a corporation can act only by its agents, and the allegation that a motorman and conductor had charge of "one of the cars of the defendant's road," that is, one of the cars used in operating its road, and upon which the plaintiff was a passenger, sufficiently showed the relation of employer and employes, and that such employes, being charged with the management of the car, were performing a duty that devolved upon the employer, and for which the latter stood responsible.

News of the Week

Central Electric Railway Association Meeting Postponed.

The executive meeting of the Central Electric Railway Association which was to be held in the Traction Terminal Building, Indianapolis, on February 28, 1907, has been postponed until Saturday, March 2, 1907, owing to the inability of Messrs. Spring, Carpenter and Emmons to attend. The meeting of the board has been called to consider topics of discussion for the entire year ahead, select the subjects of most vital interest to the majority of the members, and assign the subjects to experts in each special line. This is an advisable move on the part of the board, as it will give the members selected sufficient time to prepare their discussions, so that lack of time will hardly be a valid excuse for failure to respond to the request. A report of the committee shows that while the value of the interchangeable traction coupons collected of the roads which are members of the association was \$7,320.24 in December, 1906, the coupons collected for January, 1907, amounted to \$8,409.49. These interchangeable coupons are now accepted on 37 roads, including the two recent additions to the association—the Marion Bluffton & Eastern Traction Company and the Toledo & Chicago Interurban Railway Company.

The next annual meeting of the association will be held at the Algonquin Hotel, Dayton, O., on March 28.

Philadelphia Traction Situation.

A bill has been introduced in the Pennsylvania legislature which, if passed, will give authority to the city of Philadelphia to enter into contracts with the Philadelphia Rapid Transit Company based on the plan approved by the directors of the company. While the bill was drafted with reference especially to conditions in Philadelphia, it is general in terms and may be applied to other similar corporations and other municipalities. The bill provides that any city, borough or township, and any passenger railway company leasing and operating the franchises and property of such company may enter into contracts affecting and regulating the franchises, powers, duties and liabilities of such companies, and the regulations and respective rights of the contracting parties.

Such contracts may provide for payments by the companies to the local authorities in lieu of the performance of certain duties or the payment of license fees or charges; for the appointment by the local authorities of persons to act as directors of such companies in conjunction with the directors elected by the stockholders; and for the ultimate acquisition by the local authorities upon terms mutually satisfactory of the leaseholds, property and franchises of the contracting companies.

Another bill which has been introduced in the legislature provides that whenever the municipalities of the state shall deem it proper to organize corporations for municipal purposes they shall be authorized to contract with the purchasers of such securities as may be issued by said corporations for the payment of interest and the sinking funds necessary to redeem the securities at maturity, and to levy and collect such taxes as may be necessary therefore; provided, however, that the holders of the stock of such corporations shall hold it as trustees for the municipalities and that all revenues earned by the corporations shall be deposited to the credit of the municipalities.

Accident on New York Elevated Road.

An unusual accident occurred on the Third avenue elevated line of the Metropolitan Street Railway Company, New York city, on February 26, which at first caused a report to be circulated that the elevated structure itself had given way. It appears that a seven-car train left One Hundred and Twenty-ninth street and Third avenue southbound at 9:02 a. m., its destination being South Ferry. The train arrived at Chatham Square Junction at 9:32 a. m. The switches at the junction were set for the main track on the South Ferry track.

The motorman proceeded south and six cars passed over the switch safely, and the front truck of the seventh car also passed over safely, but the rear truck of the seventh car split the switch and took the City Hall track, causing the car to be derailed with the front truck on the South Ferry track and the rear truck on the City Hall track, which resulted in twisting the car crosswise over the triangular space at the junction of the two tracks. In this space there was a small frame shanty, or tool house, standing on a wooden platform supported by steel channel bars. When the rear truck of the car left the rails the car, half derailed, was dragged on for about 60 feet, so that the rear trucks crashed into the wooden platform and fell to the street below, breaking some of the auxiliary steel work upon which the platform and shanty rested. The trucks carried with them some of this steel and wooden frame work; and two or three of the channels, being wedged out of position, fell on end to the ground below, crushing through to the conductor rail conduit at one point. When the workmen subsequently pulled down the broken steel parts they made a complete wreck of the tool house and platform, which crashed to the street. The car from which the rear trucks had fallen remained with one end hanging over the intervening space between the two branches of the elevated system.

There were only six or seven passengers in the car and fortunately these escaped with slight bruises. Fortunately also no car or team happened to be in the street below at the place where the trucks fell through, although a car had passed under the structure a moment before. The accident caused a good deal of confusion and delay to traffic, particularly on the surface line.

The service on the elevated structure was restored within two hours and during this time trains were stalled from Fourteenth street to Brooklyn bridge. The power was cut off of the third rail as a precaution. The delay to the surface cars was somewhat longer, owing to a short circuiting of the track circuit and to the necessity of removing the debris and making some repairs in the conduit.

Legislation Affecting Electric Railways.

California.—A bill has passed both houses of the legislature restricting the hours of labor for street railway employes to eight hours a day.

Minnesota.—A bill has been introduced into the house of representatives providing that street railway companies shall sell eight tickets for 25 cents, with the usual transfer privileges. Another bill provides for six tickets for 25 cents during the rush hours of morning and evening.

New York.—The Dowling "loop bill," which provides for an elevated railroad connecting the Brooklyn and Williamsburg bridges in New York city, was passed by the assembly on February 26.

Texas.—Both houses of the legislature have passed a bill granting to electric interurban railways the right of eminent domain outside of cities and towns. The right to operate through cities and towns over the local lines is also given. The especial object of the bill is to enable Stone & Webster of Boston, Mass., to build an electric railway from Houston to Galveston, Tex. Section 1 provides: That all corporations chartered for the purpose of constructing, acquiring, maintaining and operating lines of electric railway between any cities and towns in the state of Texas for the transportation of freight or passengers, or both, shall have the right of eminent domain, as fully to all intents and purposes, as is now conferred by law upon steam railroad corporations, and shall have the right and power to enter upon, condemn and appropriate the lands, rights of way, easements and property of any person or corporation whomsoever for the purpose of acquiring rights of way upon which to construct and operate their lines of railways and sites for depots and power plants; provided, that no cemetery grounds, nor any part thereof, shall be so taken or condemned.

Cleveland Traction Situation.

It is now stated that President Andrews of the Cleveland Electric Railway and President Du Pont of the Municipal Traction Company, who have been working for several weeks on their estimate of the value of the Cleveland Electric property, may be able to report at the next meeting of the city council on March 4. Reports on the value of the real estate were presented independently by J. G. W. Cowles and V. C. Taylor on February 24. The physical valuation had to be calculated first, because the method adopted of arriving at the franchise values included some deductions in the matter of interest that could only be computed after the physical value had been decided. The franchise values are being worked out on a basis of earnings. The methods used in determining the value of the Chicago street railway property last summer, on which Mr. Du Pont was engaged, has been closely followed.

Mr. Du Pont is quoted as saying that an immediate extension of the Cleveland street railway service is required and as forecasting the construction of a subway or elevated line. He said:

"Cleveland is rapidly becoming a city of such size that traffic facilities other than surface lines will have to be provided to give adequate and proper service. One thing in the way of subway construction is its great cost. To begin with a short tube on Superior avenue, say from the arcade to the Wilshire building, and running under the square, would probably solve the problem for the time being. Within ten years, however, Cleveland must be provided with a rapid transit system running the entire length of the city. This will be especially so after the annexation of Lakewood and Collinwood. My idea is that this line should parallel the lake and be an elevated structure. The fast train service that could be provided would largely solve the time problem for years to come. With an elevated road providing fast service it would probably be better to divert some of the parallel surface lines. By this I mean the operation of more cross-town lines to act as feeders for the elevated road furnishing the fast up and down-town service."

Trolley Express Hearing in Massachusetts.

An important hearing bearing upon the trolley express problem was held before the legislative committee on street railways at Boston on February 26. Interest centered in the desires of street and interurban railways serving the outer suburban sections of eastern Massachusetts to secure entrances into Boston and other large centers for freight and express cars. The bill on which the matter came up requires connecting companies to haul each other's passengers in passenger cars, and baggage and freight in baggage cars, under such regulations as the railroad commission may determine.

The Boston & Worcester street railway has secured assent to its trolley freight and express business from the local cities and towns on its line, between Chestnut Hill and Lake Quinsigamond. A demand for express service has arisen from business men, florists, market gardeners and farmers, but the company has hesitated so far to begin such service because, the company says, the city systems in Boston and Worcester have not been willing to handle express cars on terms satisfactory to the interurban line. President Shaw of the Boston & Worcester stated that his company now has an agreement whereby the Boston elevated takes four cars per hour from the end of its lines at

Chestnut Hill, hauls them into Park Square and out again, collecting all fares on its lines and operating the cars with its own men. The city system pays nothing for the use of these cars, and all other passengers arriving at Chestnut Hill on the Boston & Worcester have to transfer to the elevated cars. Mr. Shaw stated that his road last year brought into Boston 2,800,000 passengers which would otherwise not have come, and urged that the Boston elevated should take all the interurban line's cars and haul them in and out as it does the present four per hour, paying for the use of the cars just what it would cost the company to keep in repair the same number of its own cars, or about 2.5 cents per car mile. Mr. Shaw stated that equitable co-operation between terminal and through roads was essential to any profitable and satisfactory express service.

The hearing was continued until March 15, to give those who oppose the bill an opportunity to be heard.

Rapid Transit Affairs in New York.

All that now remains to be done before bids are asked for building the Lexington avenue subway is to obtain the approval of the board of estimate and of the corporation counsel of the form of contract and the specifications. The rapid transit commission at its meeting on February 20 adopted the terms of the contract and specifications, and it is probable that bids will be asked for within a week. The form of contract adopted follows closely the draft drawn by the committee on contracts. The alternate routes remain. Bidders will be able to choose whether they shall compete for building a road from the Harlem river to the Battery, or only from the Harlem to a junction with the present subway at Forty-second street.

At the recent hearings held by the commission the Forty-second street loop was objected to by many delegations on the ground that this route would permit only the Interborough company to bid. The objection has been unheeded by the commission, as have the protests of the Broadway and Fifth avenue merchants, who insisted that any interference with the surface of Broadway would mean ruin to many storekeepers. The commission has decided that the new subway must be a near-surface one and it will be constructed as was the lower Broadway tunnel, by the "cut-and-cover" process. The commission also ignored the objections made by the Interborough company to several of the clauses in the contract. The company opposed the power the commission has reserved to order changes in the rolling stock and in equipments and to go to court to enforce its orders, the burden of proof that such orders are unreasonable being placed on the contractor.

Another strong protest made by the company is that if a part of the line is completed and operated before the whole is finished the operator shall pay rental on the basis of all the bonds issued by the city for construction up to that time, instead of computing the rental on the length of trackage placed in operation.

The only important modification made in the contract was the insertion of a clause complying with Section 13 of the American labor law and providing that none but citizens shall be employed in the construction of the tunnel and that preference shall be given to citizens of this state.

The commission determined to give consideration to the application made by F. B. Behr for a franchise to build a monorail elevated road from Atlantic avenue, Brooklyn, to Coney Island.

The commission ordered the payment of \$352,000 to the Interborough company for the installation of the ventilating plants at the subway stations.

Chief Engineer Rice reported that the plans and specifications for the so-called Tri-borough route, from the Bronx down to Brooklyn and Coney Island, would be ready in six weeks.

The Interborough Rapid Transit Company has ordered 250 new cars, 50 for use in the subway and 200 on the elevated lines. The new subway cars will be of the same type as those now in service, except that the doors will be 50 inches wide instead of 39 and will have steel instead of wooden fillings.

The report of the February grand jury of Kings county, which has been presented to Governor Hughes, contains a lengthy arraignment of the Brooklyn Rapid Transit Company in regard to the poor condition of the service in Brooklyn.

Chicago Traction Situation.

The Citizens' Non-Partisan Traction Settlement Association was formed on February 26 by 30 of the leading organizations of the city to conduct a campaign for approval of the Chicago traction ordinances at the April election. Pamphlets will be issued, mass meetings will be held and subsidiary organizations will be formed to carry on the work. The declaration of principles which was adopted says:

"For a generation past the people of Chicago have confronted in a gradually decaying street transportation system a menace to public health, individual comfort and municipal prosperity, and an offense to community pride.

"In a condition of desperation at the abominable character of the street car service and exasperated by attempts of the companies to maintain rights questionable at the best, a large number of citizens became advocates of municipal ownership and by a majority of votes cast on the subject the people of Chicago indorsed that theory, resulting in the election two years ago of a city administration pledged to the carrying out of that policy. That administration was at once confronted by financial limitations making immediate municipal ownership impossible, by reluctance on the part of the transportation companies to surrender doubtful rights and, on the part of the people, by an imperative demand for an improved public service.

"The expiration of some of the existing franchises and court

decisions invalidating others and defining the rights of the respective parties clarified the situation and made the owners of the street railway properties ready to enter into conference with the representatives of the city and to make concessions demanded in the interests of the public which would not jeopardize their admitted remaining interests in these properties and would safeguard further investment.

"After almost continuous conferences covering eight months between the committee on local transportation of the city council of Chicago and representatives of the traction companies identical ordinances have been prepared enabling the city to deal with the subject of transportation as a whole and providing for complete rehabilitation along the most modern lines, to be begun immediately and completed within three years, giving to the public the most up-to-date equipment, equal to any in the United States at the present time."

The declaration concludes: "We, the undersigned, on behalf of the organizations which we respectively represent, do hereby announce our approval of the ordinances as passed, believing them to be in their essential features equitable and to constitute a fair settlement of a vexatious and long unsettled problem, and urge the voters of Chicago at the forthcoming election of April 2, 1907, to support these ordinances as the only practical method of securing prompt reform of transportation methods and the rehabilitation of the transportation system of Chicago in a way which will be fair to all interested parties and will safeguard the interests of the future and assure municipal ownership whenever such ownership shall be found practicable."

Frederick Bode of the Chicago Commercial Association was made president; William A. Bond of the Chicago Real Estate Board, vice-president; and A. H. Wetten of the real estate board, secretary and treasurer.

The democratic city convention on February 23 renominated Edward F. Dunne for mayor. The democratic platform is based on municipal ownership and defeat of the traction ordinances. The platform says that while the ordinances pretend to "provide for municipal ownership, they are, in fact, private franchises for twenty years or more; that while they pretend to divide profits on operation with the city, they afford no assurance whatever of any income to the city; that by means of construction profits they would make possible an enormously excessive price for purchase by the city; that by authorizing unlimited contracts for power they would enable the companies "to saddle upon the city in case of municipal purchase" the obligation of contracts with private power companies at any price and for any length of time.

Western Society of Engineers.—A regular meeting of the society will be held in the society rooms, 1737-41 Monadnock block, Chicago, on Wednesday, March 6, 1907, at 8 p. m. Mr. L. T. Hotchkiss will present a paper on "Some Details of Concrete Construction," and Dr. W. Michaels, Jr., will present a paper on "How to Prevent Failure in Concrete Construction."

Rules for Safety at Drawbridges.—Since the drawbridge accident on the West Jersey & Seashore Railroad at Atlantic City last summer the New York State Board of Railroad Commissioners has made a thorough examination of conditions existing at drawbridges on the different roads of the state and has adopted rules as to the greater protection of these bridges. The rules provide for protection by home and distant signals 50 and 1,500 feet, respectively, from the end of the draw, with derails not less than 500 feet from the end of the draw, where possible, all interlocked so that the first movement to open the draw will set both signals in warning. The movable rails on ends of drawbridges must extend beyond the end of the bridge and connect with shore rails by a miter joint, the ends to meet in a trough and be interlocked.

Demurrer to Indictments of Cincinnati Traction Officials.—Atorney Miller Outcalt on February 23 filed a demurrer to the recent indictments against W. Kesley Schoepf, Robert E. Lee and Newton Wickersham of the Cincinnati Traction Company, in which they were charged with not complying with the law which specifies that street car vestibules shall be closed and heated, as mentioned in the Electric Railway Review of February 9. The demurrer sets forth that the indictments do not charge any offense against any valid law; that an attempt is made to charge an offense which does not exist under the laws of Ohio; that the indictments contain matter redundant and irrelevant and do not require a plea from the defendants. It also states that the indictments fall to state by what lawful authority a duty was imposed upon the defendants to maintain screened vestibules. A general demurrer was also filed to the indictments against J. H. Schoepf, Newton Wickersham and William E. Blasing in which they are charged with withholding records of the traction company from the grand jury.

Minnesota Court Denies Right of Eminent Domain.—The United States district court at Minneapolis on February 27 handed down a decision that the electric railways of Minnesota have no right of eminent domain to condemn land. The case was that of the Minneapolis & St. Paul Suburban Railway Company against the village of Excelsior, Minn., a summer resort 20 miles west of Minneapolis, for the purpose of testing the right to condemn property for a right of way. The case, which, it is stated, will be appealed to the supreme court, was started by a petition to the court to appoint a commission which should condemn certain land in Excelsior and Tonka Bay along the route of the proposed extension from Excelsior to the upper lake at Birch Bluff. It was opposed by property owners along the proposed route. The court, holding that the company is a street railway company, finds that

it has no right to "acquire property by eminent domain within the limits of any city or village." As to the tracts of land situated outside of the village, which the company attempted to condemn, the court finds that these tracts would not be useful or necessary unless a right of way were acquired inside the village, and denies the petition.

Subway Exits to Philadelphia Department Stores.—By a plan which has been partly agreed upon by the engineers of the Philadelphia Rapid Transit Company and Gimbel Brothers, Llt Brothers and Strawbridge & Clothier, the owners of three large department stores, one large station is to be built in the Market street subway at Eighth street, with entrances into each of the department stores, as well as passageways from one side of the railroad tracks to the other, making it possible for shoppers to go from one shop to another without going into the open street. It is understood that the department stores will build large show windows underground, so that patrons using the subway may enjoy the displays that now attract them on the street surface. Representatives of the stores have been holding conferences with the officers and engineers of the railway company to discuss plans for a station which would add to the comforts of their patrons. No definite plan has been selected, but all of those under consideration are designed so that shoppers may enter the shops directly from the station platform. Like other stations along the line, the one at this point will be 350 feet long, but it will be much wider than the others to provide for the immense traffic. The station will be centered at Eighth street, extending half way along the block east and west. It has not yet been determined how patrons are to cross the tracks. Two plans have been drawn, one for a passageway under the tracks and the other for a bridge.

United Railways Prosecuted for Allowing Mail Cars to Stand in Street.—The prosecution of the United Railways Company of St. Louis by the city for allowing mail cars to stand on Eighth street, between Pine and Chestnut streets, threatens to terminate in a conflict between the city and the postoffice authorities over use of the street as a terminal for the mail cars. A case against the United Railways is pending before Judge Tracy in the first district police court, to whom it was submitted on an agreed statement of facts. He is to render a decision on March 2. In the meantime the United Railways has shifted the burden of the trouble to the government by threatening to discontinue the street car mail service if the company is fined for letting cars stand on the street. General Manager McCullach served notice to this effect on Assistant Postmaster Stice several days ago. Mr. Stice took the matter up with the department at Washington, and received an opinion from W. S. Shallenberger, third assistant postmaster general, saying: "The contemplated action would, if carried out, be an interference with the contract relations between the United States and the transit company and result in a delay to the mails." He suggested that the district attorney be consulted to determine whether it would be a violation of any federal statute to interfere with the operation of the cars. Mr. Stice has tried to arrange a schedule which will not bring two or three cars together at that point, but finds it impracticable without working great delay in handling the mails. Two of the cars stand there over an hour and others from that time down to ten minutes.

Research Fellowships in Engineering at the University of Illinois.—The University of Illinois has extended and strengthened the field of its graduate work in engineering by recently establishing ten research fellowships in the Engineering Experiment Station. These fellowships have an annual value of \$500, and are open to graduates of approved universities and technical schools, both American and foreign. They must be accepted for two consecutive collegiate years, at the expiration of which period, if all requirements have been met, the master's degree will be granted. Preference will be given to men who have had some experience in practical engineering work outside of college. The appointments will be made upon the recommendation of the station staff of the Engineering Experiment Station and upon the approval of the faculty of the graduate school and the president of the university. The Engineering Experiment Station, it may be explained, is a department connected with the College of Engineering. It was established in 1903 for the purpose of carrying on investigations along various lines of engineering, and for the study of problems of importance to professional engineers and to the manufacturing and industrial interests of the state. The work of the station and the college is closely related, the heads of the several departments of the college of engineering constituting the station staff. The investigations are carried on by the members of the staff directly, sometimes by a fellow as graduate work, sometimes by a member of the instructional force of the college, and frequently by special investigators belonging to the station corps. The various laboratories of the station and the college offer exceptional facilities for investigational work, being well-equipped with the most modern apparatus. During the past four years about \$300,000 has been appropriated by the state legislature for the maintenance and extension of this equipment, and it is believed that the same liberal policy will be continued. By offering these research fellowships at \$500, and throwing them open to graduates of both American and foreign universities, the station hopes to secure a picked body of men imbued with the true spirit of genuine investigators who will do graduate work of high grade. It is expected that valuable results will accrue to the station, and that a body of experts will be developed, some of whom may be attached later to the regular corps of station investigators. A circular giving full information will soon be issued, and can be obtained upon application to L. P. Breckenridge, the director of the Engineering Experiment Station, Urbana, Ill.

Construction News

FRANCHISES.

Allegheny, Pa.—The Millvale Etna & Sharpsburg Street Railway Company has asked for a franchise to operate its line on Bridge street from East Ohio street, over the bridge of the West Penn Railway and the "back channel" of the Allegheny river to Herr's Island, and across the island to the western approach of the Thirtieth street bridge. Action has been referred to the corporations committee.

Allegheny, Pa.—The Pittsburg Railways Company has applied for permission to connect its tracks in Brighton road and Shay avenue by a line beginning at Brighton road, along Woodland avenue to Superior and Shady avenues; also for a franchise to lay tracks in East Robinson street from Federal to Sandusky streets in order to make a loop for the Pleasant Valley and Perryville cars. Referred to the committee on corporations.

Brunswick, Ga.—F. D. M. Strachan has applied for a 50-year franchise for a street railway and for a lighting plant.

Cheektowaga, N. Y.—The Cheektowaga Railway, recently incorporated to build from Cheektowaga to Buffalo, N. Y., 6 miles, has been granted a 50-year franchise to build a double-track road through the town, from Clinton street and the Buffalo city line to the town line of Lancaster.

Chico, Cal.—The Northern Electric Company has secured a five-year franchise to run its proposed freight line on Fifth street; also for a line on Eighth street for both passenger and freight service.

Dixon, Ill.—The Northern Illinois Electric Railway has received an extension of its franchise to February 20, 1908. The line as proposed will be built from Dixon to Amboy, Ill., with an extension to DeKalb. It is stated that negotiations practically have been completed for financing the work and that construction of the line within the time prescribed is assured.

Dubuque, Ia.—The Southwestern Wisconsin Railway has applied for a franchise to enter Dubuque with its proposed interurban line. It is stated that the company will replace the high bridge with an entirely new structure using the old piers which are considered amply able to sustain the additional load which will be put upon them by the running of the interurban cars over the bridge. It is planned, also, to build a high steel viaduct 700 feet long which will carry the line into the flats between Fourth street and the Illinois Central tracks. From there a wooden trestle will be built to a point near the steam railroad tracks in Sixth street. From Sixth street over the railroad tracks and to the surface intersection of Sixth and Clay streets another steel viaduct 550 feet long will be constructed. The construction of these viaducts and trestle work will make a continuous bridge from East Dubuque to Clay street and will cost, with the purchase price of the bridge, over \$100,000. Mr. F. W. Hild, chief engineer, 317 Bank & Insurance Building, Dubuque, Ia.

East St. Louis, Ill.—The East St. Louis & Suburban Electric Railway has secured a franchise from the St. Clair county highway commissioners to lay tracks on Harding avenue, connecting with the Lansdowne line, to Caseyville avenue, and east on Caseyville avenue.

East St. Louis, Ill.—The East St. Louis & Suburban Railway has applied for a franchise on Tenth street from St. Clair to Illinois avenue and on Illinois avenue from Tenth street to Third street. This change in the original plans for the routing of the line is said to have been due to the recent acquisition by the Suburban company of the McKinley franchises in East St. Louis.

Ely, Nev.—The Ely Electric Railroad Company has applied for a franchise to build an electric line from Kimberly, Nev., the new mining town, to the smelter of the Nevada Consolidated Copper Company, for freight, ore and passenger service.

Evanston, Ill.—The Chicago Evanston & North Shore Electric Railway has been granted a 50-year franchise for a line on Torrence avenue through the city to Bowmanville. Frank R. Grover and George W. Wilcox are interested.

Fairfield, Ia.—The Iowa-Missouri Traction & Power Company has secured a franchise to operate its proposed interurban line through Fairfield. It is stated that work will be started on April 1, and completed within the present year. The line will extend north to Marengo, Cedar Rapids and Vinton, with a branch to Oskaloosa, and on the south to Memphis, Mo.

Ga'ena, Ill.—A 25-year franchise has been granted to the Illinois & Western Railway Company to build an electric line in Ga'ena and to points in the mining district of southern Wisconsin. A loop district has been outlined in the business section and it is stated that work on construction will be started in the spring. Under the name of the Tri-State Light & Power Company the same company was empowered to take over the lighting plant, paying \$8,850 for the equipment, with another provision for the purchase of the plant, which will furnish light and power for commercial purposes.

Goshen, Ind.—The Goshen South Bend & Chicago Railway a part of the proposed line from Chicago to New York, has secured a franchise in Goshen to build its line through that city.

Ithaca, N. Y.—The Auburn & Ithaca Traction Company, which

proposes to enter this city on Cayuga street, has received a six-months extension from the city council to permit of its getting a certificate of necessity from the state railroad commission.

Michigan City, Ind.—A new franchise is being drawn up by the Chicago Lake Shore & South Bend Railway to take the place of the old one by the terms of which a double track will be laid in Franklin street. An additional bond of \$10,000 is offered besides other provisions regarding the pavement, poles, wires and other equipment.

New York, N. Y.—The Union, the Southern Boulevard and the New York City Interborough railway companies, all controlled by the Interborough-Metropolitan Company, have applied to the board of estimate for permission to make 39 extensions to the railroad systems in The Bronx. If these extensions are granted it will mean the adding of more than 50 miles to the surface railroad trackage of The Bronx. A special committee of the board has made a personal inspection of the territory to be covered by the proposed new roads. These franchises were applied for over a year ago, but some changes have been made in the route applied for.

Ogden, Utah.—The Ogden & Northwestern Railroad has secured a franchise to operate an electric line in Brigham City, Utah. The line now runs to Hot Springs, about nine miles north of Ogden, and 12 miles additional track will have to be laid to reach Brigham City. The franchise must be accepted within 60 days and the preliminary survey made within one year.

Riverside, Cal.—The Crescent City Railway Company has been granted a franchise to build a trolley line from Riverside to the plant of the Southern California Portland Cement Company in West Riverside, across Fairmont Park, North Almond, North Market and North Orange streets and Colton avenue. It is stated that ties and rails are waiting at Colton, ready for delivery whenever they are wanted and that work will be started as soon as possible and will be completed within two months after it is begun.

Silvis, Ill.—The Moline Rock Island & Eastern Traction Company has asked for a 50-year franchise to build either a single or double-track line in Silvis, to be completed within four months. It also provides for the use of the tracks by other companies for interurban service. It is stated that the Rock River Traction company already has made arrangements for this purpose.

Wheeling, W. Va.—The Wheeling Sherrard & Cameron Interurban Electric Railway has applied for a 50-year franchise to build an electric railway in Marshall and Ohio counties from Wheeling by way of Sherrard to Cameron, W. Va.

RECENT INCORPORATIONS.

Atlanta Stone Mountain & Lithonia Railway.—Incorporated in Georgia to build an interurban line from Decatur in De Kalb county, through Ingleside, Clarkston, Scottdale and Stone Mountain to Lithonia, 20 miles. It is said that the line will connect with the Georgia Railway & Electric Company's line now running to Decatur. Capital stock, \$50,000. Incorporators: A. O. Venable, A. B. Kellogg, R. M. Thompson, S. H. Venable and others.

Belleville & Interurban Railway.—Incorporated in Illinois to build an electric line from Belleville, Ill., to Smithton, 7 miles. Capital stock, \$100,000. Incorporators: Jacob Gundlach, Jr., Benjamin A. Gundlach, R. W. Hofsommer, George Hippard and Thomas A. Bell. Mr. Bell is the promoter of the company, with offices in the Commercial Building, St. Louis, Mo.

Burgettstown Florence & Paris Street Railway.—This company has applied for a charter to build an electric line on Washington street in Burgettstown and from there to Florence, Paris and other points in Pennsylvania, with possibly an extension later to Steubenville, O. Incorporators: Charles W. Dahlinger, John W. Thomas, Robert L. James, A. H. Mercer and I. W. Bigham.

California Rapid Transit Company.—Incorporated in Arizona with a capital stock of \$10,000,000 to build an electric line from San Francisco through Burlingame, San Mateo, Redwood City, Palo Alto, San Jose, Monterey to Carmel River, Cal., about 140 miles. A branch line from a point near San Jose will run through Alameda county by way of Alameda, Oakland and Berkeley to Point Richmond, ending at Martinez, Contra Costa county, a distance of 75 miles. There also is contemplated another branch 22 miles long from Redwood City through Palo Alto to connect with the line at or near San Jose; also another branch 13 miles long from a point between Redwood City and Palo Alto to the Bay of San Francisco, crossing at Dunbarton Point and from thence to Niles. The total aggregate mileage of the main line and its branches will be 250 miles. William C. Alberger, president and chief engineer; William Minto, vice-president; L. E. Lee, secretary; W. H. H. Hart, treasurer. It is stated that \$250,000 of the stock has been subscribed by the following: W. J. Morgan, H. C. Cutting, W. H. H. Hart, A. H. Butler, M. D. Eddy, H. P. Bowie, C. W. Clark, L. E. Lee, William C. Alberger, William Minto and the California Tunnel Company.

Canyon City & Royal Gorge Electric Railway.—Incorporated in Colorado to build and operate an electric railway in Canyon City, South Canyon, East Canyon, Lincoln and Orchard parks, Park Center and to other points in Fremont county. The company is authorized to do a general passenger and freight business; also to erect buildings and place machinery for an electric plant to

furnish light and power for commercial purposes. Capital stock, \$1,250,000. The principal office will be in Canyon City. Incorporators: Ex-Governor James H. Peabody, D. E. Gibson, W. H. Peabody, E. M. Smith of Canyon City; W. W. Umberhauer and Thomas J. Budd of Philadelphia; Col. Willis Wood and William Huttig, Kansas City.

Davenport & Burlington Interurban Railway.—Incorporated in Iowa to build an interurban line from Burlington to Davenport, backed, it is stated, by eastern interests. Capital stock, \$250,000. C. G. Hipwell, president; Thomas Dougherty, vice-president; and A. E. Carroll, secretary and treasurer. The C. G. Hipwell Construction Company, with the same officers and directors as the interurban company, also has been incorporated with a capital stock of \$250,000.

Electric Securities Company.—Incorporated in Ohio with a capital stock of \$50,000 to finance the proposed Cleveland Alliance & Mahoning Valley Railway, which proposes to build a line from Cleveland to Ravenna and Alliance, O., with a branch to Warren. Officers have been elected as follows: Henry Boemke, president; J. W. Holcomb, vice-president; John Morley, secretary; F. H. Townsend, treasurer. Henry Everett, C. R. Morley and David Morrison compose the board of directors. It is stated that work will be pushed as rapidly as possible.

Henderson Traction Company.—Incorporated in Kentucky with \$150,000 capital stock. Incorporators: Walter Schmidt, Cincinnati; James W. Garrison and Samuel McDonald, Louisville; C. C. Tennis, Pittsburg, Pa.; A. O. Brown & Co., New York, and J. H. Lyne, Henderson, Ky.

Kennett & Coatesville Railway.—Incorporated in Pennsylvania to build an electric line from Kennett Square to Coatesville, Pa., 12 miles. Capital, \$120,000. J. Walter Taylor, Kennett Square, is president.

Mineral Wells & Lakewood Park Street Railway.—Incorporated in Texas to build an electric line in Mineral Wells, Tex. Capital stock, \$25,000.

Paducah Southern Electric Railroad.—Incorporated in Kentucky to build an electric railway from Paducah to Hickman, Ky., by way of Mayfield and Fulton, Ky., and Union City, Tenn. W. A. Martin, president, and H. H. Loving, secretary, Paducah, Ky. E. W. Whittemore, Paducah; George Rush, Brockport, Ill., and D. R. Archer, Chicago, with the officers of the company, compose the board of directors.

Oklahoma City El Reno & Southwestern Interurban Railway.—Application for a charter to build an electric line in El Reno and to Oklahoma City, Medford, Chickasha, Hobard and Lawton has been filed by this company.

San Francisco Alameda & Eastern Railway.—Incorporated in California to build an electric line in Alameda, Cal., franchise for which was obtained about a year ago, to be operated in connection with a ferry service in San Francisco. The terminal will be the western end of a mole that will extend from the western shore of Alameda south of the Alameda mole of the Southern Pacific. It will cross the marshes intersecting Webster street near the old power house of the Oakland Traction Consolidated and in Alameda will follow Clement avenue to the eastern limits of the city; there also will be a branch line running south on Broadway. The total mileage of the proposed line is 11 miles. Capital stock, \$2,000,000, of which \$11,000 has been subscribed. Incorporators, F. M. Greenwood, A. D. Schindler, A. H. McHuron, W. H. Spaulding and L. Q. Haven. A. D. Schindler is general manager of the Northern Electric Company, Chico, Cal.

Sparta-Melrose Electric Railway & Power Company.—Incorporated in Wisconsin to build an electric railway from Sparta to Melrose, Jackson county, 20 miles. Capital stock, \$300,000. Incorporators: G. L. Cromwell and T. T. Hendered, Milwaukee; Howard Teasdale, Sparta, Wis.

Sunbury & Trevorton Electric Railway.—Incorporated in Pennsylvania to build a line from Sunbury to Plum Creek, 2½ miles. Capital stock, \$15,000. Monroe H. Kulp, Shamokin, Pa., president.

Vallejo & Northern Railway.—Incorporated in California to build a line from Sacramento to Vallejo, Cal., 105 miles. Capital stock, \$2,500,000. Incorporators: Melville Dozier, Jr., George S. Lakie, C. Francis Kinsey, and John C. Veitch of Oakland, and T. C. Gregory of Suisun.

Wabee & Wawasee Railway.—Incorporated in Indiana to build a 12-mile electric line from Syracuse to Wabee Lake, Kosciusko county, to Milford; also from Syracuse to Lingle Lake, for passenger and freight service. Directors, A. St. Newberry, W. D. Frazer, C. I. Rellay and J. P. Dolan. It is stated that parties connected with the Sandusky Portland Cement Company of Syracuse, are back of the project.

West Point (Va.) Traction Company.—Incorporated to operate an electric line for freight and passenger service. Incorporators: J. W. Marshall, president; G. E. Guvernator, vice-president; J. W. Owens, secretary and general manager. A. Julian Bagby and W. C. Dunham also are interested.

York, Pa.—The Red Lion & Airville Traction Company has been granted permission by the council of Red Lion Borough to build its line over certain streets. The proposed line will connect York and Delta, Pa., 25 miles, by way of Airville, and serve

other towns along the route. A. K. Frey, Samuel Fulton, Hugh Ross and others are interested.

TRACK AND ROADWAY.

Asheville Rapid Transit Company.—It is reported that this company has let a contract to the Railways Construction & Securities Company, 141 Broadway, New York, to build its proposed line from Asheville to Overlook Park, N. C., eight miles. J. K. Vosbell of Baltimore, Md., is president, and Charles E. Van Bibber, 60 Wall street, New York, is chief engineer.

Atlantic Shore Line Railway.—This company is now building a line 15.5 miles long from York Beach, Me., to Kennebunkport, Me., to connect the eastern and western divisions. The western division, the old Portsmouth Dover & York Street Railway, which was acquired early in 1906, connects Dover and Portsmouth, N. H., with South Berwick, Elliot, Kittery and York Beach, Me., 41 miles. The eastern division, the original Atlantic Shore Line Railway, connects Springvale, Sanford, West Kennebunk and Kennebunkport with Biddeford, Me., 37.5 miles. The new line now under construction, besides connecting the two divisions of the system, will complete the connection between Portland, Me., and Boston, Mass., by electric railway. W. G. Meloon of Portsmouth, N. H., is general manager.

Augusta Winthrop & Gardiner Street Railway.—This company has been recently acquired by a syndicate headed by John R. Graham of Bangor, Me., and it is stated that the new owners contemplate building an extension to Waterville and to a connection with the Lewiston Brunswick & Bath Street Railway at Sattatus.

Bay Counties Electric Railroad.—This company is making surveys and securing right of way for a line from Belvidere, near San Francisco, to Lakeport, Cal., via Greenbrae, San Rafael and Novato.

Beloit Traction Company.—O. S. Baylies, secretary and treasurer, 79 Dearborn street, Chicago, writes that contracts have been let for the materials and equipment for six miles of city line in Beloit, Wis. The company will do the construction work. Power will be furnished by the Rockford Beloit & Janesville Railroad, with which the new company is associated, and whose tracks will be used for about one mile. The Rock river will be crossed on a city bridge. No. 00 trolley wire will be used. The rails will be 45 and 60-pound T-rail fastened with Weber joints. Joel B. Dow, president; Charles A. Gault, vice-president; both of Beloit, Wis.

Benton Harbor-St. Joseph Railway & Light Company.—It is announced that this company will build an electric railway from the Graham & Morton docks in St. Joseph, Mich., to Paw Paw Lake.

Brooklyn Rapid Transit Company.—Supreme Court Justice Marean, in Brooklyn, has issued a mandamus directing Bird S. Coler, borough president, to permit the Brooklyn Rapid Transit Company to build tracks on Nostrand avenue from Flatbush avenue to Avenue U, and also directing the company to proceed to build the line. Mr. Coler held up the application for several months, on the ground that the franchise granted by the old town of Flatbush was invalid.

Butte Electric Railway.—It is reported that rails have been ordered for four miles of double tracking on the Butte, Mont., city lines, on South Main, Walkerville and Silver Bow streets.

Calgary, Alta.—It is reported that the city council has decided to build a municipal street railway, 12 miles long. W. F. Thorold, city engineer.

Carmichaels, Pa.—John C. Gwynne of Carmichaels is promoting an electric railway from Rice Landing to Carmichaels, Pa., and thence to a connection with the West Penn Railways at Masontown, 11 miles.

Chicago Lake Shore & South Bend Railway.—J. B. Hanna, president, South Bend, Ind., writes that 15 miles of track has been laid, from South Bend to New Carlisle, Ind., and that tracklaying is proceeding at the rate of ½ mile per day. All of the grading contracts have been let and about 20 miles of rail is on hand, to be laid as fast as grading is completed. All of the steel has been contracted for and will be delivered in instalments until May. A 66-foot right of way has been purchased for the entire distance. There is one tangent of 14 miles and there are none but high-speed curves on the whole line except in cities. The overhead construction is of the single catenary type, the poles being long-leaf southern pine, creosoted and set in concrete 6½ feet. Seventy-pound rails are being used. The road extends from a connection with the Illinois Central Railroad at Kensington, Ill., where a terminal site has been purchased to South Bend, 78 miles. J. W. S. Relgle, South Bend, chief engineer.

Coatesville & Kennett Railway.—George H. Dodge, secretary and treasurer Kennett Square, Pa., has announced that financial arrangements have been made for building the line from Coatesville to Kennett Square, Pa., and that engineers will begin in a few days to make the preliminary surveys. The road will be built entirely on a private right of way.

Dallas Interurban Electric Railway.—Charles N. Wilson, president of the American Engineering Company of Indianapolis, has closed a contract with this company, incorporated about two weeks ago, for the construction of about 73 miles of electric railway, including about 30 miles of city lines in Dallas, Tex., and a line from Dallas to Greenville and Sherman. Mr. Wilson states that work is to begin next week. D. D. Waggoner of Dallas, president.

Denver & Rio Grande Railroad.—It is reported that the Central Colorado Power Company of Denver, Colo., is furnishing estimates and specifications for the electrification of the line between Denver and Colorado Springs.

Dunkirk, N. Y.—It is reported that A. N. Broadhead, president of the Chautauqua Traction Company, is interested in a project to build an electric railway from Jamestown to Dunkirk, N. Y., via Gerry, Sinclairville, Moons, Cassadaga, Lily, Dale, Stockton and Fredonia, about 25 miles.

Elizabethtown, Ky.—A corps of engineers has begun the survey of a line from Elizabethtown to West Point, Ky., 22 miles.

Ft. Wayne & Springfield Interurban Railway.—It is reported that this company, which recently opened its line from Ft. Wayne to Decatur, Ind., is now considering the extension of its line south through Chattanooga to Celina.

Garvin, I. T.—The Choctaw Veneering Company has graded 4 miles of electric railway from Garvin south toward the Red river and will begin tracklaying in about two weeks.

Hattiesburg (Miss.) Traction Company.—Bids will be received until March 6 for furnishing material and for the construction of an electric railway in Hattiesburg, Miss. E. J. O'Bierne of Atlanta, Ga., engineer.

Hutchinson Interurban Railway.—The directors have decided to extend the doubletracking of the system in Hutchinson, Kan., from the Santa Fe railroad tracks at Third avenue to the Fair Grounds.

Illinois Traction Company.—It is reported that surveys are being made between Seneca and Yorkville, Ill. This is one of the alternative routes included in the plans of the Illinois Traction Company for the line from Mackinaw to connect with either the Aurora Elgin & Chicago Railway or the Chicago & Joliet Electric Railway for Chicago, as announced in the last week's issue of the Electric Railway Review. Congress has granted a permit to the St. Louis Electric Bridge Company, a subsidiary company, to construct a bridge over the Mississippi river between Venice, Ill., and Salisbury street, St. Louis, Mo. The line from Champaign to Decatur is now in operation from Champaign to Monticello.

Indianapolis & Cincinnati Traction Company.—It is stated that financial arrangements have been made for extending this line, which now connects Indianapolis and Connersville, Ind., to Hamilton, O., by a double-track line, connecting at Hamilton with one of the existing lines to Cincinnati. A private right of way has been secured from Connersville to the Ohio state line at College Corner, 17 miles west of Hamilton. Charles L. Henry of Indianapolis, president.

Jackson Electric Railway Light & Power Company.—This company has decided to build an extension 1 mile long on Jefferson street, Jackson, Miss., as soon as the rails can be obtained. Another extension on Gallatin street is also contemplated.

Johnstown Ebensburg & Northern Railroad.—It is reported that a contract has been let to the Pierce-Barnes Company of Boston, Mass., for building this line from Johnstown to Gallitzin, Pa.

Kansas City Springfield & Southern Railway.—C. C. McFann, general manager, has announced that all the right of way has been secured between Springfield and Ash Grove, Mo., for the line which is to be built from Springfield to Nevada.

Keokuk, Ia.—A company has been organized at Keokuk with J. E. Peterson of New London, Ia., president, to make surveys and do the preliminary work toward securing an interurban railway connecting Keokuk with various points in southeastern Iowa.

Lafayette & Chicago Railway, Rensselaer, Ind.—The Lafayette & Chicago Railway, incorporated last July to build an electric railway from Lafayette to Hammond, Ind., 114 miles, has applied for a franchise. It is stated that Chicago capitalists have agreed to finance the road when the right of way is secured.

Lake View Traction Company.—It is reported that work will begin soon on the proposed line from Memphis, Tenn., to Clarksdale, Miss., about 100 miles. R. F. Tate, of Memphis, is president.

Louisville & Southern Indiana Traction Company.—Surveys are being made for an extension to French Lick and West Baden, Ind., via Mooresville and Greenville, and thence paralleling the New Albany & Paoli turnpike to Paoli, passing through Palmyra, Fredericksburg, Hardinsburg and Chambersburg.

Mankato Electric Traction Company.—W. L. Hixon and H. E. Hand are promoting an electric railway in Mankato and North Mankato, Minn., 10 miles to be built at first. It is stated that C. W. Jackson of New York has agreed to finance the project, taking \$100,000 of stock and underwriting \$175,000 first-mortgage 5 per cent gold bonds. The company is to be chartered in New Jersey under the above name.

Metropolitan Street Railway.—Plans for the viaduct and tunnel which this company proposes to build in Kansas City along Twelfth street, from Mulberry to Broadway, have been submitted to the board of public works.

Minneapolis Rochester & Dubuque Traction Company.—This company, which proposes to build from St. Paul, Minn., to Dubuque, Ia., has filed in the various towns a map of the proposed route as determined by the final surveys, including the following towns and cities: St. Paul, Minneapolis, Wayzata, Chaska, Shakopee, Faribault, Owatonna, Hayfield, Rochester, Spring Valley, Minn.; Cresco, Ia.; Decorah, Frankville, Postville, Colesburg, Marshfield and Dubuque. It is stated that the right of way has

been secured from Dubuque to Owatonna. William P. Mason of Minneapolis, secretary.

Missouri & Kansas Interurban Railway.—This company, which now has a line between Kansas City and Olathe, Kan., operated with Strang gasoline-electric motor cars, is making surveys for a branch line from Lenexa through Merriam and Shawnee to Rosedale. Fred O'Flaherty, chief engineer, Lenexa, Kan.

Napa Valley Electric Railroad.—Twelve miles of the 16-mile extension from Napa to St. Helena, Cal., has been graded and tracklaying will begin as soon as the steel has been delivered. L. J. Perry, Napa, general manager.

Oregon Electric Railway.—Grading and trestle work has been started in South Portland for the line from Portland to Salem, Ore. Property has been purchased in South Portland for terminal purposes and right of way. The steel structure of the bridge over the Willamette river at Wilsonville, which was built by the Pennsylvania Steel Company, is expected in a few days. W. S. Barstow & Co. of Portland, the engineers in charge, have about 250 men at work, with three pile-drivers, a steam locomotive and a steam shovel, and rapid progress is being made on the grading and trestle work. Ties and timbers have been delivered.

Owosso, Mich.—E. M. Hopkins of Detroit, Mich., announces that a contract has been let to the Van Rensselaer Construction Company of New York for the construction of the Grand Rapids Belding & Greenville Railway, the Grand Rapids & Ionia Railway, the Ionia & Owosso Railway and the Owosso & Pontiac Railway. Construction is to begin at once. Mr. Hopkins is president of all four companies.

Paducah Southern Electric Railroad.—H. H. Loving, Paducah, Ky., writes that this company, recently incorporated, will build an electric line from Paducah to Hickman, Ky., 75 miles, via Mayfield, Fulton, Ky., and Union City, Tenn. Contracts are to be let as soon as the preliminary work is completed. Office, 100-102 Fraternity building, Paducah.

Pittsburg McKeesport & Greensburg Railway.—The directors have authorized the construction of 6 miles of overhead work. The line between Gross Siding and Oxford Park will be double tracked. It was also decided to proceed at once with the construction of the Manor cut-off, which will reduce the distance between Manor and Irwin 1 mile. Work will also soon commence on the Mt. Pleasant and Scottsdale extensions.

Portland & Mt. Hood Railway.—Agents of this company are now engaged in purchasing property in and near Portland, Ore., as right of way for the proposed line to Mt. Hood.

Redlands & Yucaipa Electric Railroad.—C. S. Chesnut, Redlands, Cal., writes that this company, recently incorporated, will begin grading about April for its proposed line from Redlands to Oak Glenn, Cal., 20 miles. O. D. Collins of Redlands, chief engineer.

Roanoke Railway & Electric Company.—This company is now completing the double-tracking of several of its lines in Roanoke, Va., work which was started last year. Later in the spring it is expected to lay heavier rails on several of its lines. The new track is to be laid on a concrete roadbed.

Rock Island Southern Railroad.—It is reported that preparations are being made for surveys from Monmouth to Macomb, Rushville and Beardstown, Ill. The surveying party has just completed surveys between Monmouth and Rock Island. F. H. Lanchshire, chief engineer, Davenport, Ia.

Roodhouse-Virden Railway.—C. W. Payne, secretary, Roodhouse, Ill., writes that right of way is now being obtained for an electric railway from Roodhouse to Virden, Ill., 32 miles, via Felter, Scottville and Modesto. E. M. Husted of Roodhouse is president.

Rosedale, Kan.—K. W. Stewart and the Commercial Club of Rosedale are raising funds for the construction of an electric railway from Rosedale to Shawnee, Kan.

St. Joseph Valley Traction Company.—M. L. Swinehart, chief engineer, Lagrange, Ind., is securing right of way for the proposed line from Elkhart to Middlebury, Ind.,

St. Louis, Ill.—It is reported that an English syndicate has engaged a local engineering firm to make a preliminary survey and estimates for the construction of a subway system.

Sacramento Gas & Electric Company.—The Hawk Hawley & Carly Company of Sacramento, Cal., has the contract for the immediate construction of an extension from Highland Park to Curtis Oaks, the new subdivision, through Curtis Oaks to Oak Grove, and thence to the entrance of Oak Park, Sacramento.

Seattle Electric Company.—This company is now at work on an extension of its Westlake boulevard line from Eighth avenue to the intersection of Pike street and Fourth avenue.

South Carolina Public Service Corporation.—Surveys are now being made for an electric line from Orangeburg to Aiken, via Springfield, N. C.

Spokane & Inland Empire Railroad.—Surveyors have begun work on the double-track subway to connect the passenger and freight terminals in Spokane, Wash. After the preliminary surveys have been made President Jay P. Graves, Consulting Engineer William F. Zimmerman and Chief Engineer Lupfer will visit New York, Philadelphia and Boston for the purpose of studying the subways in those cities.

Topeka & Southwestern Railway.—The Lamprecht Construc-

tion Company of Topeka has the contract for building this line from Topeka, Kan., to Council Grove, Ia., and it is stated will sublet contracts in a few days. W. L. Taylor of Topeka, president.

United Cities Traction Company.—This company is building an electric belt line for both freight and passenger service from Ft. Smith, Ark., to Ft. Smith, Okla., 4½ miles, principally for the purpose of transferring freight from a manufacturing site at Ft. Smith, Okla., to the Missouri Pacific St. Louis & San Francisco, Kansas City Southern, Ft. Smith & Western and Midland Valley railroads, which center at Ft. Smith. One mile out of Ft. Smith, Ark., has been graded and right of way is now being secured. The overhead construction is of the span type. Eighty-pound steel will be used for the first 1½ miles and 60-pound for the remainder. The ties are 6 by 8 inches by 8 feet space 2 feet center to center. Maximum grade, 3 per cent. Ira L. Reeves of Muskogee, I. T., is president and chief engineer.

United Railways.—It is stated that preparations are being made for beginning construction on the Front street line in Portland, Ore. The construction crews are being assembled and Chief Engineer Wickersham is distributing materials. It was expected to begin work last week, but the expected steel rails did not arrive. C. E. Loss, of Portland, president.

Utica Southern Railroad.—An official report from E. H. Risley, secretary, Utica, N. Y., states that contracts will be let probably in April for the construction of a line connecting Clinton, Hamilton, Norwich and Waterville, N. Y., 26 miles. Frank H. Baxter of Utica, chief engineer.

Wawasee Ligonier Topeka & Lagrange Railway.—J. N. Babcock of Topeka, Ind., has been elected president of this company, recently incorporated to build from Lagrange to Wawasee, Ind. Preliminary surveys are being made and it is the intention to begin building operations early in the spring.

Western Massachusetts Street Railway.—Surveys are being made for an extension from Huntington to Lee, Mass. H. C. Page, general manager, Springfield.

Willamette Valley Traction Company.—It is announced that this company will begin the construction of the proposed street railway system of Eugene, Ore., early this month and that 100 men are to be put to work. The company's engineers have completed the work of making the preliminary survey of the line from Eugene to Springfield. A. Welch of Portland is general manager.

Yazoo City, Miss.—The Sanders-Johnson Company has made a proposition to the city council to build a street railway, taking bonds in payment; line to be 3.1 miles long; contract price, \$53,776. Plans and specifications are to be reported on by an engineer employed by the city.

POWER HOUSES AND SUBSTATIONS.

Alabama City Gadsden & Attalla Railway.—This company has announced that E. B. Flitts & Co., Atlanta, Ga., have been awarded the contract for erecting a \$10,000 pumping station, and a 2,600-foot pipe line from the pumps to the company's power house at Gadsden.

Cedar Rapids & Iowa City Railway & Light Company.—This company is reported to be contemplating increasing the capacity of its power house by the addition of prime movers and generators having a capacity of 1,500 kw. This will, of course, also involve a considerable increase in the boiler-room capacity. The changes and additions, it is estimated, will cost approximately \$100,000. William G. Dows, Cedar Rapids, is the general manager.

Chicago Lake Shore & South Bend Railway.—President J. B. Hanna, South Bend, Ind., writes that a site has been purchased for the power house at Michigan City, Ind., 2½ acres of ground on the river front. A contract was let last week to the Westinghouse Electric & Manufacturing Company for the power house machinery, substations and car equipments. The generators will be three 1,500-kw. turbine units. The car equipments will be four 125-hp. single-phase motors each.

Freeport Railway Light & Power Company.—It has been announced that this company will construct a power plant at Brown's Mill, Freeport, Ill., at a cost of \$35,000. The new station will furnish power for the railway and also for local lighting. A. J. Goddard is the president and general manager.

Haverhill & Amesbury Street Railway.—This company is planning to erect a substation on Ring's Island, Mass. Permission has been applied for to erect poles and string wires through Salisbury for the transmission wires. L. E. Lynde of Merrimac, superintendent.

Illinois Traction Company.—It is reported that work will begin at once on the erection of an addition to the power house at Danville, Ill., to provide for the installation of a 2,000-kilowatt generator, direct connected to a pair of 36 by 60-inch twin engines.

Pacific Traction Company.—It is reported that this company has purchased a site and is making the preliminary arrangements for a power plant of large capacity to furnish power for the proposed system of electric railways in Tacoma, Wash., and the line to American Lake, although the location has not been announced. B. J. Weeks, general manager, Tacoma.

Stockton (Cal.) Electric Railway.—This company is installing in the power house of the Stockton Gas & Electric Company, which furnishes power to the railway, a 600-hp. auxiliary generating plant.

Personal Mention

Mr. H. J. Clark of Ft. Dodge, Ia., has been appointed general superintendent of the Citizens' Railway & Light Company, Muscatine, Ia., succeeding Mr. Frederick D. Polvin.

Mr. W. C. Smith of Pittsburg, Pa., has been appointed general superintendent of the Mahoning & Shenango Valley Traction Company, Youngstown, O., succeeding Mr. T. C. Armstrong, resigned.

Mr. F. L. Morse has resigned as assistant to President Bancroft of the Utah Light & Railway Company, of Salt Lake City, Utah, effective on March 1. Mr. Morse has held his present position for about three months. The reason given for his resignation is that business interests require his presence in New York.

Mr. D. Thomson has been appointed general manager of the DeKalb-Sycamore Interurban Traction Company, with headquarters at DeKalb, Ill. Mr. Thomson has had 21 years' experience in electric lighting and electric railway work in Canada and the United States, as superintendent and manager of various companies.

Mr. A. A. Anderson, general manager of the Indianapolis Columbus & Southern Traction Company, at Columbus, Ind., has been appointed general manager also of the Indianapolis & Louisville Traction Company, which is building a line from Jeffersonville north to a connection with the Indianapolis Columbus & Southern at Seymour, Ind.

Mr. J. A. Doane, who was formerly a dispatcher at the Wheaton, Ill., office of the Aurora Elgin & Chicago Railway, has been appointed chief dispatcher of the Elgin & Belvidere Electric Company at Marengo, Ill. Mr. Doane has been engaged in street and interurban railway operation in various capacities for the past 15 years and is well qualified for his new position.

Mr. Roscoe R. Anderson, chief clerk of the department of transportation of the Rhode Island Company, Providence, R. I., and for the past 14 years identified with this company in various capacities, has been chosen superintendent of transportation, to succeed Mr. Samuel Riddle, resigned to become general manager of the Chicago South Bend & Northern Indiana Traction Company.

Mr. Richard Wendt has been appointed master mechanic of the Elgin & Belvidere Electric company and has assumed full charge of the company's shops and rolling stock at Marengo, Ill. Mr. Wendt has for the past six years been associated with the Aurora Elgin & Chicago Railway Company at Wheaton, Ill., during which time he has been successively foreman in charge of the high-tension lines and of the third rail and night foreman at the Wheaton car repair shops.

Mr. Samuel Riddle, for the past two years superintendent of transportation of the Rhode Island Company, Providence, R. I., has resigned to become general manager of the Chicago South Bend & Northern Indiana Traction Company, with headquarters at South Bend, Ind., effective on March 1. This is the new company recently organized by the Murdock interests of Indiana, to take over the Northern Indiana Railway. Mr. Riddle was born about 30 years ago in Glenriddle, Pa., and graduated from Swarthmore College in 1897 with the degree of bachelor of science. After leaving college he was associated for some time with Dr. W. A. Drysdale, consulting mechanical and electrical engineer of Philadelphia, and later served in various capacities with companies engaged in the installation of electric lighting and power plants. In 1905 he assumed the duties of superintendent of transportation with the Rhode Island Company, succeeding Mr. Albert E. Potter, which position he has held until his present appointment. Mr. Roscoe R. Anderson is his successor.

Obituary.

Thomas Robinson, president and general manager of the Florence Electric Street Railway, died at his home in Florence, Colo., on February 7.

Ensign James B. Cahoon, U. S. N., vice-president and chief engineer of the Eldenbel Construction Company, New York, died at New Rochelle, N. Y., on February 16, 1907. He was born at Lyden, Vt., in the year 1856. He entered the naval academy at Annapolis, Md., and after graduating in 1879 entered active service as an ensign, being stationed at Newport, where he performed special service in the electrical department. Because of an injury received to one of his eyes while in this department, he was retired from the naval service and entered the employ of the Thomson-Houston Company, of Lynn, Mass. Upon the consolidation of this company with the General Electric Company, of Schenectady, he went with the latter company as head of the expert department. In 1894 he took the position of manager with the Elmira Railway & Electric Light Company, of Elmira, N. Y. In 1899 he was made manager of the Underground Electric Light Company at Syracuse, N. Y., where he remained two years. In the year 1901 he came to New York and associated himself with the banking house of Emerson McMullin & Co., as consulting engineer. Later he went with Farson, Leach & Co., New York. In the same capacity. After leaving this firm he went into business for himself, and opened an office as consulting engineer. Later he became associated with the Eldenbel Construction Company and in 1906 was elected to the office of vice-president and chief engineer of this company. Mr. Cahoon was ex-president of the National Electric Light Association.

Financial News

Alton Jacksonville & Peoria Railway, Jerseyville, Ill.—Stockholders of this company, on February 24, authorized an issue of \$800,000 bonds, and an increase in the capital stock from \$300,000 to \$800,000. The road will extend from Alton to Jerseyville, Carrollton, Whitehall, Roodhouse, Jacksonville and Peoria, and is now under construction from Alton to Godfrey. Part of the new capital will be used to complete the line to Jerseyville.

Chicago & Milwaukee Electric.—Earnings for January, 1907 compare with January, 1906, as follows:

	January, 1907.	January, 1906.
Gross earnings	\$62,631.55	\$43,443.33
Operating expenses	33,491.94	22,693.57
Net earnings	\$29,139.61	\$20,749.76

The Chicago & Milwaukee Electric Railroad Company has sold to the Western Trust & Savings Bank of Chicago \$2,000,000 convertible notes, dated March 1, maturing in two years, and bearing 6 per cent interest. The notes are secured by a deposit of \$2,500,000 Chicago & Milwaukee Electric Railroad Company, Wisconsin division, first mortgage 5 per cent bonds of 1925. On or before September 1, 1908, the holder of each \$1,000 note has the option of exchanging it at par and interest for a \$1,000 Chicago & Milwaukee Electric, Wisconsin division, first mortgage 5 per cent bond at 98 and interest, the company paying the difference in cash. The proceeds of these notes will be used for the completion of the road into Milwaukee, and to pay for the Milwaukee terminal and for additional equipment.

Chicago Subway Company.—Arrangements have been made to establish six general freight houses where the freight of small shippers will be received and distributed for the various railway companies. While the Illinois Tunnel Company, the operating company of the subway, will have direct connections with the largest shippers, these general freight houses will accommodate small shippers. It is estimated by the tunnel management that 2,000 small shippers will take advantage of the new facilities, which will be ready for use within 90 days. The exact location of the freight houses has not been fully decided upon, but there will be two houses on the north side; one on the south side, south of Fourteenth street and west of State; one near the South Water street district; one northwest of the center of the city, between the north branch of the Chicago river and Halsted street, and one southwest of the center of the city, between the south branch of the river and Halsted street.

Cincinnati Newport & Covington Light & Traction.—The property owned by this company has been leased for 99 years to the Columbia Gas & Electric Company, which guarantees the interest on all bonds, 4½ per cent dividends on the preferred stock and 3 per cent on the common stock for the first year; and agrees to increase the common stock dividend ½ of 1 per cent each year until 6 per cent is reached, when the dividend is to be continued on a 6 per cent basis. The Columbia company, as a guaranty, will deposit \$1,250,000 cash in Cincinnati banks. Stockholders of the Cincinnati Newport & Covington have the right to subscribe for an amount equal to 50 per cent of their holdings of either preferred or common stock in the new Columbia 5 per cent bonds, which will carry 100 per cent of common stock as a bonus. The Columbia company was incorporated in September, 1906, as the Columbia Corporation, with \$11,000,000 capital stock. The name has since been changed, the authorized stock has been increased to \$50,000,000 and \$25,000,000 bonds have been authorized. The Columbia Gas & Electric has leased the Cincinnati Gas & Electric, and has acquired most of the stock of the Cleveland Gas Light & Coke Company and the People's Gas Light Company of Cleveland.

Cleveland & Southwestern Traction Company.—Earnings for January are reported as follows:

	1906.	1907.
Gross	\$46,567.14	\$49,558.10
Operating	27,549.55	29,604.34
Net	\$19,017.59	\$19,953.76

Interurban Railway & Terminal, Cincinnati.—A re-organization of the finances is proposed whereby the outstanding five per cent bonds will be surrendered for preferred stock. The capitalization of the company, when the plan is completed, will be as follows: Bonds, \$1,650,000; preferred stock, \$1,000,000; common stock, \$2,500,000. The company owns the terminal station on Sycamore street, Cincinnati, and operates electric roads to New Richmond, Lebanon and Bethel. The Lebanon line is to be extended to South Morrow, O.

Milwaukee Electric Railway & Light.—An additional \$1,000,000 of the refunding and extension mortgage 4½ per cent bonds has been sold. They are offered by N. W. Harris & Co. and Spencer Trask & Co. at 95½ and interest.

Missouri Water Light & Traction Company, Nevada, Mo.—M. P. Murray, of St. Louis, was appointed receiver of this company on February 20, on application of the Missouri Lincoln Trust Company of St. Louis, trustee for the bondholders.

Louisville (Ky.) Railway.—Gross earnings for the year 1906 amounted to \$2,523,343, as compared with \$2,298,619 in 1905, an increase of \$224,724, or 9.7 per cent. Operating expenses and taxes were \$1,563,314, as compared with \$1,422,953, an increase of \$140,361. Net earnings were \$960,029, a gain of \$84,363. Other income

amounted to \$69,653, making a total income from all sources of \$1,039,682, an increase of \$96,815. After charges and dividend disbursements, the surplus was \$82,705, an increase of \$3,044. From the surplus there was charged off for depreciation \$70,000, an increase of \$5,000 from the previous year, leaving a final surplus for the year of \$12,705. The figures compare as follows:

	1906.	1905.	1904.
Gross passenger earnings.....	\$2,523,343	\$2,298,619	\$2,045,264
Expenses and taxes.....	1,563,314	1,422,953	1,307,165

Newtown (Pa.) Electric Street Railway.—A bill has been filed by the Real Estate Title Insurance & Trust Company of Philadelphia to set aside the sale of the electric railway.

Oakland (Cal.) Traction Company.—A trust deed has been given by this company to the Union Trust Company of Oakland, to secure an issue of \$12,000,000 bonds, bearing 5 per cent interest and maturing in 28 years. The bonds will provide money for improvements, and for refunding indebtedness of subsidiary companies.

Owensboro (Ky.) City Railroad.—An increase in the capital stock from \$50,000 to \$150,000 has been authorized.

Southwestern Traction Company, Iola, Kan.—A trust deed to the Knickerbocker Trust Company, New York, to secure an issue of \$4,000,000 bonds, has been filed in Iola. The company will build a line through the southeastern part of Allen county, Kansas.

Syracuse (N. Y.) & South Bay Street Railway.—The property owned by this company was purchased at receiver's sale on February 21 at Syracuse for \$251,000 by Clifford D. Beebe, representing a local syndicate. The road was planned to extend 15 miles from Syracuse to Oneida Lake. The syndicate will complete the road.

West Penn Railways, Pittsburg.—Additional first mortgage 5 per cent bonds to the amount of \$422,000 have been listed on the Philadelphia stock exchange, making a total amount listed of \$4,360,000.

Manufactures and Supplies

ROLLING STOCK.

Long Island Railroad, Long Island City, N. Y., is figuring on 9 double-truck cars.

Dayton Covington & Plqua Traction Company, Dayton, O., is figuring on 2 new cars.

Sheboygan Light Power & Railway Company, Sheboygan, Wis., is asking prices on 9 large cars.

Louisville & Eastern Railroad, Louisville, Ky., is figuring on 4 double-truck and 6 single-truck cars.

Rockland Thomaston & Camden Street Railway, Rockland, Me., is reported to have ordered 2 passenger cars.

Niagara St. Catharines & Toronto Railway, St. Catharines, Ont., expects to place an order soon for 16 cars.

Greensboro Electric Company, Greensboro, N. C., is asking prices on 9 cars, 3 of which will be 40 feet in length.

Norfolk & Southern Railroad, Norfolk, Va., has placed an order with the J. G. Brill Company for 5 double-truck cars.

Roanoke Railway & Electric Company, Roanoke, Va., has ordered 4 double-truck cars from the J. G. Brill Company.

Kansas City St. Joseph & Excelsior Springs Railway, Kansas City, Mo., will purchase new rolling stock later in the year.

Inter-Urban Railway & Power Company, Hot Springs, Ark., expects to purchase 8 combination cars during the coming summer.

Metropolitan West Side Elevated Railway, Chicago, is reported to have placed an order with the Pullman Company for 20 cars.

Interborough Rapid Transit Company, New York, is reported to have ordered 200 cars for elevated service and 50 steel fire-proof cars for subway use.

Duluth Street Railway, Duluth, Minn., has placed an order for 15 double-truck cars to be built at the shops of the Twin City Rapid Transit Company.

Clinton Street Railway, Clinton, Ia., is in the market for two single truck cars. These will have 22-foot bodies with 5-foot platforms and St. Louis trucks.

Camden Interstate Railway, Huntington, W. Va., has ordered 5 cars from the G. C. Kuhlman Car Company, 8 cars from the Niles Car & Manufacturing Company and 1 car from the Jewett Car Company.

Metropolitan West Side Elevated, Chicago, has placed an order with the Pullman Company for 20 passenger cars, full details and description of which will be found in the Electric Railway Review of February 9, 1907.

Omaha & Council Bluffs Street Railway, Omaha, Neb., has placed an order with the American Car Company for 30 closed cars 28 feet in length and 5 closed cars 34 feet in length, all for delivery August 1, 1907.

Atlantic Shore Line, Kennebunk, Me., has ordered 8 cars from the J. G. Brill Company, 2 of which will be open cars, 4 semi-convertible with smoking compartment and 2 semi-convertible with baggage compartment. They will all be 40 feet in length and will be used for interurban service.

Illinois Traction System, Champaign, Ill., as noted in the Electric Railway Review of February 23, has placed an order with the Danville Car Company for 6 electric locomotives, 12 closed cars 22 feet in length for city service, 30 interurban cars, 55 feet long over all, 20 interurban trailers, 40 feet over all and 20 express cars.

Connecticut Valley Street Railway, Greenfield, Mass., was reported in our issue of February 16 as about to purchase 8 new cars. We are advised that the matter of their purchase at this time has been deferred because of unsatisfactory delivery. The company has just contracted for 5 quadruple equipments, Westinghouse 12-A motors to be used in equipping open cars.

SHOPS AND BUILDINGS.

Illinois Traction Company.—Options have been secured on half a block of land in the business district of Decatur, Ill., on the south side of Wood street between Water and Main streets, on which to erect a two or three-story building for a passenger and express station and for offices.

Lake Shore Electric Railway.—Bacon & Huber of Toledo, O., are now working on a set of plans for new shops and an office building to be erected this year, at a point not yet determined.

Portland Railway Light & Power Company.—This company has purchased the block bounded by First, Second, Pine and Ash streets, Portland, Ore., for \$350,000, on which to erect a five or six-story passenger terminal and office building. It is planned to make this the central terminal for all lines entering the city, including the proposed Portland-Salem line of the Oregon Electric Railway. The engineering department is now preparing the plans and it is stated that construction will begin at an early date.

Sacramento Gas & Electric Company.—This company is contemplating the construction of a car house opposite the present car house in Sacramento, Cal.

Toledo Railway & Light Company.—This company has signed a lease for the Crystal Theater building on Superior street, Toledo, and will immediately remodel the building into an inter-urban passenger station.

Toledo Urbana & Interurban Railway.—Superintendent Charles F. Smith, Findlay, O., has been in Toledo conferring with city officials and officials of the Toledo Railway & Light Company in regard to the freight house which the company proposes to erect on South St. Clair street. The particular business which brought Mr. Smith to Toledo was regarding the turnouts from the St. Clair street tracks. Plans for the building are now being prepared and work is to begin at an early date.

Warren Street Railway.—The car barns at Warren, Pa., were destroyed by fire last week. The loss is estimated at \$125,000.

TRADE NOTES.

Northwestern Electrical Equipment Company, St. Paul, Minn., suffered a loss of \$15,000 to its plant by fire on February 12.

Midvale Steel Company, Philadelphia, has plans under way for the erection of a large iron wheel house to be 164 by 256 feet.

Automatic Electric Signal Company, Milwaukee, Wis., has been incorporated with a capital stock of \$25,000 by George L. Baldauf and others.

Chicago Railway Equipment Company will, on March 15, remove its down-town office, in Chicago, from 702 Great Northern building to 413 Fisher building.

William H. Cushman, M. Am. Soc. C. E., formerly chief engineer of the Juniata Hydro-Electric Company, of Huntingdon, Pa., has opened an office at 18 Exchange place, New York city, as a hydraulic engineer.

Findlay S. Douglas has been appointed manager of the motor and generator sales department of the New York office of the Sprague Electric Company. Mr. Douglas has been connected with the sales department of the company for a number of years.

Westinghouse Electric & Manufacturing Company, Pittsburg, has commenced the erection of a new factory building to cost \$500,000. It will be eight stories high, a fireproof structure of brick and steel construction, with ground dimensions of 400 by 70 feet.

W. W. Hoyt, who for a number of years has been general yardmaster of the New York Central & Hudson River Railroad at West Albany, N. Y., has become connected with the Quincy Manchester Sargent Company, with headquarters at the New York office, in the West street building.

Lord Electric Company, Fuller building, New York, has found it necessary on account of the increased demand for the Thomas soldered rail bond and the Shaw non-arcng lightning arrester, to increase its factory facilities, and they are now in better position to make prompt deliveries on all orders.

Mudge & Neefus, 20 Broad street, New York, have organized as railway and electrical engineers and are prepared to give advice on the design and construction of motors, generators, brakes and systems of control, and will devote special attention to the installation of electric conveying machinery for factories and industrial plants.

J. A. Fay & Egan Company, Cincinnati, at its annual meeting of stockholders elected the following officers and directors: President, Thomas P. Egan; vice-presidents, D. P. Egan and Fred Egan; treasurer, A. A. Faber; secretary, William Green; and Grif-fith Rawson, John E. Bruce, W. H. Doane, C. P. Egan and Rudolph Kleyboite.

Aluminum Company of America, Pittsburg, Pa., has just received an unusually large order from the Dayton Globe Iron Works Company, of Dayton, O., which includes 24 turbines to be installed in its plant at Massena, N. Y. The shipment will aggregate 750 tons or approximately 60 carloads, and will be delivered from July to October, this year.

Massachusetts Chemical Company, Walpole, Mass., in order to meet the demands of its rapidly growing business has built a large addition to its factory and equipped it with the best of modern rubber machinery. These improvements have doubled the capacity of the plant and will enable the company to handle business more promptly than heretofore.

American Bridge Company, New York, has plans under way for extensive improvements to its plant at Elmira, N. Y., to cost about \$1,000,000. When the additions are completed the plant will have a capacity capable of turning out from 4,000 to 5,000 tons per month. Considerable machinery for structural work will probably be purchased in the near future.

Ambursen Hydraulic Construction Company, of Boston, has been awarded the contract for the building of a second dam on the Juniata river at Huntingdon, Pa., for the Juniata Hydro-Electric Company. This will be 30 feet high above foundations in the roadway, measures 500 feet in length and includes a power house. This company has also received a contract from the Bar Harbor & Union River Power Company for the construction of a reinforced concrete dam for its power development on Union river, at Ellsworth, Me. In addition to the dam, which will be 60 feet

high, a power house, canal, transformer house and other work will be constructed.

Revolute Machine Company, 523 West Forty-fifth street, New York, has received an order from the Baldwin Locomotive Works for an outfit of its Revolute blue-printing machines to replace those which were destroyed in its recent fire. It is stated that the drafting department of the Baldwin Locomotive Works will be equipped exclusively with this type of blue-printing machine hereafter.

Electric Storage Battery Company announces that it has opened a sales office at Atlanta, Ga. This office is at 1126-27 Candler building, and is placed in charge of Harold H. Seaman, formerly engineer of the Cleveland sales office of this company. He will handle all matters pertaining to the territory of Tennessee, North and South Carolina, Georgia, Florida, Alabama and Mississippi.

Cohen-Schwartz Rail & Steel Company, St. Louis, Mo., has moved its general offices to suite 508 Mechanics' American Bank building. This move was necessitated by an increasing business which demanded larger quarters for general offices. The company is installing at its Mound street yard an alligator shear which weighs 60 tons, claimed to be the largest west of the Mississippi river, if not west of Pittsburg.

Davies Electric Corporation, Tacoma, Wash., has been incorporated with an authorized capital stock of \$150,000 and has taken over the business of the Davies Brothers Electric Company. The officers of the company are: President and engineer, Marcus C. Davies; vice-president, Dr. Ernest C. Wheeler; treasurer, H. W. Davies; secretary and business manager, A. W. Lewis. The company will manufacture electrical fixtures.

Charles I. Earll, Bowling Green building, New York, manufacturer of the Earll trolley retriever, reports a record duplicate order from the United Railways & Electric Company, Baltimore, Md., for 80 No. 5 retrievers. These machines are to be placed on the new cars (80) soon to be delivered by the John Stevenson Company, and this will make over 200 Earll retrievers in use on the United Railways & Electric Company's lines.

Illinois Bolt, Nut & Forging Company, recently organized, has elected the following officers: P. H. Joyce, Sr., president; Lloyd J. Smith, vice-president and M. L. Hunt, secretary and treasurer. The following were elected directors of the company: P. H. Joyce, Sr., Lloyd J. Smith, M. J. McDonough, A. W. Tyler and George Chilton. Contracts have been let for the buildings and the largest part of the machinery. The plant will be operated electrically and is expected to be in operation by April 1.

Russell Car & Snow-Plow Company, Ridgway, Pa., has during the past two months received several orders for the Russell snow plows, of which it is the sole owner and manufacturer. The Northern Pacific placed an order for three snow plows of the largest type and the Great Northern two, all of which were shipped promptly and are now in service. The Canadian Northern purchased two snow plows and these are now being used for the heavy work along its lines that have been blocked for several weeks.

Wire & Telephone Company of America, Rome, N. Y., suffered a loss by fire to its wire drawing plant on February 23 but the buildings in which it manufactures magnet wire, rubber covered goods and telephone products were not damaged in the least. Arrangements have been made with other wire mills for the drawing of its wire and no delay in the delivery of its products will be felt. A new wire drawing plant with a greatly increased capacity has been contracted for and will be pushed to the earliest possible completion.

ADVERTISING LITERATURE.

Hanna Engineering Works, 820 Elston Avenue, Chicago.—Hanna riveters of various types for use by bridge shops, boiler shops, tank works, locomotive works and for other railway and manufacturing purposes are illustrated and described in a brief manner in a folder.

Abenague Machine Works, Westminster Station.—Gas or gasoline driven direct-connected air compressor outfits are the products of this concern and one of them is described in an 8 page illustrated pamphlet. The outfit shown is designed for bridge erection and the smaller structural iron work.

Gardner Machine Company, Beloit, Wis.—"Gardner's No. 4 Improved Disc Grinder" is the subject of an illustrated leaflet which presents data showing the effective manner in which the grinder has been used in different services, as for instance, for grinding pump bonnets, automobile parts, centrifugal pump cases, drop forgings brass castings and iron piston rings.

Allis-Chalmers Company, Milwaukee, Wis.—Bulletins No. 1497 and 1420 deal respectively with the Bennetts pouring spoon, an accessory for converting stands designed to prevent a large amount of the splash and splatter attendant upon the pouring of the converter, and with gold milling in the Black Hills. The latter is in substance a paper prepared by Professor H. O. Hofman of the Dakota School of Mines.

Power and Mining Machinery Company, Cudahy, Wis.—Catalogue No. 7 describes in detail the complete lines of cement making machinery manufactured by this company. The progress which has been made in the Portland cement industry in this country is remarkable and has occasioned the increase of the output in the United States from 42,000 barrels in 1880 to 35,000,000 barrels

in 1905. A corresponding progress has been made in the manufacture of machinery for the production of Portland cement. Some of the most modern devices are described in the catalogue of the Power and Mining Machinery Company.

Westinghouse Machine Company, Pittsburg, Pa.—"The Westinghouse Storage Battery for Stationary Use" is the subject of a publication designated as Catalogue S. The type-S storage battery described in the catalogue is the result of many years of systematic study of many familiar and comparatively unknown storage batteries manufactured both in this country and abroad. The battery is of the pure lead sulphuric acid type.

Green Fuel Economizer Company, Matteawan, N. Y.—Fans, blowers and exhausters are described in a 96-page book recently published by this company. Dimensions are given for a large number of sizes and types of steel plate fans for heating and ventilating, drying, mechanical draft, etc., and for a number of sizes and types of planing mill exhausters for handling shavings and other light materials. Typical installations are described in detail.

Dossert & Co., 242 West Forty-first Street, New York.—Dossert solderless connectors and terminals for solid wires and stranded cables are described in an attractive pamphlet under the title of "The Dossert Solderless Cable Joints." These joints contain a number of new features and improvements which are designed to supersede methods of soldering cables. The connectors can be applied in a few minutes and possess maximum conductivity and great tensile strength.

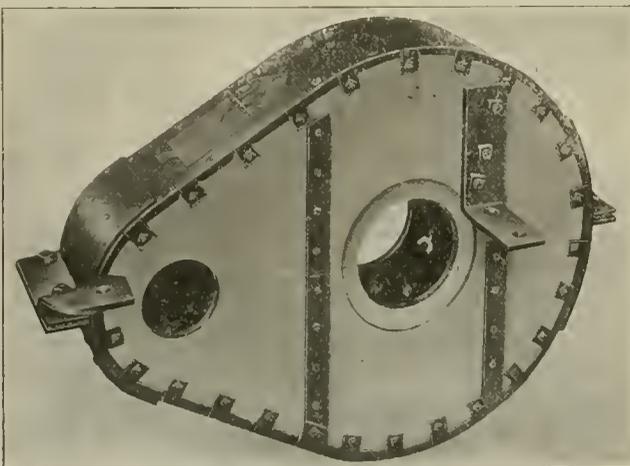

Jeffrey Manufacturing Company, Columbus, O.—Bulletin "B" deals with the grab-bucket system and coal and ashes handling machinery for power houses with particular reference to the power plant of the Scioto Valley Traction Company and the Cincinnati Traction Company. Bulletin "C" also illustrates Jeffrey coal and ashes handling machinery for power plants, employing close contact and overlapping-lip swivel buckets. The application of the system to the plants of a number of commercial houses is shown.

Union Switch & Signal Company, Swissvale, Pa.—During the present year, this company will issue monthly calendars, illustrating the day and night indications displayed by the fixed signals most generally employed on American railroads and the meanings of such indications as determined by the Railway Signal Association, the American Railway Association and other authorities. The first two of the series show, respectively, interlocked track signals of the one-arm high two-position type and a two-arm high home two-position type.

Richard Dudgeon, Broome and Columbia Streets, New York.—This firm has issued a handsomely illustrated catalogue and price list of Dudgeon jacks with special reference to the new form just being introduced to the market. Several forms of the jack in the early stages of its development are also illustrated and the pamphlet is therefore a brief history of the evolution of the hydraulic jack. The latest form is clearly shown in sectional views with key description of the various parts and the price list gives the items of cost of the several components.

A COMBINATION STEEL AND WOODEN GEAR CASE.

The desirability of reducing the weight of the equipment on electric cars has from time to time led manufacturers to design sheet-steel and wooden gear casings, many of which, however,

A Combination Steel and Wooden Gear Case.

through faulty design have proven inadequate in respect to strength and wearing qualities.

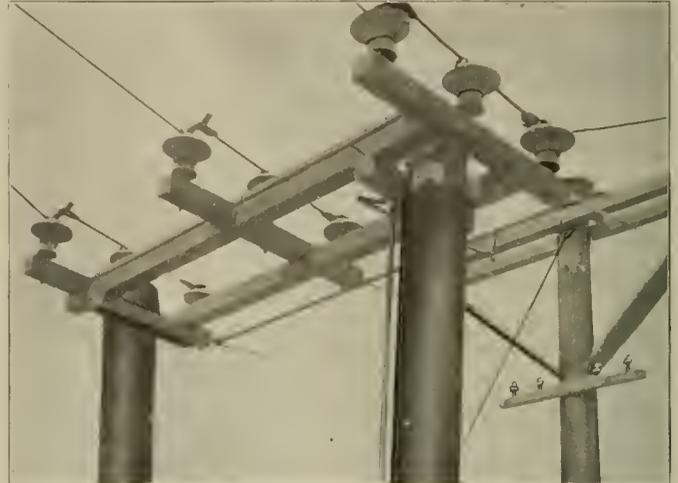

To overcome past difficulties and fulfil the requirements of lightness, wearing qualities and strength, the Columbia Machine Works & Malleable Iron Company, Chestnut street and Atlantic avenue, Brooklyn, N. Y., has introduced a combination sheet-steel and wooden gear-case, which embodies many points of superior merit.

As will be seen from the accompanying illustration, the edges of the gear-case, which conform to the shape of the gear and pinion, are made of pressed sheet-steel flanged over, making the

sides both rigid and giving a better connection between the iron and the wooden sides. In addition to the flanging there also are a large number of heavy iron lugs turned over and securely bolted to the wooden part of the casings, besides the large number of screws around the edge of the wood, as shown in the illustration. The hangers are made of wrought iron and so attached to the casing that the weight is equally distributed between the hangers in such a manner as to reduce the strain in the casing to a minimum. The wood used in the construction of these gear-cases is well seasoned and stiffened by additional iron straps, and the whole is so constructed that the gear case is both water and dust tight. It is divided horizontally and a door is provided in the side of the case for examining and lubricating the gears.

POLE-TOP AIR-BREAK SWITCHES FOR HIGH-TENSION TRANSMISSION LINES.

With the development of high-tension transmission lines the difficulty of handling large currents at high potentials has constantly increased, and with the extension of lines to great dis-

Open-Air High-Tension Switch.

tances considerable trouble has also been experienced from high-tension static discharges on the line, even when not in use. This difficulty has caused considerable trouble when it has become necessary to repair or adjust the oil switches in the power house and substations. Linemen and electricians at work on the lines and at the oil switches have often received serious static discharges when working on apparently dead lines. To obviate this difficulty it was necessary to develop a suitable type of switch which could be used on extremely high-tension lines, and which would give a visible proof to the linemen and electricians that the oil switches were disconnected from the generators or transformers and the line. This difficulty was experienced by the California Gas & Electric Corporation, of which Mr. F. G. Baun was electrical engineer. To overcome these difficulties Mr. Baun invented and later patented a well-designed form of pole-top switch which, it is said, is capable of breaking or making a circuit carrying 300 kilowatts at 100 kilovolts potential, and oil switches designed to break circuits of any capacity at 100 kilovolts.

The pole-top switches, one of which is clearly shown in the accompanying illustration, are now manufactured by the Pacific Electric & Manufacturing Company, San Francisco, Cal., which has also secured the patents and manufacturing rights for the oil switches, and in addition is prepared to equip an entire transmission line from the power house to the substations.

The pole-top switches such as shown in the accompanying illustration are generally located on both sides of an oil switch so that the electrician can open them for cleaning or making repairs with perfect safety. Another usual arrangement for power houses is to locate one of these pole-top switches outside the power house and a similar one on the side of the wall of the power house or switch room on the generator or transformer side of the oil switches.

The construction of these air-break switches is simple and rigid and the insulation is fully sufficient for safe operation at the potentials for which they are designed. It will be noted that they consist of three insulators, two of which carry the contacts and the center one, which is mounted on a pivot so that it can turn, carries a cross-arm and the switch blades. The bottom of the movable insulator carries a crank to which is attached the operating rod, the motion of which opens or closes the switch. The three insulators and their attachments, which form one switch, are mounted in place on a heavy wooden cross-arm. One or more of these, according to the number of lines which are to be opened simultaneously, are mounted in a row as shown in the illustration and the operating rod, which may be worked from the ground or the power house, is connected to the crank on each of the movable insulators. These air-break switches may also be arranged to be operated mechanically or electrically from the remote station.

The extreme temperature fluctuations of the present winter, sometimes showing a variation of 30 or 40 degrees in 24 hours, have imposed severe strains on metals as well as men, and there is little question that violent and sudden frosts in northern climates furnish the sole explanation of certain breakages in bolts, trolley harps, truck parts and other equipment of electric railway service. Cold weather is always an enemy to punctual schedules and thereby a possible primary cause of accidents; it is taken into account as much as possible by active motive power officials, but the silent and powerful effects of sharp frost on physical equipment are less realized. Unfortunately there is apparently but one way to offset the danger of fluctuating cold, and that is to increase the inspection given to trucks, brake rigging and other vital parts of the cars while on the road. The track also needs closer attention, where the rails and spikes are fully exposed. The simple test of tapping with a hammer is helpful in discovering cracks or looseness, which, if neglected, are liable to cause disaster. Redoubled vigilance is unquestionably essential in cold weather. It does not seem to be at all a matter of the amount of stock allowed in individual pieces of equipment.

One of the stock arguments frequently used by advocates of water-tube boilers is the ease with which damaged tubes may be removed and replaced. It is suggested that, as ordinarily fitted, damaged tubes cannot, as a rule, be more easily removed from water-tube boilers than from the fire-tube type. When a tube fails such failure in the usual case is caused by an opening along the weld or it has bagged from being worn thin. In either of these events the original shape of the tube has been changed. Due to such disfigurement, difficulty is generally experienced when an attempt is made to remove a leaky tube, and often it is found impossible to pull such open or bagged tubes through the header. It then becomes necessary for

the boilermaker to cut out several adjacent tubes so that he can have working space in which to manipulate tools for cutting the damaged tube into sections that may be removed through the restricted space. Why, then, would it not be an improvement in the present practice if the tubes were rolled with the head-end of a diameter larger than that of the remaining portion? This practice is observed in marine work and it would seem that it might have an adaptation on land. In localities where boiler feedwater is poor and it is necessary to frequently replace tubes, the slight additional cost for rolling the head-end to a larger diameter would be insignificant as compared with the time and labor saved in the removal of tubes. There also would result a further saving in wear and tear on the headers. It is well known that the practice of jerking or forcing bulging tubes through headers so damages the tube-holes that when new tubes are inserted excessive rolling is required before a water-tight joint is obtained, and unless special care is taken the joint between the new tube and the header will require frequent expanding to prevent leakage. Continued working of the metal at the head-end of the tube will result in a final fatigue of the metal. The plan suggested or perhaps an alternate one of using copper sleeves between the tubes and the header should afford methods for preventing leakage and escaping some of the repair work now necessary.

That regular, uniform stoking is absolutely essential for the attainment of high boiler efficiency is well known. It is worthy of note, however, that this particular subject receives entirely too little attention, though it is one of vital importance, not only for economy, but also for the prevention of smoke. This neglect of the most essential principle of boiler economy is found as often in plants with mechanical stokers as in the hand-fired plants. The reason for this is, no doubt, because it is thought that, the stoker being mechanical, all that is required is to see that the coal chutes do not clog and that the ashes are

dumped. Such management of a mechanical stoker will result in serious wastes of fuel, needless smoke and frequently damage to the boiler setting, stokers and tubes. In plants having mechanical stokers the head stoker should see that the automatic feed is continually adjusted to just meet the demand on the plant. He should not permit the firemen to feed in a large amount of coal and then allow it to burn low before feeding in a fresh supply. Careless handling of mechanical stokers will produce wastes of fuel just as will carelessness in a hand-fired plant. A good plan for stoking in hand-fired plants is to place a clock over each boiler, having only a minute hand and having its dial divided into stoking periods, say a heavy mark every five minutes. Each time the hand is on a mark the fireman should spread a little coal on the fire. To secure the maximum output of hand-fired boilers it is absolutely necessary to have a firing schedule so arranged that all the furnaces are stoked and cleaned in rotation. This will avoid having a number of fires in a thi condition at any one time and a large number of fire doors open at the same time. It is suggested that if properly heeded these simple points should assure not only the maximum output of the plant, but smokeless and economical operation as well.

THE SAFETY OF HIGH-SPEED TRAINS.

The electric locomotive makes it possible to operate trains at much higher speeds than the present schedules for steam trains provide for, and this is one of the principal advantages to be expected from the introduction of electricity for main line passenger traffic. The Berlin-Zossen experiments demonstrated the possibility of operating trains at a speed of 125 miles per hour and the result has been the serious proposal to build an electric line between Berlin and Hamburg, Germany, and operate trains at a speed of 100 miles per hour. On account of the present distrust of schedules providing for an average speed of little over 50 miles per hour and maximum speeds of 60 to 70 miles per hour, it is well to inquire whether any proposal to limit the speed of passenger trains by legislation should be encouraged.

The ability to operate high speed trains with safety is the most severe test of the efficiency of railroad engineering. It is a measure of the development of the railway structure and its rolling equipment, as well as of the skill and faithfulness of the employes. Fast trains are for this reason a matter of pride with railroad officials as they indicate that the property belongs in the first class and it rates high in the efficiency of its mechanical operation, provided such trains are run with safety. But when fast trains are operated under conditions not suited to their requirements, there is a greater liability to accident and the public is interested in the question of the limit of speed which is consistent with safe operation.

The speed of passenger trains is limited by law to some extent in France, and was at one time in Germany and Austria, but the tendency is to remove such restrictions, and it would be retrograding and discouraging to progress and improvement to impose by legislation any speed limits for passenger trains in America. The result would be especially to retard those improvements which are constantly tending to make fast trains safer.

The ability to handle high speed trains successfully is the natural result of highly developed railroading and progress in general efficiency of mechanical operation is best shown by the gradual reduction in the schedule time of limited trains between large cities. It is the severe requirements of high speed which have developed the steam passenger locomotive to such great power and speed capacity. Our magnificent Atlantic and Pacific type locomotives and the balanced compounds are the natural result of the desire

to reduce the schedule time of express trains. High speed trains have shown the necessity for stronger cars and steel passenger cars have resulted from this demand. While only a few years ago the use of steel cars in America was regarded as something very remote, experience with high speed trains has so demonstrated their necessity that the industry engaged in building steel passenger cars is now well developed beyond the experimental stage.

The air brake has been improved and made more efficient with each successive requirement for shorter stops with high speed trains. In fact, the latest improved high speed brake is far in advance of the requirements of ordinary service and it is that which will make faster schedules possible and train control safe at the higher velocities. The quick acting brake would stop a train, running on the level, at 70 miles an hour in 1,800 feet, and the high speed brake reduced this to about 1,400 feet, while recent improvements in the high speed brake will make it possible to stop a train with such initial velocity in about 1,200 feet. These wonderful improvements in the air brake would not have been developed if there had been any restrictions passed on the speed of passenger trains and we had been compelled to operate at the ordinary speeds of 40 to 50 miles an hour, which many persons now think would be the best condition. The operation of high speed trains has been the principal cause for the division of track into blocks and the equipment of railways with block signals, and the later improvements, the ingenious and effective automatic block signal, and finally the automatic stop. All these may fairly be said to be the result of the necessity of high speed traffic.

The weak point in the whole system appears to be the track, especially on curves, as it is here that high speed trains most frequently fail. The theoretical elevation of the outer rail which is proper for high speed trains is not given because the same track is used for slower freight trains, and to insure safety it is necessary to either slow down fast trains at sharp curves, or use separate tracks for them, and the danger occurs when the reduction in speed is not always made.

The wooden tie in various stages of decay and the common spike which has been redriven do not result in favorable conditions for the safety of high speed trains. American locomotives have driving wheel pressures on the rail about twice that used on ordinary locomotives in foreign countries and 50 per cent greater than their most modern engines, but the track fastenings here are not equal to the best practice in Europe. The screw spike which is there used has about twice the resistance to withdrawal of the common spike used here and its resistance to lateral displacement is $1\frac{3}{4}$ times that of the common spike. The screw spike is now used experimentally to a limited extent in this country, but this simple method of making track more secure for fast trains must recommend it for more general use. The steel tie will be used to a larger extent as the supply of good oak timber becomes exhausted, and though still in the experimental stage, it will be so improved, especially in the method of securing it to the rail, that it will prove an important factor in the effort to produce more substantial and safe track. We may have, some day, creosoted longitudinal stringers for the rail support, and a well-drained roadbed of concrete, but these things will not come if fast trains are regarded as an evil to be avoided and their use generally discouraged. High speed trains may properly be called vast testing machines, and though they do not measure maximum stresses in track and equipment, they are relentless in showing weak points and are the most potent factors in suggesting improvements which tend to the betterment of the service, and to develop all those details which make railway travel safer and more comfortable. High speed is expensive from every point of view. The consumption of fuel is enor-

mously increased, more expensive equipment is required, the cost of maintaining track largely augmented, and train or tonnage capacity materially reduced. For these reasons 2-cent fares are the more to be deplored. In the operation of trains at high speeds safety is insured only by eternal vigilance and the constant and heavy expenditure for the most efficient appliances (which are expensive) and everything which reduces the ability of the railroads to procure these is a menace to the safety of passenger travel.

VALUE OF A SHORT-TERM FRANCHISE.

Since the street railway first became a factor in transportation in America, there has been pursued, with a few exceptions or perhaps even only partial exceptions, the policy of charging reconstruction and renewals to capital accounts instead of providing for them out of earnings, a course absolutely contrary to the principles of sound business administration. Dividends were paid that were not earned; in effect they were paid out of the capital. In many cases this was doubtless because of ignorance; in others the act was deliberate and done with the purpose of inflating stock values and providing a basis for marketing bonds. One effect of this has been the deception of investors; this is perhaps a matter of small importance as affecting the industry in general. Another and vastly more important effect has been the deception of the general public, which has been taught to believe that a 20-year franchise confers "enormously valuable rights in the streets."

The public is not to be blamed for demanding universal transfers, reduced fares and contributions in the guise of street paving, street lighting, etc., when, on their own showing, the street railways were earning, and what is more were paying, in dividends many times normal interest returns on the investment, and issuing stock rights with a liberal hand. As company after company yielded to public demands when franchise renewals were needed the belief that the street railway business was an extremely profitable one became better and better established. This continued acceptance of unreasonable conditions has finally resulted in many companies undertaking to furnish a service that costs more than the fare received, while at the same time strengthening the opinion of the public that the fare is too high.

The data published in the Electric Railway Review for February 23, last, furnish a basis for some interesting deductions as to the value of a short-term franchise to the Chicago Union Traction Company.

Inasmuch as this company operates and has to make good the deficit of the Chicago Consolidated Traction Company the operations of the latter should also be considered. Since data as to the value of the physical property of the Consolidated are not available, it is necessary to make some assumptions, which it is intended shall be well within the facts.

For the year 1904 the reports cited show:

Gross Income:	North Chicago	\$ 3,195,981
	West Chicago	5,567,439
	Consolidated	1,548,374
	Total	\$10,312,394

The cost of the replacement of the physical property of the North and the West Chicago companies is known. Assuming that the value of the physical property of the Consolidated company is in the same ratio to its income as for the others, which is very favorable to the weak company, the result is:

Plant and Equipment:	North Chicago	\$ 5,506,367
	West Chicago	11,039,795
	Consolidated	2,923,707
	Total	\$19,469,869

Assuming the depreciation and maintenance on the Consolidated to be 23 per cent of gross earnings as for the other lines (which is also favorable to the weak company)

the figures show, when reserves for accrued depreciation have been made, deficits as follows:

Deficit:	North Chicago	\$123,523
	West Chicago	521,355
	Consolidated	55,715
	Total	\$700,596

Examination of the income and expense accounts of the three companies (see Electric Railway Review, February 23, 1907, page 249) shows that the only returns received by capital for 1904 are those paid in "Interest, rentals, etc." which were:

Interest, rentals, etc.:	North Chicago	\$ 573,429
	West Chicago	1,210,950
	Consolidated	673,351
	Total	\$2,456,821

Now, let it be assumed that all the bonds, notes, receiver's certificates and other obligations on which this total for interest and rentals is paid are absolutely fictitious and entitled to no return, and that this sum of \$2,456,821 may be added to the net income shown in the reports cited. Before paying dividends there would have to be deducted the deficit of \$700,596 already shown, which would leave a balance of \$1,756,225. This sum is equal to 9.02 per cent of the cost of the physical property subject to depreciation, which has been taken as \$19,469,869, on the basis stated. This "cost of physical property subject to depreciation" does not include the land on which buildings are located, so that the cost of plant and equipment here assumed would need to be increased considerably in order to equal the investment absolutely necessary for the operation of the railway.

If the Consolidated Traction company be omitted from the calculation and the Union Traction be relieved from paying the deficit of the Consolidated, the Union Traction company would show, after making full provision for depreciation, a net income in 1904 equal to only 9.24 per cent of the cost of physical property subject to depreciation.

In the two succeeding years the company showed greater receipts, both gross and net, but in order to secure these additions were made to the physical property. The amounts of such additions not being known, no deductions as to the earnings in terms of cost of plant and equipment can be made. If no additional capital had been invested the fiscal year ending 1906 (after eliminating the deficit of the Consolidated company, \$102,979) would show earnings of only 11.6 per cent on the cost of replacing the tangible property, exclusive of land, which the North Chicago and West Chicago companies had in 1904.

Thus when absolutely all of the "water" has been squeezed out of the company's capital it can show about 10 per cent per annum on the investment.

The need of urban transportation facilities will always obtain, and it might be argued that 10 per cent per annum is too great a return on an absolutely safe investment. Street railways have, however, to contemplate and insure against what may be called the risk of supersession.

Within 50 years, street railways have had their methods revolutionized twice. The horse or steam dummy railway, which was for 30 years the principal means of intraurban transportation, was superseded by the cable railway in large cities. After little more than 20 years all the cable railways in American cities have been superseded by electric lines and there is no certainty that changes almost equally complete and revolutionary will not within the next 20 years require the abandonment of existing equipment. This applies, not only to the cars themselves and the railway construction, but also to the power plants. The earlier electric railway power stations were practically obsolete before they were in complete operation, and within 10 years from the introduction of electricity as a motive power for street railways the direct-connected unit had almost entirely displaced the original belted generating machinery. Within the last six or seven years the steam turbine has been developed and has

made serious advances in territory where a few years before it was considered that the reciprocating engine would always be supreme. There is no certainty that the steam turbine will hold its present position as a prime mover for railway power plants. The claims of gas engines are being strongly pressed and the owner of an electric power station today has little reason to believe that in 20 years from now his successor in business would be willing to purchase the plant at cost, even though it was in as perfect condition as it is today. In 20 years from now the management of the company which wishes to succeed the present one may have entirely different ideas as to the proper type and size of car, as to the most desirable method of transmitting current to the motors, and as to the type of electric motor itself.

For these reasons the conservative management which operates under a limited-term franchise must provide out of earnings during the franchise term a sum sufficient to retire the capital stock at the end of the term unless investors are to take serious risks. Assuming a 20-year franchise term, and that the company can find a 5 per cent investment for its amortization reserve, there would need to be set aside each year to insure the return of the capital investment unimpaired, 3.03 per cent of the capital. This would reduce the stockholder's profit to less than banker's interest rates. In other words, a 20-year street railway franchise is merely permission to take a gambler's chance of earning the same return that is paid on a farm mortgage loan.

There is nothing novel in these arguments in favor of giving proper consideration to depreciation and amortization. They have been presented before, but nearly always in academic discussions which it was considered might be of possible interest to remote posterity, or as pleas in court when some reduced-fare ordinance was to be attacked. But in America they never have been reduced to practice. Some companies have made a little progress, but none have gone far enough. To make insufficient provision for depreciation and amortization on the ground that the company's earnings are not large enough to bear the proper charges on these accounts, and at the same time to pay dividends on stock, is to beg the question.

THE VALIDITY OF PERPETUAL FRANCHISES.

The decision of the United States circuit court, rendered by Judge McPherson, involving the franchise of the Des Moines City Railway Company, summarized in the *Electric Railway Review*, for March 2, last, brings up anew the question of the validity of perpetual street railway franchises. This decision does not settle the question. Nothing but a decision of the supreme court of the United States can do that. But this decision, as the judge himself suggests, opens the way for an appeal direct to the United States supreme court. It has been stated that this case will be taken there; but it still remains to be seen whether that court will decide the question, or will find that some other way is the proper one to dispose of the case, as has occurred heretofore when this question seemed to be involved in the litigation taken up.

The attitude of the courts generally seems to be unfavorable to perpetual franchises. Possibly the judicial expressions on the subject, such as they are, may be said to be more hostile in the state than in the federal courts.

Based upon the decision of the supreme court of Alabama, in 1885, in the case of Birmingham & Pratt Mines Street Railway Company v. Birmingham Street Railway Company, 79 Alabama Reports, 465. Booth, in his "Law of Street Railways," section 17, lays down the principle that, "in the absence of constitutional limitations upon its powers, the sovereign legislative authority in a state may grant privileges exclusive in character and perpetual in duration; but a municipal corporation cannot make such grants without

explicit legislative sanction." He also finds in the leading New York case of *Milbau v. Sharp*, decided in 1863, 27 New York Reports, 611, that a resolution of the common council authorizing persons to construct and operate a street railway upon certain conditions, without limitation as to time, is a contract void because it would deprive the corporation of its proper power of control and regulation.

Nellis, in his work on "Street Surface Railroads," states that "under the authority usually delegated to municipalities an exclusive or perpetual right to use a street for a street surface railroad cannot be conferred."

But Judge McPherson, in upholding the validity of the perpetual franchise of the Des Moines City Railway Company, seems to express the present view of the federal courts. At the same time perpetual franchises are not likely to be very liberally treated by them, even if sustained.

The supreme court of the United States has said, in the case of *Detroit Citizens' Street Railway Company v. Detroit Railway*, decided May 23, 1898, 171 United States Reports, 48, that "easements in the public streets for a limited time are different and have different consequences from those given in perpetuity. Those reserved from monopoly are different and have different consequences from those fixed in monopoly. Consequently those given in perpetuity and in monopoly must have for their authority explicit permission, or, if inferred from other powers, it is not enough that the authority is convenient to them, but it must be indispensable to them." Previously to this the court also said, in the same case, that "the power of a municipality to grant an exclusive privilege to occupy its streets for railway purposes must be given in language explicit and express. There were many reasons which urged to this—reasons which flow from the nature of the municipal trust—even from the nature of the legislative trust, and those which, without the clearest intention explicitly declared, insistently forbid that the future should be committed and bound by the conditions of the present time, and functions delegated for public purposes be paralyzed in their exercise by the existence of exclusive privileges."

This is sufficient, perhaps, to show the present position of the courts on this question. It is true that there are not many decisions directly on the subject, but, taking the question of jurisdiction and other points involved in the case under consideration, it appears that there were enough cases cited bearing more or less on the point so that Judge McPherson says that his opinion would be a volume in size if he were to notice all such authorities.

Of course, in states where there are constitutional limitations or statutes prohibiting the granting of franchises for more than a fixed term of years there cannot be a valid perpetual franchise granted while such provisions remain in force. Moreover, perpetual franchises, when obtained, would seem to be subject to forfeiture in much the same way as other franchises.

It may also be noted, in passing, that in this case the city apparently thinks to evade the constitutional prohibition against the passing of any law impairing the obligation of contracts by having adopted a resolution, instead of an ordinance, declaring the company's rights at an end, though Judge McPherson looks upon this as a distinction not making any difference, in this case.

Destroying Chicago River Tunnel.

The Great Lakes Dredge & Dock Company on March 5 began destroying the La Salle street tunnel under the Chicago river, through which the cars of the Chicago Union Traction Company operated until it was determined to destroy it because it obstructed navigation. The work should be completed in April. The tunnel was completed in 1871 and cost \$569,000.

**OPENING OF THE NEW MARKET STREET ELEVATED
RAILWAY OF THE PHILADELPHIA RAPID
TRANSIT SYSTEM.**

BY EDWARD HUNGERFORD.

Philadelphia, the fifth American community to adopt an elevated railway as a means of quickened urban transit, opened its new high-speed route through Market street from the public buildings at Fifteenth street to the Delaware county line on Saturday afternoon, March 2. The opening was an event of moment and the Philadelphia Rapid Transit Company, which controls the new road as well as all the street surface railways of the city, celebrated it by sending out several thousand invitations to railway and newspaper

has had charge of the rapid transit project from its inception, even planning such details as the men's uniforms and train schedules, felt that a good part of his work had been consummated with success. Train service was begun upon a five-minute headway, 19 minutes being allowed for the five-mile run to Fifteenth street. Public curiosity had been aroused to a pitch that crowded the trains if not the commodious stations. Owing to the incomplete state of the power equipment for the new road, two-car trains are being operated. Within a few weeks three-car trains will be placed in operation and this, it is anticipated, will be ample for traffic requirements for some time to come. In addition to the terminals only the local stations at Thirty-second street, accommodating the West Philadelphia station of the Pennsylvania railroad at Fifty-second street and Sixtieth street,

Market Street Elevated, Philadelphia—Showing Loading Platforms of Terminal Station at Sixty-ninth and Market Streets, with Philadelphia & Western Station at Left.

men throughout the country as well as to prominent Philadelphians. The response to these invitations was generous and a large party of interested men, including President James McCrea of the Pennsylvania; President George F. Baer of the Reading, and President John B. Parsons, Vice-president and General Manager Charles O. Kruger and other operating officers of the Philadelphia Rapid Transit system, boarded special trains on the new railroad and rode out to the county line (Sixty-ninth street) where they made a close inspection of the large terminal station, shops and yards that have been erected there.

On Monday morning at 6:30 o'clock the road was formally opened for regular passenger traffic by the dispatching of a downtown train from the Sixty-ninth street terminal and Assistant General Manager Frederick H. Lincoln, who

where free transfer is made with intersecting cross-town surface lines, are now complete. The other local stations on the elevated, at Thirty-sixth, Fortieth, Forty-sixth, Fifty-sixth and Sixty-third streets, are all framed and their early completion is only a matter of carpenters' and painters' details.

The Market street line, as planned from the beginning, is part elevated and part subway construction. Previous articles, showing the progress of the work, were published in the Street Railway Review of September, 1905, and in the Electric Railway Review of January 5, 1907. Beginning at the Delaware river the line is planned beneath the surface for nearly two miles to the Schuylkill river, where it emerges upon a five per cent grade upon a bridge and becomes an elevated structure for more than four miles to Sixty-ninth

street. Three-quarters of a mile of the west end of the road is upon the surface, laid in rock ballast and absolutely protected by high iron fences with concrete foundations. The line is double-tracked save that a short section of the subway between the Schuylkill river and the public buildings has been four-tracked, the outer tracks being given over to the operation of through surface cars from West Philadelphia.

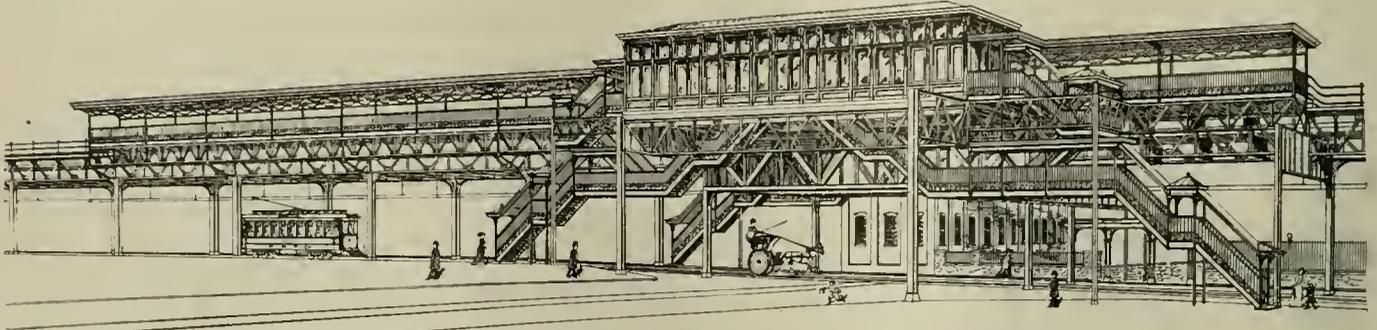

The Subway Section.

Starting from the temporary elevated and surface car terminal in the shade of the public buildings and the great

running contact rail of the New York Central type, the wood casing being painted a bright red to make it particularly conspicuous.

The Elevated Section.

The elevated trains crossing the Schuylkill river rise from sub-surface to over-surface on a three-span bridge, 563 feet in length and especially designed to meet its peculiar problem—the bringing of the elevated tracks up a sharp grade as well as bringing the surface trolley tracks up an easier grade to the street surface level of West Philadelphia. The elevated structure represents the best foreign prac-

Market Street Elevated, Philadelphia—Exterior View of Station at Thirty-second and Market Streets.

Broad street station of the Pennsylvania Railroad, the four-track line traverses a subway with inside dimensions, 48 feet 6 inches, by 14 feet 6 inches, the roof of which is supported by three parallel rows of steel columns placed between tracks and 5 feet apart on centers. Efficient ventilation is assured by means of stair openings in stations and ventilating shafts, many of which have been attached to the long

tice in the designing of such structures. Lattice girders have been universally used and an attempt made to make the road both pleasing and dignified. It rests upon concrete piers, pyramidal in shape, 8 feet square at their base, 2 feet 6 inches square at the surface and reaching to a depth of from 8 feet to 30 feet below the street level. Each is protected from vehicular traffic by steel fenders. At the top of each pier

Market Street Elevated, Philadelphia—Interior View of Subway Station at Fifteenth and Market Streets.

side walls of the Pennsylvania train shed and designed so as to appear as part of that structure.

The outer or surface car tracks are laid in cast iron chairs, on wooden sleepers, but the inner tracks, upon which the heavy all-steel trains run, have the rails resting upon short sleepers which are nothing more nor less than yellow pine blocks which in turn are bolted to 12-inch longitudinal channels set in concrete. Power for train service both in the subway and upon the elevated is derived from an under-

heavy steel bolts are imbedded in the concrete as anchorages for the upright steel columns, which are spaced in pairs, 24 feet apart from center to center, each pair averaging a 50-foot distance from its neighbor, and rising almost to the height of the rail. The longitudinal trusses which carry the floor of the elevated system are approximately 6 feet 6 inches deep, while the cross girders separating the floor system directly are spaced 10 feet apart. Expansion joints have been placed to each four spans or about 200 feet apart. The

structure is designed to carry cars weighing 100,000 pounds apiece, 25,000 pounds on each of four axles, the initial rolling stock weighing 80,000 pounds each at the load.

Possibly the most interesting feature about this elevated structure in itself is the fact that it is built with a solid floor, a city ordinance making this feature a necessity. This flooring is of steel made in longitudinal troughs and spliced with cover plates and angles so as to render it water-proof. Upon these troughs rest Vulcanite Portland cement made into a 1-3-6 concrete, reinforced with a lattice of steel rods and poured in to cover four inches as a minimum over every portion of the steel floor. The concrete is protected by one inch of granolithic and upon this has been placed the rock ballast that receives the sleepers of the standard track. Both tracks are protected the entire length of subway and elevated by a check or guard rail. The weight of the entire

are located, and these stairs are so connected with cross passages as to make each of common use. An unusual feature has been adopted by bringing the entrance stairs up within the station buildings. Passometers are used to give access past the ticket windows to the trains and also for exit past another ticket window at those stations where transfers are given to connecting surface lines. Exit turnstiles have also been installed at the stations. A continuous platform or railed sidewalk, near the level of the car floors, connects all stations, for the use of workmen or for use as emergency exits.

The Terminal Stations.

The downtown temporary terminal is now at Fifteenth street. It has been used for surface cars to West Philadelphia for some time past but entrance and egress to and from these cars is kept upon the sidewalk and separate and dis-

Market Street Elevated, Philadelphia—Interior View of Subway Near Fifteenth and Market Streets.

structure is about 98,000,000 pounds or about 5,050 pounds a lineal foot. Into its construction, including the stations, went 560,000 pounds of cast iron, 47,000,000 pounds of steel and 19,900 cubic yards of concrete. In construction an average day saw 70 feet of structure set up, 50 feet riveted and 132 feet of concrete floor laid, 300 feet having been laid on one day.

The Local Stations.

Local stations at each of the points heretofore mentioned are of a single type and are well adapted to a great growth of traffic. The center platform type does not appear, all stations being double. The platforms will accommodate eight-car trains, are of exceptional width and have adequate shelter against inclement weather. The twin buildings contain ticket offices, toilet rooms and waiting rooms, are framed of wood and steel, covered with copper on the exterior and finished within in oak. Four stairs reach each sidewalk corner at the street intersections, above which the stations

are separated from elevated traffic, a metal screen at the platform edge of the elevated terminal in the subway keeping surface car passengers from alighting there. A broad stair leading from the street through the Arcade building, on the south side of Market street at Fifteenth street, gives access through the basement of that building to the ticket offices of the terminal. Passometers have been eliminated at this point in favor of chopping boxes.

The terminal at the county line, or Sixty-ninth street, is an extensive brick structure in three parts, each devoted to the use of a distinct railroad and acting as a common interchange for passenger traffic between them. The Philadelphia Rapid Transit Company built and owns the structure, which has been made a most attractive architectural feature with a great waiting room 97 feet by 117 feet that would do credit to any line. Candy booths and such concessions line the walls of this room while a broad extension at its rear gives access for incoming and outgoing passengers on the Market

street elevated, which has its terminal just underneath. There are two regular tracks and one emergency track for the elevated there, a discharging platform 17 feet wide and 350 feet long serving one of the regular tracks and a loading island platform, 33 feet by 350 feet, between the other regular and the emergency tracks. Broad stairs lead directly from these platforms to the waiting room extension which is bridged over them.

At the level of the waiting room and just to the east of it is a five-track stub terminal of brick and steel which serves the Philadelphia & West Chester Traction Company, a rapidly expanding suburban trolley car service which already has lines reaching to Ardmore, to Newtown Square and to West Chester, 22 miles distant. Across the Market street elevated terminal tracks and platforms is the unfinished terminal of the Philadelphia & Western, the high-speed electric line which is being built to Overbrook, Ardmore, Bryn Mawr, Wayne and other nearby suburban communities of importance and which will ultimately, it is promised, be extended through to York, Pa.

The elevated tracks, at this point on a low surface level, describe an easy loop of 150 feet radius west of this station for the quick reversal of trains. Beneath this loop two tracks at a still lower level lead to the shops and lay-up yards of the line, which are about 700 feet northwest of the terminal station building. These structures of brick and concrete in the most approved and modern type of construction comprise an inspection shed, truck repair shop, machine, miscellaneous repair shop, store rooms, locker rooms, shop office, etc. Abundant provision has been made for future extension both of yard and of shop facilities.

Equipment.

The new road starts operations with 40 all-steel passenger cars, which, it estimates, will fulfil all needs for some time to come. Its trains, of three-car length for the present, are composed entirely of motor cars, each car having two GE-66 125-horsepower motors using type MC-36 control, with motorman's cab in the vestibules on the diagonally opposite corners of the car. The cars have Westinghouse airbrakes and Curtis trucks with Symington journal boxes. Each car is heated by 18 Consolidated heaters and lighted by 25 16-candlepower incandescent lamps, in addition to a headlight and two markers on each end.

The cars, which were built by the Pressed Steel Car Company, have been built with non-combustible floors, outside sheathings of cold rolled steel and the underframed having as its feature deep fish-belly side sills, which were made necessary by the introduction of center doors into each side of the car. The interior finish of the car is of a fine grade of mahogany, the ceilings being of a birdseye neutral shade for a better reflection of light. The vestibules open directly into the cars, their outer doors as well as the center doors being arranged for pneumatic opening and closing by the guard's handle. When all doors are tightly closed the fact is communicated to the motorman by a buzzer above his head. Pantagraph safety gates have been applied on the corners opposite the motorman's cabs and Mason safety treads at each door.

There are 24 side windows to the car with Pantasote shades, the seating arrangement of which is similar to the Manhattan elevated or subway type. The center set of transverse seats on each side have been installed in front of the center door. These can be easily removed when press of traffic renders it advisable for the road to begin the use of these center doors.

The exterior of the cars is painted a deep red with lettering and striping in gold. Each car is lettered "Market Street Elevated Passenger Railway" beneath the eaves and bears its serial number in the center of each panel beneath the windows.

Each car weighs nearly 33 tons unloaded. The length over platforms is 49 feet 5 inches, the inside length of the car being 39 feet 6 inches. The width over all is 8 feet 7 inches, the inside width being 7 feet 7 $\frac{3}{4}$ inches. The height from rail to top of floor is 3 feet 10 inches, height from floor to ceiling center 8 feet 6 $\frac{1}{2}$ inches, height from rail to top of car 12 feet 7 inches, opening for vestibule side door (between door posts) 2 feet 9 inches, width of end door opening 3 feet 2 $\frac{1}{2}$ inches, width of center doors opening on each side 3 feet 4 inches, distance from center to center of trucks 34 feet 6 inches.

Signals.

Both the elevated and the subway stretches have been equipped with the electro-pneumatic block signal system, manufactured by the Union Switch & Signal Company, one rail of each track having been reserved for this purpose. Home and distant signals have been placed at short intervals along the line and the modern practice of using green as a safety, yellow as a caution and red as a danger indication has been followed. In addition to the "overlap" system of blocks, an automatic stop of the same type as used in the New York subway has been installed at each signal to apply the airbrake to each train which attempts to run by the stop indication. Any defect in the track will also operate to throw the signals to danger.

All switches along the line are interlocking and are controlled by the electro-pneumatic devices manufactured by the Union Switch & Signal Company.

No special provision has been made for power for the new line besides the gradual enlargement of the Beach street house by the addition of three turbo generators. The company has been planning extensive additions to its entire power plant but as yet has made no public announcement of its plans along this line.

Progress is being made both on the inter-line terminal loop that is to encircle the public buildings and on the continuation of the Market street subway for another mile down to the Delaware river and the busy ferries that lead to Camden and many Jersey towns. It is expected that this portion of the line will be in operation in about a year.

Still further additions to Philadelphia's beginnings in real rapid transit are now being detailed. It is already being planned to build a double-track elevated in Delaware avenue from Arch street, close by and connecting with the easterly end of the Market street line, north five miles along the water front to Frankford, through a busy and congested manufacturing district now particularly difficult of access.

The limited car service between Columbus and Zanesville, Q., on the eastern division of the Indiana Columbus & Eastern Traction Company, will be doubled, beginning on Monday, March 11. The service now consists of two cars, each way, daily. Next Monday two additional limited cars will be put on, to leave Columbus at 6:55 a. m. and 12:55 p. m. This will make four cars each way a day. The distance of 64 miles is made in two hours by the limited cars. This means that, with the necessary slow running through towns and cities, a speed of from 50 to 60 miles an hour has to be maintained at various points on the line.

The Indianapolis & Cincinnati Traction Company will put a new schedule into effect on March 11, between Indianapolis and Greensburg, Ind., running every other car as a limited. The limited cars will stop on signal only at each town, and will require an additional fare of five cents for each 20 miles or part thereof. The limited cars will leave Indianapolis at 45 minutes after the even hour, and will leave Greensburg on the even hour. Local cars will leave Indianapolis 30 minutes after the odd hour, and will leave Greensburg 45 minutes after the even hour.

DEPRECIATION RESERVES OF THE MILWAUKEE AND ST. LOUIS RAILWAYS.

In the Electric Railway Review for February 23, 1907, page 245, there was published a table showing in a number of different units the expenditures made or reserves provided for maintenance and depreciation by the Chicago Union Traction Company and the Glasgow Corporation Tramways. Herewith are shown the corresponding figures for The Milwaukee Electric Railway & Light Company (railway department) and the United Railways Company of St. Louis.

In view of the fact that Mr. John I. Beggs, who administers these Milwaukee and St. Louis properties, has for many years strongly urged the need of recognizing and providing for that deterioration of physical property, commonly called depreciation, which takes place in spite of the best of current maintenance and repairs, and for the amortization or redemption of the capital in the case of companies having limited-term franchises, a statement of the policy that has been pursued by him will be of interest.

Mr. Beggs assumed the management of The Milwaukee Electric Railway & Light Company (which was a reorganization, made in 1896, of the Milwaukee Street Railway Company that had become bankrupt in 1895) in 1897 when the company was not earning sufficient to pay interest on its bonds, to say nothing of dividends on stock. At that time the Milwaukee street railway system was in urgent need of "immediate rehabilitation," the heaviest trolley wire being only No. 1 and the most of it No. 4, and the heaviest rail

and was then transferred to the credit of "Depreciation Reserve," giving that account a credit balance of \$89,697.37. On December 31, 1906, the total to the credit of the "Depreciation Reserve" account was \$593,554.72. These figures are for the railway department only.

There were two reasons for making this transfer and temporarily abandoning the attempt to provide an "Amortization Reserve": (1) It was believed that the capital represented by the stock should receive some return at the earliest moment practicable. (2) It was believed that the necessary "Amortization Reserve" wherewith to pay the bonds as they would mature and to refund the capital stock when the franchises would expire, could be accumulated later when the property had attained a greater earning capacity.

It is considered by Mr. Beggs that the 10 per cent of gross earnings which The Milwaukee Electric Railway & Light Company now sets aside for its depreciation reserve is less than should be thus reserved in order to equal the amount of depreciation of plant and equipment that has actually accrued, and furthermore, that the company should have now an "Amortization Reserve" sufficient in amount to compensate for those years of its franchise term that have already elapsed.

In the case of the United Railways Company of St. Louis the same policy in regard to depreciation that Mr. Beggs had established in Milwaukee was inaugurated the day that he assumed the management of the St. Louis company. For the last two years there has been set aside for this fund five per cent of the gross earnings. This amount is not con-

Comparisons of Totals of Maintenance and Depreciation Charges for the Fiscal Year, 1906.

	Fiscal Year Ending	Gross Income, Per Cent of	Per Mile of Track Operated, Dollars	Per Revenue Passenger, Cents	Per Passenger, Cents	Per Car-Mile, Cents	Per Car-Hour, Cents
North Chicago Street Railroad	Aug. 31	22.00	\$1.96	1.118	0.658	6.58	49.67
West Chicago Street Railroad	Aug. 31	24.00	7.669	1.214	0.710	6.82	52.32
Glasgow Corporation Tramways	May 31	35.24	8.364	...	0.677	7.46	53.25
Milwaukee Electric Railway	Dec. 31	17.97	4.606	0.777	0.580	4.65	40.83
United Railways of St. Louis	Dec. 31	15.09	4.016	0.750	0.520	4.35	41.20

Note: For Chicago and Glasgow the total of depreciation and maintenance is in per cent of gross receipts; for Milwaukee and St. Louis it is in per cent of gross earnings.

being only 56 pounds per yard with much of the strap rail laid for horse roads still in service.

Although, as stated, the company in 1896 and 1897 was not earning fixed charges, it was stipulated by Mr. Beggs, before he would undertake the management, that beginning immediately there should be set aside from earnings the sum of \$15,000 per month to be used for reconstruction and renewals and the creation of a depreciation reserve, and that no dividends on the preferred stock should be expected for five years. (Payment of dividends on the preferred stock was, however, begun after four years.) In 1897 the \$15,000 per month, or \$180,000 per year, to be set aside or used for renewals amounted to about 15 per cent of the gross earnings. The sum reserved for this purpose was kept at \$15,000 per month until the gross earnings had increased to about \$1,800,000 per annum, and since then, up to the present, the sum set aside for depreciation and renewals has been 10 per cent of the gross earnings. Because of the need of rebuilding track and replacing worn-out equipment it was not expected that the funds set aside for depreciation would accumulate as a reserve, and in fact for several years the expenditures for renewals and replacements greatly exceeded the amounts specified for this purpose, and in 1900 the "Depreciation Reserve" showed on the wrong side of the ledger.

In 1898, a year after the policy of providing for depreciation was adopted, there was also set up an "Amortization Reserve" to provide for the redemption of the capital when the franchises should expire, which would then have been, on the average, in 1924. The company was granted a new franchise, effective January 2, 1900, consolidating and extending the old grants until December 31, 1934. The "Amortization Reserve" at the end of 1900 amounted to \$360,000

considered by any means sufficient for the purpose, but it constitutes the nucleus of a fund which it is expected will become ample as the earnings of the company increase and permit a larger percentage to be devoted to the reserve.

Mr. Beggs has said that were he to build and equip a brand-new, up-to-date electric railway under a limited franchise, he would, with the first turn of the wheels, at once provide not only for a depreciation reserve that would insure the preservation of the physical property at the highest efficiency possible, but also for an amortization reserve that would insure the integrity of the capital invested. The situation of the Milwaukee company in 1897 and of the St. Louis company two years ago was, however, very different from that of a brand-new property. Therefore, since neither had the earning capacity to provide the depreciation and amortization funds necessary to compensate for actual wear of physical property and for the diminution in length of the franchise term, the policy has been to set aside for reserves at first such amounts as it was considered the property could bear, with the intention of increasing, both absolutely and relatively, the amounts so reserved as the earning power became greater.

In this connection may be noted what has been done by two other companies of which Mr. Beggs is president. The Milwaukee Light Heat & Traction Company, which is a subsidiary of The Milwaukee Electric Railway & Light Company, began to provide for depreciation by setting aside 5 per cent of gross earnings in 1903; in 1904, the amount was 6 per cent; in 1905, it was 7 per cent; in 1906, it was 8 per cent, and for the current year will be 9 per cent of the gross earnings. Similarly the Wisconsin Traction Light Heat & Power Company, of Appleton, Wis., a reorganization and consolidation of a number of properties effected in 1900, began

with the current year to set aside 5 per cent of gross earnings for depreciation.

NEW ENGLAND STREET RAILWAY CLUB.

The February meeting of the New England Street Railway Club was held at the American House, Boston, on the evening of February 28, 1907, Vice-President Reynolds being in the chair. The speaker of the evening was Professor A. S. Richey of the Worcester Polytechnic Institute, his subject being "Electric Car Testing." An abstract of his paper follows:

Car equipment tests ordinarily are divisible into tests of the apparatus before assembly on a car and tests under complete or partial service conditions. The manufacturers' tests usually are for the purpose of determining the efficiency and relative data, and in the case of motors also may include tests of equipment under constant load for the determination of the heating rate and consequently the capacity of the motor. These stationary indoor or floor tests cannot of themselves give a true knowledge of the later performance of the same motor in actual service unless made with the proper allowance for the difference in fixed conditions compared with variable service conditions. The main differences arise from the variations in the load and voltage on the motors and the better ventilation secured in actual service. Flywheels have been used in manufacturers' stand tests to imitate the inertia of the car, the brakes furnishing an imitation of the train resistance, including curve and grade resistance. The value of these tests depends upon the proper assuming of train resistances and ventilating conditions; these assumptions should have, therefore, for their bases, tests that have been made on cars under actual operating conditions, or "car tests" in place of "motor tests." It is to such tests, made under actual operating conditions, that these notes mainly will be confined.

Such car tests may be made to determine the proper constants for use in applying motor-test results, or to determine certain data pertaining to the particular stretch of track, shape, size and weight of the car or train under consideration. They may be to determine the relative value of locomotive train, multiple-unit train or single-car operation, of double or quadruple motor equipments for the particular service in question, and to determine rates of acceleration, coasting or braking, heating values or train resistance.

The temperature rise of the motors and the train resistance at the speed under consideration are the values of greatest importance in considering the adoption of a motor equipment for any given line. Professor Richey next discussed the usefulness of speed-time-current-distance curves and indicated the methods of plotting them. They enable the engineer to predict the speed and current consumption at any point on the line, to determine the service capacity of motor equipments for given schedules and the corresponding power consumption. Motor tractive effort is usually obtained from the characteristic curves of the manufacturers.

The resistance of the track bears a pretty well-defined relation to the grade and curvature. Though the grade-resistance factor has been found constant and repeated tests have shown consistent results for the curve-resistance factor, train resistance is a more or less uncertain matter unless backed by experience or tests with the particular class of equipment under consideration. It varies with the size, shape, weight and number of cars comprising the train as well as the speed. It varies, not directly as the speed, but as some power of the speed, the exponent of this quantity being not greater than 2 and probably varying with the size, weight and shape of the train and perhaps with the speed. A formula has not been definitely deduced which can be applied to all cases as yet, and therein lies one of the uses of car testing—to determine the values of train resistance for a particular class of equipment under consideration, that they may be used in plotting speed-time-distance curves, so useful in solving many if not most of the problems of electric railway design.

The current time curves, giving the variations in the input to the motors, may be used to determine the service capacity of the latter if the heating characteristic of the motor under like conditions be known; otherwise, it also may be necessary to resort to the car test in order to determine this. Car tests also are made to determine the relative efficiency or operating costs of various parts of the car equipment, such as controlling or braking apparatus, brakeshoes, wheels of various materials, trolley apparatus, different designs of trucks, springs, etc.

Reference was made to the test tracks maintained by

the large manufacturing companies, the Berlin-Zossen tests and the extensive tests of the electric railway test commission in connection with the St. Louis exposition.

In tests where motor performances and train resistance are to be studied, it is usual to provide instruments showing values of voltage, current and speed. Speed values generally are obtained by measuring the voltage of a small magneto-generator, belted or geared to the car axle, its voltage, of course, varying with the speed. All these values are read or recorded simultaneously at short intervals of time, plotting these values against time, as ordinates; or autographic or semi-autographic instruments are provided which plot curves showing the desired values on a strip of paper moved under the instrument pens at a constant rate of speed. Recording wattmeters also are generally provided; the rise in temperature of the motors is measured by both thermometer and resistance methods, and the time of passing certain landmarks and the beginning and end of grades and curves, where possible, also is recorded.

Professor Richey referred to the extensive tests made in 1902 on the interurban lines of the Union Traction Company of Indiana by the Westinghouse company and the electrical engineering department of Purdue University. The tests were made by the electric company in order to secure general data on the performance and requirements of motors for such service; by the Purdue men as thesis work and by the railway company to secure information on train resistance and motor performance for use in specifying motors for a 100-mile extension then contemplated, and also to aid in a decision as to the adoption of two or four-motor equipments for that extension. Professor Richey emphasized the importance of using autographic instruments but stated that a perfectly satisfactory recording instrument capable of working accurately on a moving car has not yet been attained although approaches are being made to it from several directions.

A description of the semi-autographic apparatus devised by Mr. John D. Keiley and as used by the Interborough Rapid Transit Company of New York, the Brooklyn Rapid Transit Company, the Boston Elevated Railway Company and others, was then given. The striking feature of this apparatus is the arrangement made to follow the various instrument needles' motions and record the movements on paper. This is done by a centralized disc over each instrument, which is connected with a pen bearing on the moving strip of record paper, the disc being moved by a handle as the observer follows the variations in the needle. Typical records and lantern slides of its equipment were shown with reference to the wattmeters for integrating the total power consumption of the car, the square root of the mean square of the current per motor, energy consumption of multiple-unit control apparatus, air compressor, motor, etc. The use of the location marker pencil, operated by a magnet and push-button system also was described. Special tests made by the students of the Worcester Polytechnic Institute were described and the methods of checking speed and distance records by calculating the area underneath speed-time curves, the comparison of total current curves and current per motor curves, were taken up. The calculation of train resistance was briefly touched upon.

One of the most interesting features of the paper was a description of the development of the plans for testing electric car equipment in the new electrical engineering laboratory of the Worcester Polytechnic Institute, now nearly completed. A special car for tests will be a part of this equipment. The car body, which is being built by the Cincinnati Car Company, is 40 feet in length and externally closely resembles the interurban cars of the day with baggage compartment, although the interior will be devoid of the usual car furniture, leaving all space clear for the apparatus and observers. The car will be carried by Baldwin M. C. B. trucks and equipped with four G. E.-80 motors, K-28 control and General Electric straight airbrakes. All of the car wiring will be done from a slate panel-board inside the car so

that the instruments may be included in any portion of the circuit desired. The car is being equipped for the purpose of offering the greatest facilities for instruction, experiments and tests of all kinds in electric car equipment.

The laboratory also will be equipped with a car-testing stand. A concrete foundation at the bottom of the pit, having I-beams embedded in it, serves as a bedplate for the apparatus. Four bearing stands are provided which may be moved along the I-beams and fastened to them at any point suiting the wheel and truck-base of any car. Each bearing stand carries a shaft upon which is mounted a pair of supporting wheels, the periphery of which is the shape of a standard T-rail, the two wheels being mounted on the shaft just track-gauge distances apart. The shafts also carry flywheels built up of various thicknesses of boiler plate, so that the weight easily may be changed over a wide range. There also is mounted on each shaft a G. E.-57 motor arranged as a separately excited generator. A traveling crane serves the testing stand and the balance of the laboratory.

A car may be run over the stand and let down upon the supporting wheels, each pair of carwheels resting upon a corresponding pair of supporting wheels. The car is kept from moving endwise by being fastened at one end to an anchor post. If the car is started it will, as a whole and relative to the building, stand still, but its motors and wheels will revolve, and with them the supporting wheels. This motion will be retarded by the inertia of the steel-plate flywheels, which can be built up to imitate correctly the inertia of the car itself if it were moving on a stationary track. The train and grade resistance are imitated by loading the G. E.-57 motors acting as generators and these can be varied at will. As the four generator armatures are in parallel and their fields separately excited in series with one another, they also act to keep the speed of the four supporting shafts uniform with each other at all times. Any car on the stand thus can be operated with the same energy consumption as in regular service conditions, and the drawbar pull at any speed and current can be measured with a traction dynamometer. This test stand, upon which either the institute's car or one from any outside road may be operated, will afford opportunity for instruction and tests not available anywhere else. Two complete systems of multiple-unit control, General Electric and Westinghouse, will be mounted in operative conditions at the side of the testing stand, and either they or the K-28 control of the car itself can be connected to the panel-board of the institute car. Westinghouse, General Electric and National airbrakes can also be operated upon the test stand.

E. H. Gary on Steel Situation.

E. H. Gary, chairman of the board of directors of the United States Steel Corporation, when asked for his opinion as to the state of the steel trade, said:

"The steel situation is sound from every standpoint. The United States Steel Corporation is booking more new business than at this time last year. New orders, in fact, are running about 6,000 tons a day in excess of what they were a year ago. Unfilled business shows little change as compared with the tonnage reported on December 31, 1906. There has been a slight falling off in orders, as compared with the unusually heavy bookings in the last quarter of last year, but new business is equal to the capacity of our mills. At this time of the year there is generally a falling off in the demand from railroad companies. We only wish we had more capacity in order to meet the requirements of consumers more promptly."

A franchise has been applied for at Geneva, Switzerland, to build a railway from Zermatt to the summit of the Matterhorn. The project includes a cog and ratchet road from the Viege-Zermatt station to the Lac Noir, 2,508 meters. The entire system is to be operated by electricity. It is estimated that it will require four years to complete the road and that it will cost \$2,000,000.

SINGLE-PHASE, 11,000-VOLT LINE IN COLORADO.

As announced in the Electric Railway Review for February 16, page 221, construction work is now in progress on the new lines of the Denver & Interurban Railway Company. It will be remembered that this company will build 16 miles of new track on the right of way of the Colorado & Southern from Globeville, a suburb of Denver, to Louisville Junction. From the latter point to Boulder the two existing tracks of the Colorado & Southern will be equipped for electrical operation.

A large quantity of earthwork will be necessary in grading for the new track, but it is expected to construct a track over which trains of three multiple-unit cars each may be run at 60 miles per hour. The rails for the new track weigh 85 pounds per yard and slag will be used for ballast.

Power for the operation of the new line will be purchased from the Northern Colorado Power Company, which is now completing a 10,000-kilowatt capacity turbine station at Lafayette, Colo., about four miles distant from the midpoint of the new line. Single-phase current at 11,000 volts pressure will be fed direct to the No. 0000 grooved trolley wires at Louisville Junction. At this pressure no transmission lines other than the trolley wires will be necessary, neither will there be required any transformer stations. The trolley wire will be hung from a catenary messenger supported by brackets and wooden poles. The height of the wire above the track will be 22 feet and the poles will be set 8 feet from the nearest rail. This location of the poles and the use of a comparatively short bracket arm will place the trolley wire at one side of the track, and over a line between the rail and the end of the ties nearest the poles.

Current will be taken from the wire with two bow or pantagraph collectors mounted on opposite sides of the car so that one will be available for operation in each direction.

The company is now making preliminary designs for new high-speed interurban cars. The new equipments will weigh about 46 tons each and will be operated by four 125-horsepower single-phase motors. The car bodies will be of the steam-coach type, both straight passenger and combination, 55 feet long over all and 10 feet wide over all. The combination cars will have baggage compartments 8 feet long and both types will have forward cabs 5 feet long. The straight passenger cars will seat 64 passengers.

The Denver & Interurban Railway Company is also building a street car system in Ft. Collins, Colo. The new work here includes the construction of six miles of city track, the erection of the necessary shops and operating buildings and the erection and installation of a 600-kilowatt rotary current substation. The local system will be operated by 550-volt current from this substation, power being purchased from the Northern Colorado Power Company.

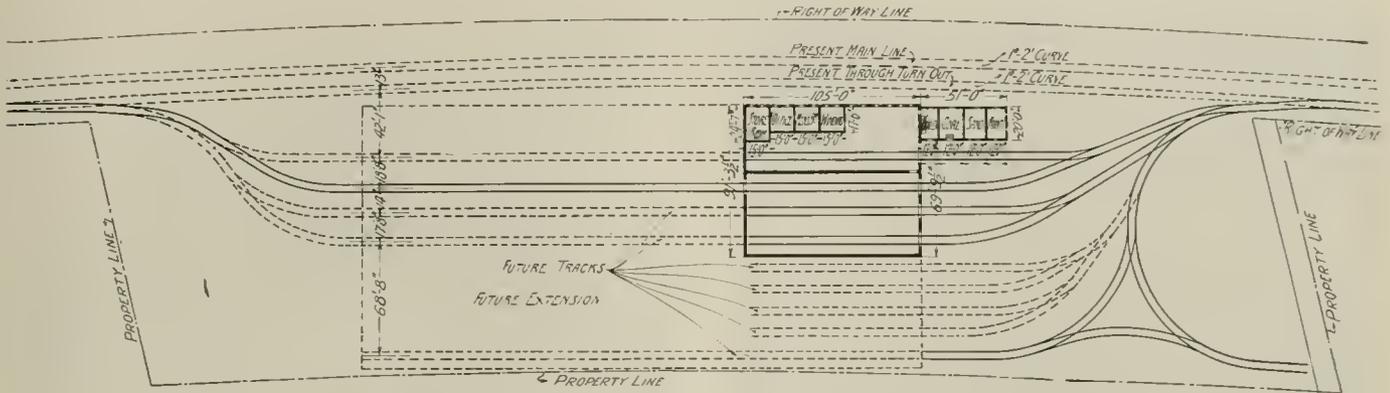

For use on the Ft. Collins lines the company has placed an order for eight semi-convertible cars with the Woepper Brothers Carriage Works, Denver. These cars are to be 40 feet long over all, equipped with four 40-horsepower motors, have vestibuled platforms, seating capacity of 40 passengers.

The Indiana Columbus & Eastern Traction Company is preparing to let contracts for the building of the London cutoff and other improvements on the Columbus and Springfield division. The cutoff will be a single track five miles long between Lafayette and Summerford in Madison county, O., and will shorten the line between Columbus and Springfield about seven miles. Other improvements that are to be made include the increasing of the capacity of the substation at Brighton near Springfield, the installation of a portable substation on the Columbus end of the division, and the renewing of the track by ballasting and replacing about 20,000 ties. Passenger stations will also be erected at Lafayette and Summerford.

Marks, Huntley, Coyne, Marengo, Garden Prairie and Camp Epworth.

The Stromberg-Carlson telephone system is used for dispatching trains. The main switchboard is located in the ticket office at Marengo and telephone booths are maintained at each of the agency stations. Jack-boxes are conveniently located on poles every 2,000 feet along the line and as each car is equipped with a portable box telephone, the trainmen can, in case of trouble, quickly get into com-

nel is 43 feet long and has a width of 14 feet and a clear height above the top of the track rails of 20 feet. The sides of the tunnel spread out into wing walls at the ends. The trolley is supported from mine hangers fastened to the under side of a wooden trough. The telephone lines and trolley feeders are carried through the subway on brackets set into the side walls near the roof, while the high-tension lines are taken over the track and telegraph lines of the railroad company. The transmission line wires are mounted on 60-

Elgin & Belvidere Electric Company—Plan of Car House and Yards.

munication with the dispatcher. The standard interurban train order system, as recommended by the committee of the American Street and Interurban Railway Association, has been adopted.

Track and Overhead Construction.

The railway is built on private right of way except through the towns. Excessive grades and short radius curves have been avoided. The longest tangent, 7 miles long, is just west of Marengo. There are also many shorter stretches

foot poles set 50 feet center to center. Protection is afforded by a guard net placed 25 feet above the railroad tracks. Standard overhead equipment furnished by Porter & Berg and the Ohio Brass Company has been used throughout. The copper wire was furnished by the American Steel & Wire Company.

A bridge over the Kishwaukee river is one of the interesting points in the roadbed construction. It is of the ribbed concrete-steel type, having four arches each 87½ feet in

Elgin & Belvidere Electric Company—Kishwaukee Bridge.

of straight track that will figure prominently in running trains on a fast schedule. There are no grade crossings with railroads and the number of highway and farm crossings is not large. The line passes under the Chicago & Northwestern and the Chicago Milwaukee & St. Paul railroads.

The subway under the Chicago Milwaukee & St. Paul Railway near Almore is of concrete construction. The tun-

length, and a solid concrete floor with 12-inch concrete stringers for retaining the ballast under the track. The approaches are built up on pile bents filled in with earth. Details of the methods employed in building this bridge were given in an article in the Electric Railway Review of August, 1906, in which many details of the track and overhead construction were described.

Power is purchased from the Aurora Elgin & Chicago Railway and is transmitted from its Clintonville substation, across the country and around Elgin to the right of way of the Elgin-Belvidere line. The current is three-phase, 25-cycle at 26,400 volts, which is stepped down and distributed from rotary-converter substations at Gilberts, Union, and Garden Prairie, approximately 10 miles apart. The three buildings are practically alike in construction and were described in the article previously mentioned, in which a ver-

Elgin & Belvidere Electric Company—Interior View of Passenger Car.

tical section illustrates numerous features. A foundation plan of the substations at Union and Garden Prairie is presented herewith and illustrates some features not shown in the vertical section.

The main portion of each substation is 29 feet 3 inches by 30 feet 5 inches and in the rear is an extension 11 feet 8 inches by 25 feet 7 inches, extending 16 feet above the ceiling of the main portion of the building. This tower receives the incoming high-tension lines on a rack fastened

Elgin & Belvidere Electric Company—Typical Cut.

outside the front wall of the building, the wires being carried over a parapet wall on two 45-foot poles located opposite the front of the building. All wires are supported by Locke No. 606 high-tension strain insulators. The wires enter the building through porcelain tubes mounted inside of three concentric fiber insulator tubes and pass through lightning arresters and oil disconnecting switches. Beyond these the

line conductors are separated by brick barriers. The main high-tension lines pass out of the building in a manner similar to the incoming lines, the arrangement virtually making a loop of the high-tension lines into the building.

The local lines, which are tapped off from the main conductors in the barriers, pass through lightning arresters, choke coils and oil disconnecting switches.

The lightning arresters are of General Electric 26,400-volt, three-phase, multiplex type and the oil-cooled choke

Elgin & Belvidere Electric Company—Substation at Union, Ill.

coils are also of General Electric manufacture. The three transformers, which are delta connected on both the primary and secondary sides, are each of 110 kilowatts capacity and step down the voltage from 26,400 to 370 volts. The three transformers feed into an alternating-current rotary panel of the switchboard which is thoroughly equipped to control the rotary.

The three-phase, 25-cycle, rotary converters are of 300 kilowatts capacity, designed for 370 volts on the alternating-current end. The direct-current voltage is 600, the cur-

Elgin & Belvidere Electric Company—7-Mile Tangent West of Marenco, Ill.

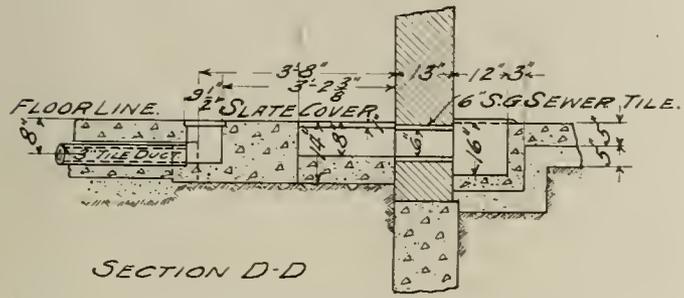

rent being fed into a direct-current switchboard containing two feeder panels of 1,200 amperes capacity serving the trolley line. The feeder panels are equipped with a 1,200-ampere General Electric C. P. circuit breaker, a 1,500-ampere T. F. T. ammeter with shunt, and a 1,500-ampere single-pole single-throw quick-break main switch. All of the electrical

equipment, including the rotary converters, switchboards, transformers, oil switches, choke coils and instruments, was furnished by the General Electric Company and consists of their standard type of apparatus designed for this work. At present one rotary converter only is installed in each station. The space left for additional equipment is shown in the accompanying ground plan of the substations. The location of the conductors connecting the various pieces of apparatus may also be seen.

All wiring is done in 3-inch tile ducts imbedded in the concrete floor as shown by the section along BB.

Rolling Stock.

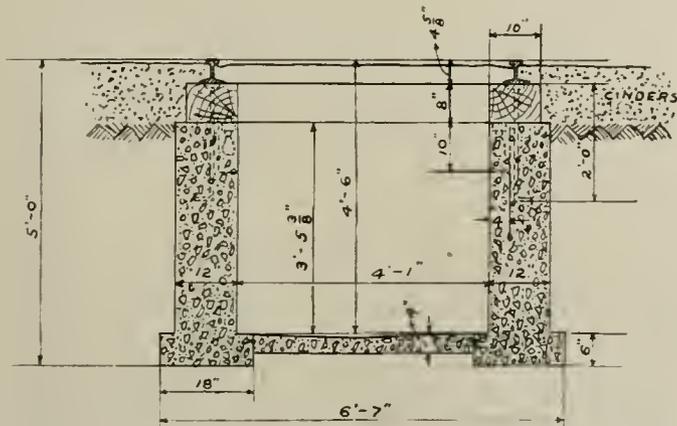

The passenger cars used on the line are of the Pullman double-truck single-ended vestibule type manufactured by

Elgin & Belvidere Electric Company—Section Through High-Tension Ducts.

the St. Louis Car Company. An exterior view is shown in the illustration of the Belvidere terminal. The cars have an overall length of 47 feet 1 inch, a width over sheathing of 3 feet 6 inches and a height of 9 feet 4 inches from the under side of the sills to the top of the roof, which is of the monitor deck construction over the entire body.

The interior of the car is divided into two compartments, the main portion being in accordance with standard interurban practice, having transverse rattan seats of the walkover pattern. The interior finish is of dark mahogany with a ceiling decorated in green and gold and finished with bronze metal fittings. The arrangement of the smoking

Elgin & Belvidere Electric Company—Section Through Concrete Track Pits.

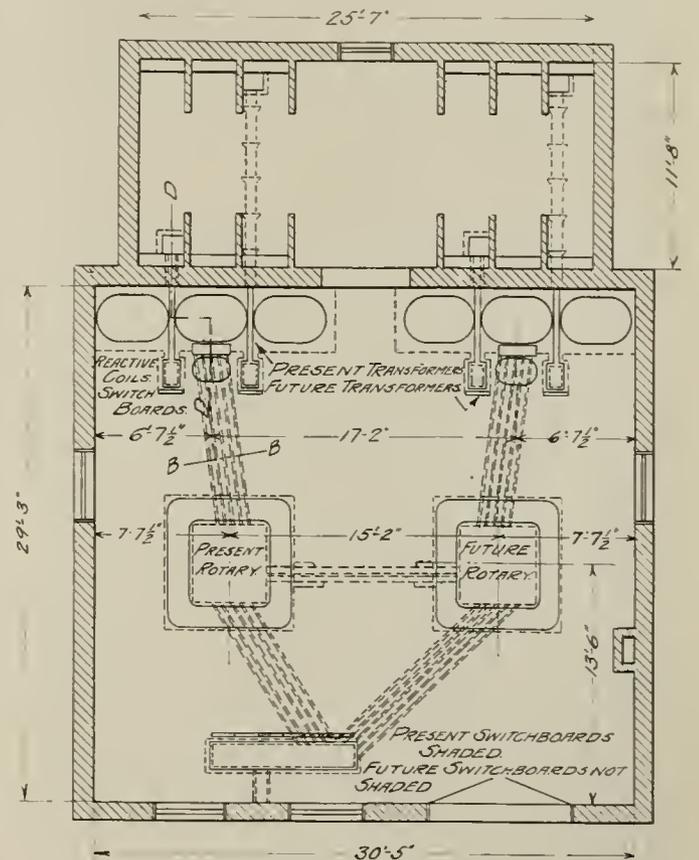

compartment is somewhat out of the ordinary. The motorman's cab is located at the forward end on the right side, as shown in the detail plan. This allows the left side for the use of passengers, affording an unobstructed view from the transverse seats. Back of the motorman's cab is a sliding baggage door. By dropping the three longitudinal folding slat seats, ample space for baggage is provided when necessary. Heating is secured by a Peter Smith No. 2 magazine coil heater, located in the smoking compartment. A

speaking tube is provided to afford communication between the motorman's cab and the rear vestibule.

While the car is intended to run forward under normal conditions, a controller and air equipment has been provided in the rear vestibule to allow backward running if necessary. Two trolley poles are also provided to facilitate running under such conditions. The trolley harps and wheels were supplied by the General Electric Company. The motor equipment, furnished by the same company, consists of four 74-horsepower motors, with parallel controllers, and all necessary auxiliary devices. The total weight of these motors is about 15,000 pounds.

The interior lighting is furnished by 25 incandescent lamps and an arc headlight is fitted at the forward end. All the wiring is placed in concealed iron conduit.

The car is equipped with a truck pilot on the forward end which is so arranged as to permit of two cars being

Elgin & Belvidere Electric Company—Plan of Rotary-Converter Station.

coupled head on. The total weight of the car with its equipment is 32 tons.

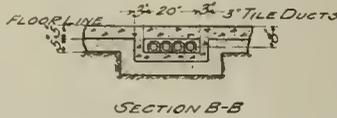

The baggage and express cars used on the line have double trucks and are 45 feet long over all and 8 feet 6 inches wide. These cars are made to conform in general exterior appearance to the passenger cars. They are equipped with four G. E. 65-horsepower motors and straight airbrake equipment, being intended to run at a maximum speed of 30 miles per hour.

Car House and Shops.

The car house and repair shops are located just outside of Marengo. The main building, 91 feet by 105 feet in area, is of brick, concrete and steel and is divided longitudinally into two equal bays, one of which is designed for the car repair work and the other for car storage purposes. The machine shop, which is equipped with a lathe, drill press and other tools essential in repairing cars, occupies the north-

east corner of the bay set aside for the car-repair work. The structure is lighted by four saw-tooth skylights which extend the length of the building. An addition 21 by 50 feet in floor area has been constructed at the northeast corner of the main building. In this portion are located a boiler room, and a coal and oil storage room. The superstructure of the building is of brick and the roof of frame construction.

The Arnold Company of Chicago had charge of the entire engineering and construction work, which was supervised by George A. Damon, managing engineer, George Wes-

ton, civil engineer, E. N. Lake, electrical engineer, and W. H. Rosecrans, superintendent of construction. The general offices of the Elgin & Belvidere Electric Company are at 181 La Salle street, Chicago, and the operating offices are at Marengo, Ill., as before stated.

UNUSUAL OPERATING CONDITIONS AT BIRMINGHAM, ALA.

The city of Birmingham, Ala., with a population of 100,000, and a suburban population of nearly as many more, is located in an iron and coal mining district which is well served by steam and electric railways radiating from the center of the city. The Birmingham Railway Light & Power Company operates 116 regularly scheduled cars over its lines. Under average conditions the tracks of the steam railways are crossed by an electric car approximately 40,000 times daily. This is an unusual condition and yet it has been met so successfully by the operating department that during the year 1906, when the total number of crossings made exceeded 14,500,000, there were but seven railroad crossing accidents. Six of this number were so trivial that no one was injured and the cars were repaired at a small expense.

In the operation of cars within the city a schedule speed of about 11 miles per hour is maintained. All railway crossings are flagged either by the conductor or a regular flagman, and the cars are required to come to a stop before a crossing is reached. During the rush hours of the morning and evening a number of extra flagmen are stationed at the crossings on the main lines. Aside from these provisions for the safety of cars the remarkably good year's record is due to the careful instructions of motormen and conductors and to the thorough working of a closely organized operating department.

The organization of the railway department consists of a superintendent, assistant superintendent, superintendent of transportation, dispatcher and 12 division superintendents.

The street railway traffic of Birmingham varies somewhat from that of other cities inasmuch as the burden of the patronage is drawn from the suburban districts. Less than 40 per cent of the business done by this railway is drawn from inside the corporate limits. This condition is partially due to the many large steel mills and iron and coal mines located outside of the city. The residence district is far removed from the business center.

Though no suburban line is more than 13 miles in length practically one-half of the company's 125 miles of track has been built to serve the suburban towns. The suburban lines are: a north line and a south line to Bessemer, each 13 miles long; a north line and a south line to Ensley, each 7 miles long, and lines to Gates City, 6½ miles; East Lake, 6½ miles; North Birmingham, 4 miles; Avondale, 5 miles; Bessemer to Jonesboro, 3 miles; Tuxedo to Wylan, 2 miles, and from Ensley to Wylan, 3 miles.

ELECTRIC RAILWAY AFFAIRS IN GREAT BRITAIN.

(FROM OUR LONDON CORRESPONDENT.)

One of the results of the introduction of electric traction on the underground railways in London has been a somewhat serious increase in the wear and tear of the rails. Some statements of an alarming and random nature have been made on this subject, and these have led to inquiries as to the effect the extra maintenance of the permanent way is likely to have on the companies' expenses. The state of things is by no means so bad as has been represented; but that the wear of the rails is greater under the altered conditions admits of no doubt, and the matter is one that is engaging the attention of the companies concerned. The rails on the lines in question have always shown an abnormally short life, owing to the frequency of the trains passing over them and to the constant starting and stopping due to the short distances between the stations. This was the case in the days of steam traction, and there are various reasons to account for the still greater wear that takes place under electrical conditions. In the first place the new rolling stock is differently constructed, and there is a greater dead weight on the axles, the wheel-base is shorter, and the diameter of the wheels is less. Then the electric trains, having a motor at each end, are subject in working to both a pull and a push, and this has the effect, especially on curves, of causing the wheels to grind on the side of the rails. Again, the greater acceleration of the trains in starting and the application of the quick-acting brakes in stopping tend in the direction of more wear and tear on the permanent way. To counteract this wear and tear various experiments are being tried, the most important being the adoption of a harder steel for the rails and the more liberal use of check-rails at curves. By the application of these and other means it is fully expected that after a short experience it will be found that the cost of maintenance of the permanent way of the electrified lines will not be materially greater than it was under the old conditions. On certain of the continental electric railways, notably in Berlin, serious damage has been caused to the rails by the so-called "wave-like wear," under which, at intervals, varying from a few inches to a foot or more in length, the surface of the rail becomes undulated, or worn into a series of ridges and depressions. The cause of this singular phenomenon has been the subject of much controversy among experts, and while in some cases it has been ascribed to inequalities in the hardness of the rail metal, due to imperfections in the rolling process, it has in other instances been attributed to the oscillations caused by the motor and to the absence of suitable springs. Observations made in the vicinity of stations and in parts of the line where the speed is normal have given contradictory results.

* * *

In connection with the electrification of the London, Brighton & South Coast Railway, which has now been in hand for some months, and which it is expected will shortly be in operation between Victoria and London bridge via Battersea park and Brixton, a new type of passenger coach has been designed by the company's consulting electrical engineer, which has now been definitely adopted for the new service. In the new type of carriage the side doors now in use on the suburban lines will be retained, but communication with the different compartments will be afforded in that the divisions between the compartments will not be built completely from one side of the coach to the other, but will allow of a space of 18 inches between the division and one side.

This means of communication will not be in the form of a corridor, as there will be no inner doors to the compartments such as are in vogue on many of the main lines. It will, therefore, be possible for a passenger, once inside the carriage, to enter any of its compartments. The coach will be divided by a door in its center in order to separate

smoking compartments from the non-smoking ones. For a half of the coach the communication will be on one side, and on the other side for the other half, so as to equalize the convenience of the new departure irrespective of which side of the coach the platform should happen to be. The new electric rolling stock on the Metropolitan and District railways contains but three doors to a coach, two of which are intended for entry and one for exit, but as most people who use these railways are aware the doors are generally used indiscriminately, frequently with inconvenience to the passengers. The same objection applies to the carriages in use on the various "tube" railways, where there are but two doors to a coach. The new type of carriage adopted by the London, Brighton & South Coast Railway will, it is confidently anticipated, greatly obviate these disadvantages, as there will be seven doors on either side of the coach, and the expenditure in space will be less than in the instances cited, as a coach of seven compartments will have seating accommodations for 70 passengers. With this system a passenger will be enabled to search for a seat after he is in the carriage, instead of having to do so before he enters it, as is at present the case on the suburban lines; this, in addition to the increased convenience afforded to the passengers, will render possible a great saving of time in the train's stoppages. It is intended to furnish these new coaches with four 10-candle power lamps in each compartment, which should result in an additional improvement. It is worthy of note that this railway is the first of the existing London railways to undertake the electrification of its suburban lines. Should the portion now being converted prove to be financially successful it is contemplated to extend the system, which is high tension overhead, to the Crystal Palace, to Croydon, and to Sutton, and in that event the electrification of the whole line to Brighton may ultimately be undertaken.

* * *

A system that is not much known in the south of England is the Wirral Railway, a line, however, of great importance in the Liverpool district. The railway connects Liverpool and the Birkenhead docks with seaside and residential resorts, such as New Brighton, Hoylake and West Kirby, and two new stations are to be erected immediately on the New Brighton branch. New coaches, to be run as single-car trains at such times of the day when a frequent service of heavy trains would be unremunerative, have been built for this service. The Wirral Railway has several claims to particular interest. One is that it was incorporated under its present title by a certificate from the Board of Trade under the powers given by the Railway Construction Facilities Acts, and another is that sections of the railway are now owned by the Great Central. This is one of the few instances where portions of a railway still enjoying separate ownership have been absorbed by another company. Of wider interest is the fact that the company has powers to electrify the line, although advantage has not yet been taken of them. The remarkable development of railway electrification in the Liverpool district seems to render the conversion of such local lines as are still steam-operated a matter of course. In this connection it is worthy of note that the route mileage of electric lines in the district is already over 35 miles, whilst the through running arrangements in force materially increase the value of the converted systems.

* * *

With the beginning of the new year the District Railway put in operation a further instalment of the increases in its train service made possible by electrification. With the old steam service the maximum capacity of the line was 18 trains an hour, and this was given only during the rush hours. By the increased service now inaugurated the maximum capacity has been raised to 24, equal to a train each way every 2½ minutes, and during the slack periods of the day a 3-minute service, or 20 trains an hour, is maintained. The

increases that have been introduced are certain to be popular, as they very greatly improve the facilities of such important residential districts as Richmond, Ealing and Wimbledon. The simplicity with which increases of this nature can be adopted on a busy system is one of the most striking object lessons afforded until now of the flexibility and adaptability of an automatic-signaled electric railway. It is generally recognized that automatic signaling is more than a perfected mechanical device and a safety factor. It forms one of the most effective means of increasing receipts. This is accomplished by its vast possibilities in increasing the possible train service without additional capital expenditure.

FINDING OF THE CORONER'S JURY ON THE NEW YORK CENTRAL WRECK.

The examination of witnesses before the coroner's jury and the state railroad commission to determine the cause of the wreck on the electrified lines of the New York Central at Woodlawn on February 16, was continued on February 27 and 28 and on March 1, 2 and 4. Vice-President W. J. Wilgus, who had supervision of all the construction work in the electric zone, testified before the state railroad commission as to the organization of the expert commission appointed to supervise and direct the installation of the new electric system and as to the tests of the new locomotives. The witness said the maximum speed attempted during the trial tests was 57 miles an hour while 75 miles an hour was the speed for which the locomotives were designed. During the tests there was a slight spreading of the gauge of the track at one point, but the rails were not displaced. Subsequent to the official test the witness drove a locomotive over the line at the rate of 83 miles an hour. Mr. Wilgus stated that safety was the first aim of the committee in the installation of the system and that the line had been turned over by him in good condition for operation. The actual running of trains came under the direction of the operating department.

Mr. Wilgus followed Mr. Newman before the coroner's jury with somewhat similar testimony. After hearing Mr. Wilgus the state railroad commission called to the stand A. H. Smith, general manager. Mr. Smith told the condition of the track at the curve just prior to the accident and of the daily inspection of the track on the Harlem division. Mr. Smith said that only in special instances was he in charge of laying original tracks; that the roadway was in safe condition for the operating of steam trains and that when the new locomotives were received his men were instructed to take them out and handle them roughly with a view to testing both engines and other equipment. He did not think the operating department should be held responsible for a failure to reconstruct the roadbed if that was necessary. The testimony of Mr. Smith had the effect of appearing to place the responsibility upon the electrical commission. Mr. Smith stated that since the wreck the rails on the curve had been double-spiked, to make assurance doubly sure.

The final hearing before the coroner was held on March 4 and the witnesses were Professor Lovell of Columbia University, Prof. George F. Swain of the Massachusetts Institute of Technology, Vice-President Wilgus, General Manager Smith and General Superintendent McCormack. After a deliberation of 40 minutes the jury returned its verdict. After reciting the death of 23 persons and the circumstances of the wreck, the verdict said:

We find that the derailment was caused by a portion of the track consisting of one of its easterly rails being forced out of its proper position.

That said rail was forced out of its proper position by the impact upon it of the above mentioned Brewster express train.

That said train, made up as it was shown to have been, was running at a speed in excess of what has proven to be safe for such a train on a track laid at the existing curvature at this point, the rails of which were fastened on in the way they have proven to have been fastened, and the super-elevation, such as it was proven to have been, of four and one-half inches.

That the running of said train at an unsafe speed over said track exerted sufficient lateral pressure on the outer or easterly

rall to cut off or shear the heads of the spikes holding said rails to the ties, thus permitting the displacement and the resultant accident.

Our conclusion is that the New York Central & Hudson River Railroad Company did not take safe and proper precautions to guard its passengers at this point, and consequently were culpably negligent, and that the responsibility for the existing conditions seems to be divided between the construction and the operating departments.

We recommend that the New York Central & Hudson River Railroad Company be compelled to reinforce the fastenings of the outer rails on all curves of their lines constructed as the one in question was proved to have been constructed by the addition of spikes, rail braces or increased superelevation, as from the testimony given we feel that unless such precautions are taken other accidents may be expected.

We further recommend that until the above strengthening is completed over the curves not so reinforced the New York Central and other lines be required to lower their speed on such curves to so-called equilibrium speed, or one that is absolutely safe to protect the lives of the passengers and employes, and that instructions to this effect be given to those in charge of trains.

Owing to the lack of information of the employes and the representatives of the New York Central to determine with exactness the speed of the electric train, we recommend that the company be compelled to install such instruments or make such tests to determine the speed under varying conditions as will enable the motorman to know with reasonable exactness the speed at which trains are traveling. This information is to cover speed at the three different positions of the controller lever, should be properly tabulated and hung in a conspicuous place in the cab.

After the foreman of the jury had reported the verdict the coroner asked if the jury found any one person responsible, to which the foreman replied that the verdict was as he had given it. The coroner then said that under the circumstances he would hold the directors of the New York Central and President Newman to the action of the grand jury. They were paroled in custody of counsel. On the following day the assistant district attorney asked that the court, in lieu of issuing warrants for the arrest of the president and directors of the company, certify to the grand jury that there is sufficient cause to believe that the New York Central is guilty of the crime of manslaughter in the second degree. This motion was granted.

An order has been issued limiting the speed of all trains in the electric zone to 45 miles an hour on straight track and 35 miles on curves.

AUTOMOBILE EMERGENCY STATION.

Several years ago the Birmingham (Ala.) Railway Light & Power Company established an emergency station near the center of the city of Birmingham, where supplies for all emergency repairs for the railway, electric and gas properties are stored. Experienced workmen are also kept at the station in readiness to respond to alarms of fire or emergencies of any nature. A description of this unique system appeared in the Street Railway Review of April, 1903, page 211.

At the time the description referred to was published horses were used exclusively in hauling emergency wagons, but since that time the company has purchased six Pope-Waverly electric trucks and two gasoline runabout automobiles for the use of the emergency department. These automobiles are kept in readiness night and day to respond at a moment's notice to any alarm that may be sent in. In addition to these there are provided at the station two line cars, three emergency trolley wagons and 22 light draft wagons. The latter are used in hauling stores from one department to another and in delivering supplies to points about the city where new work is in progress or where repairs are being made. A stable for the horses used in hauling the wagon is maintained near the station.

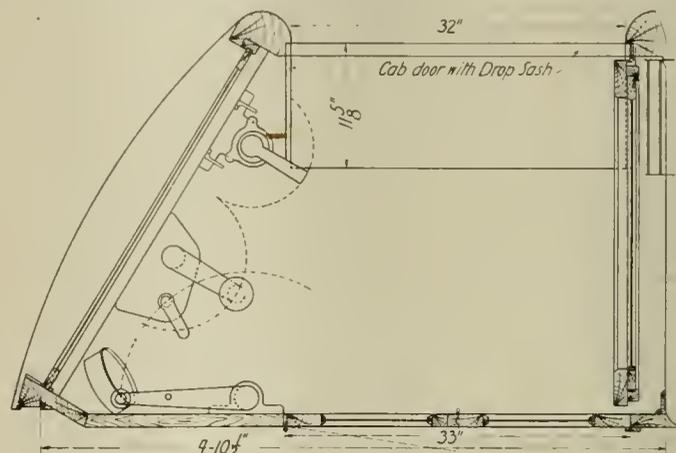

When trouble arises on any of the company's properties one of the emergency wagons and a crew of reserve workmen are hastened to the scene. So successful has the emergency station proven it is now planned to build a new and more commodious station to replace the one now in use.

The number of freight cars in service in the United States in 1905 was 1,692,194, having a combined capacity of 50,765,820 tons.

SPECIAL CABS FOR CHICAGO & MILWAUKEE CARS.

BY D. C. HINSTORFF.

Some interesting changes are being made by the Chicago & Milwaukee Electric Railway Company in the reconstruction of the vestibules on 10 cars which were received from the shops of the Jewett Car Company last

Special Cabs for Chicago & Milwaukee Cars—Plan View.

spring. The reason for making these changes is partly to have all the cars of uniform construction and partly to gain the advantages of the peculiar arrangement of the cabs which has been adopted by this road.

Among the principal advantages offered by the arrangement are that the motorman is enclosed, thus preventing conversation with passengers which would increase the lia-

Special Cabs for Chicago & Milwaukee Cars—Exterior View.

bility of accident as the result of his attention being detracted from the proper operation of his car; and it further enables the motorman to watch the rear steps without changing his position at the controller, which often saves considerable time as the motorman can proceed without having to wait for the usual signal from the conductor. The removal of the control apparatus from below the center window also gives the conductor free access to the trolley rope

when leading the trolley through special overhead work or in replacing it on the wire.

The accompanying plan view shows the partition of the cab in three sections which are hinged together. One of the sections is anchored to the end of the vestibule and floor and the other two sections, which are hinged to the first, serve as a door. When not in use the door folds against the stationary section, thus taking very little room and giving the vestibule a neat and finished appearance.

Single-sash windows are substituted in the vestibule in place of the double-sash windows on each side of the center drop windows. This eliminates the cross strip and gives the motorman a clear and unobstructed view ahead. Another interesting feature is the single door on the cab side of the vestibule which is fitted with a drop window allowing the motorman to look out without opening the door.

The illustrations clearly show the new doors which are made to resemble the folding doors which have been retained on the opposite side and end of the car to give the car body a more symmetrical and uniform appearance.

TRACTION ORDINANCES APPROVED BY CHICAGO REPUBLICANS.

The platform adopted by the republican convention, which nominated city officials in Chicago on March 2, urges unequivocally the approval by voters of the Chicago City Railway and the Chicago Railways Company ordinances at the election on April 2. Fred A. Busse, now postmaster of Chicago, was nominated for mayor. The attitude of the republican convention is squarely opposed to that of the democratic convention, which, as related in last week's issue of the Electric Railway Review, renominated Mayor Dunne on a municipal ownership, anti-traction platform.

The republican platform says that immediate and radical improvement in and extension of street railway facilities are the paramount need of Chicago. The platform says:

With growing indignation, but patient firmness, the people have endured totally inadequate transportation service and submitted to flagrant disregard of their convenience and comfort on the part of the traction companies. For 10 years street car patrons have risked health and life in overcrowded, insanitary cars, and suffered injury to their business and property through lack of sufficient and continuous service, awaiting the time when a settlement could be made with the companies that would properly safeguard the interests of the city.

Such a settlement is at last possible through the adoption of ordinances in support of which all disinterested and intelligent citizens who have the interests of Chicago at heart can unite without regard to differences of honest opinion as to the public or private ownership or operation of municipal utilities.

On February 4, 1907, the city council passed two ordinances, subject to referendum, which have for their purpose the immediate reconstruction and practical unification of the street railway systems. They reserve to the city the right to purchase the lines at an ascertained price at any time on six months' notice, and provide a direct and speedy method of bringing about municipal ownership. These ordinances received the votes of 57 out of 69 aldermen of both parties, representing every section of the city. The ordinances make practical and effective provision for the immediate and comprehensive improvement of street railway facilities throughout the entire city, for much-needed extensions of lines, especially in the outlying wards, and for a single fare over all the lines of the four great systems within the present or future limits of the city. They give the city control of construction, equipment and extensions, and of the service itself. They make the city a controlling partner in the enterprise, not only during the period of reconstruction but of subsequent operation. The city becomes a participating partner through provisions which limit the annual profits of the companies to a 5 per cent interest return and give the city 55 per cent of the net receipts, available for the purchase of the properties or for an equivalent reduction of fares. The ordinances provide for immediate construction of a central subway, and its future extension, and for the immediate establishment of 21 through routes, by means of which the central business district will be extended and new business centers established.

We believe these ordinances represent a great advance in municipal legislation, and, if ratified by the people, will settle in an equitable and satisfactory manner the question which has done so much to retard the city's growth and prosperity. We commend these ordinances to the support of the voters of Chicago, and pledge the republican party, if they are adopted by the people, to enforce all their terms and conditions, to the end that the street railways of Chicago shall be operated for the benefit of the people.

The Chicago Real Estate Board and the Chicago Com-

mercial Association have appropriated \$1,000 each to aid the work of the Citizens' Non-Partisan Traction Settlement Association. That association has passed a resolution stating that its membership is composed of men favoring municipal ownership as well as those who are opposed to it, but who are united in favor of the adoption of the ordinances, believing that they solve the traction question in a prompt and efficacious way; and further emphasizing that the association is non-partisan in character and will not enter into debates or discussions with organizations or individuals taking a partisan position on the traction question.

Headquarters have been secured by the association on the seventeenth floor of the Heyworth building, Madison street and Wabash avenue, and plans have been made to form subcommittees in each ward which will act under the direction of the executive committee.

In an address before the City Club on March 2, Walter L. Fisher, who drafted the traction ordinances while he was Mayor Dunne's special traction counsel, explained the ordinances and advocated their passage. Mr. Fisher said:

The advocate of immediate municipal ownership says: "Proceed at once to have the city acquire and operate the street railways." But to this the answer is two-fold: First, the city has not yet established its legal ability to do so, and it has not even made a faint beginning to establish its ability to finance the measures by which this must be brought about.

I know the validity of the Mueller law and of the \$75,000,000 ordinance is directly involved in the test case now pending in the supreme court of Illinois, upon which a decision can fairly be expected during the next few months. I know, also, that it is extremely probable the court will sustain the validity both of the statute and of the ordinance.

The city has won its main contention in the 99-year cases, but there are a multiplicity of other questions which were not decided in that case and upon which, in fact, the supreme court expressly reserved its decision. The Chicago City Railway Company was not even a party to the case, and will present new questions to the court.

If the supreme court of Illinois should sustain the Mueller law and the case should not be further carried to the supreme court of the United States, it would be possible for the city to institute condemnation proceedings to acquire the tangible and intangible property of the present companies.

But it may safely be asserted, first, that the price which the city would have to pay under such proceedings would in no event be substantially lower than that fixed under the present ordinances, and that the success of the companies upon any one of a large number of issues raised by them would easily increase the price many millions of dollars, and, second, that by no possibility could the property be acquired as speedily by means of condemnation proceedings as under the present ordinances.

This leaves entirely to one side the important question as to the ability of the city to finance such an enterprise under the present municipal ownership ordinance, even if it should be sustained by the supreme court of the state. It will be conceded, I think, that I have been and am in a position to know what assurances can be given in this connection, and that it is violating no confidence to state that there has been and there is now no arrangement, either definitely or tentatively, under consideration for the raising of \$1,000,000 toward the purchase of these properties by the city, and that the present city administration knows no more to what source it could turn to secure \$75,000,000 for this purpose than does any gentleman in this room.

There has been no plan and there is now no plan which has back of it any real assurance whatever that can be given to the people of this community that the city authorities can raise \$75,000,000 or any sufficient portion of that sum under the ordinance now pending in the supreme court of this state or any similar ordinance under the Mueller law.

I do not mean to state that this money could not be raised under certain circumstances and conditions and with such modifications in the ordinance as would give to the investors adequate security for their money. I merely state that no arrangements have been made or seriously undertaken to raise this money or any part of it, and that, in my judgment, there exists the most serious doubt as to the ability of the city to raise it under the present ordinance and under the political conditions which are likely to exist in this city during the next few years. Any assurances or expressions of opinion to the contrary must be placed in the same category with the assurances given by Mayor Dunne in the last mayoralty campaign.

Alderman M. J. Foreman criticized sharply the suggestion of Mayor Dunne that the ordinances should provide for lower fares. He said:

Any step looking to lower fares must mean either that the employes will suffer salary reductions or that the operation must be at a greatly reduced cost. In either case you are bound to have inferior service, and service which will be as unsatisfactory as it ever has been before. Under the new ordinance through routes and rides are provided for. There will be the south and north lines and south and west lines. It will be impossible to make

operating expenses on those routes on a 3-cent basis. Take the proposed Grand Crossing-Bowmanville route as an example. There a ride of 14 or 15 miles will be given the passenger for 5 cents. The same distance on a railroad would mean a fare of 40 or 50 cents. There will be many other through routes nearly as long, and if the companies were forced to a 3-cent rate the only way they would be able to run their cars would be by cutting expenses to a 3-cent basis. If it is taken out of the men's salaries, there will be more labor trouble than could be straightened out in many years; and if it is taken out of the operating expenses, the service will be abominable.

COMMUNICATIONS.

Correct Controller Connections.

To the Editors:

Having experienced nearly every difficulty in connecting up G. E. K-28 controllers, I think that I can answer the question put by "Seventy-Six" in the Electric Railway Review, February 16. The trouble was not in the motors in this instance but was simply due to the A-2 and A-4 connections in the No. 2 controller being crossed. I believe that if "Seventy-Six" will make these changes his car will cause him no further trouble.

R. G. STEWART.

Memphis, Tenn., February 25, 1906.

Two-Stage Feedwater Heater.

To the Editors:

As is now well known, besides the fuel economy which results directly from the heat units saved in heating feedwater with exhaust steam, there also results an indirect saving by increasing the life of the boiler. If this is true, why would not a greater saving and a longer life of the boiler result if the water always entered the boiler at the temperature of the steam?

It is true that certain of the scale-forming salts are thrown down in an open feedwater heater using exhaust steam, but there are also some which require a temperature of over 300 degrees F., and these will enter the boiler and form scale when the exhaust feedwater heater is employed. The formation of scale, of course, not only reduces the economy of the boiler but reduces the life of the tubes and shell as well, owing to the increased expansion and contraction and the liability of the surfaces exposed to the fire being burned and overheated.

Now, to utilize the advantages of having water enter the boiler at the temperature of the steam and still get the benefit of the heat in the exhaust steam, why wouldn't it be a good plan to pump the water from the exhaust feedwater heater to a second heater of the tray type having a live-steam connection to the boilers, thus giving the full steam pressure and temperature in the boiler? This heater could be located 15 or 20 feet above the boilers and the water then would flow into the boilers by gravity. The water level in the live steam heater could be regulated by a ball float.

By this arrangement all the economy of the ordinary feedwater heater would be realized, and the additional advantage of having all the scale deposited where it could easily be removed and an increased steaming capacity, efficiency and longer life of the boilers would result.

I hope you may find space to publish this in your valuable journal, so that I may get the opinion of your readers.

H. F. WATERS.

Chicago, Ill., February 23, 1907.

The Consolidated Railway Company of New Haven, Conn., has completed arrangements for installing a trolley express service between New Haven, Meriden and Wallingford, Conn., a distance of about 30 miles. This district is very thickly populated and an express service will prove a great convenience to the people along the route as well as being a profitable enterprise for the company.

BOOK TABLE.

Chicago Traction. By Samuel Wilbur Norton, Ph. D. Chicago, 1907. Cloth. 240 pp., 5½ by 8 inches. Price, \$1.00.

In a prefatory note the author states that the purpose in preparing this volume was to present facts pertaining to traction affairs in Chicago from a legislative and political standpoint. In the main the chronological order has been followed, the central theme being the controversy over the streets between the street railways and Chicago. While the avowed intention of the author has been to discuss his subject impartially, the dedication of his work indicates that his sympathy has been with those who have opposed the traction companies during the past ten years when the question has been made an issue in local politics. This dedication is "To the resolute men who withstood the aggressions of the street railway companies and preserved the streets of Chicago for the people." It might be asked pertinently whether any agency could better assist the people in securing the use of the streets than an efficient street railway system. In reviewing the ordinance of 1883 the author follows the language of the Harlan report, made in 1898, and describes the late Julius S. Grinnell as city attorney "afterwards general counsel for the Chicago City Railway Company," without mention of the fact that Mr. Grinnell did not become associated with the Chicago City Railway Company until a good many years after his opinion as to the validity of the "99-year act" was prepared for the city, and that Mr. Grinnell, after leaving the city attorney's office, was elected judge and served a term in the office. The text of this book will be very useful to one desiring to get quickly a general history of the controversy between the street railways of Chicago and the city. The adoption of the pending ordinances is discussed, but in a way that leaves the reader in doubt as to whether the author himself favors them.

DIRECTORY OF ELECTRIC RAILWAY ASSOCIATIONS.

American Street and Interurban Railway Association. Secretary, Bernard V. Swenson, 60 Wall street, New York.

American Street and Interurban Railway Accountants' Association. Secretary, Elmer M. White, assistant treasurer Birmingham Railway Light & Power Company, Birmingham, Ala.

American Street and Interurban Railway Engineering Association. Secretary, S. Walter Mower, general manager Southwestern Traction Company, London, Ont.

American Street and Interurban Railway Claim Agents' Association. Secretary, B. B. Davis, claim agent Columbus Railway & Light Company, Columbus, O.

American Street and Interurban Railway Manufacturers' Association. Secretary, George B. Keegan, 2321 Park Row building, New York, N. Y.

Canadian Street Railway Association. Secretary, Allan H. Royce, president Toronto Suburban Railway, Toronto, Ont.

Central Electric Railway Association. Secretary W. F. Millholland, secretary and treasurer Indianapolis Traction & Terminal Company, Indianapolis, Ind.

Colorado Electric Light Power & Railway Association. Secretary, John F. Dostal, Denver Gas & Electric Company, Denver, Colo.

Iowa Street and Interurban Railway Association. Secretary, L. D. Mathes, general manager Union Electric Company, Dubuque, Ia. Next meeting, Clinton, Ia., April 19 and 20.

Massachusetts Street Railway Association. Secretary, Charles S. Clark, 70 Kilby street, Boston, Mass. Meetings held in Boston on second Wednesday of each month, except July and August.

Northwestern Electrical Association. Secretary, R. N. Kimball, Kenosha, Wis. Annual meeting, Milwaukee, Wis., January, 1908.

New England Street Railway Club. Secretary, John J. Lane, 12 Pearl street, Boston, Mass. Meetings held on fourth Thursday of every month.

Pennsylvania Street Railway Association. Secretary, Charles H. Smith, superintendent Lebanon Valley Street Railway, Lebanon, Pa.

Southwestern Electrical & Gas Association. Secretary, R. B. Stichter. Annual meeting, San Antonio, Tex., May 14, 15 and 16.

Street Railway Association of the State of New York. Secretary, J. H. Pardee, general manager Rochester & Eastern Rapid Railway, Canandaigua, N. Y.

Wisconsin Electric and Interurban Railway Association. Secretary, Clement C. Smith, president Columbia Construction Company, Milwaukee, Wis.

PIPING AND POWER STATION SYSTEMS—XXXII.

BY W. L. MORRIS, M. E.

As shown in Figure 257 (I2-2), the bottom of the discharge waterway should be slightly lower at the point where the thawing-out pipe is run into the intake. The mouth of the discharge should be slightly higher than the intersection marked "low-point" to insure water flowing through the line at times of low water. The discharge of the thawing pipe should be a sufficient distance below the water to protect it against freezing. The entire thawing line should

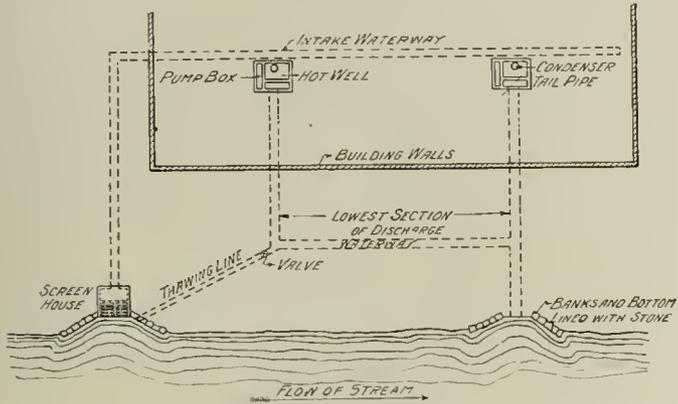

Figure 257-(I2-2).

have not less than five feet of earth over it. In case the water is taken from the cooling pond it would be unnecessary to provide a thawing line to the mouth of the intake.

The mouth of the discharge into the cooling pond should be provided with an oil or grease catcher to prevent grease from getting into the pond. This is necessary not only to prevent the disfigurement of the banks and surface of the pond, but also to prevent the liability of oil reaching the boilers. A simple grease catcher is shown in Figure 258 (I2-3). This may be constructed of wood, concrete, brick, or other desirable material. The discharge from this compartment is through an opening located as far as possible below the surface of the water. The opening from the grease-catching compartment is provided with a valve and handle for operating it. Inside of the grease-collecting compartment is an overflow into a trough which discharges into a sewer or grease-catching cistern. The grease is allowed to

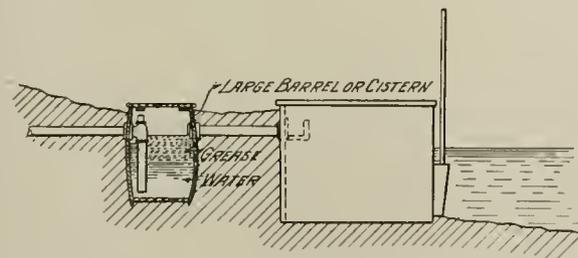

Figure 258-(I2-3).

accumulate in this compartment until the operator desires to draw it off, the latter process being accomplished by opening the trap, the latter process being accomplished by opening the trap to observe the overflow, and by closing the valve sufficiently to cause the water level in the compartment to rise to the skimmer edge and overflow into the sewer. An objection to this skimming device is that the sewer will become clogged with the gum and grease discharged into it. To avoid this difficulty and at the same time save the grease it would be profitable to place the grease tank between the overflow and the sewer, as shown in Figure 259 (I2-4). It may seem at first thought that the arrangements proposed are rather elaborate for the pur-

pose of removing grease, but if some such provision is not made the condition of the pond at the end of five years or so would be unbearable. It should be remembered that all the cylinder oil leaving the engine remains in the pond and it is very probable that 30 or 40 barrels of cylinder oil would be scattered along the banks, intake, etc., in this period of time.

In reference to the elevated jet condenser discharge, a modification of that shown in Figures 253 and 254 can be made by placing the condenser bowl at the power house and instead of running the tail-pipe vertically it can be run down the bank in a covered trench, allowing ample means for expansion and contraction as shown in Figure 260 (I2-5). The hotwell in this case would be made considerably larger. The

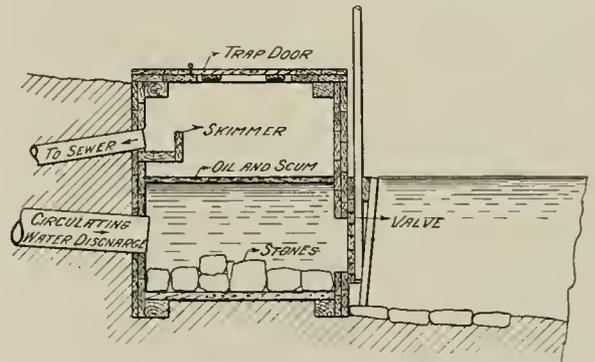

Figure 259-(I2-4).

volume of the hotwell measured from the discharge opening in the tail-pipe to the water level must be greater than the contents of the entire tail-pipe up to the condenser bowl. With this arrangement it would be necessary to run three pipes in the trench—the injection line, tail-pipe and heater supply.

To provide for the low-pressure water service in the plant it would be advisable to have two small low-pressure pumps in addition to the motor-driven circulating pump. It would further be advisable to have two centrifugal pumps attached to the motor shaft, one of which should take water from the hotwell and the other from the intake. This arrangement would require four pipe lines from the screen-house to the basement. This condenser system is suitable only where the proper elevations can be secured, the distance from the base of the condenser to the water level being ap-

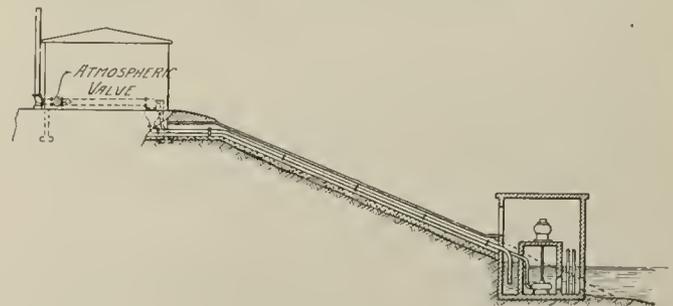

Figure 260-(I2-5).

proximately 34 feet. In determining the details of the intake and discharge waterway and the location of the condensers, pumps, etc., the water requirements should also be duly considered. These requirements are for boiler feed, general cold water service and fire protection.

If the power house is to furnish fire protection for other buildings as well, it would be necessary to provide steam pumps for this service, if for no other reason than to comply with the requirements of the board of fire underwriters. It will be observed that the plants shown in Figures 253, 254 and 260 fail to provide suitable equipment for this service. It also will be noted that these different services require elec-

trically-driven pumps as shown, leaving only the exhaust from the feed pumps for heating the feedwater, and a loss of economy follows as previously stated under this class heading, "1-2." To make possible the use of steam-driven pumps it would be necessary to locate the floor of the pump room so low that the pump could lift the water. This can be accomplished as shown in Figure 261 (12-6).

The following pumps should be placed in the pump room: The condenser, circulating water and underwriter's fire pump, hotwell pump to the heater and low-pressure pump from the intake. The air pump, if employed, may be located in the room directly over the pump room. The circulating and boiler-feed pumps should be of the compound type with high and low pressure steam cylinders to reduce the steam consumption and permit the use of as many steam-driven auxiliaries as possible. The fire pump if used regularly on the low-pressure service also should be compounded with provision for using high-pressure steam in both cylinders for the fire service, or boiler feed, tube-drilling, etc. If there are two feed pumps one may be used for tube-drilling, etc., and the other pump may then be operated continuously for the low-pressure service, which is very desirable if other buildings are supplied with water. The portion of the low-pressure system which must be always operated at low pressure may be fed from elevated tanks. A valve then should be placed close to the pump so that in case of fire the pressure can immediately

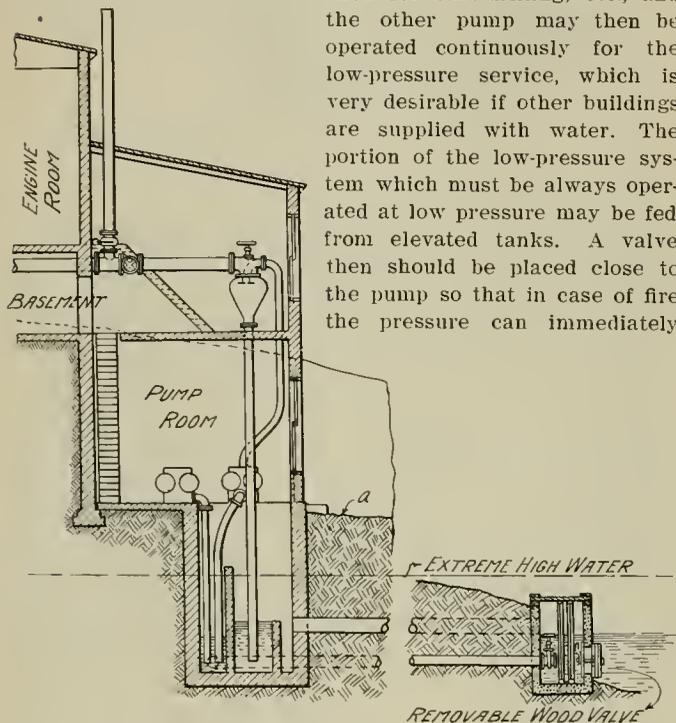

Figure 261-(12-6).

be raised on the remaining pipes by closing this valve, thus permitting the change from low to high pressure without stopping the pump. The tank will then supply the low-pressure system while the pump is being used for the high-pressure service.

(To Be Continued.)

The number of cases prosecuted in the police and justice courts of Columbus, O., by traction lines entering the city against persons accused of improper conduct on cars outside of the city are becoming much fewer. This is due to the vigorous campaign against persons of this character who took advantage of the lack of city police jurisdiction while on cars running through the country. Rowdiness became so annoying to other passengers on the cars that radical measures had to be taken to stop it. The conductors were informed that they had police power and were authorized to use it in all cases of improper conduct. This for a while kept traction officials busy in the courts, but it soon manifested a wholesome effect on the disorderly element. The Columbus New Albany & Johnstown Traction Company went farther than to instruct its conductors to make arrests and kept private detectives on the cars for several months.

RECENT ELECTRIC RAILWAY LEGAL DECISIONS.

BY J. L. ROSENBERGER, LL. B., OF THE CHICAGO BAR.

JUROR IN POSSESSION OF BOOK OF FREE TICKETS.

Shepard v. Lewiston Brunswick & Bath Street Railway, 65 Atl. Rep. 20.

The supreme judicial court of Maine says, in the personal injury case of Shepard v. Lewiston Brunswick & Bath Street Railway, 65 Atlantic Reporter, 20, that it cannot persuade itself that the gift of a "blue book" of free tickets on an electric railroad, of trivial value, as a favor, not particularly to the recipient, but rather to the society of which he was a trustee, months before the donee was, or could have been expected to be, drawn as a juror, should of itself be regarded as evidence of bias or prejudice on the part of the juror, or as raising a presumption that his verdict was affected by improper influences, or that it might have been otherwise tainted. It is true, in human experience, that almost all things are possible, but the possibility of bias under such circumstances as these seems so remote as not to be worthy of consideration.

RIGHT TO CROSS STEAM RAILROAD ON STREET WITHOUT APPROPRIATION PROCEEDINGS—THAT ROAD UNDER CONSTRUCTION IS A STREET RAILROAD AS AUTHORIZED CANNOT BE QUESTIONED—NATURE OF "RIGHT OF WAY" ACROSS STREET—NO RIGHT TO CHANGE GRADE OF RAILROAD.

Pennsylvania Co. v. Lake Erie, B. G. & N. Ry. (U. S. C. C., Ohio), 146 Fed. Rep., 446.

It appearing from the proof that the defendant company, which was authorized to construct a railroad operated by electricity or other motive power, had received from the council of the village of Woodville, Ohio, authority to construct a street railroad along Water street, which included the point where the tracks of the complainant crossed that street, the United States circuit court, in Ohio, thinks that there could be no doubt that the defendant, without resorting to appropriation proceedings, possessed the right to put in crossing frogs of the kind required by section 2503 of the revised statutes of Ohio of 1906. More than that, it thinks that one would look in vain for any authority in the defendant to prosecute any proceeding looking to the appropriation of a right to cross the tracks of a steam railroad in a municipality, in Ohio.

With regard to the contention that the defendant was not a street railroad company, and that the railroad which it was constructing in the village of Woodville was not a street railroad, the court says that it does not think this question was open to discussion, the council of the village of Woodville, in the manner provided by law, having authorized the construction by the defendant company of a street railroad along Water street and over a point where the complainant's railroad crossed that street. This, it seems to the court, was conclusive upon the question as to what kind of a railroad the defendant proposed to construct.

Furthermore, the court says that the complainant's bill assumed the possession by the complainant of a right in the street which in law it could not possess. The bill alleged that the defendant was about to enter upon the complainant's "right of way." In the sense in which this term is used in the bill, the complainant has no right of way in the street; that is, it has no tangible property therein. True, it has in strictness a right of way across the street; but this right is of an intangible nature. It has no more substance than the right of way over a street possessed by a pedestrian. So that to say that the defendant is about to enter upon complainant's "right of way," meaning the right of way it possesses across the street, is to say that the defendant is about to do what any and everybody has a right to do at all times, subject only to the movement of complainant's trains. What the defendant proposes to do is to introduce

in the public highway, at the point where complainant's tracks cross it, another public use thereof, under authority of the municipal legislation necessary in such cases. The complainant has no property in the street, and none on it except a few ties and rails. The disturbance of these for the purpose of suiting them to the new use to be made of the public highway is necessary, and results in no invasion of complainant's rights. But the right to put in crossing frogs does not carry with it the right to change the grade of the railroad.

VALIDITY OF ORDINANCE RELATING TO TEMPERATURE AND OVERCROWDING OF CARS, ETC.—NO INJUNCTION AGAINST PROSECUTIONS THEREUNDER—COMPANIES NOT DEEMED TO REPRESENT A CLASS.

City of Chicago v. Chicago City Railway Co. et al. (Ill.), 78 N. E. Rep. 890. Oct. 23, 1906.

Section 1958 of the Revised Municipal Code of the city of Chicago, as amended by a city ordinance in 1905, makes it unlawful to permit any car to be in use on the public streets unless an average temperature be maintained therein at not lower than 50 degrees Fahrenheit, a thermometer and copy of this section with invitation to report violations to the commissioner of public works are put up in the car, the car is reasonably clean, disinfected, and ventilated to be as free as practicable from foul or vitiated air, nor unless the track and car are in such condition as to insure the reasonably safe, convenient and comfortable transportation of passengers, nor unless there shall be furnished a sufficient number of cars, on each separate line, to carry passengers comfortably and without overcrowding, the same to be run on a proper and reasonable time schedule; nor unless each car, on each separate line, except in case of blockade or other unavoidable interruption of traffic, when it once starts on its trip, shall be run to such terminus of said line as is designated on said car without switching back before reaching said terminus, if there are any passengers on said car who desire to be carried to such terminus, etc. Section 1959 provides that any person or company violating any of said provisions shall be fined not less than \$25 nor more than \$100 for each car operated in violation of this law, and each day of the operation of such car shall be considered a separate offense.

The supreme court of Illinois says that this ordinance is within the power conferred upon the city by the clause of the cities and villages act giving cities power to regulate the occupation of the complainants. The provision is also within the police power, but it is of a nature to directly affect the business of the defendants. In such a case rights are involved which may authorize interference by a court of equity, although the mere invalidity of the ordinance affords no ground for such interference. Litigation commenced in a court of competent jurisdiction should be allowed to proceed to a final conclusion in that court, and for a court of equity to take jurisdiction to decide a suit upon a ground equally available in a court of law would be obvious error. That is especially true of cases like this.

The ordinance in this case is within the powers conferred upon the city, and it has for its object the laudable purpose of protecting the traveling public against discomfort, annoyance and danger. It is designed to promote the public comfort, safety and health by preventing the overcrowding of cars, and it should be sustained if it is legally possible to do so. To grant an injunction and prevent the prosecution of offenses against the ordinance during the progress of a chancery cause would be to render the municipal authorities helpless in the discharge of their public duties and suspend their legislature functions, contrary to public policy and public interest. If a court could take jurisdiction of a bill to declare an ordinance void because of the numerous prosecutions under it, a complainant would be able to confer juris-

dition by repeating his offense, and of course that could not be so.

Nor does the court think that two companies operating in different parts of the city and furnishing practically all of the railway service for the city, with a population of upwards of 2,000,000, could be said to represent a class and on that ground entitled to maintain a suit in equity to settle the question of the validity of the ordinance, there being besides them twelve other lines, which operated in outlying districts and did not own downtown terminals, the difficulty there being perhaps not so much to prevent overcrowding cars as to fill them with passengers.

ACTS GIVING PRIORITY OF RIGHT TO USE OLD ROADBED—THAT CAPITAL STOCK HAS NOT BEEN ISSUED, MONEY PAID THEREON, OR ANY PART OF ROAD IN TOWN CONSTRUCTED IS IMMATERIAL—NO CONDEMNATION BY ANOTHER COMPANY—RIGHT TO INJUNCTION.

Fayetteville Street Railway Co. v. Aberdeen & Rockfish Railroad Co. (N. C.), 55 S. E. Rep. 345. Oct. 30, 1906.

The principal question presented to the supreme court of North Carolina in this case was as to which of these two companies had the better right to appropriate and use the old and abandoned roadbed from Fayetteville to Hope Mills, seven miles distant, as its right of way. It appeared that the plaintiff, on August 23, 1906, after securing a franchise from the city of Fayetteville to build a street railway, obtained a street railway charter for that purpose from the secretary of state under the general corporation law, which, among other things, authorizes the construction of branch lines to towns within a radius of 50 miles. On the same day, after organization under the charter by electing directors and officers, a directors' meeting was held, and by resolution the roadbed in question was formally adopted as the plaintiff's permanent location between Fayetteville and Hope Mills, and direction given to mark and stake the line. On August 24th this was done by the agent of the company appointed for the purpose, report was duly made to the company, and on August 27th this action was likewise, by resolution of the directors, approved and confirmed. Moreover, the plaintiff avowed its good faith and intention and ability to go on and condemn the right of way and construct its road pursuant to law.

The court holds that the plaintiff obtained the prior right to the use of the roadbed as a part of its right of way.

The court says, too, that it was contended that the capital stock had not been issued and that no money had been paid thereon, and that the plaintiff, incorporated as a street railway, had built no part of the road as yet in Fayetteville or any other town, but was only proceeding in the country, and on a branch road, before the main road was constructed. These and all such objections, however, even if valid, could only be made available by direct proceedings instituted by some member of the company for unwarranted or irregular procedure on the part of the officers, or by the state, for abuse or non-use of its franchise, and were not open to collateral investigation in a case of the character of this one, which was brought to enjoin the defendant from interfering with the right of way claimed by the plaintiff, nor at the instance of the defendant. But these objections were not valid.

Furthermore, the court holds that the plaintiff's right to the exclusive use of this roadbed, as against the defendant's claim to appropriate it for its own right of way by condemnation, was clear, and that the plaintiff was entitled to be protected by injunction, there being no express grant to the defendant to condemn the plaintiff's right of way and no necessity for such action being shown, while this roadbed was only sufficient to permit the laying of one track.

A party of engineers will inspect the new turbine generating station at Fort Wayne, Ind., on March 9, 1907.

News of the Week

Second Tube of the New York Rapid Transit Tunnel Pierced.

The south tube of the New York Rapid Transit Commission's double-tube tunnel being built under the East river from the Battery on Manhattan Island to Brooklyn, was pierced on February 28. The north tube was put through about December 10. Much of the work was rock excavation but at the point where the tubes met the New York Tunnel Company, which had charge of the work, found it necessary to use the shield method in connection with the freezing process, the latter being used to prevent deviations in the alignment in the tunnel shields in the quicksand and very soft material.

Legislation Affecting Electric Railways.

Illinois.—Bills have been introduced in the legislature providing for the equipment of street cars with safety appliances and heating apparatus and regulating the hours of employment.

Minnesota.—A bill has been introduced in the legislature to authorize villages of 3,000 population or over to grant franchises to electric railways to carry freight.

Nebraska.—A bill is now before the state house of representatives which permits municipal street railways to own and control the stocks, bonds and securities of interurban railways. Another bill proposes to repeal the law which permits precincts to vote bonds to aid interurban railways.

Texas.—A bill prohibiting steam or electric railways, express or other transportation companies from giving free passes or accepting anything but money for transportation has passed the house of representatives.

Des Moines, Ia., Franchise Case.

The attorneys for the city of Des Moines, Ia., have filed objections to the form of decree submitted by the attorneys for the Des Moines City Railway Company for the signature of Judge McPherson in the injunction case. The objections to the decree submitted by the corporations are summed up in the statement that the attorneys for the street railway company attempt to secure an adjudication on only the Turner franchise, while the city's counsel claims that the adjudication extends over all of the franchises. The decree is also declared as ambiguous and not specific.

The decree filed by the corporation for Judge McPherson's signature states that the perpetual feature of the Turner franchise shall run without end and that the terms within the Turner franchise and the privileges therein stated are alone adjudicated, but the questions of the other franchises under which the company operates are still unadjudicated.

This, the city claims, is unfair because the terms of the other franchises were pleaded by the corporation in arriving at the adjudication which ended in the declaration of the perpetuity of the Turner franchise and the securing of an injunction to keep the city solicitor from interfering with the rights of the company through the medium of further litigation.

Mr. Shonts on New York Rapid Transit.

Mr. Theodore P. Shonts, who on March 4 assumed his duties as president of the Interborough-Metropolitan Company, controlling the elevated, subway and surface lines of Manhattan, has made the following suggestions in regard to the improvement of service conditions:

"As far as the surface roads are concerned, my observations lead me to believe that little can be done to better conditions without the intelligent co-operation of the city authorities. In my opinion it is not that we do not run enough cars on the surface lines to relieve as far as it can be relieved in certain hours the congestion that confronts us, but rather that we do not get a reasonable use of the facilities that we have furnished for trolley transportation. What I mean is that we do not get a reasonable use of the tracks we have laid in some highways when it is important that we should have almost exclusive right of way for our cars in certain hours of the day. In many of these thoroughfares trucks and other slow-moving vehicles are allowed to take their way along the trolley tracks, thus holding up an immense amount of traffic and making it impossible to give anything like a satisfactory service. Much of this heavy traffic could, I am sure, be diverted to other streets in the hours of congestion without any great inconvenience to the drivers, but this cannot be done without the co-operation of the city authorities.

"In view of the city's rapid growth in population I do not think it would be wise to build any more new lines of elevated railroads. I feel that we must look to subways, not piecemeal subways here and there, but a comprehensive system of subways that will provide for all future increases in traffic."

Trolley Express in Massachusetts.

The Boston & Worcester Street Railway has finally secured the necessary authority to carry freight and express matter over its line from Boston to Worcester, Mass., although it has not yet made arrangements for terminal facilities. Every city and town on the line has granted the local permits, Newton, Marlboro, Wellesley, Natick, Framingham, Westboro, Shrewsbury, Northboro, Southboro and Hudson, and the Massachusetts railroad commission has given its approval. Special cars are all ready to handle the traffic but the service has not yet been started for lack of terminal arrangements. President James F. Shaw says:

"People all along our line are anxious for us to take up this kind of business at once. But it is practically useless for us to

attempt to do anything without some agreement with the Boston Elevated and the Worcester Consolidated for getting our express cars in and out of the two cities, between the points where our own line ends and the center of the business sections, where we could have the stations necessary for receiving and delivering freight and express matter. There is not business enough along the line outside to warrant us in beginning a freight and express service before we get an entrance to the terminal cities."

However that there is reason to believe that the difficulties may be obviated is shown in the following statement by Gen. W. A. Bancroft, president of the Boston Elevated Railway:

"Any representation that the Boston Elevated Railway Company looks with disfavor on a plan for carrying freight over certain of its lines is unwarranted. On the contrary, the company looks with favor on the general plan, and undoubtedly a scheme can be arranged by which freight can be handled and terminal facilities provided without undue interference with the transportation of passengers."

Reorganization of Brooklyn Rapid Transit Companies.

President E. W. Winter of the Brooklyn Rapid Transit Company on March 1 issued the following statement:

"In order that the supply of electrical power and the maintenance of track, overhead work and structures of the railroads embraced in the Brooklyn Rapid Transit system should be under a concentrated management, and therefore more economically administered for each of the railroad companies, those companies have contracted with the Transit Development Company (which already owns some of the principal power houses of the system) to furnish power and to take charge of the maintenance and repair of the railway properties, including their equipment.

"The Transit Development Company is incorporated under the business corporations law and is authorized to manufacture and sell power and to do general contracting work. All the stock of this company is owned by the Brooklyn Rapid Transit Company.

"Inasmuch as the court of appeals in its recent opinion sustaining the right of the Brooklyn Heights Railroad Company to charge a fare of 10 cents to Coney Island has decided that Article IV of the railroad law relates only to street surface railroad corporations and that different provisions of the railroad law govern elevated railroad corporations and steam surface railroad corporations, it has been decided to hereafter limit the functions of each railroad corporation embraced in the system to the operation of its own character of railroad. Under this plan hereafter the Brooklyn Union Elevated Railroad Company (an elevated railroad corporation) will operate the elevated railroad, the steam surface railroad corporations will operate railroads of that character and the street surface railroad corporation will operate street surface railroads only. In order to accomplish this reclassification the leases of the Brooklyn Union Elevated Railroad Company, the Sea Beach Railway Company and the South Brooklyn Railway Company to the Brooklyn Heights Railroad Company have been terminated and the lease of the Prospect Park & Coney Island Railway Company has been assigned to the South Brooklyn Railway Company. This arrangement will in no way interfere with the through operation of trains and cars as heretofore wherever thereby the convenience of the public will be subserved."

Three-Cent Fare Bill Fails to Pass Congress.—The bill providing for a 3-cent fare on all street railway lines in the District of Columbia was passed by the house of representatives on March 2, but was not considered in the senate.

Speed Limit Ordinance in Louisville.—An ordinance has been introduced into the Louisville, Ky., city council which makes it unlawful to operate street cars in the city at a speed greater than nine miles per hour. The penalty is from \$5 to \$100.

Street Railway Investigation in Toronto.—The Ontario Railway & Municipal Board is now conducting an investigation of the operating conditions of the Toronto Railway Company with a view to determining how the service may be improved and overcrowding prevented.

Block Signal System for Chautauqua Traction Company.—The Chautauqua Traction Company of Jamestown, N. Y., has recently completed the installation of an electric block system on its entire line from Jamestown to Chautauqua, N. Y. The first part of the line was so equipped several months ago.

Interurban Line Cannot Enter Over City Tracks Without Franchise.—The supreme court of Illinois has given a decision that the Aurora Elgin & Chicago Railway cannot permit the cars of the Joliet Plainfield & Aurora Railroad to enter the city of Aurora over its tracks, because the latter has no franchise from the city.

Ogden Rapid Transit Company Increases Wages.—The Ogden Rapid Transit Company has announced an increase in the wages of its employes. Apprentices and beginners will receive 20 cents an hour for the first six months and 22½ cents for the succeeding eighteen months. Regular conductors and motormen who have been in the service of the company for two years will receive 25 cents an hour.

Four-Cent Fares Discontinued.—General Manager J. H. Van Brunt of the St. Joseph (Mo.) Railway Light Heat & Power Company has announced that the company will discontinue the sale of 4-cent tickets. The company has for years been selling books of 100 tickets for \$4.00. The officials of the company state that the tickets were withdrawn because of a bill which has been favorably reported by both houses of the state legislature which would materially reduce the fare to be charged on the line to Lake Conroy, a resort owned by the company. Citizens of St.

Joseph are now circulating a petition to the legislature urging that the bill be defeated, as being unfavorable to the best interests of St. Joseph.

Demurrer by Metropolitan Company. The Metropolitan Street Railway Company of New York City has interposed a demurrer in the United States circuit court to the bill of complaint filed by Daniel W. Burrows of Chicago asking that the Interborough-Metropolitan merger be declared illegal and invalid.

Willow Grove Park.—George Wyncoop, Jr., superintendent of Willow Grove park, located on the lines of the Philadelphia Rapid Transit Company and owned by that company, announces that the park will be opened on May 25. Engagements have been made with Damrosch and the New York Symphony Orchestra, Arthur Pryor's Band, Victor Herbert's Orchestra and Sousa's Band to furnish the musical entertainments at the park for the coming season.

Guard Rail for New York Subway.—A new suggestion has been made by W. T. Lawrence for minimizing the disastrous effects of derailment on curves in the New York subway. The plan proposed is identical with that proposed by Mr. Martin some months ago. It consists of a metal band running along and attached to the supporting columns at about the height of the car windows, and rollers or wheels placed on the side of the car above the windows, which would engage with the band or rail, in case of derailment, and prevent the car from striking the posts and becoming seriously damaged.

Ordinance for Increased Service in St. Paul.—The board of aldermen of St. Paul, Minn., on March 5 passed an ordinance requiring the Twin City Rapid Transit Company to increase its service on the principal lines of the city by reducing the headway in several cases and by making changes in routes. The ordinance is the result of a report submitted by a joint committee of the two branches of the council, appointed to investigate the street railway service. The report of the committee stated that, after a thorough investigation of the subject, it had been found that the cars used by the Twin City Rapid Transit Company were excellent, well ventilated, well cared for and of the highest type of efficiency, but that the increase of service had not kept pace with the growth of the city. The committee reported that it had deemed it best not to enter at the present time into the question of reduced fares, transfers or extensions.

Ordinance to Prevent Overcrowding of Cars.—Mayor Thompson of Detroit, Mich., has submitted to the city council an ordinance limiting the number of passengers to be carried in a street car and making it obligatory on the street railway company to provide sufficient cars. Section 1 provides that: "Every person, firm or corporation operating cars upon the streets of the city of Detroit shall, between the hours of 5 o'clock a. m. and 8:30 o'clock a. m., and between the hours of 11:30 a. m. and 2:00 o'clock p. m., and between the hours of 4:30 o'clock p. m. and 6:30 o'clock p. m., Sundays excepted, provide a sufficient number of cars of sufficient capacity to accommodate and provide for the transportation of passengers, so that no car, in consequence of the failure to so provide, shall carry a greater number of passengers than the seating capacity of said car and one-half as many more: Provided, That it shall not be lawful for any car, when it is filled with passengers to or in excess of the number herein specified, to pass by without stopping for additional passengers, or decline to receive passengers, whenever so signaled, unless another car on said line and following in its rear is within a distance of 200 feet: and Provided further, That this section shall not apply on any line that is maintaining, continuously, during the time herein named, a service where the cars are 20 seconds apart." The ordinance further requires that in each car shall be posted a notice giving the seating capacity of the car. A penalty of \$100 is fixed for each violation.

Ordinance to Reduce Noise and Accidents.—Corporation Counsel T. E. Tarsney of Detroit, Mich., has drafted an ordinance to be submitted to the city council requiring that "all street cars in the city shall be equipped with fenders and wheel guards and that the running gear of cars shall be kept in a reasonably good condition of repair," the object being to reduce the noise of the cars and to prevent accidents. The combination fender and wheel guard is described in the ordinance, which reads as follows:

"That all persons, associations or corporations now or hereafter owning or operating street railways in the city of Detroit shall equip each and every car so operated with wheel guards, so constructed that the entire space between the body of said car, except the space across the rear of said car, and a distance of not more than 2½ inches from the level of the rail, shall be enclosed in a shield constructed of wood with proper fastenings of iron to attach said shield to said car. The forward end of said shield shall be so constructed that the sides thereof shall converge to a point not to exceed 45 degrees, said point to be covered with rubber or other substance to operate as a cushion thereon.

"At least 30 of the cars operated upon said street railway shall be equipped with wheel guards on or before the first of May, 1907, and all cars operated thereon shall be so equipped on or before January 1, 1908.

"Each and every street railway company so operating cars in the city of Detroit shall keep and maintain its tracks and the running gear of its cars in a reasonably good condition of repair and adjustment, and prevent, as far as practicable, noise and sound from the operation of said cars."

A fine of \$100 is prescribed for each violation. Mr. Tarsney states that the fender is one that is used by the Liverpool Corporation Tramways with excellent results, and that the device is not patented.

Construction News

FRANCHISES.

Asheville, N. C.—The Asheville Rapid Transit Company, recently incorporated, has secured a franchise to build an electric railway to Overlook Park on Sunset mountain, with an extension later to Weaverville, about 8 miles from Asheville. It is stated that the company contemplates extensive improvements at the park involving about \$25,000. Charles E. Van Bibber of Holden, Mass., and Thomas E. Rollins and John P. Arthur of Asheville are interested.

Buffalo, N. Y.—The International Railway Company has secured an additional grant of 25 years to its present franchise to build an extension of its Elmwood avenue line and to construct new lines in Franklin, Chippewa and other streets.

Chicago, Ill.—The Metropolitan West Side Elevated Railway has applied to the Cicero town board for a franchise to extend its road 2½ or 3 miles west from its present terminus at Fortieth avenue to Forty-ninth avenue, south in Forty-ninth avenue to Ogden avenue and west to the town limits. The grant is for 42 years in order that its expiration date may correspond with the existing franchises of the company.

Everett, Wash.—The Puget Sound Skyhomish & Eastern Railway, recently organized, has applied for a franchise to build an electric railway between Galena and Index, Wash., about 10 miles, and for telephone, telegraph, electric light and power lines in Snohomish county.

Johnstown, Pa.—Franchises have been granted to the Johnstown Terminal Street Railway and the Southern Cambria Railroad for a line in that city. A \$10,000 bond has been filed as a guarantee of the construction of the road.

Lincoln, Neb.—The Citizens' Railway Company has secured permission to construct a line from Twenty-Sixth and N streets east on N to Twenty-ninth street and north to Q street with a turnout switch between P and Q streets.

Natchez, Miss.—A ¾-mile extension of the Southern Light & Traction Company's line to the city and national cemetery over the cemetery road, which is under government control, has been authorized by congress.

Paris, Ill.—The Terre Haute & Western Railway of Paris is applying for a 20-year franchise.

Philadelphia, Pa.—The Philadelphia Rapid Transit Company has secured permission to build and operate an overhead trolley line along Second street from Erie to Tioga and along Amber street from Lehigh avenue to Huntingdon street. It will also lay a double track on Lehigh avenue from Second street to Richmond. The Wissahickon Electric Railway also has obtained permission to extend its tracks on Dupont, Baker and Gay streets.

Portland, Ore.—A 25-year franchise has been secured by the promoters of Rose City park for the construction of an electric line along the Sandy road from East Sixteenth street toward Columbia river, a distance of 2 miles. Track-laying is to begin at once in order that cars may be in operation to Rose City park by the middle of June. It is stated that \$500,000 will be expended on developing the park. Hartman & Thompson, Title Guarantee & Trust Company, Jacobs & Stein, T. B. Wilcox, W. F. Burrell, S. G. Reed, O. W. Taylor, F. I. Fuller, R. B. Miller, T. Richardson and A. B. Slausson of Portland and Dr. J. W. Harris of Eugene are interested in the project.

St. Louis, Mo.—A special committee of the city council which has under consideration the bill granting a franchise to the St. Louis Electric Terminal Railway, a corporation organized to secure terminal facilities in St. Louis for the Illinois Traction Company, on March 5 reported the bill adversely. The bill has been before the council in different committees for eight months and a few days ago the council instructed the committee to report at once. The reason given for the adverse report was that sufficient signatures of property-holders has not been obtained. It is believed that this difficulty can be remedied in time to pass the bill at the present session, as a majority of the council have expressed themselves favorably.

San Diego, Cal.—H. A. Howard has been granted a franchise for an electric railway in Pueblo avenue, Fillmore street, Wash and Scott avenue, Steiner street and Fairmount avenue. It is stated that construction work will commence immediately and be completed within four months.

San Jose, Cal.—The San Jose & Santa Clara Interurban Railway has been granted franchises for a comprehensive system of city lines in San Jose. C. C. Bluson, general manager.

Spokane, Wash.—A franchise granting the Spokane & Inland Empire Railroad the right to build its lines in certain streets and alleys of Spokane is under consideration by the city council. The franchise calls for a single-track freight and express electric line and it is stated that an arrangement has been made with the Spokane Traction Company to operate over its line a part of the way.

Tacoma, Wash.—The Tacoma Railway & Power Company has been granted a franchise for an electric line to Bismarck, Wash.

Youngstown, O.—The Mahoning & Shenango Railway & Light Company has applied for an extension of its present franchises

in Youngstown for a period of 11 years, agreeing to build several extensions and give 25 tickets for \$1.00 with universal transfers.

York, Pa.—The city council has granted to the York Street Railway franchises for about 6½ miles of city lines, taking the place of franchises previously granted with changes in routes.

RECENT INCORPORATIONS.

Bluffton Geneva & Celina Traction Company.—Incorporated in Indiana to build an electric railway from Bluffton, Ind., to Celina, O., capital stock \$100,000. Incorporators, R. F. Cummings, L. C. Justies, Samuel Bender and A. W. Brown, all of Bluffton, where the office of the company is located.

Burlington & Davenport Interurban Company.—Incorporated in Iowa to build an electric interurban line from Davenport to Burlington. Capital stock, \$250,000. The C. G. Hipwell Construction Company, which also has filed articles of incorporation, will conduct the construction work of the road and the interurban company will operate the line after its completion. C. G. Hipwell, Davenport, Ia., is interested in both companies.

Capital Traction Company.—Incorporated in California with \$100,000 capital stock. Incorporators: E. A. Phillips, J. J. Scriver, D. B. Edwards, J. W. Scott and G. E. Phillips of San Francisco.

Cleveland Southwestern & Columbus Railway.—Incorporated in Ohio as a consolidation of the Cleveland & Southwestern, the Cleveland Ashland & Mansfield and the Ohio Central Traction companies, with a capital of \$10,000,000. This gives the Pomeroy-Mandelbaum interests a direct route from Cleveland to Bucyrus by way of Wooster and Mansfield. From Bucyrus it is possible to reach Columbus over the Columbus Delaware & Marion line.

Columbia River Outlook & Northwestern Railway.—Incorporated in Washington to build from Vancouver to a point in or near Spokane, Wash. Capital stock \$3,000,000. Incorporators: W. McF. Stewart and M. C. Stewart, Outlook, Wash.

Derry & Goffs Falls Electric Railway.—Incorporated in New Hampshire to build an electric railway 8 miles long from Derry to Goffs Falls, where it will connect with the Goffs Falls Litchfield & Hudson Street Railway. Incorporators: Roswell Annis, James F. Cavanaugh and others of Manchester.

Frederick Interurban Railroad.—Incorporated in Maryland with a capital stock of \$1,000,000, to construct an electric railway connecting the towns of Frederick, Middletown and Jefferson. Incorporators: Emery L. Cobientz, Thomas H. Halley, Richard P. Ross, James E. Ingram, Jr., and Robert P. Graham.

Ocean Shore & Eastern Railway.—Incorporated in California to build a line from Santa Cruz to Watsonville, 20 miles. The line will be an extension of the Ocean Shore Railway and will pass through Soquel, Aptos and other towns in the Pajara fruit valley. It is said that surveys have been completed and that construction is to begin at once. Capital stock, \$3,000,000. Incorporators: J. Downey Harvey, president and general manager of the Ocean Shore Railway, San Francisco; J. A. Folger, Woodside; Charles Carpy, Charles C. Moore and B. Corbet.

Seashore Municipal Railroad.—Incorporated in New York to build and operate an electric railway from Hempstead, Nassau county, to East Rockaway, 5 miles. Capital, \$150,000. Incorporators: G. A. Green and M. H. Day, Brooklyn; R. M. Lamb, H. M. Olmstead, Jr., Freeport; H. M. Pratt, Julien Leadbeater, M. J. White of New York; H. D. Bristol, Rockville Center, N. Y.

Springfield, Ill.—Incorporation papers for a new electric interurban line from St. Elmo, Fayette county, to Springfield have been filed. The capital stock is \$5,000 and the headquarters will be at St. Elmo, Ill. The line will extend through Fayette, Shelby, Montgomery, Christian, Macoupin and Sangamon counties to Springfield. Incorporators: Presley M. Johnston, Heraldson L. Hunt, John W. Griswold, George W. Bledsoe and George T. Turner.

Susquehanna Railway Light & Power Company.—Incorporated in Connecticut with a capital of \$20,000,000. Incorporators: Lucius F. Robinson and John T. Robinson of Hartford and Albion B. Wilson.

Syracuse & Milford Railroad.—C. J. Reilly, superintendent of the Sandusky Portland Cement Company, Syracuse, Ind., writes that the above is the correct name of the road reported last week as the Wabab & Wawasee Railway, incorporated to build from Syracuse to Milford, Ind.

Terre Haute Indianapolis & Eastern Traction Company.—Incorporated as a holding company for all the traction lines between Indianapolis and Terre Haute, by the Indiana syndicate represented by Hugh J. McGowan of Indianapolis. The roads which are to be merged are the Indianapolis & Western, which runs to Brazil and Terre Haute; the Indianapolis Danville & Western, and the Indianapolis & Plainfield. It is stated that it is the intention of the company to connect with the interurban lines of Illinois at some future time. The company is capitalized at \$100,000. Robert I. Todd, president; Thomas B. McMath, vice-president; William S. Milholland, secretary and treasurer; Fletcher M. Durbin and R. E. A. Foley, directors.

Washington Spa Springs & Greta Railroad.—Incorporated in Maryland to construct a railroad commencing at the Maryland line and the District of Columbia at a point on the Baltimore and Washington turnpike near Bladensburg to Greta, which is near the junction of the Riverdale and Edmondston roads, motive power to be decided later. Capital stock, \$20,000. Incorporators:

James C. Rogers, Benjamin D. Stephens, Fillmore Beall, J. Enos Ray, Jr., and Marion Duckett, all of Prince Georges county.

Wisconsin Valley Electric Railway.—Incorporated in Wisconsin to build an interurban railway from Grand Rapids to Stevens Point, Wis., with an extension later to Wausau and Merrill. It is stated that the plans call for an expenditure of \$1,000,000. Capital stock, \$25,000, to be increased later. Incorporators: George A. Whiting, Neenah, Wis.; F. F. Whitecomb and George Lines, Milwaukee.

TRACK AND ROADWAY.

Benton Harbor-St. Joseph Railway & Light Company.—H. C. Mason, manager, Benton Harbor, Mich., writes that contracts are to be let April 1 for the construction of an extension from Benton Harbor to Paw Paw, Mich., 12 miles. Contracts are to be let for a steel bridge 400 feet long. Contractors are requested to correspond with the company. Seventy-pound rails have been purchased. C. K. Minary of Benton Harbor is president.

Boston Lowell & Lawrence Electric Railroad.—This company, which proposes to build an electric road from Boston to Lowell, Mass., is seeking legislation which will permit the construction of about 900 feet of elevated structure for the entrance into Lowell and about 1,300 feet more for the entrance into the Sullivan Square terminal in Boston.

Consolidated Railway (New Haven, Conn.)—It is reported that a line will be built this spring from Dayville through Attawaugan and Ballouville to Pineville, Conn.

Dallas Electric Interurban Railway.—The American Engineering Company of Indianapolis has nearly completed the surveys for the belt line around the city of Dallas, and it is expected that the surveyors will begin locating the line to Greenville early next week. It is the intention to put grading crews to work as fast as the route is located and to push the construction as rapidly as possible.

Defiance, O.—It is reported that A. L. Irish of Toledo and eastern capitalists are interested in a project for building an electric road from Defiance to Toledo via Napoleon, Liberty, Whitehouse, Waterville and Maumee. Surveys have been made and it is stated that prospects are bright for making the necessary financial arrangements.

Detroit Jackson & Chicago Railway.—Superintendent J. L. Millsbaugh, Ypsilanti, Mich., has announced that the Saline branch will be extended from Saline to Adrian, Mich., via Clinton and Tecumseh. The tracks of the Saline branch are to be relaid with heavier rails.

Detroit, Mich.—It is reported that the Westinghouse Electric & Manufacturing Company is making plans, specifications and estimates for the complete electrical construction and equipment of a road from Ft. Wayne, Ind., to Detroit, Mich., via Bryan, O., for C. M. Pierce of New York and others.

Georgia Railway & Electric Company.—The directors have approved the plans for the rebuilding and extension of several miles of city lines in Atlanta, Ga., and the construction of the line to Hapeville. Rails for this line have already been laid in Hapeville. The line will be built on a private right of way.

Grand Rapids & Kalamazoo Valley Traction Company.—President W. H. Patterson of Kalamazoo, Mich., has announced that the rails have been purchased for building the road from Kalamazoo to Otsego and that the work of tracklaying will begin as soon as the weather will permit. It is the intention to build the first part of the road before June 1 and to build on to Grand Rapids during the summer.

Idaho & Nevada Railroad.—W. D. Kenyon of Burley, Idaho, is one of the organizers of the above company, which proposes to build an electric railway from Burleigh to Oakley, 25 miles.

Illinois Traction Company.—Work is progressing rapidly on the Champaign-Decatur line. The first section, from Champaign to Monticello, was opened for operation about two weeks ago. Track has been laid into Sangamon from the east and poles are being distributed. From the Decatur end of the line track has been laid from the junction at Jasper street to the Swartz farm and poles are distributed. At present the contractors are putting in the timbers for the overhead crossing of the Wabash. Soon the only gap in the line will be at the Sangamon east of Decatur, where work on the bridge and the grading must be finished before cars can run into Decatur.

Indianapolis Coal Traction Company.—Work is now in progress on a large arch bridge over White Lick, west of Plainfield, Ind., on the extension to Amo.

Indianapolis Huntington Columbia City & Northwestern Railway.—M. V. Ryan of Syracuse, Ind., has the contract for building this line from Huntington to Goshen, Ind., 60 miles, which it is proposed to extend ultimately to connect Indianapolis and Goshen. Grading is completed from Wawasee Lake to Goshen, and tracklaying is to begin in a few days. D. L. Homer, Syracuse, Ind., chief engineer.

Iowa City-Davenport Traction Company.—Surveys have been completed and nearly all of the right of way has been secured for this proposed line from Iowa City to Davenport, Ia., via Springdale, Rochester, Sunbury, Maysville and Tipton.

Lafayette & Logansport Traction Company.—The work is progressing rapidly on this extension of the Ft. Wayne & Wabash

Valley Traction Company from Lafayette to Logansport, Ind. From a point half way between Delphi and Rockfield, the steel is laid to Logansport, and the road is being ballasted. The bridge over Rock creek will soon be completed. Painters are putting the finishing touches to the two bridges at Logansport. Rails are laid from one mile east of Colburn to Wild Cat creek and the roadbed is graveled. H. L. Weber, Ft. Wayne, Ind., chief engineer.

Lake View Traction Company.—H. E. Craft, vice-president, Memphis, Tenn., writes that construction will begin in about 60 days on this proposed line from Memphis, Tenn., to Clarksdale, Miss., a distance of 77 miles, of which 15 are in Tennessee and 62 in Mississippi. The entire route has been surveyed. R. F. Tate, 552 Randolph Building, Memphis, Tenn., is president.

Lewiston & Southeastern Electric Railway.—Judson Spofford, Lewiston, Idaho, vice-president and general manager, writes that this road will extend from Lewiston to Grangeville and Nez Perce, Idaho, 135 miles. The entire route has been surveyed and grading has been completed from Lewiston to Tameny, 6 miles. Grading is now in progress from Nez Perce to Dublin, 6 miles. There will be no large bridges and no tunnels on the line and no heavy grades. The road will handle a general freight, passenger, mail and express traffic, and 80-pound steel rails will be used. G. W. Thompson, president, and W. P. Wood, chief engineer, both of Lewiston, Idaho.

Lima, O.—It is reported that the Schoepf-McGowan syndicate, which owns the Indiana Columbus & Eastern Traction Company, has let a contract for building the line from Lima to Bellefontaine, O.

Louisville (Ky.) Railway.—Preparations have begun for the construction of an extension of the West Broadway line about ½ mile long.

Milwaukee Northern Railway.—The grading and bridge work is now completed from Port Washington to within a mile of the city limits of Milwaukee and steel is on the ground ready to be laid at once. As soon as this section is completed it is intended to build the line from Port Washington to Sheboygan. The Comstock-Heigh-Walker Company of Detroit has the contract. F. W. Walker, Port Washington, vice-president.

Nashville & Columbia Interurban Railway.—H. H. Mayberry of Franklin, Tenn., is president of this company, that proposes to build an electric railway from Nashville to Mt. Pleasant, Tenn., via Franklin and Columbia. It is stated that financial arrangements have been completed and that construction is to begin at once.

Nashville & Huntsville Railroad.—It is reported that a contract has been let to the American Construction Company for building this road from Nashville, Tenn., to Huntsville, Ala. Thomas M. Steger of Nashville is president.

Nashville Railway & Light Company.—Percy Warner, president and manager, Nashville, Tenn., has announced that the company proposes to expend \$1,000,000 in improvements, extending several lines and double-tracking others and building new transfer station. New rails are to be laid on many of the present lines.

New York Auburn & Lansing Railroad.—H. A. Clarke, chief engineer, Auburn, N. Y., writes that grading has been completed on this line from Auburn to Ithaca, N. Y., 37 miles. The road is chartered as a steam road but will be operated by electricity, using the third-rail system and three-phase transmission. Twenty miles of the road, from Auburn to Genoa, is now completed and freight and construction trains are operated. The Auburn Construction Company, Auburn, N. Y., has the contract. The power house, which is now under construction, will be equipped with two 800-kilowatt steam turbines. Two substations are also under construction. Connection for interchange of freight is made at Auburn with the New York Central & Hudson River and the Lehigh Valley Railroads. A. H. Flint, New York, president; B. M. Wilcox, Auburn, vice-president; B. Halladay, New York, secretary and treasurer.

Schuylkill Valley Traction Company.—This company has prepared plans for the extension from Ringing Rocks to Boyertown, Pa.

Scioto Valley Traction Company.—It is reported that the directors have decided upon the construction of an extension from Lancaster to Logan, O., and that work is to begin as soon as the weather is favorable.

Southern Pacific Company.—Orders have been placed for the electrical equipment of the present steam lines constituting the Alameda mole system in Alameda, Cal. The lines will diverge into three terminals, one at High street in Alameda, another at Fruitvale and a third at Fourteenth street in Oakland. A site for the power house has been purchased.

Sparta-Melrose Electric Railway & Power Company.—Mr. H. Teasdale, secretary, Sparta, Wis., writes that this company, recently incorporated, proposes to build an electric railway from Sparta to Melrose, Wis., 28 miles, passing through Angelo, Trout Falls, Cataract and Melrose; 18 miles of the line has been surveyed; grading is to begin this spring. The company is now securing the right of way and contracts will be let about April 1. George Cromwell, Sparta, Wis., is president.

Terre Haute, Ind.—C. M. Shedd of Indianapolis is reported to be interested in a project to build an electric line from Terre Haute to Charleston, Ind., via Marshall and Westfield.

Tacoma Railway & Power Company.—The South Tacoma line

between Hosmer Junction and Pine street is being double-tracked. This work will complete the double-tracking of the entire South Tacoma line, which will be used in connection with the new line to American Lake.

Toledo & Chicago Interurban Railway.—It is stated that this company is making preparations for the proposed extension from Kendallville west to Goshen, Ind. Surveys have been made and it is stated that work will begin early this spring. F. B. Perkins, general manager, Kendallville.

United Cities Traction Company.—This company is now building an electric railway for both freight and passenger service from Ft. Smith, Ark., to Ft. Smith, Okla., 4½ miles. The principal traffic of the road will be derived from handling freight from the Missouri Pacific, St. Louis & San Francisco, Kansas City Southern, Fort Smith & Western and Midland Valley railroads, which center in Ft. Smith, Ark. One mile out of Ft. Smith, Ark., has been graded and work will be pushed as soon as the right of way is secured. Contracts have been let; overhead construction will be of the span type; the rails will be of 80-pound steel for the first mile and a half and 60 pounds for the remainder; standard ties with 2-foot centers; maximum grade, 3 per cent. Ira L. Reeves, of Muskogee, I. T., is president.

Winona (Ind.) Interurban Railway.—This company has distributed along the right of way the ties, rails and poles necessary for the construction of the Peru extension. The work of building this line will be resumed as soon as weather conditions will permit. A Bullock 300-kilowatt rotary converter, which is to be used in furnishing current for this division, has recently been installed at the company's power house at Winona Lake.

Youngstown & Southern Railroad.—Grading has been completed on the extension from Columbiana to Leetonia, O., and the work of setting poles, stringing the wire and laying the track has been started.

POWER HOUSES AND SUBSTATIONS.

Alabama Railway & Power Company.—It is reported that this company is making a location survey for the construction of its power plant at Birmingham, Ala. C. L. Young of Dawson, Ala., is chief engineer.

Boston Elevated Railway.—It is reported that this company has just closed a contract with Allis-Chalmers Company, Milwaukee, Wis., through the Stone & Webster Engineering Corporation of Boston, for the largest engine type alternators ever constructed. These machines will be installed in the new extension of the Boston Elevated Railroad.

Huntsville (Ala.) Railway Light & Power Company.—It is reported that this company will spend between \$30,000 and \$40,000 for improvements to its power house. Some extensions amounting to 2 or 3 miles will also be made to the tracks of the company. Francis M. Lawton, Huntsville, Ala., is manager and purchasing agent.

Indianapolis Columbus & Southern Traction Company.—The breaking of a piston rod in the Edinburg power plant of the Indianapolis Columbus & Southern Traction Company at about nine o'clock March 3, 1907, caused considerable delay to its patrons, as five cars were stalled on the line some distance out of Taylorsville, and the company had to hire carriages to bring in the delayed passengers. The reason for the long shut down, which lasted all day, was that part of the auxiliary generating unit had been sent away for repairs, so that this was not available.

Indianapolis Newcastle & Toledo Electric Railway.—It is reported that work on the power house of this company is progressing favorably in spite of the unfavorable weather so far this season. This, it is said, will be one of the largest power houses in that part of the country.

Joplin (Mo.) & Pittsburg Electric Railroad.—It is reported that this company has been negotiating for the purchase of the power plant of the Consolidated Light Power & Ice Company of Joplin, Mo., with the intention of using the power from this plant for the operation of its new line. It is also reported that this company will purchase land for park purposes, which will probably be located at Grand Falls park on Shoal creek, which is said to be one of the most beautiful park locations in southwestern Missouri.

Little Rock Railway & Light Company.—This company announces that it will soon let a contract for a surface condenser, air pumps, etc., which will be used in connection with the 1,500-kw. Curtis turbine which is being installed in its power plant.

Mt. Vernon (Ohio) Electric Light & Railway Company.—The power plant of this company was partly destroyed by fire on the morning of March 2, 1907. The extent of the damage is said to be several thousand dollars. The indications are that the fire started from spontaneous combustion in the store room over the dynamo room.

Savannah Electric Company.—This company has found it necessary to increase the speed of its cars to prevent the congestion of traffic which has resulted from an unusually rapid increase in business. The increase in speed will be obtained by replacing all the old 30-inch wheels by new wheels 33 inches in diameter.

Southern Pacific Company.—This company has purchased an entire block lying west of Fruitvale avenue, Oakland, Cal., to be used for the erection of a large power house and car barns, in connection with the proposed electric lines which will supersede the local steam lines in Oakland and Alameda.

Personal Mention

Mr. H. C. Roome has been appointed manager of the Miami (Fla.) Electric Railway, succeeding Mr. T. H. Tatum, resigned.

Mr. Frank Eckerson, Pittsfield, Mass., has been appointed chief engineer of the Pittsfield Electric Street Railway, effective February 18.

Mr. E. R. McDowell, superintendent of the Ashtabula, O., Rapid Transit Company, has been promoted to general manager of that company.

Mr. W. T. Durfee of Decatur, Ill., has been appointed to the newly created position of traveling express auditor of the Illinois Traction System.

Mr. Harry Nye, of Dayton, O., has been appointed park manager of the Indiana Union Traction Company, in charge of the company's various amusement resorts.

Mr. James A. Robertson, who, for the past 25 years has served in various capacities with the Georgia Railway & Electric Company, has been appointed division superintendent of its south side lines.

Mr. A. A. Hoehn, formerly superintendent of the San Jose & Santa Clara (Cal.) Railway Company, has resigned to engage in other business. Mr. Hoehn will have no successor, the office having been abolished with his resignation.

Mr. J. White Sprong, purchasing agent of the Delaware & Hudson Company, Albany, N. Y., has had his jurisdiction extended over the recently consolidated United Traction and Hudson Valley lines and will assume his new duties at once.

Mr. James McCabe has been appointed division superintendent in charge of the Elizabeth lines of the Public Service Corporation of New Jersey, succeeding Mr. F. C. Southard. Mr. McCabe formerly was in charge of the turnpike line between Newark and Jersey City.

Mr. Charles Kline has been appointed general manager of the Enid (Okla.) and the Tulsa (Ind. Ter.) Street Railway companies. Mr. Kline goes to his present position from Piqua, O., where he has been train dispatcher for the Dayton Covington & Piqua Traction Company since it first began operations.

Mr. Joseph S. Wells, acting general manager of the Utah Light & Railway Company, Salt Lake City, Utah, has been appointed general manager. The office of assistant to the president, heretofore filled by Mr. F. L. Morse, whose resignation, as previously reported, took effect on March 1, has been abolished.

Mr. Axel Eckstrom, consulting electrical engineer for the Delaware & Hudson Company, assumed charge, on March 1, of all mechanical and electrical work of this company and will hereafter be known as general electrical and mechanical superintendent of the traction department. The extension of Mr. Eckstrom's jurisdiction is a step toward the more efficient organization of the steam and traction properties of this company.

Mr. W. H. Zimmerman has resigned as general manager of the DaKalb-Sycamore Electric Company to accept a similar position with the Michigan Power Company, at Lansing, Mich., in charge of a large amount of reconstruction work, which the Michigan Power Company expects to undertake in the near future in the way of constructing a new auxiliary steam plant and making further developments of the water power on the Grand river.

Mr. H. C. Prather of Newark, N. J., has been appointed superintendent of transportation of the Roanoke (Va.) Railway & Electric Company, a position recently created by the company on account of its rapid growth within the last two years, and will assume his duties at once. Mr. Prather's street railway experience extends over several years, including similar positions with the Springfield (Ill.), St. Louis (Mo.) and Paterson (N. J.) systems.

Mr. Bion J. Arnold, president of the Arnold Company of Chicago, has been retained by the city of Toronto, to interpret the conditions of the agreement between the municipality and the street railway company with regard to the operation of its lines. A difference of opinion as to the legality of certain regulations imposed by the city in connection with the existing franchise of the company has led to a misunderstanding and Mr. Arnold's advice on the subject has been sought by the city.

Mr. R. E. Hunt, formerly associated with the Williams traction interests at Augusta, Ga., and more recently superintendent of railways for the Norfolk & Portsmouth (Va.) Traction Company, has resigned his position, effective March 15, to become superintendent of railway service for the Utah Light & Railway Company, Salt Lake City. Mr. Hunt will occupy the position recently made vacant by the resignation of Mr. Walter P. Read, noted in the Electric Railway Review of January 12.

Mr. F. D. Hoffman, heretofore assistant secretary and treasurer of the Chicago City Railway, has been elected treasurer of that company, succeeding Mr. J. P. Burke, who has been elected assistant treasurer. Mr. Hoffman was born in Milwaukee on December 25, 1880, and began his street railway career in 1898 as messenger for the Milwaukee Electric Railway & Light Company. He was later secretary to Mr. T. E. Mitten, now president of the Chicago City Railway, and accompanied Mr. Mitten to Buffalo in 1901 when he was in charge of the Buffalo street railways during the Pan-American Exposition. In 1905 he became secretary to President H. J. Pierce of the International Railway of Buffalo and in

February, 1906, was made assistant secretary and treasurer of the Chicago City Railway.

Mr. W. T. McCaskey, formerly special agent of the Allis-Chalmers Company of Milwaukee, Wis., has been appointed general manager of the Indianapolis Newcastle & Toledo Electric Railway, which is building a new line from Indianapolis to Newcastle, Ind.

Mr. William J. Mullin, who recently was appointed general traffic manager of the Delaware & Hudson Company, on March 1 had his jurisdiction extended over the associated traction properties of this company, including the United Traction Company of Albany, and the Hudson Valley Railway of Glens Falls. It is stated that beginning on March 1 the officials of the passenger and freight traffic department will, in addition to their present duties, have entire supervision of the associated electric railway properties controlled by the company. This will extend the jurisdiction of Mr. Paul Wadsworth and Mr. J. W. Burdick, assistants to Mr. Mullin.

In the reorganization of the Brooklyn Rapid Transit Company, by which the leases of several of the subsidiary companies to the Brooklyn Heights Railroad Company have been terminated, effective on February 28, Mr. Henry Heibert has been elected president of the Brooklyn Union Elevated Railroad; Mr. J. G. Jenkins president of the Sea Beach Railroad; Mr. John E. Borne president of the Nassau Electric Company, and Mr. H. C. Duval president of the Brooklyn Queens County & Suburban Railroad and the Coney Island & Gravesend Railroad. Mr. Howard Abel has been appointed comptroller and Mr. G. D. Youmans general counsel of the South Brooklyn Railroad.

Mr. A. A. Anderson, whose appointment as general manager of the Indianapolis & Louisville Traction Company in addition to his present duties as general manager of the Indianapolis Columbus & Southern Traction Company was noted in last week's issue of the Electric Railway Review, brings to his new position the training born of long experience in street railway work. From 1878 to 1893, during its several changes in ownership, he served in various capacities with the City Railway Company of Indianapolis. In 1893 he accepted a position with the City Railway properties of Youngstown, O., where he remained nine years, during which time the Mahoning Valley interurban system was built. During a portion of 1903 he was connected with the Union Traction Company of Indiana. In 1904, at the solicitation of Mr. Charles L. Henry, he became connected with the Indianapolis & Cincinnati Traction Company, where he remained until his appointment as general manager of the Indianapolis Columbus & Southern in October of last year.

An official circular issued by the Utah Light & Railway Company, Salt Lake City, Utah, states that the office of chief engineer, heretofore held by Mr. O. A. Honnold, has been abolished. Mr. William Ashton, chief engineer of the Oregon Short Line, has been appointed consulting engineer. Mr. L. L. Dagrón, who has been connected with the engineering department of the Oregon Short Line, has been appointed engineer. He will have direct charge of all surveys, real estate, rights of way and records of same; construction, additions, betterments and maintenance of railway lines; dams, reservoirs, canals, pipe lines and buildings, and such other work as may be assigned to him by the general manager from time to time. Mr. O. A. Honnold has been appointed electrical engineer. He will have general charge of construction, maintenance and operation of electrical power plants; transmission lines and distributing systems pertaining thereto; also general charge of electric lighting and power distribution, and such other work as the general manager may assign to him from time to time.

Obituary.

Robert Edwin Jenkins, formerly president of the Metropolitan West Side Elevated Railway of Chicago, and a well-known lawyer, died at the Hahnemann hospital in Chicago on March 5, aged 61 years. He was born at Alexandria, Clark county, Mo., in 1846 and came to Chicago in 1866, where he received his legal education. He has held several important public positions. For a number of years he was chairman of the Chicago Bar Association; he also was vice-president of the Chicago Citizens' Association, was one of the organizers of the Union League Club and was the author of the present jury commission system in Cook county.

David Plume, formerly first vice-president of the Connecticut Railway & Lighting Company, Waterbury, Conn., died recently. Mr. Plume was well known in street railway circles through his connection for many years with the railway interests of Waterbury. He was one of the original owners of the old horse-car system of that city and later, before its consolidation with the Connecticut Railway & Lighting Company, was president of the Waterbury Traction Company. He has been identified in various capacities with a number of manufacturing and commercial enterprises in Connecticut and at the time of his death was president of the Colonial Trust Company and the Thomaston National Bank, and treasurer of the Plume & Atwood Manufacturing Company and the American Ring Company. He also was a director in a number of corporations.

The Scioto Valley Traction Company has taken a case to the Ohio supreme court in which it will test the constitutionality of an ordinance passed by the council of Circleville, O., which creates police jurisdiction in compelling the traction company to stop its cars at all street crossings in the town. Alvin Townsend, a conductor on the Scioto Valley, was arrested under the ordinance for not stopping his car at all street intersections and was fined. The common pleas court of the county decided against the traction company.

Financial News

Amherst & Sunderland Street Railway, Amherst, Mass.—An offer has been made for the \$120,000 capital stock of this company and it is announced that the directors and principal stockholders will recommend that the offer be accepted by all shareholders.

Buffalo & Lake Erie Traction Company.—This company has applied to the railroad commissioners of New York for authority to increase the capital stock from \$6,750,000 to \$7,500,000. The proceeds will be used to acquire the stock of the Jamestown Chautauqua & Lake Erie Railway Company, which is now a steam road. The Jamestown Chautauqua & Lake Erie lines run from Jamestown to Westfield, Mayville to Chautauqua, and Clifton to Falconer, N. Y., a total of 37.39 miles.

Chicago & Milwaukee Electric Railroad.—A. C. Frost, the president of the company, in a letter to the Western Trust and Savings Bank of Chicago regarding \$2,000,000 notes, which were mentioned in last week's issue of the Electric Railway Review, gives the following information regarding the company:

"The Chicago & Milwaukee electric railroad is double-tracked throughout. The route is practically an air line between Chicago and Milwaukee, having a maximum of 0.4 per cent grade and a maximum of 1 degree curve. All abutments and culverts are of concrete, built for four tracks. The company has no railroad grade crossings except two, which are provided with modern interlockers. All other railroad crossings have been separated by going over or under them and many of the important highways and streets are crossed by means of subways. All bridges are of steel on concrete abutments and have a carrying capacity of 100,000-pound cars. Eighty-pound rails are laid on first quality white oak ties, 2-foot centers. The company has built 37 stations costing from \$1,000 to \$30,000 each, besides many shelters. The roadbed, power plant, substations and equipment are of the highest standard of electrical railroad construction, permitting, with safety, a speed of 60 to 70 miles per hour.

"The railroad is incorporated under the general railroad act of the state of Illinois and under the general railroad act of the state of Wisconsin. The company holds most satisfactory franchises, all but four being in perpetuity; all the franchises of the Wisconsin division are perpetual except for the entrance into Milwaukee, which is for 30 years. The entire right of way is owned in fee simple and is from 100 to 150 feet in width, allowing for the construction of additional tracks. The company has expended over \$2,000,000 for right of way, depot grounds and terminals.

"The property consists of two divisions—the Illinois division and the Wisconsin division, incorporated as separate corporations under the laws of Illinois and Wisconsin. The Wisconsin division, however, is leased to the Chicago & Milwaukee Electric Railroad Company (Illinois corporation) for a period of 50 years, and the Illinois corporation guarantees the principal and interest of the Wisconsin division bonds.

"The Illinois corporation owns that portion of the road from Evanston to Waukegan, which has been completed and in operation since 1900, and the branch from Lake Bluff to Rockfeller, which was completed and placed in operation in 1903—a total of 76 miles of main track. It connects at Evanston with the Chicago Union Traction system and the Evanston branch of the Chicago Milwaukee & St. Paul railway. Arrangements have been made for a connection with the Northwestern Elevated, which will give us a direct entrance into the business center of Chicago. The Illinois corporation has a total bond issue of \$5,000,000 first-mortgage 5 per cent bonds.

"The Wisconsin division begins at the junction of the main line of the Illinois division and its Libertyville branch and extends north through Waukegan, Kenosha and Racine, and a number of small towns between these cities, to Milwaukee, a distance of 55 miles. The road is now completed to a point within 15 miles of Milwaukee and will be completed and in operation into Milwaukee by September 1, 1907. The Wisconsin corporation has an authorized bond issue of \$10,000,000, of which \$7,000,000 will have been issued when the road is completed into Milwaukee. The remaining \$3,000,000 are reserved for building branches from the main line west from Waukegan to Fox Lake, and from Kenosha west to Lake Geneva. These extensions will develop an enormous passenger business in the summer and a large ice traffic in the winter.

"We have freight connections with the Elgin Joliet & Eastern (outer belt line of Chicago), which is a medium of connection with every trunk line radiating from Chicago, and with the Wisconsin Central. Although freight has only been handled by the company during the last two years, the freight business has already assumed considered proportions and there is every prospect of a very large increase in our freight business during the next few years.

"On December 1, 1906, the company entered into a contract with the United States Express Company for operating its express business over this company's lines, from which we are assured a profit of at least \$25,000 for this year.

"The company has made a contract with the Racine Stone Company, whose quarries and plant are located three miles north of Racine, for hauling its entire product of about 1,000 cubic yards of crushed stone per day. This contract assures us a profit of \$75,000 this year.

"The company owns extensive gravel beds at Libertyville and near Kenosha. This gravel is used in large quantities for road making. The company can deliver this gravel on its cars anywhere along its line for 30 cents per cubic yard, including the cost of loading, and receives \$1.00 per cubic yard for it.

Cleveland Southwestern & Columbus Railway.—This company

has been formed to acquire the properties of the Cleveland & Southwestern Traction Company, the Cleveland Ashland & Mansfield Traction Company and the Ohio Central Traction Company. Stockholders of these three companies have approved the plan for combination, and the shareholders in the new company will meet on April 21 to organize. The new company will have \$7,500,000 common stock and \$2,500,000 preferred stock. A bond issue of \$10,000,000 is authorized. Of this amount \$3,110,000 will be held to retire Cleveland & Southwestern bonds, and \$400,000 to retire Ohio Central bonds. In exchange for Cleveland & Southwestern preferred stock the new company will offer \$200,000 bonds, \$2,000,000 preferred and \$200,000 common stock; and for Cleveland & Southwestern common stock \$3,000,000 of the new common stock will be given. For Cleveland Ashland & Mansfield bonds the new company will give \$1,000,000 bonds and \$1,000,000 common stock. Holders of Ohio Central preferred stock will receive \$400,000 new preferred; and the holders of the common will receive \$500,000 new common. For the immediate needs of the combined property \$290,000 in bonds will be used. The proceeds from \$5,000,000 in bonds, \$100,000 preferred stock and \$2,300,000 common stock will be used from time to time in acquiring or building other lines and in the making of improvements.

Connecticut Railway & Lighting Company.—The Commercial & Financial Chronicle publishes the following authoritative statement: "The company's property has been leased to the Consolidated Railway Company for 999 years from August 1, 1906. The payment of the rental has been guaranteed by the New York New Haven & Hartford Railroad Company. The lessee pay taxes and a cash rental amounting to \$975,000 for the year 1906-07, increasing gradually to \$1,400,000 for the year 1914-15 and for every year thereafter. Out of this amount must be paid fixed charges, consisting of bond interest and sinking fund amounting to \$673,882 annually. Under the lease no further bonds are to be issued by the Connecticut Railway & Lighting Company. The holders of the stock of the company have ratified the execution of this lease. The common shareholders have agreed to pay to the Colonial Trust Company, trustee, \$10 per share on either stock; while the preferred shareholders have agreed hereafter, and during the term of the lease, to accept 4 per cent dividends per annum in place of 5 per cent. The above payment of \$10 per share on common stock, added to the surplus rentals received under the lease, will provide a fund sufficient to pay dividends at the rate of 4 per cent on the preferred stock from August 1, 1906, and dividends at the rate of 4 per cent on the common stock from August 1, 1907, which the agreement provides shall be so applied. The present certificates are to be exchanged for new certificates on which will be endorsed the above stipulations."

Havana (Cuba) Electric Railway.—At a meeting of stockholders in Jersey City on March 6, a reorganization of this company was effected whereby the following were elected directors: Warren Bicknell of Cleveland; David T. Davis; Robert Mather, vice-president of the Rock Island Company; Walter G. Oakman of the Guaranty Trust Company of New York; James Rattray, Samuel San Miguel, Henry Runken, Carlos Zaldo and Frank Steinhart. The last four are of Havana.

Indiana Union Traction Company, Anderson, Ind.—At the annual meeting of stockholders on March 5, the following directors were elected: Randall Morgan, J. Levering Jones and I. H. Kingston of Philadelphia, Pa.; W. Kelsey and Jacob Schoepf, Cincinnati, O.; Hugh McGowan, Indianapolis; George F. McCulloch, Muncie, and Arthur Brady, Anderson. Officers were elected as follows: President, Phillip Matter, Marion; vice-president, E. C. Carpenter, Anderson; secretary and treasurer, W. C. Sampson, Anderson.

Louisville (Ky.) Traction Company.—A meeting of stockholders will be held on April 13 to vote on a proposition to authorize an increase in the common stock from \$12,000,000 to \$15,000,000. The new stock will be issued as capital for improvements is required.

Metropolitan West Side Elevated Railway, Chicago.—During the fiscal year ended February 28 gross earnings, according to an officer of the company, were about \$2,546,000. The total number of fares collected was 50,935,060, as compared with 46,186,753 in the previous year. The daily average number of passengers carried was 139,548, an increase of 13,008, equal to 10.28 per cent, over the preceding year.

St. Louis & Suburban.—The number of directors of this company, which is controlled by the United Railways Company of St. Louis, was reduced at the annual meeting of stockholders on February 26, from fifteen to five. The following were elected: John I. Beggs, C. H. Huttig, Robert McCulloch, Richard McCulloch and Frank R. Henry. Most of the stock of the St. Louis & Interurban is held in a voting trust and it was voted by the trustees, who are: Julius S. Walsh, Breckinridge Jones, C. Marquard Forster, Benjamin Altheimer and Samuel Kennard.

Union Railway Company of New York City.—In the year ended December 31, 1906 the gross earnings were \$1,566,871, as compared with \$1,420,990, an increase of \$145,881. The earnings compare as follows:

	1906	1905	1904
Gross	\$1,566,871	\$1,420,990	\$1,367,633
Expenses	1,049,129	1,067,825	977,328
Net	\$517,742	\$353,165	\$390,305
Other income	76,120	49,683	30,888
Total income	\$593,862	\$402,848	\$421,193
Charges	351,440	302,573	300,131
Surplus	\$242,422	\$100,275	\$121,062

Manufactures and Supplies

ROLLING STOCK.

Charleston & Summerville Electric Railway, Charleston, S. C., is figuring on 8 cars.

Erie Cambridge Union & Corry Railway, Erie, Pa., has purchased 8 interurban cars.

San Jose & Los Gatos Interurban Railway, San Jose, Cal., has ordered 3 interurban cars.

Columbus Newark & Zanesville Electric Railway, Newark, O., is figuring on five 28-foot cars.

Columbus Delaware & Marion Railway, Columbus, O., is about to place an order for a special funeral car.

Grand Rapids Railway, Grand Rapids, Mich., has ordered 10 cars from the G. C. Kuhlman Car Company.

Columbus Magnetic Springs & Northern Railway, Delaware, O., is considering the purchase of a number of new cars.

Nashville Railway & Light Company, Nashville, Tenn., has placed an order for 30 new double-truck cars for August delivery.

Ft. Dodge Des Moines & Southern Electric Railway, Boone, Ia., has purchased 11 interurban cars from the Niles Car & Manufacturing Company.

Northern Electric Company, Chico, Cal., has just placed an order for 50 standard box cars of 80,000 pounds capacity with the American Car & Foundry Company.

Elmira Water Light & Railroad, Elmira, N. Y., has purchased 6 cars from the G. C. Kuhlman Car Company, 4 of which are closed cars for city service and two 15-bench open cars for interurban service.

Austin Electric Railway, Austin, Tex., has placed an order with the Southern Car Company for four 10-bench open cars to be equipped with GE-54 motors. The company expects to have these cars in service in April.

Brooklyn Rapid Transit Company, Brooklyn, N. Y., recently reported in the market for 200 cars, has placed an order for 100 surface cars with the J. G. Brill Company and is reported to have ordered the 100 elevated cars from the St. Louis Car Company.

Manchester Street Railway, Manchester, N. H., has placed an order with the Laconia Car Company for 6 new cars to be used on the new Manchester and Nashua line. The cars will be 46 feet in length and of the same type as those now in operation on that line.

American Railways Company, Philadelphia, placed an order some time ago with the Jewett Car Company for 10 double-truck cars for the Peoples Railway Company, Dayton, O., and 4 of the same type for the Springfield Street Railway, Springfield, O., to be used for city service.

Oregon Electric Railway, Portland, Ore., as reported in our issue of February 23, has placed an order for 8 motor cars with the Jewett Car Company and 2 electric locomotives with the General Electric Company. The order was placed through W. S. Barstow & Co., New York and Portland.

Winona Interurban Railway, Winona Lake, Ind., has placed an order for 6 interurban cars which will be duplicates of the cars described and illustrated in the Electric Railway Review for November, 1906. Four cars of the same type which were ordered last year will be delivered within the next 10 days.

Ferrocarril Electrico de Lerdo a Torreon, Gomez Palacio, Mex., has just placed an order with the J. G. Brill Company for 11 cars as follows: Two 35-foot 12-bench open motor cars, two 30-foot closed motor cars, all to be equipped with GE-80 motors; also four 30-foot 8-bench trailers and three 21-foot trailer gondola cars, delivery on all to be made before May 20, 1907.

Denver & Interurban Railway, Denver, Colo., on February 25, placed an order for 8 semi-convertible cars, with the Woeber Brothers Carriage Works, Denver. These cars are to be 40 feet long over all, equipped with four 40-horsepower motors, have vestibuled platforms, seating capacity of 40 passengers and will be operated on the new Ft. Collins city lines which this company is now building.

York Street Railway, York, Pa., has recently purchased 5 cars, 2 of which are of the Pullman type, 47 feet in length over all, and 3 single-truck cars for city service, 20 feet long over corner posts. These cars will be mounted on Standard Motor trucks of the 0-50 type city and suburban high speed double-trucks and of the C-35 type single trucks and will be equipped with Westinghouse 101-B motors. The company is also about to order 5 cars for its new Hanover and York line.

Denver & Interurban Railway, Denver, Colo., is making preliminary designs for new high-speed interurban cars. The new equipments will weigh about 46 tons each and will be operated by four 125-horsepower single-phase motors. The car bodies will be of the steam-coach type, both straight passenger and combination, 55 feet long over all and 10 feet wide over all. The combination cars will have baggage compartments 8 feet long and

both types will have forward cabs 5 feet long. The straight passenger cars will seat 64 passengers.

Chicago South Bend & Northern Indiana Railway, South Bend, Ind., has placed an order for 10 interurban cars. They will be 62 feet in length, equipped with four 75-horsepower motors, and will have baggage compartment, smoking compartment and lavatories.

Washington Baltimore & Annapolis Electric Railway, Washington, D. C., has just placed an order with the Niles Car & Manufacturing Company for 25 cars. Nineteen of the cars are 60 feet in length of the passenger type; four are combination passenger and baggage cars, 54 feet in length and two are of the express and locomotive switching type cars and 54 feet long. The cars will be geared to 75 m.p.h. and will be equipped with GE A-603-A motors and Baldwin trucks of the 90-40 class.

Texarkana Gas & Electric Company, Texarkana, Ark.-Tex., placed an order about the first of January with the J. G. Brill Company for 3 semi-convertible cars, 2 of which have 20-foot bodies, equipped with Brill 21-E trucks, 2 GE-54 motors and 1 double truck car equipped with 4 GE-54 motors and National Brake & Electric brakes. This car is 41 feet in length over all. The company has also purchased 5 National Brake & Electric Company's equipments and one 2 GE-54 motor equipment.

Omaha & Council Bluffs Street Railway, Omaha, Neb., as reported in the Electric Railway Review of March 2, has placed an order with the American Car Company for 30 closed all-wood passenger cars with a seating capacity of 34 persons and 5 closed cars with a seating capacity of 44 persons. They will have the following dimensions:

Five Cars.

Length of body.....	34 ft.	Width, inside.....	7 ft. 6 in.
Over vestibule.....	45 ft.	Over all.....	8 ft. 3 in.
Over all.....	46 ft. 6 in.	Height, inside.....	8 ft. 2 1/4 in.
		Sill to trolley base	9 ft. 1 in.

Thirty Cars.

Length of body.....	28 ft.	Width, inside.....	7 ft. 6 in.
Over vestibule.....	39 ft.	Over all.....	8 ft. 4 in.
Over all.....	40 ft. 6 in.	Height, inside.....	8 ft. 2 1/4 in.
		Sill to trolley base	9 ft. 1 in.
		Body and underframe	Wood

Consolidated Railway Company, New Haven, Conn., has placed the following orders for new equipment with the Wason Manufacturing Company to be distributed among its several lines as follows: For the New Haven Line, twenty 15-bench open cars to be equipped with Taylor trucks, 2 GE-87 motors, Christensen air brakes and Sterling-Meaker No. 5 registers; also three cars, 36 feet in length and 44 feet over all, for trolley express purposes to be equipped with heavy Taylor trucks, 4 GE-87 motors and Christensen air brakes; for the Hartford Street Railway, 20 15-bench open cars to be equipped with Taylor trucks, 2 GE-87 motors, Christensen air brakes and New Haven Recording registers; for the New London Street Railway, four 15-bench open cars to be equipped with Taylor trucks, 4 GE-80 motors, Sterling-Meaker No. 5 registers, and Christensen air brakes; for the New England Investment & Security Company's lines as follows: Berkshire Street Railway, ten 14-bench vestibule open cars to be equipped with Standard Motor trucks, 4 GE-87 motors, Christensen air brakes and New Haven-Philadelphia type registers; for the Springfield Street Railway, ten 14-bench vestibule open cars, equipped with Standard Motor trucks, 4 GE-80 motors, Christensen air brakes and Sterling-Meaker No. 5 registers; for the New York & Stamford Street Railway, eleven 15-bench open cars equipped with Taylor trucks, 2 GE-87 motors, Christensen air brakes and Sterling-Meaker No. 5 registers. All of these cars will be equipped with the Crouse-Hinds arc headlights. The company also expects to order a lot of closed cars within the next few days.

SHOPS AND BUILDINGS.

Exeter Hampton & Amesbury Street Railway.—One of the car barns at Hampton, Mass., was burned the night of March 1, destroying a considerable amount of rolling stock. The estimated loss is \$50,000.

Ft. Dodge Des Moines & Southern Electric Railway.—The work on the car barn at Boone, Ia., is said to be progressing rapidly. J. F. Ivis has the contract.

Georgia Railway & Electric Company.—The directors have authorized the construction of new car barns and repair shops at Atlanta, Ga. Both buildings will be fireproof, of brick and steel construction. The barns will have a capacity of 60 cars. The shops will include blacksmith, machine and carpenter shops and a planing mill.

Hannibal Street Railway & Electric Company.—It is reported that this company has decided to build a concrete car house at Hannibal, Mo.

Illinois Traction Company.—It is reported that a large tract of land has been purchased in the suburbs of Decatur, Ill., on which to erect a large car house and shops.

Indianapolis Coal Traction Company.—Work has been begun on the construction of a new station in Plainfield, Ind. It will be of brick and stone, of artistic design and equipped with all modern conveniences.

Meridian Light & Railway Company.—The directors at a recent meeting decided to build new car barns at Meridian, Miss., with a capacity of 80 cars. A. B. Paterson, manager.

Roanoke Railway & Electric Company.—This company will

close contracts within the next few days for four 500-horsepower water tube boilers for its new power plant. Most of the equipment has been purchased, including one 1,500-kilowatt and two 500-kilowatt Curtis generators, two 500-kilowatt rotary converters and other machinery.

Toledo Railways & Light Company.—This company is reported to be negotiating for the purchase of land in the vicinity of Riverside Park, Toledo, O., on which to erect a car house with accommodations for 100 cars. The company now has four car houses in the city, but their capacity is being outgrown and it is expected that they will be enlarged or abandoned and new ones built with a capacity for 400 or 500 cars.

United Railway & Electric Company.—This company has acquired land on North avenue east of Patterson Park avenue, Baltimore, on which to erect a car barn. The company has plans for building nine car barns, three of which are now under construction.

United Traction Company.—It is reported that this company will soon begin the erection of a car barn at Rensselaer, N. Y. E. S. Fassett, general manager, Albany, N. Y.

Washington Baltimore & Annapolis Electric Railway.—Bids are being requested for the construction of a one-story car-repair shop, 84 by 257 feet, at Academy Junction, Md., after plans prepared by the Roberts & Abbott Company of Cleveland. It is reported that the Engineering Contracting Company, Baltimore, Md., is estimating on the construction. The office of the Washington Baltimore & Annapolis is at 801 Maryland Trust building, Baltimore.

Winona (Ind.) Interurban Railway.—This company will soon begin the construction of a new building 56 by 60 feet in floor area for a carpenter and a paint shop. The building is to be located immediately back of the present shops at Winona Lake and is to be equipped with all tools necessary for use in car building. The excavation has been started and part of the building material is now on the ground.

TRADE NOTES.

W. S. Barstow & Co., New York, have recently opened a branch office at Montreal, Que., in the Bank of Ottawa building, which will be in charge of Robert S. Strangland.

Col. Homer J. Lindsay, assistant to the president of the Carnegie Steel Company died at his home in East Pittsburg on March 5 of Bright's disease. He was 47 years of age.

Columbia Brake Shoe & Foundry Company, Cincinnati, O., is the new name of the Columbia Foundry Company. The company manufactures brake shoes for steam and electric cars.

American Conduit Company, manufacturer of bituminized fiber conduit, has moved its New York office to 140 Nassau street, where it will be more centrally located and will have larger office facilities.

R. L. Rand, who has recently resigned as manager of the Ft. Smith (Ark.) Light & Traction Company, has accepted a position with H. M. Bylesby & Co., Chicago, owners of the Ft. Smith plant.

Nathan Shute, formerly salesman for the Crouse-Hinds Company, has accepted a similar position with the Ohio Brass Company of Mansfield, O., and will be connected with the New York office of that company.

Stuart-Howland Company of Boston has been appointed the New England representative of the Kalamazoo Railway Supply Company of Kalamazoo, Mich., and will carry a stock of Moore track drills, track tools and jacks.

Sherwin-Williams Company is having plans prepared by Eames & Young, Lincoln Trust building, St. Louis, for a 3-story warehouse, 64 by 110 feet, to be located at Second and Clinton streets, in that city. It is estimated to cost \$30,000.

W. J. Martin has been appointed manager of the Clark Electric Company of Detroit, Mich., recently organized to handle electrical supplies. Mr. Martin was formerly connected with the People's Telephone Company in that city.

Buffalo Railway Supply Company, Buffalo, N. Y., has been incorporated with an authorized capital stock of \$50,000 for the purpose of manufacturing railway equipment and supplies. The incorporators are: Henry D. Miles, Michael Sullivan, Harris T. Dunbar, all of Buffalo.

Hisey-Wolf Machine Company, Cincinnati, O., has increased its capital stock from \$20,000 to \$100,000. Plans are being considered for the erection of a new plant in Cincinnati that will provide for a large output of electric drills, grinders, etc., which are products of the company.

Arthur J. Arwine is one of the late additions to the sales force of the Ohio Brass Company of Mansfield, O. Mr. Arwine is connected with the company's new branch office recently established at 10 North Fourth street, St. Louis. He was previously connected with the sales department of the Dearborn Drug & Chemical Works of Chicago.

Cortright Metal Roofing Company, 50 North Twenty-third street, Philadelphia, is calling attention to an item in the Cortright Metal Shingle Advocate, a publication issued monthly in the interest of its product, which in turn calls attention to another publication issued by the company which it is believed will be of sufficient interest to every architect, builder, contractor, roofer, carpenter and home builder to warrant the trouble of a request

for a copy. The book contains illustrations of many of the finest buildings in America and will be sent free to anyone writing the Cortright company for it.

Charles I. Earll, Bowling Green building, New York, manufacturer of the Earll trolley retriever, reports an order from the San Paulo Light & Power Co., Limited, of Brazil, S. A., for 100 of its retrievers. These machines are now used on many of the largest electric railways in the United States and they are guaranteed unconditionally for one year.

New York Electric Controller Company, 21-27 New Chambers street, New York, manufacturer of motor starters and controllers, owing to its greatly increasing business will during the early part of April move its plant to 35-37 Rose street, where new and modern machinery will be installed which will increase the capacity of the plant and insure prompt delivery.

Rail Joint Company of Canada, Limited, has been organized and has taken over the patents and business of the Continuous Rail Joint Company of Canada, Limited. The headquarters of the company are at 216 Board of Trade building, Montreal, Can. The manufacture of its products in Canada has been commenced and the company is prepared to make prompt deliveries.

George Moses, for the past several years associated with the mechanical department of the Southern Railway, has accepted a position as traveling representative with J. B. Sipe & Co., Allegheny, Pa. For the present Mr. Moses will make his headquarters in Washington, D. C., and handle the sale of Japan oils manufactured by this company in the eastern southern states.

Independent Pneumatic Tool Company, Chicago, has received a large order for its "Thor" piston air drills and pneumatic hammers from the Wisconsin Engine Company of Corliss, Wis. It is stated that this company, after testing and experimenting with many different makes of pneumatic tools, decided to place its order for "Thor" air tools, on account of their great efficiency and durability.

Carbolineum Wood Preserving Company, New York, has secured the services of Henry Grinnell, late forest inspector of the United States Department of Agriculture, who has taken charge of the wood preserving experiments carried on by the department under Mr. Crawford. Mr. Grinnell will give special attention to the preservation of poles and mining timbers and will have his headquarters at Washington, D. C.

General Purchasing Company is a recently incorporated organization with offices at 525 The Rookery, Chicago. The business of the company consists mainly in cashing the daily sales of manufacturers and jobbers whose active capital would otherwise be tied up in accounts due some time in the future. The purpose of this arrangement is to enable a company with a growing business to realize daily on the output at no greater expense than would be incurred by allowing the customer the usual discount for payment on shipment. This plan is in use more or less extensively in the east and the General Purchasing Company is now introducing it in the west.

Curtis Motor Truck Company has been incorporated in Illinois with an authorized capital stock of \$250,000 by Edmond A. Curtis, John P. Drennan, Arthur O. Bolen, James D. Johnson and Charles C. Leforge. The company is organized for the purpose of manufacturing and selling the patented motor trucks which have been invented by Edmond A. Curtis and proposes to acquire by purchases all of the patents covering his designs in the United States, Canada and Great Britain. The officers of the company will be as follows: J. P. Drennan, president; A. O. Bolen, vice-president; James D. Johnson, secretary and treasurer; E. A. Curtis, general superintendent. The incorporators are most of them citizens of Decatur, Ill., and it is proposed to establish at that point a plant which will have a capacity of about 15 trucks per day, with a total value per annum of about \$750,000.

ADVERTISING LITERATURE.

Western Electrical Instrument Company, Waverly Park, Newark, N. J.—A new instrument, the Western electroplaters' voltmeter, Model 131, is the subject of bulletin No. 7 issued by this company.

Allis-Chalmers Company, Milwaukee, Wis.—Bulletin No. 1050 is a 20-page publication describing alternating-current generators of the water-wheel type. The generators are described in the usual manner as to general construction, armature, field or rotor, excitation, rating, voltage, etc., with divisions under the various heads for the consideration of particular features.

United States Engineering Company, Philadelphia, Pa.—A catalogue describing and illustrating the Nachod automatic signal for electric railways has been issued. This system is intended for use on single-track roads, wherever it is necessary to converge them for a distance into single-track, as may be occasioned by tunnels, bridges or narrow streets, where cars run in both directions.

Electric Service Supplies Company, Philadelphia, Pa.—"Garton-Daniels Lightning Arresters" is the title of a substantial catalogue issued in the interests of the Garton-Daniels Department of the Electric Service Supplies Company. The publication covers in an unusually complete manner the matter of lightning arresters, detailed descriptions being presented of the various types and prices being quoted.

Kinnear Manufacturing Company, Columbus, Ohio.—The problem of a suitable door for car barns is one deserving the attention of all those interested in the proper protection and mainte-

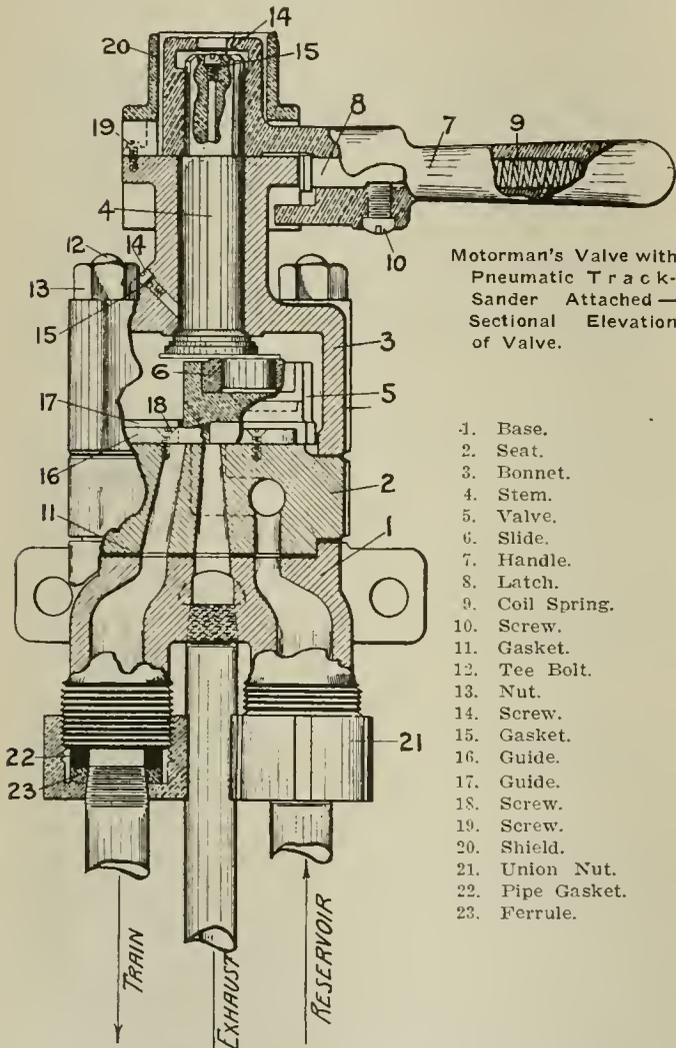

nance of equipment and property, particularly in climates where there is a wide range of temperature during different seasons of the year. The Kinneer Manufacturing Company has published a pamphlet giving exclusive consideration to this subject and calling attention to the efficacy of its steel rolling doors for this service.

Charles I. Earll, 11 Broadway, New York.—A very complete catalogue describes and illustrates the Earll trolley retrievers and catchers which prevent damage, accidents and delays when the trolley jumps from the wire, and relieve conductors of the necessity of watching the trolley. The instant the trolley jumps a wire the retriever automatically pulls it down from two to four feet and holds it until the conductor replaces it. In addition to giving a general description of the retriever the catalogue describes in detail the various parts.

National Association of Manufacturers of the United States of America, 170 Broadway, New York, N. Y.—This association is organized for the purpose of affording its members facilities for procuring personal service in the nature of news service, advice in legal matters, and advertising, trade marks, reports on various matters such as foreign matters and foreign credit, customs tariff, etc. The organization is a mutual one for the promotion of the industrial interests and commerce of the United States, the betterment of relations between employers and employes and the encouragement of the business and financial interests of its members at home and abroad.

A MOTORMAN'S VALVE WITH PNEUMATIC TRACK-SANDER ATTACHED.

There is probably no other invention of modern times that has contributed so largely to the safe operation of high-speed cars as the modern airbrake. The airbrake of the present day, which is suit-

able for the highest speeds, has been developed by gradual improvements extending over many years. The handbrake and the mechanical friction brake have been superseded by it entirely for high-speed work as such devices are entirely inadequate. The requirements of a perfect high-speed airbrake are not only that it will be able to bring the car to a stop in case of danger but that it shall accomplish that act without undue inconvenience to the passengers or excessive wear and tear on the mechanical equipment of the car, such for instance as is caused by the wheels skidding. Further, the valve which controls the air supply to the brake must be so constructed that even the motorman of only medium in-

telligence will be able to accomplish these results and still feel confident that the stops will be made in the required distance. A feature which is of the greatest importance in securing the proper operation of the brake, assuring the greatest possible negative acceleration of the car and at the same time preventing the wheels from skidding, which results in those much dreaded flats, is the proper sanding of the track. This can be accomplished in the most economical way by an air track-sanding valve which is fitted to the motorman's valve such as is manufactured by the National Brake & Electric Company of Milwaukee, Wis.

The arrangement of the track-sanding valve directly above the motorman's brake valve, as shown in one of the accompanying

Motorman's Valve with Pneumatic Track-sander Attached—
Elevation.

illustrations, permits the motorman to apply sand to the track exactly when it is needed, and thus it will be evident that besides assuring a positive smooth stop, it also prevents the extravagance and wasteful use of sand which it is impossible to avoid with the older form of track-sanding devices. Though this feature may at first appear of little importance, the element of cost is the least important to be considered, for many times a most serious accident may be avoided if sand is available to assist the brakes, and it is well known to all railroad men that many serious accidents in the past have resulted from a lack of sand at the critical moment.

A sectional view of the National Brake & Electric Company's motorman's valve is also shown herewith. The essential parts of the brake may be followed in order by the numbers upon the diagram and in the accompanying table.

The base, valve seat and bonnet are made of cast iron, and the remainder of the valve with the exception of the tee bolts, is made of a high-class bronze. All the parts have been so designed and constructed as to withstand the maximum of wear and tear and the rough handling to which they are inevitably subjected. For the same reason a common flat slide valve was decided upon to control the various port openings. This valve, which is constructed of bronze, working on a scraped cast-iron seat, it is stated, will work satisfactorily with but one oiling and without any perceptible wear for more than 150,000 applications of the brake. Further, the pressure on the valve is so adjusted that as the valve and seat wear they will always form a perfectly air-tight seat, so that planing and scraping are very seldom necessary. Occasionally, depending upon the severity of the service, it will, however, be necessary to take the valve apart, clean it thoroughly with gasoline and oil it before reassembling to assure satisfactory operation.

A quiet, easy stop, even in the hands of medium class motormen, is obtained by the construction of the train service force, part of which is formed in the shape of a V so that a graduated application and release of the brakes is easily obtained. The lap position of the motorman's handle and the other positions of application are located the same as on most airbrakes. In many of them important and desirable features will be noted by careful examination of the illustrations presented herewith.

The municipal ownership fad takes on curious phases under the peculiar conditions of various efforts at local application.

Philadelphia, which once had a municipal gas plant of which even Professor Bemis wrote that the city officers "mismanaged the works and used the offices under it as rewards for party services," is now offered

by Mayor Weaver a scheme for the resumption of the works. His idea is to raise capital by "popular subscription" and to divide profits between the city and the subscribers until the capital-cost is made up. The idea of getting users to advance the purchase money and then to reimburse themselves out of the profits on their own gas bills is certainly unique. If the citizens of Philadelphia have forgotten their experience with this same gas works they ought to turn to the report of the Committee of One Hundred, which, in referring to the investigation of the works, says: "At the outset (of the investigation) difficulties were encountered which only yielded to the persistent efforts of counsel. Little was known of this trust. (The gas works was managed by a board known as the City Gas Trust.) Its meetings for years had been held in secret, while its published annual report to the councils was confused and unintelligible, and, as now appears by the evidence, actually falsified. The visible results of the management of the trustees had been the sale of gas at a high price to Philadelphia consumers without realizing an adequate profit to the city. The vast purchases of supplies, made at excessive prices from favored parties, without competition or advertisement (in some instances from the trustees themselves, in violation of the ordinance), the disbursement of enormous sums annually for these purchases in checks drawn to bearer, the frequent failure to produce any record of the supplies having been received or the work performed, the admission that, not content with paying bills rendered, the employes in some cases habitually made out the bills themselves, make some of the general features of the management of this municipal trust as appearing in the very voluminous testimony." Before Philadelphians decide that their former experience was ex-

ceptionally unfortunate and that they might do better with the next experiment, they might reflect upon the recent report of Allen W. Thurman on the Columbus, O., municipal electric lighting plant. In this report Mr. Thurman says: "So far as we have gone in the investigation of the municipal light plant, we are convinced that the manner of conducting the plant, from the highest to the lowest officials, verges on criminal negligence." If municipal ownership is desirable, or can be made desirable, some one should produce at least one American instance in which it has proved, on a large scale, at least a moderate success.

The 10-years' struggle between the city administration of Chicago and the traction companies has at last reached a crisis. The present campaign for the election of city officers, unlike its predecessors for 10 years, is not based on an elusive hope of traction settlement, but is founded on a definite issue, which is the approval or rejection by voters of ordinances which will be accepted by the companies. Those who have lived in Chicago or who have followed its history closely in the last decade have seen the city ruled by mayors who, in pre-election promises, have agreed to settle the problem. Carter H. Harrison secured office on a traction settlement platform in four successive elections. After he had been mayor for eight years he was followed in 1905 by E. F. Dunne, who is the unwilling instrument through which the question has been brought to the present important point. Now, for the first time in 10 years the traction portion of the campaign is something besides a politician's mere catch-word. Although the republican candidate approves the ordinances without qualification and the democratic nominee stands for their rejection and for municipal ownership, public-spirited citizens have taken steps to emphasize strongly that the approval of the ordinances is a vital, non-partisan question. Thus, while the candidates are diametrically opposed on the only real issue of the election, an independent campaign has been undertaken for the ordi-

nances. In the history of the struggle which is now fast approaching culmination, there are interwoven broken promises of city executives, losses of investors, the revelation of a municipal ownership craze, and eventual public indifference. The city is now aroused to the need of action. Thoughtful people will recognize that the companies, made desperate by long years of contest and negotiation, have made most liberal concessions in a final effort to secure a settlement. But if the ordinances were less favorable to the city, even then a settlement would be better for the public than the perpetual retention of the traction question for the uses of politicians.

The tendency toward higher speeds in both interurban and suburban service calls for high-class mechanical work in the erection of trolley wire and rather close inspection of the wire in service if annoying breakages are to be avoided. In fact, the original wire must be of good quality to begin with, free from scales and flaws.

Permanent Trolley Construction. and of high conductivity. The practice of putting up trolley wire under the stress of emergency construction without even a superficial examination of its quality is responsible for a good many troublesome subsequent interruptions of the schedules, and often these occur at times when the traffic is heaviest. Whether round or grooved trolley wire is the better for high speed and even moderate speed service is a question upon which opinions differ. On a prominent interurban line in the east operating about 75 miles of track recent experience is unfavorable to the use of grooved copper, and round wire is being substituted in every break. The grooved trolley in this case shows nicks and flaws on careful examination, and all the recent breakages have been at those weak spots or else near the ends of the suspension ears. The question is raised whether grooved wire can be drawn with the same perfection of texture as round copper, and it is undoubtedly true that the strain on the thinner section of the wire near its center is liable to be serious if the alignment and sag of the line are not just right for the conditions. In the above case it is probable that the whole line will be restrung with round copper inside of a year or two. The maximum speed of the cars is about 45 miles per hour on this line, and practically all the wear of the trolley is in one direction, as the road is double tracked. Experience has shown in general trolley practice that a flexible suspension of the hanger and ear, the use of long tapering ears and overhead switches and frogs with gradual approaches and recessions from the center are more favorable to continuous service and more reasonable wear than short ears and frogs with relatively stiff ends. The point is to avoid sudden changes in the direction of the wire as the trolley wheel runs over it; otherwise wear and possibly heavy arching develop or aggravate weak spots in the wire at the points of defective suspension. Undue wear also comes from excessive sag. Constant watchfulness of the way the wheels take suspected spots is essential, and in some cases the use of frequent expansion ears and the occasional taking up of slack in the trolley itself will be found helpful.

The practicability of an electric railway company building its own cars is well illustrated at Colorado Springs, Colo.

Practicability of Home-Built Rolling Stock. After continued experimenting with several makes of rolling stock built in different sections of the east, the Colorado Springs & Interurban Railway Company has, during the past two or three years, undertaken the construction of all of its own cars. There are several reasons given for adopting this course. It has been found in practically all the Rocky mountain cities that woods that may have been ever so thoroughly seasoned in localities having lower altitudes and higher percentages of humidity, will shrink

and warp after a few months' service in the Rocky mountain climate. Also, like other progressive properties, the Colorado Springs company has its own methods for installing control and lighting wiring and for placing the various other "fixtures" of a car. It is thought that better economy can be had in the long run when this work is done locally, since inspection may then be more thorough, and the men who equip a car are the ones who are also responsible for its maintenance. Familiarity with detail car construction is considered a factor tending greatly to reduce repair costs. Probably the most important reason for the Colorado Springs company building its own cars is because it can thus get a good, serviceable car, suited to local weather and traffic conditions for less money than such a car could be purchased in the east and shipped west. The excessively heavy tourist traffic of the electric road, lasting about five months each year, demands a more complete working organization than would ordinarily be required and for this reason a well-organized shop force is available for car building during seven months of the year, thus making the labor item, when all other things are considered, an extraordinarily small one.

SWITCHBOARD MAINTENANCE.

The increasing relative cost of switchboard apparatus in power plants justifies more thorough inspection on the part of attendants than at present obtains in many installations. There is a feeling in some quarters that if a switchboard is blown out every day with compressed air and the instruments wiped with a dust cloth, nothing further in the way of inspection need be done until something goes wrong.

There are more moving parts on a modern switchboard than one would at first suppose, and a certain amount of attention is an essential of continuous reliable service. In addition to the indicating and recording instruments there are time limit relays, circuit breaker controls, oil switch mechanisms and other contacts to look after, while the possibility of overheated parts of switches and coils is always present. Oil switches in operation should be inspected for overheating at least three times a day during the heaviest part of the load, and the binding posts of potential transformers, regulators and instruments should be looked after every two or three weeks with an eye to their becoming loose.

The oil tanks on oil switches ought to be dropped certainly once in three months and the contacts carefully examined to locate any broken or bent springs, burned contacts or loose connections. When these contacts are cleaned with a file or in any way where there is a chance of personal connection with the wiring system, the utmost care is essential that current should be cut off and high-potential contacts avoided. Knife switches for simple disconnecting work are worth many times their cost.

The solenoid equipment of time-limit relays are often neglected for long periods. The adjustment of these devices should be tested every two or three months and the contacts cleaned with the finest sandpaper or emery cloth. There is a tendency sometimes to forget that these relays are delicate apparatus. The adjustment of spring tension to hold contact pieces in place and the varnishing of solenoid plungers need to be carefully done. No little trouble can arise by careless varnishing of plungers so that they stick in one position and do not respond to the load variations above normal. Another point likely to be neglected is the care of the leather diaphragm on the relay bellows. This should be dressed with neatsfoot oil every two or three months to prevent it from becoming stiff and hard. Lightning arresters should always be examined and placed in condition after a storm; rheostat contact points, fixed and movable, carbon brakes and copper feeder and switch jaws all need regular inspection just as much as commutators, brushes and bearings.

Instrument calibration is of less importance on a rail-

way switchboard than in a central station selling current to individual consumers, but it would seem wise to check up the voltmeters and recording wattmeters at least once a year, and if possible to make an annual calibration check of the other instruments. The cost of power cannot be properly determined with recording wattmeters of inferior accuracy.

All these little details of operation are important factors in securing reliable service, and in some plants it will pay to reduce them to the compass of printed and framed rules.

AN ECONOMICAL SHOP LAYOUT.

The new Nashville shops which were described in the *Electric Railway Review* of March 2, 1907, illustrate in a marked degree the tendency of the times toward economical administration in the maintenance department of street railways. Breadth of outlook in repair work is one of the most essential factors in successful railway operation, for the increasing weight, power and ornamental attractiveness of modern rolling stock demand highly organized treatment in the preservation of regular service and prevention of breakdowns. The central location of the shops with respect to the business district tends to reduce dead mileage at night and morning and to shorten the time during which cars with minor defects remain out of service.

The Nashville shops are unique in their adoption of the direct-connected motor drive in both machine and wood-working departments. Group driving from one or two motors has been such a common practice heretofore that the advantages of subdividing the shop motive power have generally been overlooked. The character of work done in the street railway repair shop is so varied in its scope, so entirely different from the regular and uniform production of the ordinary manufacturing plant, that the individual drive should be exceptionally valuable on account of its elasticity. In repair shop practice the different machines are seldom operated continuously for any great length of time, so that there ought to be a considerable saving in power; if any part of the shop has to be run overtime, it can be done without the least difficulty, and the elimination of belts and shafting counts strongly in favor of increased compactness of installation and enlarged facilities of natural lighting. The tool can be brought to the work when necessary and the increased amount of head-room should afford the utmost facility in handling armatures, wheels, axles and other parts. In many repair shops the arrangement of tools has developed along circumstantial lines, without much regard to the sequence of operations, and in some cases the belts and shafting prohibit the mechanical handling of heavy work by an overhead crane or traveling hoist. With the direct electric drive the expansion of the shop work can be as easily handled as the production of the first installation; and if experience proves that the location of any special tool is not the best, the electric wiring problem is so simple that matters can be rectified at very slight expense. This is frequently impossible with the group system of driving.

The amount of power used in the machine shop, 51.5 horsepower in total rating, taken in conjunction with the size of the machine tools, shows that the shops should be able to undertake even heavier work than the simple maintenance jobs if necessary. In striking boldly into the field of individual driving the company has done well to avoid using too small sizes of 600-volt motors for single machines. It is as yet difficult to build very small motors for reliable service at this potential, and it was undoubtedly a wise step to group the smaller tools, such as emery wheels, grinders, backsaws, etc., for operation by a 5-horsepower motor. The first cost of motors specially designed for shop driving with individual speed control is naturally a considerable item, but when the reduced expense of operation, the lessened amount of shafting and the possibility of more rapid production by speed

adjustment are taken into account, the installation expense shrinks in importance. The use of induction motors in the carpenter shop reduces the fire hazard so materially that there ought to be a distinct reduction in insurance rates on account of their installation. The relatively large amount of power consumed by the wood-working tools is of interest, judging by the total rating of 110 horsepower, and the benefits of the individual drive in this department ought to be even greater than in the machine shop.

Other features of the Nashville installation which make for economy and which can readily be availed of in other situations are the provision for manufacturing spare parts when desirable, the use of a traveling crane over the shop pits, the saving of waste oil in the pumping room, plans for electrically hoisting the armatures to the winding room, drainage of pits and unification of car equipment. Reduction of idle movement of stock, the loading of machines with work against times of emergency material consumption, the storage of cars over pits to facilitate right inspection and the protection of expensive rolling stock by fireproof housing all commend themselves to the close observer of car house and shop design.

DOUBLE-SECONDARY TRANSFORMERS.

A relatively new departure in transformer design will be found on another page of this issue in the description of the Litchfield substation of the new Manchester and Nashua electric line. The use of multiple-voltage primary and secondary stops has been common practice for some years in the design and operation of large power transformers, but the construction of transformers with double secondary windings for the separate operation of independent rotary converters on the low-tension alternating-current side of the substation is something of a novelty.

The frequency of the system in point was necessarily 60 cycles on account of the supply of the power from long-established plants carrying a heavy lighting service. The parallel operation of 60-cycle rotary converters in sizes of 300-kilowatt is, of course, perfectly practicable at the present time, but from some points of view there is greater assurance of reliable service if the alternating-current sides of such machines can be operated separately. The use of a separate secondary for each of the two rotaries in the station permits applied voltage adjustments upon either or both machines with practically no reflex action, and enables a wide range of service conditions to be met by simple double-throw switches on the main board.

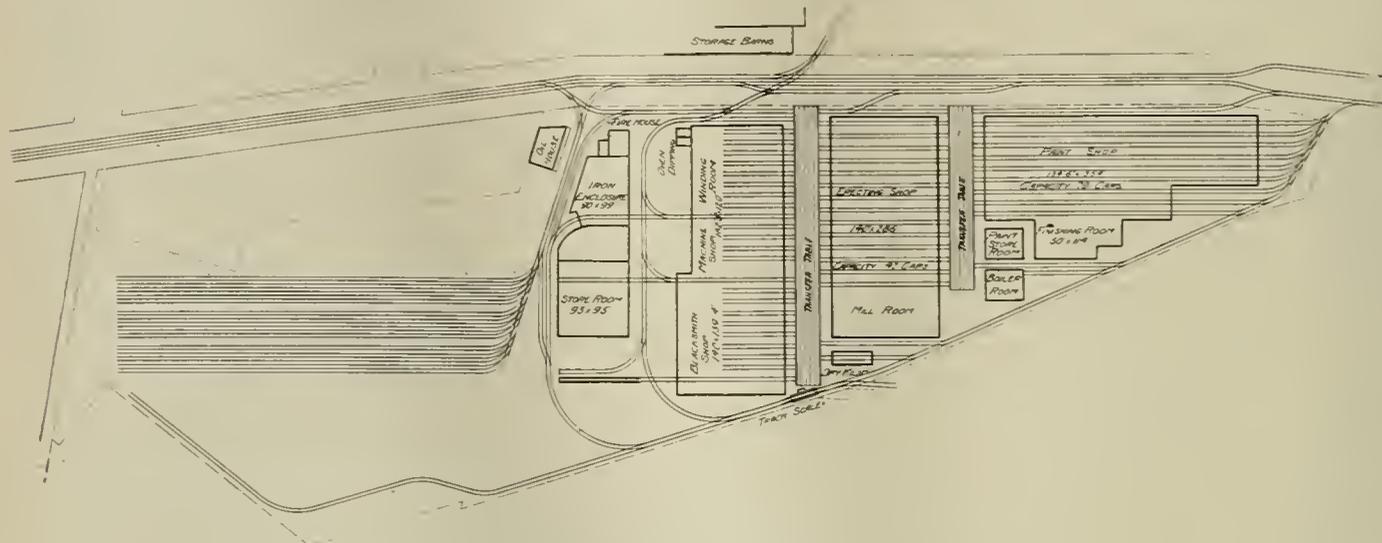

Off-hand it would seem as though a slight sacrifice in transformer efficiency would be the price of double-secondary isolation, but this is probably too small to carry much weight. In a substation likely to be extended by the addition of considerable new equipment, there is some question if the attempt to segregate machines in the above way would not defeat its own ends by reducing the general flexibility of the plant. There is undoubtedly a practical limit to the amount of independent winding which is permissible on a transformer, for the requirements of moderate first cost and high efficiency are difficult to meet in proportion to the multiplication of separate coils. In a small substation, however, flexibility of operation on a common set of busbars is an important factor in the reliability of service, and the actual convenience of being able to adjust the voltage independently on the alternating-current sides of two rotaries running smoothly in parallel on the direct-current busbars may work out to be a valuable insurance against operating troubles. The experience of plants equipped in this way will be worth watching. It is certainly a great convenience to be able to set the circuits for an alternating-current potential of 396, 376 or 360 volts without the laborious task of unbolting terminals and trying to manipulate stiff and unwieldy cables in the narrow space beneath the transformer case.

SHOPS OF THE NORTH JERSEY DIVISION OF THE PUBLIC SERVICE CORPORATION.

The North Jersey Division of the Public Service Corporation of New Jersey has a total mileage of 550 miles and includes the following street railway properties: The North Jersey Street Railway Company, the Jersey City Hoboken & Paterson Street Railway Company, the Elizabeth Plain-

overhauling of the entire division are done at the Plank Road shops.

The company has auxiliary or light overhauling shops on the North Jersey Division at five points, as follows: The Montgomery Street shop at Jersey City, the Market and Jersey Street shop at Paterson, the Angelque and Clinton Street shop at West Hoboken, the Milltown shop at Milltown and the Dunellen shop at Lincoln. Each of these auxil-

North Jersey Shops—General Layout.

field & Central Jersey Street Railway Company, the Elizabeth & Raritan River Street Railway Company, the Orange and Passaic Valley Street Railway Company, the South Orange & Maplewood Traction Company and the Bergen Turnpike Company.

The mechanical department of these lines is in charge of Charles Remelius, general superintendent of rolling equipment, with headquarters at the Plank Road shops, the main shops of the system. These shops, which constitute one of

ary shops is available for light repairs needed by cars operating in its vicinity. The only work performed outside of the Plank Road shops and the auxiliary shops is the inspection, oiling and trivial repairs performed at terminals. We present herewith a diagram showing the relative sizes and location of the main repair shops and auxiliary overhauling shops, and also a diagram showing the organization of the mechanical department of the North Jersey division.

The total number of cars operated by the foregoing prop-

North Jersey Shops—General Exterior View of Shop Buildings.

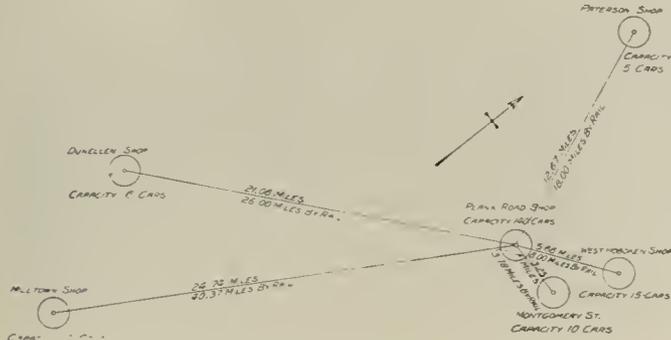

the largest and best equipped plants for shop work and car house storage to be found on any street railway system in the country, are located on the eastern outskirts of Newark. The shops formerly consisted of a machine shop 190 by 120 feet. This has been remodeled and greatly enlarged and a large erecting shop, paint shop, auxiliary buildings and car storage barns have been added. The plant has been in service since June of last year. All the heavy repairs and

erties and subject to the supervision of the mechanical department in the shops mentioned is approximately 2,000 cars. Since the amalgamation of the properties 600 new double-truck cars have been purchased and 150 are under construction. The equipment represents almost every imaginable variety on account of the corporation having been made up of so many different companies, but the aim of the department is to standardize equipment as rapidly as practicable

and this has been effected in a remarkable degree in the time the organization has been in existence, that is, since June, 1903. The standard car which the company has adopted for general use is the city and interurban car of the 1600 type. The principal dimensions of this car are as follows: Length over all, 42 feet 8 inches; length of body, 30 feet; width, 8 feet 4 inches. The car has seats for 42 passengers. Among the standard devices adopted are the center bell-ringing device, the Detroit fender and platform, etc.

Plank Road Shops.

The general layout of the Plank Road Shops and car houses presented herewith shows the convenient relation of

North Jersey Shops—Diagram Showing Location of Shops.

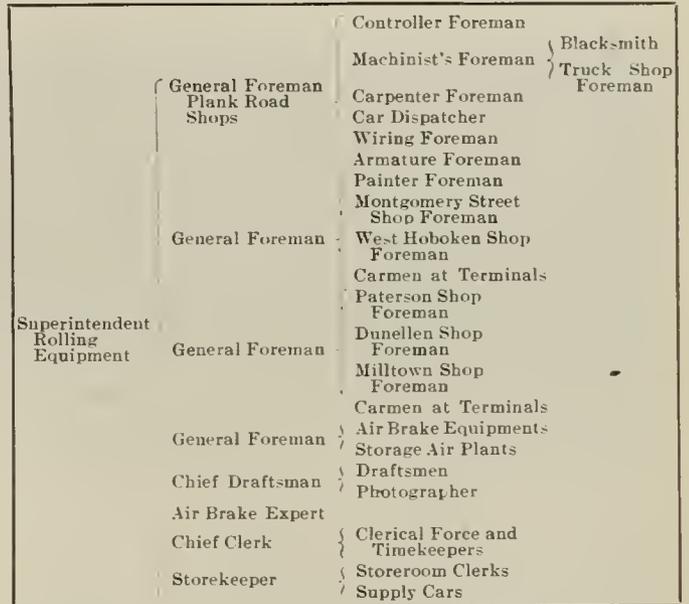

the three main buildings—the machine shop and blacksmith shop building, the erecting shop with a capacity of 42 cars and the paint shop with a capacity of 70 cars, which buildings are served by two transfer tables. The front elevation of the shops is on Ferry street and on the other side of this street is located the car house, built in five bays with a capacity of 150 cars.

The entire property devoted to shop purposes is fenced in. On the front, along Ferry street, is an iron fence seven feet high, with three-quarter inch pickets set diagonally and supported by three rails, having posts set in concrete every seven feet. There are four track entrances which necessitate

ings is equipped with a time clock and a careful record is kept of the hours of service of all employees.

Machine Shop.

The machine shop is reached from the outside through a front entrance and a stairway leading to the balcony, in the forward portion of which are located the offices of the superintendent of rolling equipment. Here is also the drafting

room and the office of the chief clerk of the department. There is a private inter-communicating telephone system so that the superintendent can call up from his office the foreman of any particular department and issue orders, or go into detail with regard to any particular situation. There is also a dining room and kitchen on the balcony of the ma-

North Jersey Shops—General View Interior of Machine Shop.

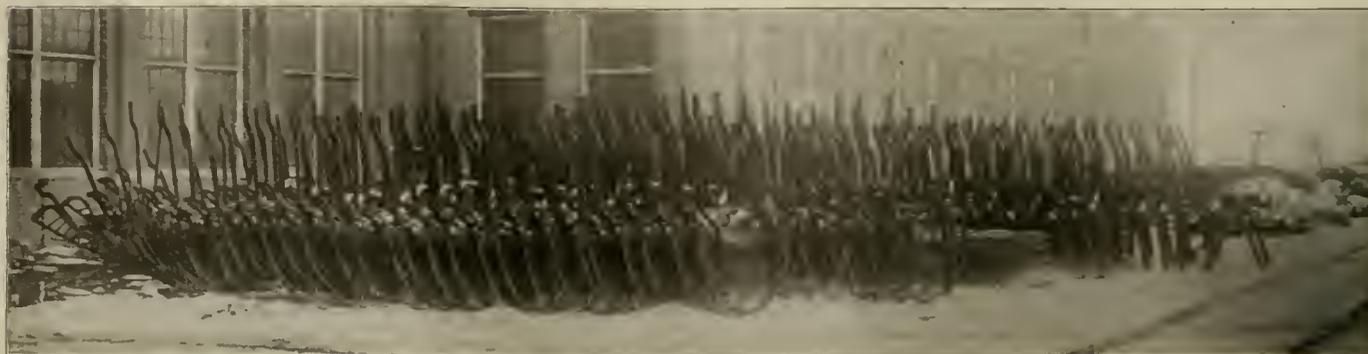

openings as wide as 50 feet and these have sliding gates. These gates are among the largest of the type that have been erected. Care is taken that no one is allowed to enter or leave the property, except through the small gate at the watchman's house, and through this entrance the workmen pass to and from their duties in the various buildings. These fences complete with the gates were built by the E. T. Barnum Iron Company, Detroit. Each one of these build-

ings is equipped with a time clock and a careful record is kept of the hours of service of all employees. The machine shop is reached from the outside through a front entrance and a stairway leading to the balcony, in the forward portion of which are located the offices of the superintendent of rolling equipment. Here is also the drafting

lighting effect in the machine shop attracts attention at once. A skylight 25 feet wide runs the entire length of the room, and this, in addition to the windows on the side under and above the balcony, makes the place almost as light as if it were in the open. We present herewith a general view of one side of the interior of the shop taken from the balcony and looking toward the armature-banding and field-winding machines.

The first floor of the shop is reached from the balcony

that they may be served by self-supporting cranes that are placed between each pair of pits. The cranes were especially designed by the company. The cranes consist of an 8-inch pipe, that serves as a revolving mast, held in place by a base casting. The mast revolves on ball bearings placed in a casting bolted to the floor. The jib of the crane is made up of two 6-inch channel irons and trussed with $\frac{7}{8}$ -inch rods. The channel irons are placed 15 inches apart, allowing a movement of the carriage that supports a 6 inch by 5 foot

North Jersey Shops—Fenders Piled Adjacent to Blacksmith Shop.

by means of an elevator in the front of the building. The east side of the building on the first floor is taken up with the overhauling pits. Each pit is equipped with a special car hoist, of which a view is presented herewith. This hoist is made up principally of four jackscrews driven by a motor in the forward end of the pit. This motor has an extended shaft with two miter gears on each end to mesh into miter gears that attach to two longitudinal shafts that run parallel with the pit and under the floor. The longitudinal shaft is arranged with worms that drive the worm gears, which operate the jackscrews. The motors used in these pits are old ones, taken from discarded cars, and are of the Westinghouse 12A type. When the pit is clear the jackscrews are always down so that the I-beams that are placed on top and

air cylinder and piston. The crane revolves very easily and operates on loads readily with the air. The pressure used on all of the shop tools is maintained at about 90 pounds by the compressor plant, which consists of a twin electrically-driven set. The compressors were installed by the National Electric Company and have a capacity of 100 cubic feet.

No traveling crane system is used in the shop, the latter having been laid out so that the cranes at the head of the pits handle the heavy work on and off from the trucks. The heavy parts are taken through the shop by small especially designed trucks, that are pulled along the floor. It is believed that this is the more economical practice for the reason that when a traveling crane is in service for one purpose, other work is compelled to wait, whereas by the sys-

North Jersey Shops—Car Repair Pit with Body Hoist.

which are intended to support the car bodies rest directly on the cement floor. About two minutes are required to raise a car body from its trucks and the hoists are very reliable and definite in their action. They appear to have considerable advantage over the overhead hoist on account of being out of the way and taking up little room. In the bottom of each pit is a track of 3-foot gauge, upon which an air-operated pit jack is placed. This pit jack may be moved the length of the pit on its trucks and is so built that it may be shifted transversely.

When the car body is raised the trucks are run out so

North Jersey Shops—Drop Pit with Wheel Grinding Apparatus.

tem adopted no delay whatever is experienced and in view of the disposition of the self-contained cranes herein described, and those placed at the machines, an efficient economical service is obtained.

One of the pits is fitted up with a wheel grinder, which was designed by the superintendent of rolling equipment, and is shown in one of the accompanying cuts. Cars are run over the pit and jacked up and the wheels made to revolve by running the current through the motors, after a water rheostat has been connected in series with them. A movable section in each rail permits work upon the car

wheels, and the latter are ground down by coming in contact with the emery wheels of the grinder. This operation is very effective, as it is not necessary to dismantle the car, and an ordinary flat spot is taken out in a few minutes. The operation of this grinder has proved it to be much superior to the old lathe method and so effective and satisfactory that six other machines have been installed at various terminals on the system. The machine work in the shops is done on the ground floor on the west side of the old building. It

chine and a Ferguson oil furnace for the bulldozer. Oil furnaces are also arranged for the Ajax forging machine and two power forging hammers. The oil furnace is found to be superior to the ordinary forge for making the heats as large areas of iron are quickly brought up to the welding temperature. The bulldozer is equipped with forms for forging break hangers, bumper irons, etc. Each piece is forged with a few blows of the machine and a great deal of work and time are saved by reason of using these machines in place of the

North Jersey Shops—Blacksmith Shop.

North Jersey Shops—Wheel Repair Department.

was noted that the tools are run in gangs instead of being separately driven. It is claimed by the management that the running of tools in gangs with line shafting is much preferable to a practice of driving them independently. Especially when it is imperative to use 500 volt direct current. Of course this does not apply to the large insulated machine tools, as these are independently driven.

hand forges. Six Buffalo down-draft forges are in service. These forges get their blast through underground ducts from air generated by fans and the smoke and gases are taken away through exhaust ducts by the same method. One of the accompanying cuts shows a group of the new standard fenders piled outside, convenient to the forge shop, which is equipped for their manufacture.

One of the accompanying cuts shows a view of the tool room and shop foreman's office, the tool room being below and the office above. In providing this office the spot best suited to ready supervision was selected. From the superintendent's office one is able to see about the entire shop

Wheel Room.

The wheel room, shown in one of the accompanying cuts, takes up the rear end of the building and is convenient to the wheel platform outside. The machines in the wheel room are driven by separate motor and line shafting and there

North Jersey Shops—Tool Room and Office of Shop Foreman.

North Jersey Shops—Electric Yard Crane at Work In Wheel Storage Yard.

and have an eye on all that is going on. The new portion of the machine shop building is single floor, similar to the remaining new construction, the west side being a continuation of the overhauling shop and the east side being reserved for the smith work in the blacksmith shop. In the forging department are some heavy tools not usually met with in street railway shops. The accompanying photograph shows a heavy Williams & White bulldozer and Ajax forging ma-

are two improved 200-ton wheel presses, two boring mills and a lathe. Axle racks are arranged between the columns, convenient to the work. All the new axles are 4½ inches and the gear wheels are pressed on the axles instead of being of the split type. We understand that the gear wheels placed on the axle give much better satisfaction and last longer than the split gear. The wheel and axle storage tracks

are near at hand. One of the accompanying views shows the method of storing the standard wheels and axles that are ready to be repaired in the wheel room or those that are finished and waiting for distribution about the system by the wheel car. This car is used solely for handling wheels and is equipped with a crane having a revolving mast and chainfall, so that the wheels can be handled readily.

One of the cuts herewith, presenting the general view of the blacksmith shop, shows a Bradley power hammer and an air hammer. The Buffalo down-draft forges are shown on the left, opposite them on the right are cast-iron forms, which are used by the blacksmith for bending special shapes. In connection with the forging department there is also a large double fire. Buffalo forge that is used for babbitting. The babbitt is melted in pots and taken with a ladle and poured into the special babbitting molds which are manufactured by the Columbia Machine Works & Malleable Iron Company of Brooklyn. This form of mold was first used and

North Jersey Shops—Bulldozer and Oil Furnace in Blacksmith Shop.

originally designed at the Plank Road shops, and is said to be more rapid than the old core method, by which the complete bearing was made, instead of in halves as by this mold. It is stated that by the new method a much more perfect bearing is obtained and one that needs very little dressing down or finishing.

(To be continued.)

ELECTRIC RAILWAY OPERATIONS IN ILLINOIS.

The preliminary report of the Illinois Railroad and Warehouse Commission, covering the operations of surface and elevated electric railways during the fiscal year ended June 30, 1906, states that the daily business of the commission demonstrates "that all of the provisions of the statutes governing railways operated by steam should be extended over the electric railways." and that electric railways "are getting to be a very important factor in the transportation problem of the state." An abstract of the report follows:

The total mileage, main line and branches of surface and elevated electric railways for the year was 935.76 miles, an increase of 173.07 miles. The total mileage of second, third and additional main track was 190.7 miles, an increase of 12.55 miles. The mileage of yard tracks and sidings was 56.84 miles, an increase of 19.01 miles. The total mileage of all kinds of track was 1,187.43 miles, an increase of 204.63 miles.

The capital stock and funded debt of this class of roads for the year was \$160,587,228, an increase of \$7,664,609, which is accounted for by the increased mileage put in operation. The average capitalization (stock and bonds) per mile of road of surface and elevated electric railways for the year was \$171,782. The average capitalization (stock and bonds) per mile of surface roads was \$75,868. The average capitalization (stock and bonds) per mile for elevated roads was \$2,035,289.

The total dividends paid were \$742,969, an increase of \$112,595. The total assets were \$173,724,598, an increase of \$7,258,189. Liabilities were \$169,726,314, an increase of \$6,-

113,907. The net surplus of assets over liabilities was \$3,998,284.

The total income from passengers, mail, express and advertising was \$11,016,920, an increase of \$1,587,790. The total income from freight service was \$446,320, an increase of \$82,732. The total earnings from all sources were \$12,805,420, an increase of \$2,050,539.

Passenger earnings per mile of road were \$11.771, as compared with \$12.030. Freight receipts per ton per mile were 4.8 cents. The average amount received from each ton of freight was 35 cents, as compared with 54 cents in the previous year. Freight earnings were \$751 per mile of road, as compared with \$1.144.

The expenditures for the year for maintenance of way and structures, maintenance of equipment, conducting transportation and general and unclassified expenses and fixed charges, were \$10,900,208, as follows:

	1905.	1906.
Maintenance—		
Way and structures.....	\$ 498,588	\$ 564,470
Equipment	749,801	921,332
Transportation—		
Operation of power plant.....	1,231,870	1,359,872
Operation of cars.....	2,217,876	2,377,785
General expenses	994,991	1,255,219
Unclassified expenses	15,091	29,752
Total operating expenses.....	\$5,708,217	\$6,508,930
Total fixed charges.....	4,080,142	4,391,278

Total oper. exp. and fixed charges.....\$ 9,788,359 \$10,900,208

The number of revenue passengers carried was 183,650,979, an increase of 21,001,944. The revenue freight carried amounted to 1,277,566 tons, an increase of 641,823 tons. While gross passenger and freight earnings per mile of road were less than in the preceding year, the operating expenses were lower and the net earnings per mile of road were \$74 larger than in the previous year.

The number of officers and employes was 6,726, an increase of 1,603. There was paid in salaries \$3,965,761.53, an increase of \$622,399.39. The daily average compensation for all classes was \$2.12, an increase of \$0.04 per day.

During the year 4,117 tons of steel rails and 80,755 new ties were laid. There are 351 stations on these roads, an increase of 34. The number of highways crossed at grade is 2,146, an increase of 96. The number of under highway crossings is 458 and the number of overhead highway crossings is 7. The number of electric railways crossed at grade is 54, an increase of 11. The number of crossing frogs is 167, an increase of 9. The number of steam-railway crossings at grade is 123, an increase of 5. The number of crossing frogs is 403, an increase of 61. The number of overhead crossings of steam railways is 40. The number of overhead electric railway crossings is 12.

The increase of mileage of ballast, such as gravel, stone, cinders, etc., shows a disposition on the part of the management of these roads to place their properties in the best physical condition for the careful handling of business.

These lines have 10 bridges of masonry, 15 of iron, 97 of steel, 4 of wood and 2 combination, with an aggregate length of 15,499 feet. There are 104 pile and frame trestles, with an aggregate length of 12,127 feet.

The number of passengers killed was 7, an increase of 4. Ten employes were killed, an increase of 3. The number of other persons killed was 31, an increase of 12. The total number of passengers injured was 306, a decrease of 29; 97 employes were injured, an increase of 20, and 65 other persons were injured, a decrease of 14.

The accident reports for steam railways show that 1 passenger was killed for every 1,659,314 passengers carried and that 1 passenger was injured for every 96,744 passengers carried. The accident reports for steam railways also show that 1 employe was killed in every 359 employed and 1 employe was injured in every 29 employed. The accident reports for surface and elevated electric railways show that 1 passenger was killed for every 26,235,854 passengers carried, and 1 passenger was injured in each 600,166 passengers carried. The accident reports for surface and elevated electric railways also show that 1 employe was killed in every 672 employed and 1 employe was injured in every 69 employed.

The amount of taxes paid shows an increase of \$89,673.95 over the previous year, and an increase of \$537,362.18 over the amount paid ten years previous.

The income account, with a comparison, is as follows:

	1905.	1906.
Gross earnings from operation.....	\$10,354,559	\$12,280,192
Operating expenses	5,758,623	6,573,261
Income from operation.....	\$ 4,595,936	\$ 5,706,931
Income from property and other sources....	472,883	682,845
Total income	\$ 5,068,819	\$ 6,389,776
Expenses assignable to fixed charges.....	4,097,925	4,423,277
Net income	970,894	1,966,499

CONCRETE TIES—RAIL CORRUGATION.

The committee on way matters of the American Street and Interurban Railway Engineering Association has issued the following circular relating to "Concrete Railway Ties":

It is a well-known fact that the available supply of wood for railway ties is becoming less year by year, and that the cost thereof is increasing in proportion. The question of the future means to be employed in providing substitutes therefor is rapidly becoming an acute one. Numbers of experiments are being made and various materials used. The possibility of using concrete has appealed to many, and experiments with concrete ties are now undoubtedly under way. The committee of the American Street and Interurban Railway Engineering Association having charge of way matters desires to assist all who may require information upon this subject, and is to this end sending out this circular letter with the request that all roads which have been or now are engaged in experiments with concrete ties, kindly notify the committee that they have been or are so doing, with information as to the method of construction used in the manufacture of the tie and the cost thereof, and forward a statement of results obtained and conclusions arrived at on account of these experiments.

If no result has yet been obtained, the committee suggests that a careful record of all phases of the experiments

Please state what remedies have been applied, if any, and what result has been obtained therefrom; also, the cost of applying such remedies, if possible.

Please give your general conclusions in the matter and such other information as you may think pertinent.

Fred G. Simmons, Thomas K. Bell, C. A. Alderman, Committee.

FORTY-TON SWITCHING LOCOMOTIVE, ILLINOIS TRACTION SYSTEM.

Two electric locomotives have been built recently for the Illinois Traction System by the General Electric Company and the American Locomotive Company. The locomotive is a swivel truck switching type, weighing 40 tons on drivers, and equipped with 4-GE-55-H.P.-motors; in other words, is classified as a 4-0-4-E-80—4-GE-55-H.P. type, in accordance with the standard system of classification recently adopted by the General Electric and the American Locomotive companies for the rating of electric locomotives.

The truck is of the M. C. B. equalized type with plate bolster. The wheel base is 6 feet 6 inches, the wheels 36

Forty-Ton Switching Locomotive for the Illinois Traction System.

be kept so that the result may be used later for the benefit of all concerned.

The same committee has issued the following circular of inquiry on "Rail Corrugation":

If you have had any experience with the phenomenon commonly called rail corrugations, will you please furnish the following information:

Type of rail affected.

Are different types of rail affected where conditions are similar?

Length of section affected.

Length of time rail was in service before corrugations appeared.

Length from center to center of corrugations.

Depth of corrugations.

Please describe rails most affected, giving the type, weight, manufacturer, date rolled, date laid and composition of rail, if possible.

Please describe the track construction, giving the rigidity, drainage, condition of paving and general method of construction, and specify as between track in paved streets and track laid on earth and loose stone or gravel ballast.

Please describe location of corrugations, both on straight tracks and as to inner or outer rails on curves, with degrees of curvature; as to grades and their percentage; as to points where brakes are applied and all other locations tending to indicate a cause. Are opposite rails always corrugated?

Please describe the traffic conditions at points of corrugation, giving frequency of car service, weight, type and speed of cars, type of brake used, type of truck employed, etc.

inches in diameter with fused steel tires and the journals are 5½ inches by 10 inches, the construction being particularly heavy in order to meet the demands of locomotive service. The weight of the truck is carried upon equalizers, each of which is made of two 5½-inch by 1½-inch bars held apart by suitable distance pieces and carrying the truck frame on spiral springs. The top frame is a 2 by 3½ inches rolled bar, and end frames of the same section are bolted to it. The truck transoms are built up of 13-inch channels riveted to ½ inch by 18 inch gusset plates and securely bolted to the truck frame. The plate bolster carrying the center pin and side bearings is built up of 9-inch channels and plates riveted together.

The motors are designed especially for the slow speeds and heavy tractive effort required in locomotive service. At the rated load of the motors the locomotive will give a tractive effort at the rail head of 16,800 pounds, and at the slipping point of the wheels will develop 20,000 pounds tractive effort with a load on the motors slightly in excess of their rated load.

Some of the particular dimensions of the locomotive are:

Length over all31 feet 1 inch
Height over cab11 feet 9 inches
Width over all9 feet 6 inches
Rigid wheel base6 feet 6 inches
Weight of electrical equipment27,500 pounds
Weight without electrical equipment52,500 pounds

INSPECTION TRIP TO SPY RUN GENERATING STATION
OF THE FT. WAYNE & WABASH VALLEY
TRACTION CO., FT. WAYNE, IND.

A party of engineers and railway officials left Cincinnati on a special Pullman train at 8 o'clock March 9, 1907, for Ft. Wayne, Ind., to inspect the new turbine generating station of the Ft. Wayne & Wabash Valley Traction Company, on Spy Run avenue, Ft. Wayne, as the guests of the Westinghouse Machine Company, Westinghouse Electric & Manufacturing Company and the Babcock & Wilcox Company. The party was joined at Ft. Wayne by representatives of the press and Ft. Wayne Electric Company, and after breakfast a special car furnished by the Ft. Wayne & Wabash Valley Traction Company conveyed the party to the power house,

ably commented upon by everyone present was the absence of vibration. This illustrates in a very clear manner the perfect balance which is obtained in the spindles and rotating fields of these units, as in this particular case the machines are practically without a foundation other than the 18-inch concrete floor of the generating room. Another point which was generally commented upon was the absence of noise, as, in spite of the high speed at which these turbines run and the hollow sounding-board effect of the light generating room floor, the noise made by the turbines was considerably less than would be made by reciprocating engines of the same capacity. This result is obtained by the system of forced ventilation of the generators, which are totally enclosed except for two openings into the air ducts located under the engine room floor. Besides the great reduction

Spy Run Generating Station, Ft. Wayne & Wabash Valley Traction Company.—Inspection Party.

which is located about one and a half miles from the center of the city.

Mr. C. D. Enmons, manager of the Ft. Wayne & Wabash Valley Traction Company; Mr. J. A. Brett, manager of the Westinghouse Electric & Manufacturing Company; Mr. G. H. Gibbs, manager of the Cincinnati office of the Westinghouse Machine Company, and Mr. E. K. Gillett, manager of the Cincinnati office of the Babcock & Wilcox Company, acted as guides for the party and explained the many interesting features of the installation and the apparatus and its operation.

As will be seen by referring to the complete description of this plant, which was published in the October, 1906, issue of the Electric Railway Review, the arrangement of this power house is rather unique in that the generators are located in the second story of the power house, directly above the boilers. This arrangement was made possible by the use of steam turbines in place of reciprocating engines. One of the remarkable operating features which was very favor-

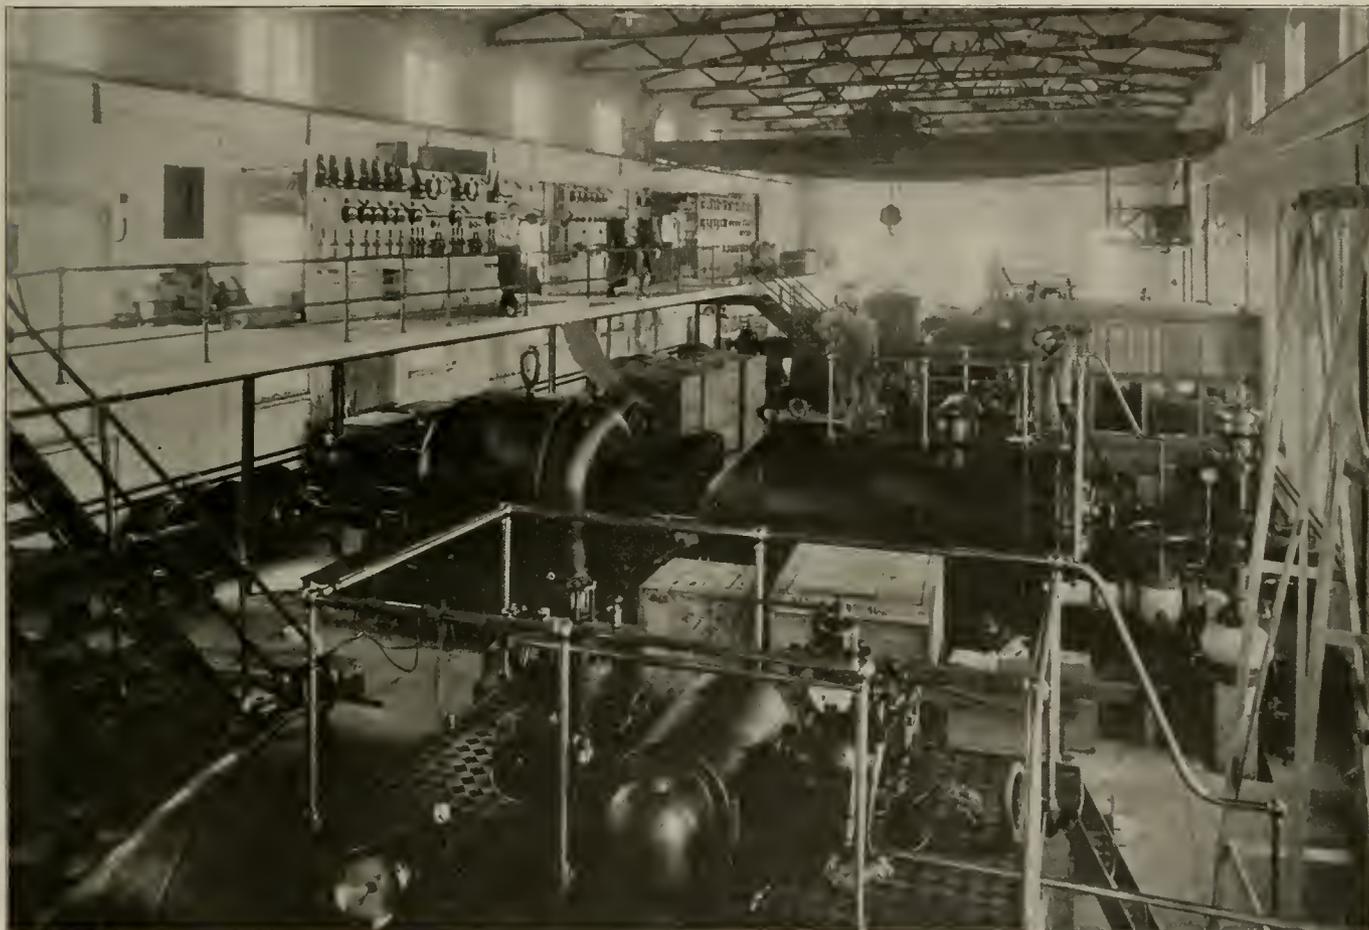

ably commented upon by everyone present was the absence of vibration. This illustrates in a very clear manner the perfect balance which is obtained in the spindles and rotating fields of these units, as in this particular case the machines are practically without a foundation other than the 18-inch concrete floor of the generating room. Another point which was generally commented upon was the absence of noise, as, in spite of the high speed at which these turbines run and the hollow sounding-board effect of the light generating room floor, the noise made by the turbines was considerably less than would be made by reciprocating engines of the same capacity. This result is obtained by the system of forced ventilation of the generators, which are totally enclosed except for two openings into the air ducts located under the engine room floor. Besides the great reduction

in the amount of noise, the system of forced ventilation here employed also greatly reduces the temperature rise of the generators, which were very cool considering the load they were carrying. The first enclosed turbo-generator supplied with forced ventilation was the 400-kilowatt turbine which was installed in the old generating station of Ft. Wayne & Wabash Valley Traction Company, and which is now doing duty in the new station. The 400-kilowatt turbine and generator were dismantled for the inspection of the guests. This was one of the most interesting parts of the exhibit in that the turbine had been running under a heavy overload nearly 18 months, during which period it had never been opened or adjusted and was only shut down two or three times for an hour at a time, during the entire period. An examination of the blades of the stator and spindle showed that there was no appreciable wear on the blades which could be observed by the closest scrutiny. A further condition which speaks very highly for the operation of the turbines, is the fact that owing to a very large amount of scale-forming material in

the water, which was used in the packing glands, a heavy incrustation had formed inside of the turbine shell, and on the end of the low pressure dummy, which at times must have come in contact with the shell, but in spite of this the machine ran very quietly and no ill effects were visible upon the closest inspection. Some of the scale had chipped off and fallen into the equalizer pipe, but it had not completely filled up, so there was sufficient passage for steam. The very large axial clearances between the stationary and moving blades were a surprise to many who have heard of the small clearances in the Westinghouse-Parsons turbine. An examination of the bearings of the turbine and generator showed that no noticeable wear had occurred, and, as has been stated at times, some of the original tool marks on the bearings were still visible, which speaks well for the lubri-

by the general manager, who acted as a guide through the works. The principal points of interest here were the new type of revolving field belted alternator, and a 75-kilowatt Curtis turbo-generator of the horizontal type. The turbine and generator operated very quietly, with practically no vibration.

The party consisted of the following: Louis Arnold, George Weidemann Company; F. C. Armstead; J. A. Brett, manager Cincinnati office, Westinghouse Electric & Manufacturing Company; A. A. Brown, Westinghouse Machine Company; A. C. Beattie, Beattie Electric Company; F. C. Bittgood; Walter A. Black; Robert Bowman; Thomas Cookson, Cookson Steam Specialty Company; George W. Cleveland, manager Cincinnati Inspection and Report Bureau; Daniel Delaney, Dearborn Drug & Chemical Company; C. D. Emmons, manager Ft. Wayne & Wabash Valley Traction Company; Thomas Elliott, consulting engineer Cincinnati

Spy Run Generating Station, Ft. Wayne & Wabash Valley Traction Company—Interior of Turbine Room.

cation. The switchboards and controlling apparatus were next inspected, after which the party descended to the boiler room floor. Here, some of the boilers and stokers had been taken down for inspection and general satisfaction was expressed about the operation of the stokers and the fine condition of the boilers and furnaces. Behind the boilers the condensers, which are the jet type, are located directly under the engine room floor, making a very compact arrangement with short exhaust, injection and tail pipes, which is made possible only by the use of turbines, which require no foundations and can therefore be located above the boilers. The boiler feed pump and circulating water pump, which are of the Worthington manufacture, and were specially designed, facilitating easy access to the valves, are located in the boiler room and were one of the features which received the special attention of the party.

Having had their photographs taken, the party was conveyed to the Ft. Wayne Electric Works, where it was met

APPLICATION OF THE INTERSTATE COMMERCE LAW TO ELECTRIC RAILWAYS.

Since the passage of the Hephurn interstate commerce law last June there has been considerable speculation in regard to the status of electric interurban railways under that law and in regard to the jurisdiction of the interstate commerce commission over such companies. The matter has not yet been brought before the commission in any general way, and consequently no general ruling has been issued. In reply to a recent inquiry on the subject, however, from the East St. Louis & Suburban Railway, Commissioner James S. Harlan responded for the commission, expressing his views unofficially on the particular facts set forth in that communication. In view of the widespread interest in the subject and as the points touched upon affect other companies similarly situated, we publish Mr. Harlan's letter in full:

March 12, 1907.

The East St. Louis & Suburban Railway Company, East St. Louis, Ill.

Dear Sirs:—I have the honor to acknowledge the receipt of the letter of your assistant treasurer of February 26, in which he inquires whether the electric street car lines operated by your company are subject to the act to regulate commerce, as amended June 29, 1906.

In a communication from Messrs. Schaefer and Farmer, attorneys at law, of Belleville, Ill., dated September 4, 1905, and written by them apparently as your legal advisers, it was stated that your company operates electric street car lines in the cities of East St. Louis and Belleville, and interurban lines between East St. Louis and other points in St. Clair and Madison counties. These lines are all in the state of Illinois within a radius of 20 miles from East St. Louis, which is in that state. The interurban lines, as stated in that letter, have a terminus at East St. Louis, at which point passengers for St. Louis, in the state of Missouri, may take what is referred to in the correspondence as an ordinary street car line over the Eads bridge. This line across the bridge is said to carry passengers only. Whether it belongs to and is operated by your company or by a separate company does not appear on the correspondence. Nor is the fact material to this inquiry; for tickets are sold on your line that entitle the holder to transportation from points on your line in the state of Illinois to the corner of Third street and Washington avenue in the city of St. Louis in the state of Missouri. Tickets are also sold in St. Louis for passage over the same route to points in Illinois. So that, even if there be no common ownership or management, or any definite contract between the two lines, the tickets sold by your line in Illinois and by the other line in Missouri would seem to constitute a contract with the holder and an arrangement between the two lines for continuous transportation from a point in one state to a point in another state. Under such conditions the transportation, whether carried on under a common ownership or management or by two connecting lines, would seem to be subject to the provisions of the act to regulate commerce. But a further statement of the details of the actual arrangement between the two lines and of the form and wording of the through tickets might possibly lead to a different conclusion.

Under that act—to respond to your further inquiries—there is no distinction made between the transportation of passengers and the transportation of property. Either kind of transportation constitutes interstate commerce if it originates at a point in one state and is destined to a point in another state. Moreover, if such transportation be carried on for the general public and for hire, it is interstate commerce whatever may be the vehicle or the motive power used. It would be interstate commerce in every legal sense if carried on by means of omnibuses or automobiles, or by a ferry or otherwise, if it is done for the public and for hire and is carried on between points in different states.

You will understand, however, that interstate traffic, as

here defined, whether of passengers or other property, comes under the jurisdiction of this commission and is subject to the provisions of the act, only when carried on by means of one of the several classes of common carriers that are enumerated in the act; that is to say, by a pipe line or a railroad (or by a water line in connection with a railroad). But we think it clear that the word "railroad," as used in the act, includes all kinds of rail carriers that transport either passengers or property, whatever may be the form of motive power used by them. In other words, we hold that any form of transportation on rails, whether the motive power be electricity or steam or gasoline, compressed air, horse-power, or otherwise, is a railroad within the meaning of the act and to the jurisdiction of this commission, if it transports either passengers or property for hire from a point in one state to a point in another state.

For your further information it may be well to add that the law makes no distinction between electric lines that connect urban communities and are engaged in the transportation of passengers and property, and are commonly known as "interurban lines," and the shorter lines that are operated chiefly for the carriage of passengers within, or for short distances beyond, the limits of urban communities, and are commonly called "street car" or "traction" lines. Any such line that transports passengers or property from a point in one state to a point in another state, either on its own rails or in connection, under some arrangement for through transportation, with the rails of another carrier, is itself an interstate carrier engaged in interstate commerce, and is subject to the jurisdiction of this commission and to all the provisions of the act to regulate commerce.

You will understand, of course, that what I have said in this letter is simply the expression of my personal views. The commission does not ordinarily respond formally to such inquiries.

Very respectfully,

JAMES S. HARLAN,
Commissioner.

CHICAGO TRACTION SITUATION.

Fred A. Busse, postmaster of the city of Chicago, in accepting the republican nomination for mayor, made the following statement regarding the traction situation:

For several years we have had too much traction for the politicians and too little for the public. Traction has been used to carry various people into office, but there has not been enough of it to carry people to and from their homes rapidly and in comfort.

This traction question is the people's question, and it is proper that they should have the last word as to whether the ordinances now before them for their decision should become laws. We are all interested. The present surface transportation is utterly inadequate. Elevated and suburban trains are overtaxed because the surface lines are inadequate. The consequence is wasted time and discomfort of all who ride.

Improved transportation, as our platform well says, would lessen congestion in the downtown business center, develop new business centers, give people a chance to live out where they can get better air, more room and more healthful surroundings, and at the same time benefit thousands of small taxpayers.

Street car employees are injuriously affected by present conditions. Overcrowded and out-of-date cars and equipment make their work much harder and more hazardous than it should be.

The ordinances now before the people for their decision are the results of years of investigation and study, and the successive steps in formulating them were apparently approved by all of those active in the work until just before they were completed. No good reason has yet been given, so far as I can discover, for reverting again to talk instead of proceeding to action.

The proposal to acquire the street railway properties by condemnation is one that does not commend itself to me. It will mean years of litigation, the result of which no man can prophesy, during which time the companies will reap the harvest of fares without being under any obligation to divide profits with the city or to install new equipment or to maintain through routes or to do any of the other things which are immediately provided for by the pending ordinances.

Everybody is agreed that we want better service at once. The pending ordinances provide for that. They provide for extensions, for through routes and for transfers that will enable us to ride from any part of the city to any other part of the city reached by the lines of any one or all of the four great systems—namely, the Chicago City, the Union Traction, the Chicago Consolidated and the Chicago General Railway companies.

These ordinances safeguard the city's interests. They

make the city a participating partner in the profits of the street railway companies, and permit this revenue to be applied either to purchase of the lines or to reduction of fares. They also provide ample opportunity for the city to acquire the lines whenever the people desire to embark in the enterprise. Therefore, I cannot see why any person who wants better car service, whether he does or does not believe in municipal ownership, should be against the ordinances.

CHICAGO & MILWAUKEE ELECTRIC RAILWAY SEEKS JOINT RATES WITH STEAM RAILWAYS.

A petition that the Illinois Central Railroad Company be compelled to establish joint traffic arrangements with the Chicago & Milwaukee Electric Railroad Company has been filed by the latter corporation with the interstate commerce commission. This is the second case of this character to be brought to the notice of the commission. Evidence in the petition of the Cedar Rapids & Iowa City Railway & Light Company for joint rates with steam railways was heard in Cedar Rapids on January 29 and 30.

The Chicago & Milwaukee Electric represents in its petition that it is a railroad corporation and that it has the right to operate from the city of Chicago in a northerly direction to some point on the state line between Illinois and Wisconsin, with power to appropriate such land as may be necessary for the transaction of its business and to contract with railway corporations in other states for leasing and running their roads. It has secured by contract the right to operate its trains upon the tracks of the Chicago & Milwaukee Electric Railroad of the state of Wisconsin, which has laid its tracks from a connection on the state line with the Illinois corporation to Racine, Wis.

The petitioning company operates the lines of railway in Illinois and Wisconsin as one system, using as motive power both electricity and steam. It states that it is fully equipped with locomotives, passenger and freight cars for the operation of its business; that its roadbed is constructed under the most modern and improved systems; that its rails are 80-pound rails and its bridges of concrete and steel; that its grade at no point exceeds 1.5 per cent; that in every way it is thoroughly equipped to handle successfully the freight and passenger business in the territory which it serves; and that its freight and passenger business is successfully conducted.

The petition says the Chicago & Milwaukee Electric connects with the Wisconsin Central Railway Company at Rockefeller, Ill., and with the Elgin Joliet & Eastern Railway at Rondout, Ill. The Elgin Joliet & Eastern operates a railway extending from Waukegan, Ill., to Porter, Ind., known as the "outer belt line." The Elgin Joliet & Eastern interchanges freight between all railways entering the city of Chicago and, the petition recites, must be a party to joint traffic arrangements for freight shipments beyond Chicago between the various roads which enter Chicago. A general tariff and division sheet has been established by the Chicago & Milwaukee Electric with the Elgin Joliet & Eastern covering all freight interchanged between the two roads.

The Chicago & Milwaukee Electric represents that the territory it serves in the counties of Kenosha and Racine, Wis., is exceedingly fertile and produces a large tonnage of farm products, one of which is cabbage; that there was shipped during the year 1906 from Racine county over 2,000 carloads of cabbage, all of which came from the territory served by the Chicago & Milwaukee Electric, and which was hauled by wagon to the Chicago & Northwestern Railway at Berryville, Racine and Kenosha, Wis. The Chicago & Milwaukee Electric secured from the Illinois Central, the Yazoo & Mississippi Valley and the Elgin Joliet & Eastern a joint freight tariff on cabbage in carload lots from Racine, Hansche Siding and Piper Siding, Wis., to Vicksburg, Miss., New Orleans, La., Natchez, Miss., and Memphis, Tenn.

This tariff was filed with the interstate commerce com-

mission on November 1, 1906, and thereafter the Illinois Central and the Chicago & Milwaukee Electric shipped freight under its terms. At the time the tariff was put into effect, the petition says, the traffic manager of the Chicago & Milwaukee Electric and the assistant general freight agent of the Illinois Central had many conferences concerning the extent of the business and the promulgation of tariffs; and in conformity with the tariff in existence the Chicago & Milwaukee Electric secured a shipment of 15 carloads of cabbages for lower Mississippi valley points reached by the Illinois Central and the Yazoo & Mississippi Valley, and requested of the Illinois Central the delivery of sufficient cars at Rondout to carry the cabbages.

The petition states that the Chicago & Milwaukee Electric, through its traffic manager, was definitely promised these cars, but they were never delivered, and on November 19 the Illinois Central, without notice, filed with the interstate commerce commission a notice of cancellation of the joint tariff.

The Chicago & Milwaukee Electric charges that "said cancellation notice operated as a great hardship" and prevented it from "conducting its legitimate business and deprived the shippers of cabbage of a competition in freight rates to which they were justly entitled."

In conclusion, the Chicago & Milwaukee Electric prays that the Illinois Central and the Yazoo & Mississippi Valley may be required to answer the charges, and that after due investigation they may be compelled to enter into joint traffic arrangements with the Chicago & Milwaukee Electric for the transportation of cabbage and other commodities originating at or destined to points in the territory of the Chicago & Milwaukee Electric in Wisconsin; that through rates and joint rates be established covering articles of merchandise from all points along the petitioner's railway in Illinois and Wisconsin to points on the defendant's railways outside of Illinois, and from points on the line of the defendant's railways lying outside of Illinois to points on the Chicago & Milwaukee Electric in Illinois and Wisconsin; that through rates and joint rates be established from points upon the petitioner's railway in Wisconsin to all points upon the defendant's railways in other states, except in Wisconsin; and that the commission may prescribe a division of such rate or rates and the terms and conditions thereof. The interstate commerce commission will hear the evidence in April.

Movement in Brooklyn for Free Ferries.

A conference of representatives of various civic organizations in Greater New York was held in Brooklyn on the evening of March 7 to discuss the subject of free municipal ferries, to relieve the crush on the Brooklyn bridge. The agitation for free ferries will be carried on by means of enrollment cards and circulated petitions as well as by further meetings. It is said that some 500 signatures have been obtained on the cards, which read as follows: "Believing that free ferries will give immediate relief to the bridge crush, and will help Brooklyn generally, I hereby request that my name be placed on the membership list of the 'League for the Promotion of Free Ferries.'"

The petitions, to which some 600 or more signatures are already known to be appended, read as follows:

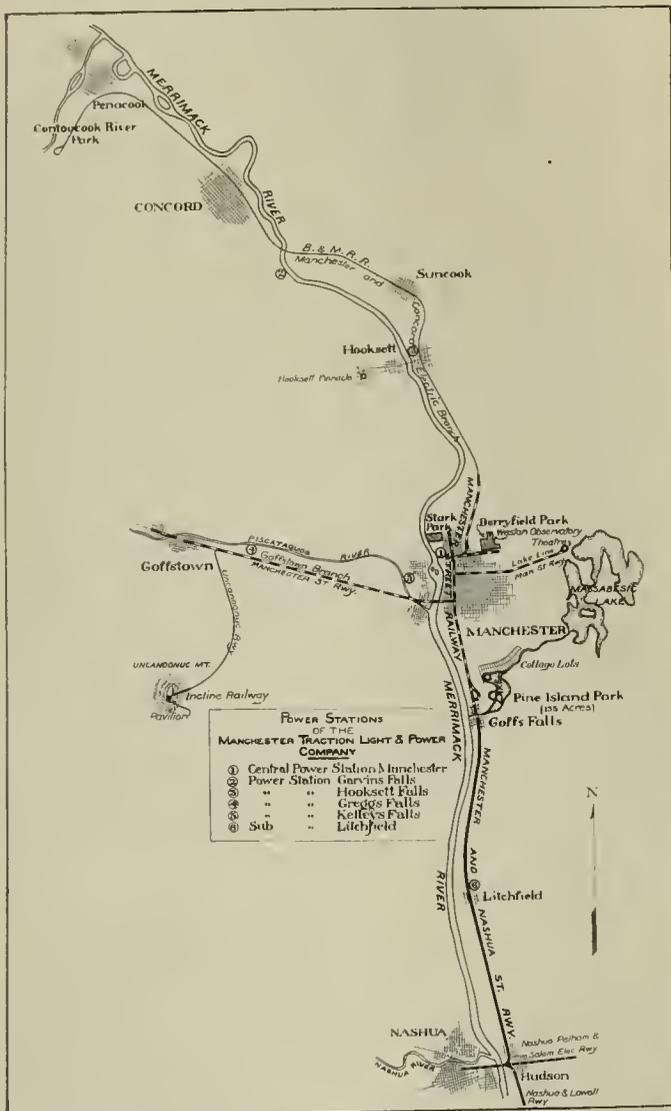

"It is the firm belief of the undersigned residents of Brooklyn that the municipal ownership and operation of the East river ferries free of charge to the public will at once very greatly diminish, if not entirely do away with, the bridge crush horror until a permanent remedy can be had by the building of more bridges, tunnels or subways, and that making the ferries free to all users would greatly help to give new life to the deserted ferry localities, stimulate business, encourage manufacturers to settle there, improve property and be a great convenience to the residents of these neglected districts of this neglected borough."

THE MANCHESTER & NASHUA STREET RAILWAY.

The Manchester & Nashua Street Railway, an important new electric interurban line in southern New Hampshire, connects the lines of the Boston & Northern Street Railway Company in the outskirts of Nashua with the system of the Manchester Traction Light & Power Company, and forms the final link in the continuous trolley route between Boston, Lowell, Nashua, Manchester and Concord. The new line began operation on January 1, 1907. It is owned by the Manchester Traction Light & Power Company, whose officers are:

sufficiently substantial to permit speeds of 40 miles per hour and upwards.

The length of the new line in Goff's Falls, Litchfield and Hudson is 12.5 miles, the total distance between Manchester city hall and the Tremont house, Nashua, being 18.25 miles. The running time from terminal to terminal is 55 minutes; from Goff's Falls to Hudson it is about 28 minutes, making

Manchester-Nashua Street Railway—Map of Route and Connections.

President, William A. Tucker; vice-president and general manager, J. Brodie Smith; treasurer, S. Reed Anthony.

Route.

In physical features the new road is somewhat unique, at least in comparison with other electric lines in New England. It is built entirely upon a private right of way; the heaviest grade is about 1.5 per cent and the sharpest curve has a radius of 1,042 feet. Long tangents are frequent, and in several localities the track is straight for upwards of two miles. Most of the electric railways in New England have a certain percentage of their lines located in the public high-ways, and severe grades or sharp curves are frequent characteristics of the profile and alignment. Fast running is therefore out of the question, except where the character of road-bed and track construction on the private right of way is

Manchester-Nashua Street Railway—Exterior Litchfield Substation.

a schedule speed of about 27 miles per hour on the private right of way with a maximum of approximately 40 miles per hour. The population of Manchester is now about 70,000; Nashua, 30,000; Litchfield, 500; Merrimack, 2,000; and Hudson, 2,000. About 69 per cent of the through run is via the new line.

Cars leave Manchester city hall hourly between 5:30 a. m. and 9:30 p. m., the last southbound car leaving at 11:00 p. m. Northbound, cars leave Nashua at 6:30 a. m. and thence hourly until 9:30 p. m., the two later cars being 11:00

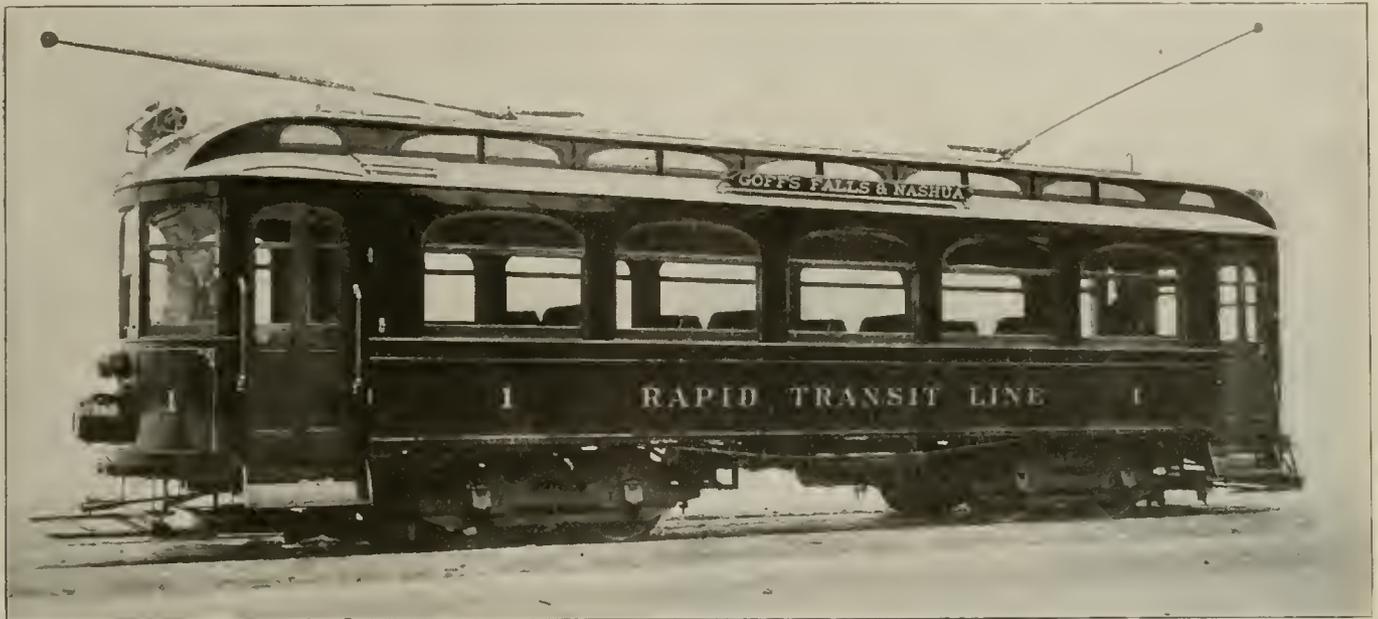

Manchester-Nashua Street Railway—Emergency Car with Trolley Repair Platform.

and 11:50 p. m. During the night the cars are held in the car house of the Manchester company, and the repair work is also carried on at the latter point, with the exception of tire turning and wheel renewals, which are usually performed by contract with the Manchester works of the American Locomotive Company. It will, of course, be a simple matter to decrease the present headway when traffic warrants it.

The new line proper begins at Goff's Falls, a southern suburb of Manchester, and in a general way follows the east bank of the Merrimack river through level farming lands through Litchfield to Hudson, which is on the east side of the Merrimack opposite Nashua. The roadbed is all single track on the private right of way, but turnouts one mile long

the trolley being grooved, size No. 00 B. and S. gauge. But one trolley was installed. With the exception of one-half mile north of Hudson the entire line is fed with 600-volt direct current by a 500,000-circular mil copper feeder which parallels the trolley. Power for the operation of the road is transmitted from the generating plants of the Manchester Trac-

Manchester-Nashua Street Railway—Standard Passenger Car.

are shortly to be in service. The rails were laid in 33-foot lengths, T-section, each joint being bonded with the No. 0000 soldered bond of the Lord Electric Company. Chestnut ties of standard steam railroad specification were used, spaced 2 feet apart on centers. Gravel ballast was used throughout, and the right of way is about 50 feet in width. There are four grade crossings with highways, and five steel trestles

tion, Light & Power Company to a substation located in Litchfield, just half way from each end of the private right of way. The 500,000 circular mil feeder is divided into two sections at the Litchfield substation, one section feeding north and the other south. The poles used are of chestnut, 35 feet in average length, with 7 and 8-inch tops, and spaced 100 feet apart. The contractor for the grading, track and overhead

Manchester-Nashua Street Railway—Garvins Falls Hydro-Electric Plant.

built upon concrete foundations. At the crossings danger signs have been installed, and the trestles are equipped with inside guard rails and outside guard timbers. The construction of the roadbed was carried out under the direction of Mr. A. R. McReel.

Bracket suspension was used throughout the new line,

work was the Hub Construction Company of Boston. The material for the overhead construction was furnished by the H. W. Johns-Manville Company. The chief engineer was Mr. John E. Egan of Windsor Locks, Conn.

The power generating system of the Manchester Traction Light & Power Company consists of five plants, including

the central substation and auxiliary steam equipment at Manchester. At Garvin's Falls, on the Merrimack river, is a water-power station rated at 3,900 k.w.; at Hooksett, on the Merrimack, is a 600-kw. water-power plant, with the prospect of an early increase in capacity; at Gregg's Falls, on the Piscataquog river, is a 1,200-kw. water-power station; and at Kelley's Falls, on the Piscataquog, is an 830-kw. plant, both

transformers to enable the rotaries to be operated on high, normal or low voltage, e. g., with 11,000 volts primary, 396, 376 or 360 volts. The alternating current sides of the rotaries in this substation are not operated in multiple, though the transformer primaries are permanently connected in delta, there being but one set of these. One secondary winding in each transformer is devoted to the exclusive use of a corresponding rotary. The direct current sides of the rotaries are operated in multiple, as usual.

An accompanying sketch shows the general transformer arrangement, with the single primary winding and double secondaries of each transformer. P_1 , P_2 and P_3 are the primaries of transformers 1, 2 and 3; S_1 , S_2 and S_3 are the secondary windings of the three transformers devoted to one rotary R; and S_1' , S_2' and S_3' are the windings connected with the other rotary R'. The taps H_1 , N_1 , L_1 , t_1 , t_2 and H_3 , N_3 , L_3 , t_3 give the high, normal and low voltage combinations for rotary R, while the corresponding taps of the other windings do the same for rotary R'.

Another sketch shows the secondary connections to impress high, normal or low voltage upon the terminals of rotary R. T_1 , T_2 and T_3 are the secondaries of the three transformers and the taps are shown as in the other figure. On the high and low positives the second transformer is not needed. When rotary R₁ is shut down the corresponding secondary windings are idle. The connections shown in the diagram are made easily on the switchboard by manipulating the double-pole, double-throw switches for each rotary.

Switchboard.

The switchboard in the Litchfield substation consists of six 24-inch panels. One panel carries a bracketed synchro-

Manchester-Nashua Street Railway—Standard Track and Overhead Construction.

steam and hydro-electric. At the Brook street station in Manchester is a capacity of 1,450-kw. alternating current power, with 2,160-kw. in direct-current, 550-volt machinery. Steam power is rarely used on the system.

All these generating plants are connected radially with the Manchester substation by transmission lines, and are operated in multiple at the latter point as far as is desirable. Between Garvin's Falls and Manchester, 14 miles; Gregg's Falls and Manchester 6 miles, and Hooksett and Manchester, 10 miles, 11,000-volt circuits are run. The Kelley's Falls plant is a 6,600-volt installation, and it feeds Manchester over a 3-mile line. The Litchfield substation, 6.25 miles south of Goff's Falls, is supplied with power from the high tension net work by an 11,000-volt 3-phase circuit of No. 4 wire branching southward from the Gregg's Falls line.

On account of the lighting and power business of the Manchester company, the frequency of the alternating system is 60 cycles, and the rotaries in the Litchfield substation are therefore wound for that periodicity. The Litchfield substation is a neat brick building, 23 by 30 feet, with an equipment of two 12-pole, 300-kw., 600-volt Westinghouse rotaries, normal speed 720 revolutions per minute, and three 250-kw. 11,000-396-volt transformers of the same make, oil-cooled type. Each rotary is equipped with a direct-connected induction motor on the end of its shaft for starting purposes. Toilet facilities are provided in the substation, together with a storage room and small workshop.

Double-Secondary Windings.

A special and novel feature of the transformer equipment is the provision of a double set of secondary windings in each transformer, with special taps in the windings of two of the

Manchester-Nashua Street Railway—Standard Trestle.

scope and a high-tension automatic oil switch; the next two are duplicate alternating-current rotary panels and each contains a power factor meter, an 800-ampere ammeter, synchronizing and starting-motor switches, a main three-pole rotary switch, rheostat and the transformer switches mentioned in the preceding paragraph; the next two panels are direct-cur-

rent generator slabs, with the usual switches, ammeters and recording wattmeter; and the last panel is a direct-current feeder panel with recording totalizing wattmeter, two switches, two 800-ampere ammeters and two circuit-breakers. Busbar and direct-current machine voltmeters are bracketed at the end of the board.

The substation roof is of concrete, supported on steel I-beams. Two of those beams support rolling hoists which facilitate the handling of heavy machine parts.

Rolling Stock.

Six new cars have been purchased for the service between Manchester and Nashua. These were made by the Laconia Car Company, and each is 41 feet long over all, 8 feet 4 7/8 inches wide, and mounted upon double trucks of the Laconia 8 B2 type. The motor equipment is four G. E. 80 motors, with K28 control. The brakes are straight air, General Electric system, and each car has two trolleys and a seating capacity of 40 passengers. The interior finish is red oak. These cars are among the handsomest ever operated in New Hampshire.

The trucks are equipped with 33-inch wheels, having 2 1/2-inch treads, 7/8-inch flanges, steel tires and a 4-foot 4-inch wheelbase. Imperial headlights of the arc type with an incandescent lamp in the headlight for use in city streets; Pfingst fenders, International registers, consolidated heaters and twenty 16-candlepower interior lamps make up the car fittings. The seats are reversible with the exception of four at each vestibule corner. The aisles are 18 inches wide, and each of the eight cross seats on each side of the aisle is 32 inches long by 15 inches wide. The longitudinal end seats also carry two persons each.

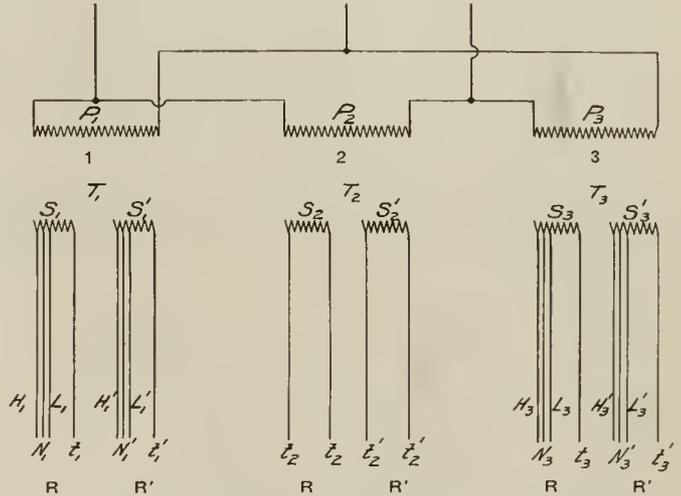

The interior lighting of the cars is unusually good. Four 16-candlepower lamps are spaced at even distances apart under the roof; six lamps are installed on each side of the car at the monitor bottom, and four others are installed on each side over the adjacent pairs of seats. On each side of the car are five plate glass windows 21 inches high and 50 inches long, surmounted by semi-oval windows. Each window covers two seats, and is balanced with weights to enable it to be pushed down between the side panels to convert the car into an open car for summer use. In each vestibule a vertical brass switch-stick holder is provided, together with the usual lighting and heater switches, and a small shielded incandescent lamp to illuminate the air gauge dial.

Operation Details.

The fare from any point in Manchester to any point in Nashua via the new line is 25 cents, three of these fares be-

The repair shops in Manchester are unusually compact for a system covering as much territory. The Manchester company has one of the most complete equipments of snow-fighting apparatus in the state. Armature and field coils are made by the company.

A special arrangement for drying sand has been tried successfully in these shops. An ordinary pit 15 or 20 feet long has been equipped with steam pipes and the sand is dumped into this pit and shoveled out as it is needed. The

Manchester-Nashua Street Railway—Transformer Connections for Single Primary and Double Secondary Windings.

car house has to be heated, in any case, and it was thought unnecessary to go to elaborate lengths when steam was easily available for the purpose.

Another convenience is an emergency trolley car which takes the place of the frequently slow-moving tower wagon. This car will shortly be equipped with high-powered motors to enable it to make fast time over the lines. Its most interesting feature is a platform which can be raised or lowered by a single man through the agency of a special tackle inside, swung around radially and locked in position to permit work on either side of the trolley. An iron ladder is provided on each side of the car to facilitate quick mounting or dismounting from its top.

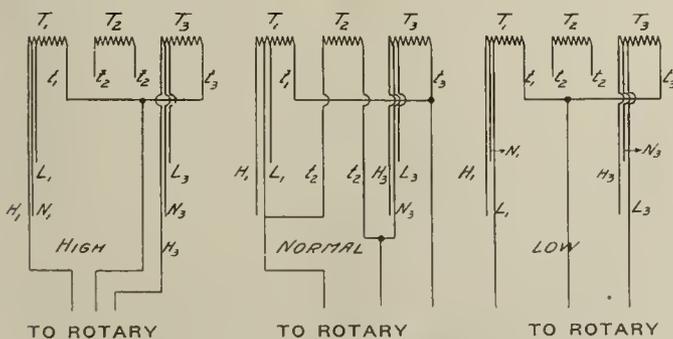

Form for Recording Car Equipments.

Mr. F. A. Bundy, master mechanic of the Lima & Toledo Traction Company, Lima, O., has developed a form to be used in compiling statements of cars and car equipments, which, because of its thoroughness, does away with the necessity of keeping book records of equipments. The form, which is 18 inches wide and may be made any desired length, contains columns for the respective heads and subheads under which the various car parts are grouped as follows:

Car, number, open or closed; motors, make, kind, number, horsepower; controller, type, number; trucks, make, single or double, wheel base; wheels, diameter, tread, flange, bore, kind; axles, length, diameter, gear section, size of journals; brake, hand or air, resistance, number of tanks, kind of gird; body, length over bumpers; width out to out, extreme height above rail, height of floor above rail, length of passenger compartment, length of smoking compartment, length of baggage compartment; gear, ratio; seats; remarks.

Blue prints of the form containing complete records of all the cars owned by the Lima & Toledo Traction Company are furnished the heads of all departments.

The pig iron produced in Canada in 1906 was 541,957 long tons, of which 525,716 tons were made with coke, 16,021 with charcoal and 220 tons by electricity.

Manchester-Nashua Street Railway—Secondary Connections for High, Normal and Low Voltages.

ing charged for the run over the Goff's Falls, Litchfield and Hudson line. The company is equipped with Couch & Seeley telephone apparatus, stations being placed at important points along the line. Portable telephones are also supplied for car use. Near the Goff's Falls end of the line is a pleasure resort known as Pine Island park, and it is anticipated that in the coming summer there will be a large travel to this point from the vicinity of Nashua.

FREIGHT TERMINAL STATION AT FT. WAYNE, IND.

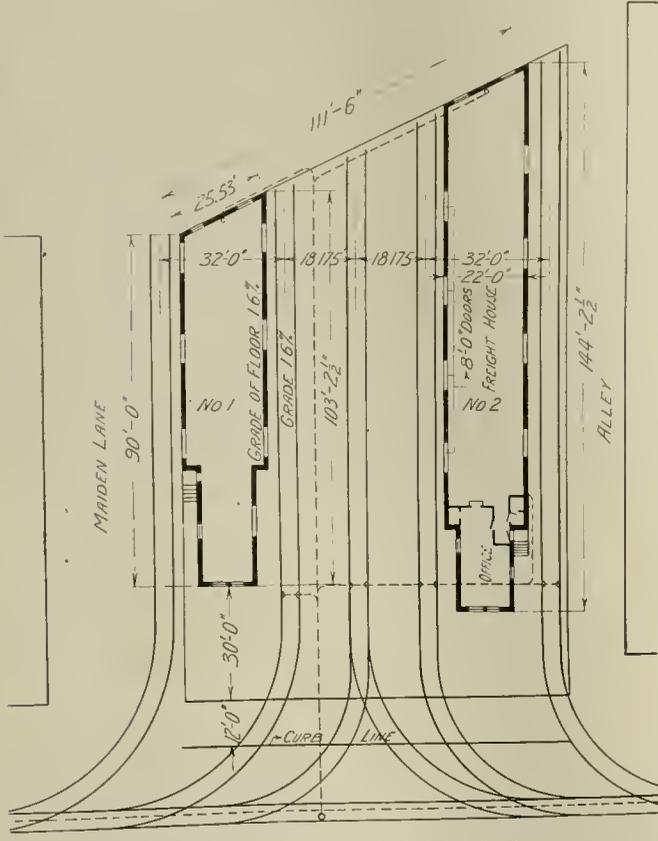

The Ft. Wayne & Wabash Valley Traction Company is perfecting plans at Ft. Wayne, Ind., to handle the extensive freight traffic that is being developed by the five interurban railways radiating from that city. This company controls the city lines and the terminal facilities at Ft. Wayne, and in a way is the dominating spirit in the interchange of traffic between the interurban lines.

The waiting station from which all interurban passenger cars are started on their outward journey is located at the corner of Pearl and Harrison streets, about two blocks from the center of the city. Immediately at the rear of this station a freight terminal has been laid out that is intended, when completed, to furnish facilities for speedily handling the incoming and out-going freight for all electric railways entering the city. The space set aside for the development of the terminal station—in the form of a trapezoid—is 100 feet wide and 160 feet long on the longest side. Along the

charge freight at the same time. Five tracks enter the terminal. Two are designed to serve the building for incoming and two to serve the building for out-going freight. The fifth track is to be used for car-storage purposes. The center lines of the tracks adjoining the buildings are located 4 feet 11 inches away from the foundations, which brings the sides of the average interurban freight car while standing at the station, about four inches from the door sills. This feature was designed to do away with gang planks in loading and unloading freight.

All freight trains entering Ft. Wayne over the Ft. Wayne & Wabash Valley, the Lima & Toledo, the Toledo & Chicago, the Ft. Wayne Bluffton & Marion, and the Ft. Wayne & Springfield railroads are accommodated at this station. Freight interchange arrangements have been made between the several interested companies so that the country surrounding Ft. Wayne is very thoroughly served. The arriving and departing time of freight trains over the various divisions are:

- For Bluffton and points south to Muncie, leaving time 9 a. m. and 3 p. m.; arriving time 2 p. m. and 7 p. m.
 - Local freight for Huntington, Wabash, Peru, Logansport and intermediate points, leaving time 10 a. m., arriving time 8:30 a. m.
 - Through freight for Indianapolis by way of Peru, leaving time 5 a. m., arriving time 1 p. m. The Southbound car on this run arrives at Indianapolis at 1 p. m. and leaves again for the north at 2 a. m.
 - For Auburn, Kendallville and way stations on the Toledo & Chicago, leaving time 12 o'clock, noon, arriving time 10:30 a. m.
 - For Van Wert and Lima, Ohio, and way stations, leaving time 8:20 a. m. and 2:20 p. m.; arriving time 7 a. m. and 1 p. m.
 - For Decatur, Ind., by way of the Ft. Wayne & Springfield railroad, leaving time 1 p. m.; arriving time 10:30 a. m.
- In addition to the above extra cars are frequently operated over the several divisions. Freight is received at the Ft. Wayne freight office between the hours of 7 and 12 a. m. and 1:00 and 5:30 p. m.

Plan of Ft. Wayne Freight Terminal.

east and the west sides of this plat of ground the general plan calls for the construction of two freight buildings, one of which is to serve for receiving and the other for dispatching freight commodities.

The first unit of the general scheme has been erected and the second structure, in which the freight agent's office will be located, will be built at an early date. The completed building which is intended for out-going freight is 22 feet wide, 103 feet long, on the long side, 90 feet long on the short side and 22 feet high from the foundation to the coping. It is intended later to make this building two stories high.

The superstructure of the building is of brick and the floor and roof are of concrete-steel construction. The window and door lintels are also of concrete, moulded in sections 13 by 13 inches by 10 feet in size. The floor is 3.85 feet above the freight tracks, which brings it to a level with the floors of the average freight car that enters the station.

The track layout for the terminal has been developed so that the largest possible number of cars can load or dis-

NEW CAR HOUSES OF THE INTERNATIONAL RAILWAY COMPANY AT BUFFALO, N. Y.

Owing to the rapidly increasing traffic of the International Railway Company, the old storage and repair facilities which, with the completion of the car houses at Cold Spring in 1906, were thought would be sufficient to accommodate the increase in traffic for a number of years to come; the growth of the business, however, has been so rapid that it has been again necessary to increase the storage and repair accommodations. With this object in view, the company has erected a new car house and an open storage yard on Broadway, east of Bailey avenue, Buffalo.

The new car house will accommodate one hundred and eight 46-foot cars and the storage yard along the south side of the building will accommodate one hundred and thirty-five 46-foot cars. It is expected in the near future to build an extension of the car house, which will cover the storage tracks which are now in the open. The general dimensions of the new car house are, length 561 feet, fronting on Broadway, and a uniform depth of 148 feet, extending back to Stone street. The property on which the barn and storage yard are situated has a total length of 698 feet 4 inches, and is 270 feet 8 inches wide.

The general arrangement of the car house has been so planned that it can be divided into four fireproof compartments by means of rolling steel fire doors, thus making it possible to confine the fire to only a portion of the building, should such an emergency arise.

Concrete and steel only have been used in the construction of the barn, with the exception of the roof, which is constructed of 6 by 12 inch and 4 by 12 inch yellow pine purlins and 2-inch matched hemlock roof plank, with a covering of 5-ply felt and 1/4 inch of actinolite.

In the building are provided recreation rooms for the conductors and offices for the clerical force. Bowling alleys, card tables and pool and billiard tables, as well as a library, are provided for the motormen and conductors, and the general arrangement and fittings throughout show the attitude

of the company in trying to make the men as comfortable as possible when off duty.

A full description of the new improvement, with detail plans, will be published in a subsequent issue of the Electric Railway Review.

REPORTING ACCIDENTS AT NASHVILLE.

It is generally conceded that a large percentage of damage suits growing out of accidents on street railways are results of the diligent solicitation of shyster lawyers. Few people are injured through their own carelessness without being ready to admit, at the time the injuries are received, that the fault was their own.

After making a careful study of this subject the claim department of the Nashville (Tenn.) Railway & Light Company has devised a means of obtaining a complete account of an accident within a few minutes after it occurs. It is a duty of the conductor to telephone the details, as soon as possible, to the dispatcher, giving the name and address of the injured, advice as to whether medical or surgical aid has been obtained, if the injured has been removed (and to where), location and time of accident.

The conductor is always supplied with blank forms which enable him to get a concise statement from the injured per-

FORM 257 SM-10-00

FOR THE PROTECTION OF CAR MEN.

Date. _____

NASHVILLE RAILWAY AND LIGHT CO.

GENTLEMEN—I hereby state that the CAR MEN WERE NOT IN ANY WAY TO BLAME for this accident in which I was injured or damaged. I was myself to blame, and make this memorandum at the time in full knowledge of the facts of the accident.

Signature. _____

Address. _____

Reporting Accidents at Nashville—Car Men's Release as Signed by Injured Passenger.

son and thereby to furnish to the claim department accurate information on the subject.

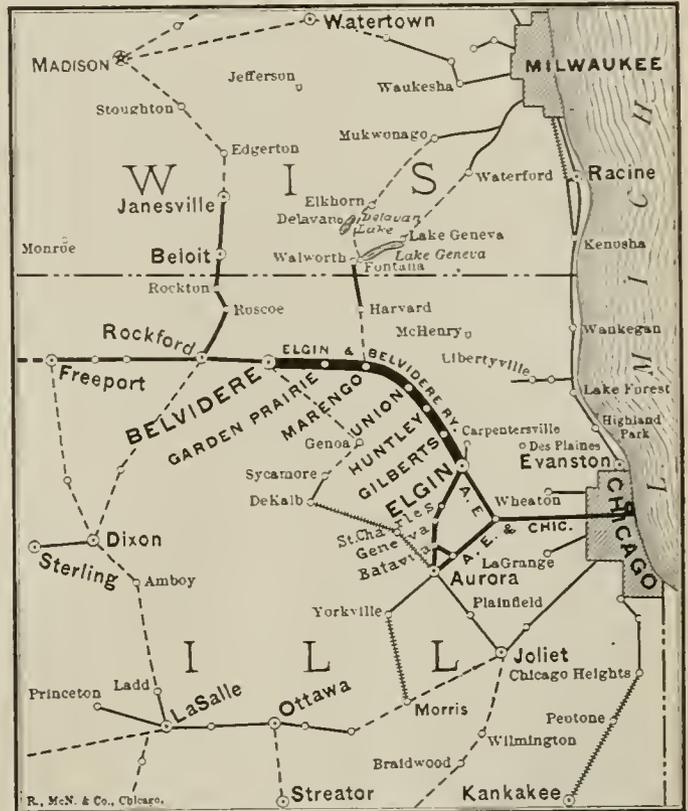

In case of any accident to persons or property, however slight, in connection with or near a car the car-men are required to obtain the names and residences of persons injured, a clearance from blame, if possible, and a list of witnesses of the accident. All disputes and troubles which occur on a car are reported as accidents. Failure or neglect in reporting accidents is punishable by discharge.

As soon as an accident occurs the conductor of the car tries to obtain the signatures of the persons injured to printed blank forms, which exonerates him from all blame. After this is done a memorandum of the accident is made out on a card-board form, printed in blank, four by eight inches in size. From this memorandum a formal report is made to the superintendent of transportation. This report is very complete and contains, in addition to the usual information required for a comprehensive understanding of the conditions, a diagram of intersecting streets which enables the car-men to fill in the names of the streets and to give a rough sketch of the exact location of the car at the time the accident occurred.

When this report is received at the office the division superintendent conducts a thorough investigation, after which he sends to the general manager a report on his decision as to whether or not the trainmen were to blame for the accident.

NEW ROADS PLANNED NEAR ILLINOIS-WISCONSIN STATE LINE.

Important developments in electric railway operations will take place this year in the territory tributary to that served by the Elgin & Belvidere Electric Company. This line, which was constructed by The Arnold Company of Chicago, was described in last week's issue of the Electric Railway Review. The accompanying map shows the route of the road, its immediate connections, and other lines in operation and proposed in the territory. Announcement is made of the organization of the Marengo Harvard & Geneva Lake Railway Company, which will build during the present year an electric line from Marengo to Harvard, Ill., where connection will be made with the Chicago Harvard & Geneva Lake

ELECTRIC RAILWAYS

 - - - - UNDER CONSTRUCTION
 PROPOSED

Elgin & Belvidere Electric Railway—Map Showing Roads in Operation and Proposed Near State Line.

Railway, which is already in operation between Harvard, Ill., and Fontana, Wis., a point on the southwest shore of Lake Geneva. It is proposed to combine these two lines and to build an extension of the Chicago Harvard & Geneva Lake Railway from Fontana to a point on the east shore of Lake Delavan. A further extension will be made to Elkhorn, Wis., where the line will connect with the electric road which is to be constructed from Mukwanago to Elkhorn. Hamilton Browne of Chicago is president of the new Marengo Harvard & Geneva Lake Railway Company.

General Manager H. C. Page of the Springfield, Mass., Street Railway, has announced a new schedule of wages for conductors and motormen, effective on March 16, as follows: For the first six months, \$2 per day; second six months, \$2.10 per day; second, third and fourth years, \$2.20 per day; fifth, sixth and seventh years, \$2.30 per day; eighth and ninth years, \$2.40 per day; tenth and subsequent years, \$2.50 per day.

PIPING AND POWER STATION SYSTEMS.—XXXIII.

BY W. L. MORRIS, M. E.

To overcome the difficulty of opening up a trench as deep as shown for the waterway it may be found more economical to use scrapers and lower the section of ground between the condenser and screen-house so that the ground over the waterway lies just below the pump-room floor as shown by the grade lines, a. This would make a trench about 16 feet deep for the intake instead of possibly 30 to 35 feet deep. By lowering the ground in this manner there could be a door from the pump room and a walk leading down to the screen-house and this would also provide more room for windows in the pump room, which is very desirable. If a surface condenser is employed practically the same arrangement would be adopted for a circulating pump and fire pump in the pump room, but the condenser and wet-vacuum pump would be located as close to the engines as possible. The pump room and the well to the waterway can be made considerably smaller, in fact the waterways may be run directly under the pump and be fitted with a manhole opening and ladder leading down to the water. The floor of the pump room shown in Figure 261 may also be run over the intake and hotwell, there being no serious objection to this arrangement, as there is no machinery located in the well, as would be the case in Figures 253 and 254. Figure 261 unquestionably is the most practical system for plants located at a considerable distance above the water supply, as it is possible to start the pump and obtain the full vacuum before the engines are started, and thus avoid interruption caused by the opening of circuit-breakers and the stopping of the pump motors.

The system is more economical from an operating standpoint and it would be in most cases as economical to construct as any of the other systems described, due to the fact that only standard apparatus is employed. It would be necessary in such a system to have an elevated water tank and priming lines connected to all the pumps in the pump room so that they can be started with a 14 or 16-foot suction.

Class 13, 4 and 5.—Circulating Water, Main and Branches.

If the plant is fitted with more than one condenser or more than one pump, a main should be provided into which all the pumps discharge and one from which all the condensers receive their water. This arrangement enables the operation of any of the pumps with any of the different condensers. Such an arrangement is particularly essential in the case of motor-driven pumps, as it permits the use of as many pumps as may be required. The pressure on these

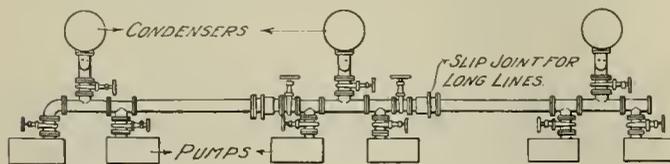

Figure 262-(13-1).

lines would be very slight, in fact they may be under vacuum, this being determined by the style of the condensers and the relative elevations of the line with respect to the condensers. Light cast-iron pipe is very suitable for this service, but special provision must be made for the expansion and contraction with changes of temperature. Valves should be placed in each branch and should also be located along the main so that each condenser unit may be isolated, together with its pumps, as shown in Fig. 262-(13-1).

By arranging lines in this manner, it is possible to shut down any portion of the main to make repairs and permit the remaining portion to operate without interruption. The size of the main required is only that required for one con-

denser or two pumps, and for three condensers would simply be the size of the branch pipe to the condenser. This main is also desirable if the pumps are steam driven as it makes the injection water more easy to control. A pressure gauge should be placed on the main to indicate whether the pumps are delivering more water than required, which would cause the pressure to increase, or whether the supply is insufficient, which would result in a decrease. The injection valves (or admission valves to a surface condenser) are generally controlled by hand, and as they are opened or closed to meet the demand of the condensers, the capacity of the pumps is also changed, due to the increased or decreased pressure against which they are delivering. It is therefore quite impossible to keep the quantity of cooling water properly regulated, as the conditions constantly change, so that if the water supply is adjusted at a sufficiently large amount to insure the maximum vacuum obtainable, then the tail water is for the greater portion of the time at a very low temperature. If the quantity of water is reduced to raise the temperature of the discharge water, then the vacuum will be less than that which is obtainable, except when the load may be temporarily light.

The ideal method of controlling the circulating or cooling water would be by means of a thermostatic regulator operated by the temperature of the tail water, opening or closing the inlet valve as quickly and as often as the temperature of the discharge changes. Controlling the quantity of injection by the vacuum is very uncertain and undesirable, as it is evident that if leaks should occur or for any other reason, such as the condenser becoming air-bound, the vacuum drop, the quantity of injection would be abnormally increased, resulting in too low a temperature of the tail water and a waste of power in the circulating pump, as the extra supply of injection is useless. A thermostatic regulator for controlling the quantity of the injection water is shown in Fig. 263-(13-2). The regulator, as will be seen, consists of an expansion tube which is permanently attached to a point near the lower end of the tail pipe and attached to the injection valve by an adjusting screw which permits the regulator to be adjusted.

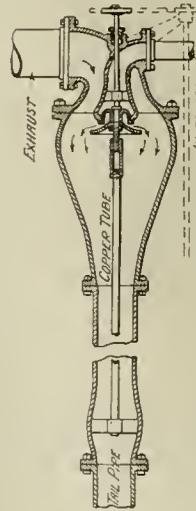

Figure 263-(13-2).

The length of the tube is so chosen that it will give the desired travel to the valve. As copper has a higher coefficient of expansion than cast iron, as the temperature of the injection water becomes too high, the lengthening of the copper tube increases the opening through the injection valve, which admits more water and constantly lowers the temperature of the injection. Should the temperature of the tail water become too low, it is evident that the reverse process occurs. The shaft, sprocket, etc., shown by dotted lines on the diagram, is for a valve extension so that the valve can be operated from the floor if desired. A thermometer placed in the tail pipe and a vacuum gauge connected to the exhaust pipe should be placed near the operating handle of the injection valve so that the attendant may observe the vacuum and temperature of the discharge when adjusting the amount of injection water supplied to the condenser.

In reading the vacuum gauge a correction must be made to allow for the column of water in the pipe if there is a long drop or rise in the gauge connection. Each foot of pipe filled with condensation is equal to about an inch on the vacuum gauge. It is seldom that two or more vacuum gauges will read the same, due to the difference in the length of their water columns. The pointer on a gauge is set to show the pressure at the gauge connection, and if the pipe runs from either above or below the gauge and water collects in

the pipe, the gauge will read incorrectly. To determine the extent of this inaccuracy, the gauge should be read and the line then quickly blown out and the gauge re-read, at the same time noting the pressure on some other gauge to ascertain whether the pressure remained constant while the gauge connection was being blown out.

Class 1, 6, 7 and 8—Waterway Connections for Other Service than Condensing.

In regular operation, the feed pump would draw water directly from the hot well or from the hot-well pump which would deliver the warm water to an open heater, from which the feed pump would deliver it to the boiler. The fire pump would draw its water from the intake line only, regardless of whether it is supplying the low-pressure main or the high-pressure lines in case of a fire. The pump that is used for tube-drilling should have an intake connection and the feed pump should also have a connection to the intake for use when the condenser is not in operation. To facilitate the arrangement of these different connections with the circulating water lines it is generally found that the best arrangement is to run both the intake and discharge waterways under the building in such a way that all the pumps can take their suction directly from the waterways without the necessity of using a long suction main to which the different pumps are attached, with their numerous pipe joints, valves, etc.

When laying out waterways for condensing machinery it should be remembered that there are other uses for the water which if not properly provided for at the start will lead into complicated and troublesome pump suction. If the intake is laid out as a part of the building construction and the portion under the building is completed before making a connection to the water supply there should be no particularly difficult features met in its construction. The location of the waterways that is best adapted for all the various connections is parallel with the dividing wall between the engine and the boiler room, the various pumping machinery being set along the wall and over or just to one side of the waterway. To avoid the possibility of loosening the soil alongside of the waterway and provide a safe footing for the division wall, crane columns, etc., it would be found both a safer and more economical construction to support the walls on the masonry of the waterway as shown in Fig. 264-(16-1). The top and bottom of the waterway may be reinforced as shown. Sleeves should be placed in the concrete for the suction pipe to pass through, and manholes provided with ladders built into the concrete should be placed in the waterway to facilitate entrance for cleaning or inspection.

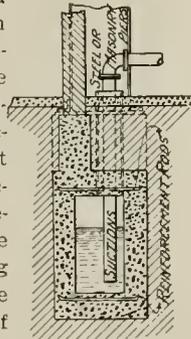

Figure 264-(16-1).

(To Be Continued.)

Submersion of Wood in Water.

In an article on "Kiln Drying Hardwood Lumber," published by the Forest Service, Frederick Dunlap says:

"Prolonged submersion of wood in water is believed to prepare it well for drying. The probable reason for this is the leaching out of the sap constituents so that the cell cavities finally contain approximately pure water; for the organic sap, as we have already seen, appears to hamper the extraction of water in drying. In rafting, logs frequently remain a long time in water before they are sawed, and the lumber cut from such logs is held to dry more readily and thoroughly. For the past two years the Forest Service has been conducting experiments on the influence of submersion upon subsequent air-seasoning. These experiments are not yet concluded, but present results add weight to these views. The effect of submersion upon subsequent drying varies with species and climate.

RECENT ELECTRIC RAILWAY LEGAL DECISIONS.

BY J. L. ROSENBERGER, LL. B.

Passing Teams Left Unguarded.

If among the many teams left unguarded some may be negligently so left, the supreme court of New Jersey says, *Brower v. Public Service Corporation of New Jersey*, 64 Atlantic Reporter, 1052, that a street railway company cannot have imposed upon it the burden of assuming that all unguarded teams are sources of danger and be made negligent for passing any unguarded team.

Not One Continuous Trip, But Two Trips.

A man left his office intending to go to his home, and, being invited by a friend, took a car, and, visiting with his friend, rode beyond the point where he would have transferred by the usual route to reach his home, and kept on riding away from his ultimate destination. Having finished his visit, he sought to reach his home by transferring from line to line, but was finally refused a transfer, and accounted himself aggrieved by what he alleged was the company's violation of the provisions of section 104 of the New York railroad law, requiring the company "to carry between any two points * * * any passenger desiring to make one continuous trip between such points for one single fare." But the second appellate division of the supreme court of New York holds, *Hunt v. Brooklyn Heights Railroad Company*, 101 New York Supplement, 209, that his trip was not continuous as the term is used in this section, and that he was not entitled to recover a penalty for being refused a transfer. It says that he was making two trips—the first to last as long as his visit with his friend was incomplete; the second to reach home from the point where his visit ended.

Walking on Track to Avoid Snow—Duty of Motormen.

Discussing rights in streets, the supreme court of Indiana says, on the appeal of the Indianapolis Traction & Terminal Company v. Kidd, 79 Northeastern Reporter, 347, that pedestrians have a right to use any part of such highways, but the question whether a particular use is such as a reasonably prudent person would make must depend upon the attendant circumstances. When a certain portion of the highway has been paved as a sidewalk or otherwise reserved for the exclusive use of foot passengers, and the same is unobstructed and in suitable condition for such use, it may not be prudent to walk in the roadway set apart for the use of vehicles.

In this case it appeared that the street along which the plaintiff was passing was covered with melting snow and ice to a depth of from six to fourteen inches, except the space between the rails of the company's tracks, which was paved with brick and was practically free from all obstructions. This condition of the street explained the plaintiff's use of the track. She was required to use ordinary care for her safety, and the duty which she owed to the company was to vacate the track when apprised that the same was required for the passage of a car. She had a right to assume that the company's cars would not be run at an excessive rate of speed, and that she was not required to anticipate that a car upon a straight track in broad daylight would run her down from the rear without any warning. In considering the question of her alleged contributory negligence, due regard for the reciprocal rights, duties and obligations of the company must be observed. It had no right to exclude her from its track upon the street, but had the right merely to require her to remove therefrom when she ascertained or was notified that the same was needed for the passage of one of its cars.

Its servants in charge of the operation of its cars were required to exercise diligent and constant watchfulness for persons who might be upon or approaching the track. Such servants were required to take notice of obvious obstructions

to the ordinary and free use of the street. The drivers of such cars were chargeable only with the exercise of ordinary care for the safety of other users of the street, but ordinary care in law implies a high degree of watchfulness and vigilance when propelling a car at a speed of 20 to 25 miles per hour through the streets of a populous city, where persons on foot and in vehicles are constantly passing and repassing, including the aged, infirm and crippled, as well as children thoughtless and wanting in prudence and discretion.

Regard to Be Had for Disabilities of Passengers.

The correct principle, which is deducible from all the better-reasoned cases, the supreme court of Washington says, *Plattor v. Seattle Electric Company*, 87 Pacific Reporter, 489, is that the conductor, having supervision and control of the car and of the passengers on the car, must exercise that supervision in a reasonable way, taking into consideration the appearance of the passengers and the circumstances surrounding them. It is the infirmity of the passenger and his incapacity to protect himself that he must take notice of, no matter whether that infirmity is produced by age or from being crippled, or from ravages of disease, or from excessive obesity. Or it might be that a passenger, who was young, agile and alert, would be incapacitated from protecting himself from the sudden lurch of a car for the reason that his hands were occupied by holding a child or some other burden. In all such cases the conductor should see that the passenger has time to obtain his seat before the car is started with such suddenness as to imperil his safety. This doubtless is more or less burdensome upon the conductor, but it is a burden imposed in the interest of common humanity and for the welfare of the public.

Conductors' Transfer Statements—Ordinance v. Orders.

A statement by a conductor when issuing a transfer that it was good on a certain line the supreme court of Illinois holds admissible in evidence in an action by the holder for alleged wrongful ejection from a car on said line. It says, *Chicago Union Traction Company v. Brethauer*, 79 Northwestern Reporter, 287, that in the view which it takes of this question the conductor of a street car line who is placed in charge of a car, supplied with blank transfers and authorized to punch and deliver them to passengers upon request, in consideration of cash fare previously paid, stands in the relation to the street car company and its passengers very much like a ticket seller who has been chosen for the purpose of supplying the public, for a consideration, with tickets entitling the holder to certain rights and privileges. In such case the ticket seller, for the purpose of that transaction, is the direct representative of the company for which the tickets are sold, and what such agent says in connection with the sale of tickets and as to the extent of the privileges thereby secured has often been held admissible as part of the *res gestæ* (things done) and as characterizing the subsequent conduct of the purchaser of such ticket. Such evidence having been held admissible with respect to ticket agents by the courts of many other states of the Union, this court sees no reason why a conductor of a street car, in delivering transfers to passengers when it is his legal duty to do so, should not be governed by the same rules.

The court also holds that an ordinance requiring certain transfers having been held valid, the ordinance was as valid before the rendition of its decision as it was afterwards, and if the company chose to regard it as invalid, and instructed its employes accordingly, it did so at the risk of having its contention set at naught and its acts in violation of the ordinance pronounced illegal. A violation of the law cannot be excused on the ground that the violator believed the law unconstitutional. The validity of the ordinance having been established, the duty of the company and its servants, and their relations to the plaintiff, must be determined by the ordinance

rather than by the instructions of the company to its servants based on the assumption that the ordinance was invalid. It was the duty of the conductor issuing the transfer referred to as a servant of the company, to issue transfers regardless of any instructions he might have had to the contrary from his superiors, and in carrying out this duty he must be held to have been acting for and on behalf of the company.

Occupation of Street and Inquiry Into It by State.

The occupation of a public street for railway purposes, the supreme court of Iowa says, *State v. Des Moines City Railway Company*, 109 Northwestern Reporter, 867, is not a matter of common right, and without a legislative grant therefor the construction or maintenance of such a railway would expose the party responsible therefor to punishment as for a nuisance. The municipality to which is given authority to grant such a privilege exercises a delegated power only, and it cannot grant to any person or corporation a privilege which is confessedly in derogation of the common right, in a manner which shall exclude the power of the state to inquire into its abuse, or to prevent the subversion of the public interests which the legislative grant was intended to protect.

To say that the state has surrendered to the city all its power and authority to protect public interests against usurpation, neglect or abuse by a corporation of its own making, and that so long as the city authorities are content to remain quiescent the state is powerless in the premises, is to say that the state may surrender its sovereignty and the legislature estop itself by an abdication of its legislative power. Even the state itself cannot constitutionally authorize the occupation of the streets for anything but a public purpose, and if a city government by its indifference to public interests or by a mistaken estimate of its own power in the premises permits a corporation to occupy its streets without legal right to such franchise or to assume without authority other rights which are not common to the people generally, the state has the inherent and reserved right to call upon such corporation to show by what warrant it assumes to hold or exercise such franchise.

Number and Kind of Fenders—Leaving Rear One Down.

A fender, the supreme court of New Jersey says, *Whilt v. Public Service Corporation of New Jersey*, 64 Atlantic Reporter, 972, is a usual appendage of a street car, intended to promote the safety of travelers upon the highway. In some states it is required by statute. Whether the street railway company shall have a fender at one end only or at both is a matter of detail in the construction of its cars, which ought to be left to the reasonable judgment of the managers. It may reasonably be thought advisable to have fenders at each end rather than a movable fender, to be transferred from one end to the other, as necessity requires. Whether a rigid and immovable fender is likely to serve the public safety better than a movable fender is also a matter upon which men may reasonably differ. It may well be that a rigid fender will better serve the purpose intended than a movable one. So, too, the company may fairly think that the danger of a fender becoming loose and falling, in case it is fastened up, is greater than the danger to be apprehended from a fender that is always down. It is bound to the exercise of a reasonable judgment and of due care and skill, but it is not to be condemned as negligent merely because the event that happened would have been avoided if its judgment had been different.

In this case the plaintiff, a passenger on a street car, alighted for the purpose of taking another car, and in passing to the rear of the first car came in contact with the chain running down from the rear dash to the end of the fender, and was injured. The fender, contrary to the usual custom as to rear fenders, was down. The court holds that the facts did not justify an inference of negligence on the part of the street railway company.

News of the Week

Louisville Strike Is Settled.

By a unanimous vote on the evening of March 14, the striking employes of the Louisville (Ky.) Railway Company resolved to accept the terms agreed upon by their executive committee and the officers of the company. The strike became effective at 5 o'clock on the morning of March 10, and 800 employes participated in it. The terms of settlement provide for an increase in wages from 18 to 20 cents an hour for new men and wages of 22 cents an hour for all employes after the first year, 25 cents an hour for overtime, 30 minutes for lunch, the men to be restored to their positions, and, for the company, an open-shop policy in the hiring of new men. The executive committee which represented the strikers did not secure the establishment of a closed-shop policy or recognition for the union. It was agreed that if future differences arise they will be settled by arbitration. The strikers created riots, and the settlement was due partly to the efforts of commercial organizations in the city and representatives of the Greater Louisville Exposition.

Plans for a Municipal Street Railway in Detroit.

Mayor Thompson of Detroit is said to be forming plans for a semi-municipal three-cent fare street railway company to be organized on the plan of the Municipal Traction Company of Cleveland, to gain a foothold in the streets of Detroit and to take over the lines now operated by the Detroit United Railway as fast as that company's franchises expire. He has made no definite announcement of the details of his plans, but he has been in conference with Mayor Johnson of Cleveland in regard to the matter and on March 11 stated to the city council that a syndicate was ready to guarantee to pay the Detroit United Railway a 10 per cent advance on the cost of any track extensions made by the company without a city franchise. When questioned recently as to his plans Mr. Thompson refused to show his hand but quoted the following paragraph from his inaugural speech: "If an equitable adjustment is not possible, capital is ready and willing to build all lines in the city of Detroit, and take over and occupy existing grants as they may expire and upon terms far more favorable than any heretofore offered. The strongest position for the city to occupy and the one most likely to lead to a reasonable and right settlement of this question will arise when there exists a rival company to test the claims of the existing company by the law of competition."

Single Fares on Connecting Systems.

A broad decision on the question of allowing a single fare within the limits of a city traversed by two separate but connecting street railways was rendered recently by the railroad commission of Massachusetts. Citizens of Walden petitioned for a 5-cent fare for rides within the city limits, although these rides involve parts of two distinct systems, the Boston & Northern Street Railway and the Boston Elevated Railway.

The board states that the serving of one of the important thoroughfares of the city in part by one system and in part by the other has been a barrier to the enjoyment of a single five-cent fare between all sections, but that the same conditions exist at nearly all other points where interurban railways connect with the system of the Boston Elevated Railway Company. The peculiar privileges granted to that company under the acts of 1897 include the right to insist upon a five-cent fare from every passenger, a right that stands in the way of any arrangement for a joint fare to be shared with other companies. The board states that it has no authority to suggest that the Boston Elevated relinquish a part of the fare to which it is entitled by law; that it cannot rightfully ask the Boston & Northern to render services without compensation, and that it has no jurisdiction over the extensions of railway lines or changes in the control or ownership of such lines. Under these circumstances no action is open upon the complaint which will afford the complainants the facilities which they desire.

Henry Loomis Nelson on Municipal Ownership.

"Should Municipalities Both Own and Operate All Public Utilities?" was the subject of a debate held on March 10 at the New Rochelle, N. Y., under the auspices of the People's Forum of that city. Martin W. Littleton, ex-borough president of Brooklyn, said that they should, while Henry Loomis Nelson, who is now filling the chair of political economy at Williams College, contended that municipal ownership had been a failure wherever tried, in this country or abroad. Mr. Nelson asserted in his argument that the world had prospered and grown to what it was by individual effort, and that the great incentive to thoughtful men was the profit that they might reap as the fruit of their genius or industry. The question that everyone must put to himself, he said, was whether "we are prepared as yet to drive out the individual from business by taking away his incentive." He continued:

"Are you going to take the management from him and are you going to begrudge him a fair profit and pass it over to the average man of the community? Are you going to go very far if you give it to the average man? In your railroad service, your street railway transportation and transportation by water, your telephone service and all other such important public necessities—is the average man going to take those enormous chances which the exceptional man has ever taken in this country? It is the exceptional man who has built up large communities long before they could have otherwise been built up. It is the exceptional man who makes homes for the workingman better than they

could otherwise have had. What is the real outcome of municipal ownership? Mayor Johnson recently put it right when he said 'free rides.' The majority of the voters of all large cities are non-taxpayers, and if the municipal ownership idea is adopted they will always have the power to compel the taxpayers to give them free rides, free lights, free telephones, etc. Such a condition will be the ultimate outcome of municipal ownership. If the public utilities operated by the municipalities fail to make their running expenses and meet interest on bonds, the deficit will always have to come from the pockets of the taxpayers."

Cleveland Traction Situation.

The negotiations between Presidents Andrews and Du Pont of the Cleveland Electric and Municipal Traction companies are so near a conclusion that it is believed an agreement or disagreement will be arrived at within a few days.

It is now nearly two months since the temporary peace agreement was made and all of this time has been consumed in making up a detailed inventory of Cleveland Electric physical and franchise values. Since the negotiations were commenced both sides have made important concessions and have completely reversed their respective attitudes toward important points involved. These changes in front have been largely due to revelations made in the inventory of physical values. During the past few days there has been a great deal of work done on the valuation figures at the city hall. It is stated that the figures of the Cleveland Electric experts are being minutely checked up under the supervision of the mayor.

Mayor Johnson has declared that a number of reports as to physical valuation and unexpired franchise values circulated within the past week emanated from persons whose efforts have been in the direction of bulging the stock of the Cleveland Electric Railway. He said the reports came from speculators and added that constant spreading of these rumors would tend to delay a settlement of the street railway question.

"This rumor business and stock manipulation is not sanctioned by the principal officers of the Cleveland Electric Railway," said he. "Such stories certainly are not helping progress toward a settlement. Instead they are really serious obstacles to an agreement."

"The men who are doing the negotiating are patiently and painstakingly working out their problem, which is a most complex one. There is a deliberate attempt on the part of somebody to unload stock on innocent people, who are lead to believe that there will be a settlement within a few days on prices much higher than the market one week ago. Such belief is based on groundless rumors. There is not the slightest chance of a settlement on anything like the market prices today."

It is now stated that besides determining on the valuation of the property the conferees are arranging the terms of the lease to the Municipal Traction Company and that City Solicitor Baker is preparing the security franchise under which the street railway lines will revert to the Cleveland Electric Company if the holding plan should prove a failure.

Legislation Affecting Electric Railways.

California.—The assembly has passed a bill authorizing boards of supervisors, city councils and other governing bodies of municipalities to grant franchises to interurban and street railways for carrying freight on their lines.

Illinois.—A bill has been introduced in the house to require all electric railways to do away with the third rail or overhead trolley systems and substitute the underground contact system.—The committee on municipal corporations has taken favorable action on a bill limiting the service of street railway employes to ten hours a day and providing that the ten hours employment must be had within a period of twelve consecutive hours.

Iowa.—A bill is now before the house that provides that city railways shall allow interurban railways the use of their tracks, power and terminal facilities to enter the city, the amount of compensation to be fixed by the state railroad commission in case of a disagreement between the companies.

Massachusetts.—Several bills have been introduced to amend the so-called "interurban" law of 1906, requiring electric railway promoters to secure location consents from local communities before applying to the railroad commission, and fixing the obligations for damages to property caused by elevated structures.

Minnesota.—The house committee on express, telegraph and electric lines has recommended for passage a bill giving the state railroad and warehouse commission power to make reasonable rules and regulations for the operation of electric railways in any village, city, town or county in the state of Minnesota. An amendment has been added to the original bill, at the suggestion of the city attorneys of Minneapolis, St. Paul and Duluth, to the effect that the railway and warehouse commission shall not take away any of the power at present vested in any municipality for the regulation of street cars, or that may be vested in home rule or special charters.

Nebraska.—The bill permitting the city railway companies to own and operate interurban lines has been passed by the senate and approved by the railroad commission of the house. Several amendments have been added.

New Jersey.—A bill in the house fixes electric railway rates as follows: Not more than five cents for every ten miles; transportation coupons or tickets to be sold as follows: 25 tickets, \$1; 50 tickets, \$1.75; 100 tickets, \$2.50; larger amounts at the rate of the 100-ticket book. Each coupon thus sold to entitle the holder thereof to one ride not exceeding 10 miles. Each cash fare or coupon shall entitle the bearer to transfer to any other line owned, leased or operated by the same company, and shall be good for one hour at the junction point.—Another bill amends the corporation act so that two of the three incorporators shall be residents

of New Jersey; limits the period of duration to thirty years; authorizes all absent stockholders to vote at all meetings by proxy in writing; that all property in payment for stock must be clearly described and, if real property, must be located; if any part of stock is issued for services or expenses such services or expenses must be described in detail; provides a new method of changing corporation's business or its name, or increasing or decreasing capital stock, etc.

New York.—Attorney-General Jackson has introduced a bill providing that no more than a 5-cent fare shall be charged within the corporate limits of a city or town for a continuous ride on any railroad, on branches, or leased lines, or connections of such road.—The so-called "public utilities bill" championed by Governor Hughes was introduced in both houses of the legislature last week. The act creates one public utilities commission for New York city and another for the remainder of the state. Each is to be composed of five members, who are to receive \$10,000 each per year. The New York city commission is given all the powers of the present rapid transit commission and many additional ones, including control of all common carriers operating exclusively within its jurisdiction and of those portions of other railways within the limits of the city, and also of all gas and electric corporations. Both passenger fares and freight rates may be regulated by the two commissions in their respective jurisdictions, and they have power to compel adequate service to be given. All mergers are prohibited unless consented to by the commissions. Present holdings of stocks of public service corporations by stock companies are not interfered with, but no new holding companies are permitted to be formed. The fines for disobeying the orders of the commissions range from \$1,000 to \$50,000, and officers and employes of quasi-public corporations, as well as shippers and others who violate the law, may be held guilty of a misdemeanor. The governor is empowered to appoint both commissions.

Ontario, Canada.—A bill has been introduced in the legislature to permit the Port Arthur Electric Street Railway Company, which is owned by the municipality of Port Arthur, to operate its cars on Sunday, within the limits of the city and as far as the limits of Ft. William.

Pennsylvania.—Forty-eight different bills affecting electric and steam railroads have been introduced in the senate and house. The house committee on electric railways has reported favorably on bills giving electric railways the right of eminent domain and the right to carry freight, also bills permitting cities and traction companies to enter into contracts and requiring the consent of local authorities before charters are granted to passenger railways.—The Hall bill, prohibiting steam railroad companies or their officers or directors to own a part or controlling interest in the stock of a parallel street railway line was reported out with a heavy penalty clause attached.—The Dunsmore bill creating a state railroad commission was reported with several changes, providing for five members with salaries of from \$5,000 to \$6,000 annually.—A bill introduced by Representative Edward H. Fahey of Philadelphia permits municipalities, boroughs and townships to have representation in the directorates of electric railways. This is to provide for the reorganization of the Philadelphia Rapid Transit Committee, according to the plan of the retail merchants' association.—Other bills include the following: Providing for the construction of bridges over or under street railroads where a public highway is about to be opened which intersects or will intersect a railroad and the township in which it is reasonably unable to bear the expense to be erected as county bridges.—Requiring that all street cars be provided with vestibules in cold weather.—Requiring street railway companies to furnish seats for every passenger or to collect only half fare.—Requiring suburban trolley cars to be equipped with toilets and water closets.—Requiring steam and electric railways to report the number of statute miles operated by them.—Requiring township assessors to assess all traction engines, motor cars, automobiles, trucks and vehicles propelled by steam, electricity or other motive power.—Authorizing municipal authorities to compel railroads to erect safety gates.—Forbidding railway companies to lease or purchase the franchises of or own stock or in any way control a parallel or competing street railway line.—Forbidding officers of any transportation company from holding stock in any competing lines or from being officers thereof.

Texas.—Governor Campbell has signed the bill granting to interurban railroads the right of eminent domain. The bill was intended to facilitate the building of the line from Houston to Galveston, in which Stone & Webster of Boston are interested.

Washington.—Both houses have passed a bill authorizing the city of West Seattle to sell its municipal street railway to the Seattle Electric Company.

Progress of Subway Plans in New York.

The rapid transit commission will begin advertising on March 15 for bids for the construction of the first section of the subway to connect the Manhattan terminals of the Williamsburg and Brooklyn bridges. Sealed bids will be received until noon of April 11. The time for opening bids will be fixed at a meeting of the board on that day. The board will bind itself to make the award to the successful bidder within 10 days after the opening of the proposals.

The bridge loop is to be built by the city and to be controlled by the city. This is to enable the municipal authorities to give access to the tunnel to the Brooklyn Rapid Transit Company as well as to a Manhattan railroad system. The contracts for the operation of the tunnel will not be let until after it has been finished. The section for which bids will be asked on Saturday will extend under Centre street from Pearl to Canal. As this will be more difficult to build than the second section from Canal

street to Williamsburg Bridge, there will be no hurry on the part of the commission to ask for bids for the second stretch.

The bidder to whom the contract is awarded will have to deposit \$300,000 security and must complete the section within 21 months. If the work is completed in 18 months a bonus of one per cent of the unexpended balance due to the contractor from the city will be paid. It is estimated that this will be about \$15,000. The plans call for a four-track subway in Centre street and two tracks under Walker and Canal streets when the turn to the east is made. There is to be a station between Leonard and White streets.

Pipe galleries are to be laid, but for this work separate bids will be asked for. The advertisement will state that the manner of construction shall be by the "cut and cover" method, so far as Centre street is concerned, but in Walker and Canal streets the opening excavation process is to be permitted.

The commission awarded on March 11 the contract for the printing and engraving of 500 copies of each of more than 350 detailed drawings of plans for the Lexington and Seventh and Eighth avenue subways and the loop line connecting the Manhattan terminals of the East river bridges. Bids for the construction of all these routes will be advertised for simultaneously. Final action on the Seventh and Eighth avenue lines cannot be taken until after a statutory public hearing on the form of contract. This hearing has been fixed for March 25. The contract will then be passed upon by the board of estimate at its meeting on March 28 and it is expected that about a week later the advertising for bids will begin. The advertisements must appear for six weeks and by about the middle of May the commission will be able to award the contracts.

Street Railway Association of the State of New York.—The next regular meeting of the New York association will be held the latter part of June at Bluff Point, N. Y.

Annual Meeting New England Street Railway Club.—John J. Lane, secretary, Boston, Mass., announces that the annual reception and dinner of the New England Street Railway Club will be held on the evening of March 28 at the Hotel Somerset, Boston.

Oklahoma Electric Light Railway & Gas Association.—The first meeting of the newly organized Oklahoma Electric Light Railway & Gas Association will be held on April 22 and 23 at Oklahoma City. Charles W. Ford, of Oklahoma City, is secretary. The programme has not yet been announced.

Electric Road Gets Mail Contract.—The Houghton County Street Railway of Hancock, Mich., has taken a contract to carry United States mail between the Houghton and Hancock postoffices and Franklin Mine and Demmon. The service will begin on March 18 and will include a delivery of mail each way twice daily.

Physical Examination for Trainmen.—The Fort Wayne & Wabash Valley Traction Company has adopted the system of physical tests which is in vogue on all the principal railroad systems of the country. Dr. M. H. Thomas of Huntington has been employed to make the tests and all of the trainmen of the company will be required to submit to the examination.

Proceedings of Iowa Association Issued.—The proceedings of the third annual convention of the Iowa Street and Interurban Railway Association, held at Des Moines, Ia., on April 19 and 20, 1906, have been issued. The principal paper is that by Mr. F. W. Hild of Chicago on "The Gasoline Car for Interurban Service," which contains exhausting and interesting data as to the cost of operation and maintenance of different types.

Freight Interchange Agreement in Massachusetts.—The Old Colony Street Railway of Boston, Mass., and the Brockton & Plymouth Street Railway of Plymouth, Mass., have effected an agreement for the interchange of freight and express, which went into effect on March 4. By this arrangement shippers along the lines of the extensive system of the Old Colony company will have easy access to the towns between Brockton and Plymouth.

The Question of Municipal Ownership.—Mr. R. W. Hutchinson, Jr., whose technical work, "Long-Distance Electric Power Transmission," has just been published by the D. Van Nostrand Company of New York, has an article in the March issue of Public Service on "The Question of Municipal Ownership," in which publicly owned utilities are heavily scored. Mr. Hutchinson is on the staff of the National Brake & Electric Company of Milwaukee.

Value of Creosotes.—The forest service of the department of agriculture announces that it has investigated by chemical analysis the qualities of different creosotes used for preserving timber and a detailed account of the methods employed and the results obtained are now published. Those who desire the publication should ask for "Circular No. 80—Fractional Distillation of Coal Tar Creosote," and requests should be made to The Forester, Forest Service, Washington, D. C.

Ten Fares for a Quarter for School Children.—The Citizens' Railway Company of Lincoln, Neb., has recently put on sale a new form of tickets for school children, at the rate of 10 rides for 25 cents. The tickets are not transferable and are good only on school days and at stated hours. In order to secure the tickets, the pupil and parent sign a statement that the ticket is to be used exclusively by the pupil and the principal of the school attended certifies to the correctness of the statement.

Service Ordinances in St. Paul.—The St. Paul, Minn., assembly has passed the three ordinances passed by the board of aldermen on March 5 providing for increased service by the St. Paul City Railway, which is controlled by the Twin City Rapid Transit Company. One of the ordinances directs what service shall be main-

tained during rush hours on ten of the principal car lines of the city. The others order the building of a new line and the operation of a loop line at the terminus of the Maria street line.

Paper Car Wheels for Detroit.—It is reported that the management of the Detroit United Railway will equip several of its cars with a patented car wheel, of which the axle collar and tire are of cast steel and the space between of many thicknesses of paper, held by bolts and iron side pieces. The principal object of the test is to ascertain whether these wheels possess the qualities of noiselessness that have been claimed for them, as there has been considerable protest by the city authorities of Detroit recently against the noisy cars.

Shelters Under Boston Elevated Stations.—The Massachusetts railroad commission has recommended to the Boston Elevated Railway that it erect shelters under the elevated stations at City square and Thompson square, Charlestown, to protect passengers waiting to transfer onto the surface lines from rain and snow. The recommendation provides only for a temporary overhead covering because when the Washington street subway is completed it is contemplated lengthening the elevated station platforms because the length of the trains is to be increased from five cars to eight.

Car Stops at Street Crossings.—After a week of experimenting with a rule requiring motormen to stop all cars at both the near and far sides of street crossings the Philadelphia Rapid Transit Company on March 8 issued an order that the rule would be discontinued on March 11 and that cars would stop hereafter only on the near side to receive and discharge passengers. An exception is made at streets occupied by double-track railroads, where the cars will stop on both sides. The rule requiring stopping at both sides of the street seriously delayed the cars and caused many complaints on the part of both the public and the employees.

Employees' School at Youngstown.—M. E. McCaskey, second vice-president and general manager of the Mahoning & Shenango Railway & Light Company, which operates the city lines of Youngstown, O., and other towns in that vicinity, has instructed General Superintendent G. J. A. Paul to open a school for conductors and motormen at Youngstown. The public has been requested to report to the management full particulars of any cause for complaint in the conduct of the employees, and these cases will be taken up in the class-room, where the men are to receive instructions both in the handling of cars and in their relations to the public.

Massachusetts Merger Suit.—W. S. Slocum has been appointed master in equity to hear the suit brought by Attorney-General Malone of Massachusetts several months ago against the New York New Haven & Hartford Railroad Company for an injunction to restrain the company from further using the franchises or guaranteeing the bonds of street railway companies. It is charged that the company, in violation of the law passed by the 1906 legislature, owns and controls, directly or indirectly, the Worcester & Southbridge, the Worcester & Blackstone, the Worcester & Webster and the Springfield street railways, and that it guarantees the payment of bonds and dividends of those companies.

A New Engineering Course at the University of Illinois.—A railway engineering and administration course has been established at the University of Illinois, which no doubt will supply the long standing demand for instruction on railway subjects. The small bulletins which have just been sent out and which can be obtained by writing to the registrar of the university, explain the course briefly and show some interesting photographs of the test cars and test locomotives which are at the disposal of the students. These cars which have been built especially for test purposes are of standard design except for the interior, which has been equipped with all the instruments necessary for making tests of any description. W. L. Pillsbury is registrar, Urbana, Ill.

New Bi-Monthly Mining Journal.—The incorporation of the Canadian Mining Review with the Canadian Mining Journal has been announced by the publishers, the Mines Publishing Company, 171 St. James street, Montreal, Que., with branch offices at Halifax, Victoria, and London, England. The first issue of this paper has been received and contains a large number of excellent articles on mining, metallurgy and allied arts. Besides a staff of able editors, a large staff of special contributors has been secured, which contains the names of most of the prominent mining engineers and metallurgists of Canada. Among the many excellent contributions of the first issue are: "Mines and Mining at Cobalt," by Willet G. Miller; "Western Coal Resources," by J. C. Gwillim; "Recent Developments in Metallurgy," by S. F. Kirkpatrick; "Iron Mining in Northern Ontario," by H. B. Willmott."

New Type of Fender.—F. I. Fuller, manager of the Portland (Ore.) Railway Company, appeared recently before the special fender committee of the Portland city council and requested that no action be taken by the body until the company had time to experiment with a type of fender that is now being constructed. Mr. Fuller said that he believed the fender he had in mind would be practical and that it would be superior to the one now in use. The committee granted his request and adjourned to meet again at the call of the chairman. The new fender in which Mr. Fuller has faith is a double one, and if it works as is planned it will be almost impossible for a street car to run over a person lying on the track. If an object struck by a car is not caught by the first fender but instead passes beneath it, the second fender will fall to the ground to act as a scoop, the device acting automatically.

Construction News

FRANCHISES.

Atlantic Highlands, N. J.—The New Jersey Traction Company has applied for a franchise to build an electric railway in Atlantic Highlands from the pier to connect with the main line.

Augusta, Ga.—The Augusta Railway & Electric Company has made application for permission to lay a single-track line and operate freight and passenger cars on certain streets in Augusta. One object of the company is to connect the line on Reynolds street with the new freight and express warehouse which it proposes to erect at 757 Broad street.

Brazil, Ind.—The Indianapolis & Western Railway has applied to the board of commissioners to build its road from the eastern line of the county to Harmony, Ind., and from there to the eastern city limits of Brazil. It is stated that the commissioners will demand a rate of 1 cent a mile between Brazil and Greencastle and between Brazil and Terre Haute as one of the provisions of the grant. Final action will be taken next Tuesday. C. C. Reynolds, general manager, Indianapolis.

Burlington, Wis.—A franchise has been granted to the Milwaukee Light, Heat & Traction Company for an extension of its suburban line through Burlington.

Cheektowaga, N. Y.—The Cheektowaga Railway Company, recently incorporated in New York with a capital of \$75,000, has been granted a 50-year franchise to construct its line through this town. The line will run from Clinton street and the city line of Buffalo to the intersection of Lawson road and the Transit road by way of Cheektowaga, about 6 miles, and will be double-tracked part of the way. The proposed line will serve the New York Central's gravity yards which are to be built in Cheektowaga and will cross the yards on an overhead structure 2,000 feet long. A certificate of necessity soon will be applied for and it is stated that New York contractors have been asked for bids on the construction of the road. Charles L. Williams, William H. Kinch, Edmund L. Ryan and others are interested.

East Aurora, N. Y.—A franchise has been granted to the Buffalo Southern Railway for a line from Main street in Buffalo to East Aurora.

Fremont, O.—A franchise has been granted to the Fremont Belt Line Railway for a belt line in Fremont and a line from there to Port Clinton. It is stated that the owners of the Toledo Port Clinton & Lakeside Railway are back of the project. Col. Webb C. Hayes of Fremont, is interested.

Greenfield, Ia.—The American Electric Railroad Company, which will build an interurban line from Des Moines to other points in Iowa, has asked for a franchise to build and operate an electric line in Greenfield, reserving the right to use steam or gasoline for construction or wrecking trains only. The line must be completed by March 1, 1909, or the franchise will be void. A special election will be held on March 19 to vote on the question. C. W. Baker, Des Moines, Ia., president.

Lincoln, Ill.—The Springfield & Northeastern Traction Company has applied for a franchise to enter Lincoln on Chicago street and to build its line over certain other streets. This is part of the line that is contemplated to Peoria by way of Pekin or Mackinaw. It is stated that a large car barn will be located in Lincoln at the south end of Chicago street; also a freight house to care for the freight traffic will be erected. Final consideration of the franchise will be given at the meeting of the council next Monday. L. E. Fischer, Danville, Ill., general manager.

Menominee, Wis.—The Chippewa Valley Electric Railroad Company has accepted the franchise recently granted by the council for right to lay its line in that city. A light and power franchise also has been granted, acceptance of which the company has under consideration.

Nauvoo, Ill.—The Mississippi Valley Electric Railway will make application at the meeting of the city council on March 25 for a franchise to build its line through Nauvoo. It is stated that the company is ready to deposit \$25,000 with the city as guarantee of its intention to build the road.

Newark, N. J.—The Morris County Traction Company is seeking permission to lay a double-track line in Milburn avenue from the corner of Main street to the Maplewood line. It is stated that work will be started as soon as possible and the line probably in operation by summer.

Oshkosh, Wis.—The Winnebago Traction Company has applied for a franchise to operate interurban cars in Oshkosh and do a general passenger, freight, mail and express business. In return the company agrees to inaugurate a commutation system of transfers between the city and interurban lines, and, beginning in March, 1910, will pay the city \$300 a year for the grant, provided an extension of its line from Omro to Berlin is in operation by that date. Action has been referred to a special committee appointed to confer with the city attorney regarding the high-tension transmission lines.

Tampa, Fla.—The county commissioners have granted a franchise to J. Craig Phillips, former county attorney, James N. Holmes and C. B. Ware, for a line from Tampa to St. Petersburg and Clearwater. The road will begin in Armenia avenue, West

Tampa, and will run through the western portion of the county to Clearwater, about 30 miles. At some point near Seven Oaks it is proposed to build a spur of the road to St. Petersburg. Work must begin within 18 months and be completed inside of five years. It is stated that the question of whether it shall be an electric line or an automobile system has not yet been determined.

Tiffin, O.—The Cleveland & Indianapolis Interurban Railway is seeking permission to enter Tiffin on Market street and extend its line from the western to the eastern limits of the city. The franchise calls for a 25-year term and a general freight, passenger, mail and express business. Before commencing work \$10,000 must be deposited as a guarantee of good faith. The company has until March, 1910, in which to have the line in operation.

Vallejo, Cal.—The Vallejo & Northern Railway has secured permission from the board of trustees to cross certain streets in the northwestern part of the city and to lay tracks over the tidelands along the city front.

RECENT INCORPORATIONS.

Indiana Punxsutawney & Sagamore Street Railway.—Incorporated in Pennsylvania to build a 35-mile electric line in Indiana county. Capital stock, \$210,000.

Orrville Doylestown & Barberton Railway.—Incorporated in Ohio to build an interurban line between Barberton and Orrville, touching the towns of Doylestown, Easton, Marshallville, Hametown and Johnson's Corners. Right of way will be secured by a committee appointed for the purpose and it is stated that the franchise of the Barberton Wadsworth & Western and one granted to another proposed line between Barberton and Doylestown some time ago, will be purchased by this company. Capital, \$50,000. Incorporators: J. B. Meech, Dr. A. E. Stepfield, John W. Zimmerman of Orrville; John W. Hartel and George Landis, Doylestown.

Roanoke (Va.) Traction Company.—Incorporated in Virginia to build a street railway in Roanoke. Capital, \$40,000. Incorporators: C. Markley, president; C. G. Cannaday, vice-president; M. A. Riffe, J. T. Bandy, B. B. Dillard, R. C. Camp, G. R. Paris and J. A. Staff, all of Roanoke.

Salem Street Railway.—Incorporated in Ohio with a capital stock of \$10,000. Incorporators, W. M. Baldwin, George Lomitz, F. Williams, F. H. Fowler and F. P. Shellhorn. This is a subsidiary company of the Youngstown & Ohio River Railroad to which the latter's franchise to operate on Broadway may be transferred if the injunction suit now pending in the circuit court stands. The Youngstown & Ohio River Company has acquired an old street railway franchise on that street, and the suit was brought by the city to restrain operation under it because the company is chartered as a railroad.

Squirrel Hill Street Railway.—Incorporated in Pennsylvania to build an electric line in Pittsburg in Boundary and Joncaire streets, Woodlawn avenue, Northumberland street and Dennison avenue, 2½ miles. Capital stock, \$15,000. Incorporators: M. J. Hosack, president, Roger Knox, James M. Magee, Charles K. Robinson and W. D. McBryan.

Syracuse & South Bay Electric Railroad.—Incorporated in New York to build an electric line from Syracuse to South Bay, N. Y., on Oneida lake. Capital stock, \$1,500,000. Incorporators: A. K. Hiscock, William Nottingham and C. A. Lux, Syracuse, N. Y.

Toledo & Defiance Railway.—Incorporated in Ohio to build an electric line in Lucas, Fulton, Henry and Defiance counties. Preliminary surveys for the line were made several months ago by Riggs & Sherman of Toledo and soundings for a bridge over the Maumee river at Defiance also have been taken. This is one of three projected interurban lines between Toledo and Defiance, the other two being an extension of the Toledo & Indiana from Delta to Defiance and the other the Cincinnati Toledo & Detroit Short Line. It is said that grading for the latter line will commence as soon as the frost is out of the ground. Capital stock, \$10,000. Incorporators, Clem V. Wagner, M. I. Brown, M. O. Topuiff, H. C. Ehlert and C. V. Ferson, all of Toledo.

TRACK AND ROADWAY.

Asheville Rapid Transit Railway.—C. E. Van Bibber, vice-president and general manager, 60 Wall street, New York, writes that this company has purchased the Asheville Loop Line Railway, 3 miles long, and will build a line from Asheville to Overlook Park, 8 miles, to operate in connection with the loop line. Five miles have been graded. The overhead construction will be of the span type. The Railways Construction & Securities Company has the contract. Overlook Park, the objective point of the new line, is a large recreation park overlooking Asheville and the surrounding country at an altitude of nearly 3,000 feet, and is fitted up with a casino, dancing pavilion, and the usual amusement park features. J. K. Vochell, Baltimore, Md., is president. Headquarters, Asheville, N. C.

Aurora Elgin & Chicago Railway.—It is reported that the Yorkville line is to be extended to Plano and Sandwich, Ill., and that work will begin as soon as the right of way can be secured.

Bellingham, Wash.—Stone & Webster of Boston will soon begin the construction of an electric railway from Bellingham to Skagit county towns, for which surveys are now being made. S. L. Shuffleton will be the engineer in charge.

Boston, Mass.—The Boston Transit Commission has awarded

the contract for constructing the entrances and exits to the Washington street tunnel for \$20,592. A contract for furnishing 185 tons of steel and iron for section 6 of the tunnel has been awarded to the Eastern Bridge and Structural Company.

Boyetown & Pottstown Railway.—The contract for grading, concrete work and bridges on the line from Pottstown to Swamp, Pa., has been let to Fine & Harris, of Philadelphia. The contract for the bridges and steel work, including two 70-foot plate-girder bridges and one 460-foot plate-girder bridge, has been sublet to the McClintic-Marshall Construction Company. The rails will be 75-pound. All contracts for material have been let. Thomas K. Bell, of Philadelphia, chief engineer.

Buffalo & Lackawanna Traction Company.—This company, which some time ago secured a franchise for an electric railway from the Hamburg turnpike at the city limits of Buffalo to Lafayette square, has begun construction work in the city. J. C. Calisch of Buffalo, general manager.

Chicago South Bend & Northern Indiana Railway.—It was announced at a recent meeting of the board of directors that more than \$1,000,000 will be expended in improvements and extensions to the South Bend system, by this company which recently took over the Northern Indiana Railway. Plans were formulated for the improvement of Spring Brook park in South Bend and for the establishment of a new resort at Chain Lakes, about 6 miles west of the city. Arrangements were also made for forestalling the movements of the Chicago Lake Shore & South Bend Railway, which is building a competing line from South Bend to Chicago, by ordering the necessary material and equipment for the Murdock line at once.

Cincinnati Northern Traction Company.—A contract has been let to J. C. Carland of Toledo, O., for grading and bridge work on 9 miles of new line between Middletown and Hamilton, O. Contracts for 70-pound rails and tracklaying are to be let in a few days. C. A. Alderman, chief engineer, Hamilton, O.

Cincinnati Toledo & Detroit Short Line Railroad.—It is reported that this company has purchased all the right of way owned by the People's Rapid Transit Company between Cincinnati and Toledo, O., and that contracts have been let for the line between Toledo and Defiance. J. M. Morgan of Toledo is president.

Cleveland Alliance & Mahoning Valley Railway.—Work is to begin at once on the branch from Ravenna to Warren, O., 20 miles, and two steam locomotives have been ordered for construction purposes. The main line will extend from Cleveland to Ravenna and Alliance and the section from Ravenna to Bedford is to be completed this year. B. M. Frink, Salem, O., chief engineer.

Cleveland, O.—M. B. Excell, of this city, is interested with others in a project to build an elevated railway system approximately 5 miles long, from the Public Square. The plan contemplates making trackage arrangements with Interurban lines.

Coos Bay Gas & Electric Company.—It is reported that this company recently organized by Henry Hewit of Tacoma, Wash., Seymour H. Bell of Sumpter, Wash., and Louis Simpson of North Bend, Wash., will build an electric railway connecting North Bend, Marshfield and Empire City, Wash.

Corn Belt Traction Company.—Surveys are being made and right of way is being secured in the vicinity of Champaign for the proposed line from Champaign to Bloomington, Ill. H. C. Billingsley of Bloomington is interested.

Denver City Tramway.—At a meeting of the directors last week plans were adopted for the extensions to be undertaken by the company this spring and summer. Over a hundred men and teams have been put to work on the extension of the Eleventh avenue line on Madison street east of Congress park, and arrangements were made to begin work this week on the Sixth avenue line and the Eighteenth street line, which is a part of the line to Globeville to connect with the Colorado & Southern's new electric line now under construction. Construction work on the city line extensions is to be pushed this year as rapidly as possible and as much work is to be done as laborers can be found for. John A. Beeler, vice-president and general manager.

Elmira Corning & Waverly Railroad.—It is stated that construction work is progressing rapidly between Elmira and Waverly, N. Y., on this proposed line from Corning to Waverly, and that 1 mile has been graded out of Elmira toward Corning. The Powers & Mansfield Company of Troy, N. Y., has the contract.

Findlay-Marion Railway & Light Company.—Surveys have been made and right of way secured for this proposed line from Findlay to Marion, O., 47 miles, via Mt. Blanchard, Forest, Marselles and Cochranton. R. P. Hankey, president, Findlay, O.

Galion Mt. Gilead & Delaware Railway.—T. E. Buck of Mt. Gilead, O., states that the work of securing right of way for this proposed electric line from Galion to Delaware is progressing rapidly.

Grafton, W. Va.—Rails have arrived and surveys have been made for one mile of street railway in this city, and surveys are being made for an extension.

Hamilton Grimsby & Beamville Railway, Hamilton, Ont.—At the recent annual meeting the extension of the road to St. Catharines was authorized.

Henderson Traction Company.—K. R. Battin, superintendent, Henderson, Ky., writes that this company will build two miles of city extensions this year. H. P. Barrett of Henderson, president.

Highland Grove Traction Company, McKeesport, Pa.—It is re-

ported that this company is planning to extend its lines from McKeesport to East Pittsburg. The extension is to begin on the road leading from North McKeesport to the Greensburg pike, reaching East Pittsburg via Dixon's Hollow. It will also touch Wilmerding and Turtle Creek. The terminal will be directly opposite the Westinghouse works at East Pittsburg. The company expects to have the line in operation by next fall. John Christy, McKeesport, general manager.

Huron & Ontario Railway.—It is reported that contracts are to be let by April 1 for the proposed lines from Toronto to Windsor and to Owen Sound. Surveys have been made and part of the right of way has been secured. The third-rail system is to be used. S. F. Kilgore, president; H. W. Middlemest, chief engineer, both of Toronto.

Illinois Valley Railway.—This company is beginning the construction of a line between Streator and Ottawa, Ill., and surveys are being made for a connection with Chicago from the terminus of the line at Seneca either by way of Yorkville and the Aurora Elgin & Chicago Railway or by way of Morris and Joliet and the Chicago & Joliet Electric Railway. This line will form part of the Chicago-St. Louis line of the Illinois Traction Company. H. E. Chubbuck, general manager, Ottawa, Ill.

Indianapolis Huntington Columbia City & Northwestern Railway.—Several carloads of rails have arrived and a force of about 40 men is employed in laying the track between Syracuse and Vawter Park, Ind. When this section is completed track will be laid from Syracuse north toward Goshen. The road will extend from Huntington to Goshen, 60 miles. D. L. Homer, of Syracuse, chief engineer.

Indiana Columbus & Eastern Traction Company.—Contracts have been let to J. C. Carland of Toledo for 31 miles of grading and concrete and steel bridges between Leipsic and Toledo, O., to complete the Lima & Toledo Traction Company's line, and for 45 miles of grading and bridge work from Lima to Bellefontaine, O. Other contracts, including those for 70 pound rails and tracklaying are to be let in a few days. Thomas Elliott of Cincinnati, O., consulting engineer.

Joplin & Pittsburg Steel Railroad.—Mr. W. O. Hands, manager and engineer, Joplin, Mo., writes that this company has constructed about a mile and a half of track in the city of Joplin, and that it contemplates building about 17 miles of track this summer. Surveys have been completed for lines running from Joplin to Webb City, Carthage, Galena and Carl Junction, about 48 miles in all. An amusement park called Tiff Cave is now being developed. Joseph J. Heim of Kansas City is president.

Kalamazoo Elkhart & South Bend Railway.—It is stated that grading will begin between Kalamazoo, Mich., and Elkhart, Ind., within 30 days.

Kennett & Coatesville Railroad.—G. H. Dodge, secretary, Kennett Square, Pa., writes that grading is to begin April 1 on this single-phase electric railway from Kennett Square to Coatesville, Pa., 12 miles, via London Grove, Upland, Doe Run and Modena. Surveys have been completed from Kennett Square to London Grove, 4½ miles, and surveys are in progress from the latter point to Coatesville. Current will be generated for transmission at 6,600 volts. The overhead construction will be of the catenary type, No. 0000 trolley wire being used. Mr. Dodge has the general contract for building and equipping the line. Contracts for cars and equipment, bridges and all material are to be let within 30 days. J. Walter Taylor of Kennett Square is president.

Lederachville & Pennsburg Electric Railroad.—This company will build an electric railway from Lederachville to Pennsburg, Pa., 30 miles. Right of way has been secured and surveys have been completed. W. C. Riffert, Dauphin, Pa., chief engineer.

Lewiston Brunswick & Bath Street Railway.—An official report states that this company, which has recently acquired the Augusta Winthrop & Gardner Railway, proposes to build lines from Lewiston to Mechanic Falls, Me., 10 miles; from Lewiston to Augusta, 20 miles, and from Augusta to Oakland, 20 miles. Grading is to begin on April 1. The overhead construction will be of the bracket type and 70-pound T-rails of Pennsylvania standard section will be laid. John R. Graham, Bangor, Me., president.

Louisville New Albany & Corydon Railroad.—J. G. White & Co. have completed surveys for this company's proposed electric line from New Albany to Corydon, Ind. McKinley Boyle of Corydon, president.

Memphis Street Railway.—A large amount of improvement work has been planned for the coming summer, much of it in the nature of extension of work already planned and partially completed. Work is now in progress on the South Memphis extension of the suburban lines, some extensions of the East End lines will be rebuilt and a number of other lines are to be repaired and reballasted. E. W. Ford of Memphis, general superintendent.

Middlesboro, Ky.—It is reported that a number of prominent coal operators of the Middlesboro district are considering the building of an electric line from Middlesboro to Hartranft, Tenn., 9 miles, touching a number of large mining towns.

Milner, Idaho.—Grading is now in progress for an electric railway from Milner to Gooding, Idaho, and it is reported that orders have been placed for 9,000 poles and sufficient ties and rails for completing the line.

Mississippi Valley Electric Railway.—This company, recently incorporated, proposes to build an electric railway from Carthage to Nauvoo, Ill., connecting with Keokuk and Ft. Madison, Ia., a

total distance of about 45 miles. Surveys are now being made. W. A. Calhoun of Buffalo, consulting engineer.

Missouri & Kansas Interurban Railway.—Mr. Fred O'Flaherty, chief engineer, Lawrence, Kan., writes that this company proposes to build a branch from Kansas City to Lenexa, Kan., 11 miles, via Rosedale, South Park, Merriam and Shawnee. Surveys have been completed and grading is to begin about June 1. This company now has a line between Kansas City and Olathe, and operates Strang gasoline-electric cars. A. F. Hunt, Jr., 15 Wall street, New York, president.

Mt. McKay & Kakabeka Falls Railway.—This company has made surveys and is securing right of way for a line from Ft. William to Kakabeka Falls, Ont., 30 miles. W. F. Hogarth of Ft. William is president.

Nashville & Columbia Interurban Railway.—The survey has been completed for this proposed line from Nashville to Columbia, Tenn., 45 miles, and engineers are now staking out the grade lines. H. H. Mayberry of Franklin, Tenn., president of the company, announces that the contract for constructing the road has been awarded to Patrick Hirsch of New York, who is now in Nashville preparing to begin work. When this part of the road is completed President Mayberry states that it will be extended from Columbia to Mt. Pleasant, 11 miles.

Newark, N. J.—The board of public works has instructed the city engineer to investigate and report on the feasibility of a subway on Broad and Market streets.

New York Northern Railway.—This company has been organized to build an electric road from Watertown to Oswego, N. Y. Foster P. Shines of Watertown, president.

Oklahoma City, Okla.—W. R. Silsby of Saginaw, Mich., is interested in a project to build an electric railway connecting Oklahoma City, Shawnee and Norman.

Oakland (Cal.) Traction Company.—This company has begun building a line to Alameda via East Oakland. A double track is being laid on Thirteenth street between Oak and Washington streets in Oakland.

Palestine-Corsicana Interurban Railway.—The surveyors have finished locating the line from Corsicana to Palestine, Tex.

Paris, Ill., Traction Company.—A contract has been let for building this company's line in Paris to Ralph Baum. An extension to Christman, 13 miles north of Paris, is being considered.

Peoria, Ia.—Citizens of this and neighboring towns are interested in a project to build an electric railway from Oskaloosa to Newton, Ia., via Peoria and Galesburg, and C. B. Judd, a civil engineer of Pittsburg, Pa., has been engaged to make estimates and surveys.

Pensacola Electric Company.—The line from Pensacola to Ft. Barrancas, Fla., 9 miles long, which has been electrified since the property was acquired by Stone & Webster of Boston, Mass., was formally opened on March 10.

Portland & Mt. Hood Railway.—The engineers have started on the final surveys for this road from Portland, Ore., to Mt. Hood, 46 miles. It is stated that the project has been fully financed and that construction will begin at once. The Portland terminal will be in the blocks surrounded by East Washington, East Oak, East Water and East Second streets. Tracks will be laid from the terminal grounds east on East Washington and East Oak streets to Sixth street; south to East Taylor street, east to East Twelfth street, south to Hawthorne avenue, east to Ladd avenue, south-east to Division street, east to the city limits, and from thence east through the rich agricultural district to the Sandy river, where the road will follow the Sandy river until the side of Mt. Hood is reached. A cog road will reach the peak of Mt. Hood. It is proposed to build a large hotel on the side of the mountain. M. G. McCorkle of Portland is one of the promoters.

Portland, Ore., Railway Light & Power Company.—An appropriation of about \$2,000,000 has been made for improvements this year, not including the new terminal station. Nearly a mile of new 72-pound rails has been laid on Dawson street, 2½ miles of 70-pound rail will replace the 40-pound steel on Union avenue north of Welder street and 2 miles of new road will be built from East Twenty-eighth and East Burnside street to Rose City Park, as well as other extensions.

Puyallup Valley Northern Transit Company.—It is reported that contracts have been let to the Engineering Construction Company of New York for building this line, which is part of a proposed line from Puget Sound to Spokane, Wash.

Redlands, Cal.—It is reported that W. F. Whittier of San Francisco will build a road from Redlands to Hemet, Cal., which was surveyed several months ago.

Rochester Corning & Elmira Traction Company.—The appellate division of the supreme court of New York has directed the state railroad commission to issue this company a certificate of public convenience for the construction of its road from Rochester to Elmira, N. Y., and W. C. Gray, chief engineer, will begin making surveys at once.

Rockford Oregon & Southern Railway.—A company with the above name is being organized at Oregon, Ill., for the purpose of building an electric railway in the territory between Rockford and Dixon, Ill., via Oregon. F. G. Jones of Oregon is interested.

Saginaw Owosso & Lansing Railway.—J. A. Thick, chief engineer, Owosso, Mich., writes that this line from Saginaw to Lansing, Mich., 64½ miles, has been surveyed and that grading will be-

gin this spring. The road will be built on a private right of way, all of which has been purchased, and 70-pound rails will be used. Maximum curvature, 6 degrees. John L. King of Syracuse, N. Y., president; Charles W. Baird, vice-president. Headquarters, Detroit, Mich.

Santa Ana, Cal.—S. H. Finley, of Santa Ana, has completed surveys and is securing the right of way for an electric railway from Santa Ana to Huntington Beach, 10 miles.

Selma Street & Suburban Railway.—It is reported that this company will build several extensions to new suburban points. F. M. Abbott, Selma, Ala., president.

Shore Line Electric Railway.—An official report states that this line has been surveyed from Stony Creek to Ivorton, Conn., 35 miles, passing through Guilford, East River, Madison, Clinton, Grove Beach, Westbrook, Saybrook, Essex and Centerbrook. Grading is now in progress between Ivorton and Saybrook, 12 miles. C. W. McChesney, New York, president, and A. William Sperry, New Haven, Conn., chief engineer.

Sioux City & Ireton Interurban Railway.—This company, which proposes to build an electric railway from Sioux City to Doon, Ia., about 57 miles, has secured about half the right of way, has 50-year franchises in Ireton, Doon and Rock Valley and has had a large part of its stock subscribed for. A trackage arrangement has been made with the Sioux City Traction Company for an entrance to the city from Leeds. S. A. Mitchell of Rock Valley, Ia., is president.

Southern Kansas Railway Light & Power Company.—It is reported that 15,000 ties have been shipped for the proposed lines connecting Parsons, Independence, Cherryvale and Coffeyville, Kan. H. F. Smith of St. Louis, engineer of construction, is now making surveys and it is the intention to begin construction in a short time in three directions out of Cherryvale. R. C. Rawlings, president, Chanute, Kan.

South Carolina Public Service Corporation.—The surveyors have completed the surveys for this proposed line from Charleston, S. C., to Aiken, Ga., where connection is to be made with the Augusta & Aiken Electric Railway for Augusta.

Spokane & Inland Empire Railway.—It is reported that this company has purchased an old right of way of the Oregon Railroad & Navigation Company from Colfax to Penewawa, Wash., and will build to Dayton and Walla Walla.

Springfield Clear Lake & Rochester Electric Railway.—The first section of this line from Springfield to Clear Lake and Rochester, Ill., was formally opened on March 11 when a party of officers and guests made the first trip from the corner of Fifth and Monroe streets in Springfield to a point about four miles from the center of the city. Regular service over this section has since been instituted. The grading is now almost completed between Springfield and Rochester and construction is progressing rapidly. Large quantities of ties and rails are on the ground and some track has been laid. It is now expected to have the entire line in operation by June 1. Power is rented from the Springfield Consolidated Railway, over whose tracks the cars enter Springfield, and the same company will furnish the cars until those that have been ordered are delivered. J. H. Melick of Rochester, Ill., is president.

Stroudsburg & Wind Gap Electric Street Railway.—J. B. Williams, president, Stroudsburg, Pa., writes that this company proposes to build an electric railway from Stroudsburg to Wind Gap, Pa., 14 miles, via Snyder'sville, Kellersville, Sciota, Saylorsburg, Ross and Common. Surveys have been completed, but the date of beginning construction has not yet been determined.

Tacoma Railway & Power Company.—The final surveys are now being completed for the branch from the main Seattle-Tacoma line $\frac{3}{4}$ of a mile east of Brookville, near Tacoma, to Puyallup, Sumner and Orting. A bridge is to be built across the Puyallup river. W. S. Dimmock, manager, Tacoma, Wash.

Tidewater Development Company.—President J. M. Dewberry of Birmingham, Ala., has received the report of the engineers, containing the profiles and other details of the proposed road from Gadsden to Tuscaloosa, Ala., and states that contracts will be let in a month or two.

Toledo Uran & Interurban Railway.—It is reported that this company proposes to extend its line from Findlay south to Bellefontaine, via Arlington, Dunkirk and Kenton, O. Charles Kilgour, Findlay, O., chief engineer.

United Traction Company.—It is reported that this company will begin on April 1 on the extension of the Broadway line in Rensselaer, N. Y. E. S. Fassett, general manager, Albany, N. Y.

Union Traction Company of Kansas.—Tracklaying on the line from Coffeyville to Independence, Kan., 20 miles, has been completed for 6 miles south of Independence and for 5 miles north of Coffeyville, to Jefferson, and the poles have been set for most of the distance. The right of way for the branch from Coffeyville to Cherryvale is nearly all secured and it is stated that construction will begin this week. D. H. Siggins of Coffeyville, president.

Union Traction Company.—This company, which operates about 15 miles of electric railway in Santa Cruz, Cal., and vicinity, will change its system from narrow to standard gauge. S. W. Coleman, Santa Cruz, general manager.

Utica Southern Railroad.—It is stated that this company will award contracts in April for building its line, which will connect Clinton, Hamilton, Norwich and Waterville, N. Y., 26 miles. Right

of way has been obtained and surveys made. F. H. Baxter, Utica, N. Y., chief engineer.

Vallejo & Northern Railway.—Melville Dozier, Jr., president and chief engineer, Oakland, Cal., writes that this company will begin grading this summer on a line from Vallejo to Sacramento and Woodland, Cal., 105 miles, via Cordelia, Suisun, Fairfield, Cement, Vacaville and Winters. Surveys have been completed from Vallejo to Sacramento, 58 miles, and from Winters to Woodland, 18 miles. Both the third rail and trolley systems will be used. T. T. C. Gregory, secretary; George S. Lackie, treasurer, both of Vallejo, where the offices of the company are located.

Vincennes Washington & Eastern Traction Company.—A. J. Padgett, attorney for the company, states that contracts have been let for the construction material and equipment for this line from Vincennes to Loogootee, Ind., and that work will begin about May 1 on the first section, from Vincennes to Washington. W. H. Schott of Chicago, president.

West Penn Railways, Connellsville, Pa.—It is reported that this company is making surveys for an extension from McKeesport to Glassville, Pa.

West Shore Traction Company.—This company, incorporated last October, has been authorized by the New York railway commission to build an electric railway along the Hudson river in New York from Tompkins Cove to Cartaret, 25 miles. Searing & Co., bankers, of New York city, are interested in the project.

Wilksburg East Pittsburg & Turtle Creek Street Railway.—This company has been securing right of way for the past several months and has now begun construction work on its line from East Pittsburg through Turtle Creek, Falls Hollow, Coalville and Mucklerat to Wilksburg, Pa. About two miles of tracklaying and overhead work has been completed at the western end beyond Mucklerat.

Yazoo City, Miss.—The city council has awarded to the Saunders-Johnson Company of Vicksburg, Miss., a contract to build a municipal street railway, 3 miles long, costing \$50,000, for which city bonds have been issued. The contractors take bonds in payment. The road is to be completed by July 1.

POWER HOUSES AND SUBSTATIONS.

Bloomington & Normal Railway & Light Company.—This company has been doing considerable work on its lines, which will tend to increase the schedule speed of the cars. An eight-foot cut has been made north of Salt Creek Bridge, which will also reduce the demand for power materially. A new sub-station has been erected at Magill, a siding about a mile and a half south of Clinton, and the old sub-station located at Johnson's siding has been moved to the siding at the county line north of Wapella.

Chicago Lake Shore & South Bend Railway.—A contract has been let to James E. Southard & Co., for all the concrete work foundations, etc., for the power house at Michigan City. The Westinghouse Electric & Manufacturing Company has the contract for the equipment.

Cumberland & Westport Electric Railway.—This company has broken ground for the erection of a new power house 30 by 90 feet. A 550-kilowatt generating set and boilers of 650 horse power capacity will be installed. H. R. DeWarren is president.

Freeport Railway Light & Power Company.—Mr. A. B. Goddard, general manager of this company, states that the contracts for all the machinery and for the installation of the machinery in the new power plant have been let.

Henderson Traction Company.—K. R. Battin, superintendent, writes that this company will install one complete additional unit in its power house at Henderson, Ky., and contracts are to be let for a 250-hp. boiler and a 125-kw. direct-current engine and generator.

Indianapolis & Louisville Traction Company.—It is reported that work on the power house of this company is progressing rapidly. Four of the six 300-horsepower boilers have been installed and it is expected that the cars may be running some time between April 15 and May 1, 1907. It is stated that the cost of the new power house and the equipment will be about \$297,000.

Indianapolis Crawfordsville & Western Traction Company.—The power house at Crawfordsville, which is being built by this company, is rapidly approaching completion. It is expected that the overhead work of the lines and the feeders will be completed by March 15, and the track ready for the through operation of cars by June 1, 1907, which has been set for the opening of the line.

Union Traction Company of Kansas.—Rapid progress is being made on the power house at Independence, Kan., and it is expected to be ready for operation by May 1. The building is 60 by 80 feet in floor area, with an addition 15 by 50 feet.

Winchester & Washington City Railway Company.—President S. H. Hansbrough and a party of officials of the company visited the large water power electric plant of this company, located at Millville, Jefferson county, West Virginia, for the purpose of inspecting the dam, turbines and machinery and to start the turbines in operation for the first time. S. L. Hoover, manager of the company, stated after the trip that everything was satisfactory and that the plant would be put in regular operation as soon as the transformers are thoroughly dried out.

Personal Mention

Mr. W. Gillette has been appointed general manager of the Ft. Smith (Ark.) Light & Traction Company, succeeding Mr. R. S. Rand, resigned.

Mr. John Davey has resigned his position as master mechanic of the Trinidad (Colo.) Electric Railroad, effective on March 10, to accept a position with the Philadelphia & Western Railroad.

Mr. W. H. Hurlburt, formerly president of the Oregon Water Power & Railway Company, Portland, Ore., has been appointed general manager of the Jersey Central Traction Company, Keyport, N. J.

Mr. A. L. Ober, of Chatfield, Minn., has been elected president of the Minneapolis Rochester & Dubuque Traction Company, which proposes to build an electric railway from Minneapolis, Minn., to Dubuque, Ia.

Mr. H. G. Kruse has been appointed superintendent of the Peoria & Pekin Terminal Railway, with headquarters at Peoria, Ill. Mr. Kruse formerly was connected with the Baltimore & Ohio Southwestern.

Mr. C. Denny, formerly superintendent of construction work for the Tacoma Railway & Power Company, Tacoma, Wash., has been appointed master mechanic of this company succeeding Mr. William Glenn, resigned.

Mr. Frank Cooley, for the past 10 years associated with the Brooklyn Rapid Transit Company in various capacities, has been appointed superintendent of employment for the system, succeeding the late F. D. Valentine.

Mr. W. M. Kessler, formerly superintendent of transportation of the Dayton & Troy Electric Railway, has resigned to accept a similar position with the Pittsburg & Butler Street Railway at Butler, Pa. Mr. W. S. Coy, chief train dispatcher for the company, will succeed Mr. Kessler.

Mr. Theron A. Atwood has been appointed general manager of the Michigan United Railways, with headquarters at Lansing, Mich. The duties of this office heretofore have been incorporated with those of the vice-president. Mr. Atwood formerly was a member of the Michigan state railroad commission.

Mr. F. E. Fitzpatrick, formerly manager of the Sacramento (Cal.) Electric Gas & Railway Company, has resigned to become general manager of the Bay Counties Power Company with headquarters at San Francisco. Mr. C. W. McKillip, recently supervisor for the Sacramento system, will succeed Mr. Fitzpatrick as general manager.

Mr. E. E. Lillie has been appointed superintendent of the Spokane & Inland division of the Spokane & Inland Empire Railroad, with headquarters at Spokane, Wash. Mr. Lillie goes to his present position from St. Paul, Minn., where he was formerly chief dispatcher and more recently assistant in the general superintendent's office of the Great Northern Railway.

Mr. M. O. Chadbourne has been appointed general manager of the Albuquerque (N. M.) Traction Company. The duties of this office heretofore have been combined with those of the vice-president, Mr. H. A. Jastro. Prior to accepting his present appointment Mr. Chadbourne had been acting as superintendent of construction for the American Lumber Company.

Mr. William Glenn, master mechanic of the Tacoma Railway & Power Company and the Puget Sound Electric Company, and for the past 17 years associated with the street and interurban systems of Tacoma, Wash., has resigned to accept a more lucrative position with a large street railway system in the east. As a token of esteem the employes of the company on March 2 presented him with a gold watch. Mr. Glenn will be succeeded by Mr. C. Denny.

Mr. J. N. Akarman has resigned as superintendent of the South Jersey division of the Public Service Corporation of New Jersey. He has held his present position since last August, having been transferred at that time from the Newark division of the company. It is stated that with Mr. Akarman's resignation the office of superintendent will be abolished and its duties incorporated with those of the general manager in South Jersey. A portrait and biographical sketch of Mr. Akarman were published in the Electric Railway Review of October, 1906.

Mr. Warren S. Bicknell, until recently president of the Lake Shore Electric Railway, has been elected president of the Havana (Cuba) Electric Railway Company under its reorganization, which took place in New York on March 6. The road is financed by American capital and probably will become, under its present management, one of the most important of the enterprises in Cuba controlled by American interests. Mr. Bicknell severed his connection with the Lake Shore Electric Railway about a year ago and is at present in New York preparing to take up his new duties. Associated with Mr. Bicknell as directors under the new management are David T. Davis and Robert Mather of the Chicago Rock Island and Pacific Railway interests; Walter G. Oakman of the Guarantee Trust Company; James Rattray, San Miguel, editor of a newspaper in Havana; Carlos Zaldo, president of the Bank of Havana; Henry Runken of Upmann & Company, bankers, and Henry Steinhart, United States consul-general at Havana.

Financial News

Alton (Ill.) Granite & St. Louis Traction Company.—The income account for 1906 compares as follows:

	1906.	1905.	Increase.
Gross	\$468,262	\$376,768	\$91,494
Expenses	302,490	206,912	95,578
Net	\$165,772	\$169,856	*\$4,084
Charges and taxes.....	131,685	+104,166	27,519
Surplus	\$ 34,087	\$ 65,690	*\$31,603

*Decrease.
†This item includes twelve months' interest on the original bonded indebtedness and ten months' interest on additional bond issues to acquire properties and to build the interurban road, which began operation on March 1, 1905.

The increase in operating expenses for the year 1906 was due to unusual expenditures for the improvement of the physical condition of the properties and which were charged to operating expense.

Atlantic Shore Line Railway, Sanford, Me.—The \$1,900,000 refunding 4 per cent bonds of this company are offered by A. H. Bickmore & Co. of New York, at a price to net 5¼ per cent interest. The road has 79 miles of track in operation and 18 more under construction.

Auburn (N. Y.) & Northern Electric Railroad.—The state railroad commission of New York has granted authority to this company to increase its capital stock from \$250,000 to \$1,500,000. The company will operate an electric railway from Auburn to Port Byron and from Auburn to Cayuga and Seneca Falls.

Catskill (N. Y.) Electric Railway.—Arthur M. Murphy of Catskill was appointed receiver of this company on March 7 in foreclosure proceedings brought by the Hamilton Trust Company of Brooklyn as trustee under the mortgage made in 1899 to secure \$400,000 bonds.

East St. Louis (Ill.) & Suburban Company.—The report for the year ended December 31, 1906, compares as follows:

	1906.	1905.	*1904.
Gross earnings	\$1,551,737	\$1,351,579	\$1,363,552
Operating expenses	739,218	594,801	593,159
Net earnings	\$ 812,519	\$ 756,778	\$ 770,393
Fixed charges and taxes.....	377,539	363,514	358,198
Surplus	\$ 434,980	\$ 388,264	\$ 412,195

*World's Fair year.

Indianapolis Crawfordsville & Western Traction Company.—At the annual meeting of stockholders of this company on March 6 in Chicago, the following directors were elected: P. C. Summerville, Eli P. Baker, A. E. Reynolds, C. N. Van Cleave and E. C. Voris, Crawfordsville, Ind.; Edward Hawkins, O. P. Ensley, A. M. Glossbrenner, A. A. Barnes and H. A. Mansfield, Indianapolis, Ind.; George P. Haywood, Lafayette, Ind.; A. A. Swartz, Jeffersonville, Ind.; W. O. Ford, Madison, Ind., and A. M. Hewes, Chicago. The old officers were re-elected as follows: President, A. F. Ramsey, Crawfordsville, Ind.; vice-president, A. E. Reynolds, Crawfordsville, Ind.; secretary, Edward Hawkins, Indianapolis, Ind.; treasurer, Oliver P. Ensley, Indianapolis, Ind.

Minster Loramie & Southern Railway.—This company, recently incorporated, has organized by electing the following officers: president, J. H. Goeke, Wapakoneta, O.; vice-president, Wm. Schulenberg, New Bremen, O.; secretary, F. M. Horn, Wapakoneta; treasurer, R. B. Anderson, Wapakoneta; financial agent, R. J. Depenbrock, Wapakoneta. The above also constitute the board of directors. The company will proceed forthwith to make a survey over at least two different routes; one from Minster, Auglaize county, O., to Piqua in Miami county, O., and the other from Minster, via Versailles, Darke county, O., to Greenville. After the survey and estimates have been made and completed, steps will be taken to finance the road.

Mt. Vernon (O.) Electric Railway.—It is reported that control of this company has been acquired for the new Cleveland Southwestern & Columbus Railway Company.

Norfolk (Va.) & Ocean View Railroad.—This company has acquired the Bay Shore Terminal Company of Norfolk and has given a trust deed to the Baltimore Mortgage & Guarantee Company to secure an issue of \$1,500,000 bonds due in 30 years and bearing 5 per cent interest.

Northwestern Elevated Railroad, Chicago.—Plans for the purchase by this company of the property owned by the Chicago & Oak Park Elevated Railroad have progressed so that it is announced that a consolidation will be completed before May 1. This announcement has revived the talk of the general consolidation of all of the elevated roads of Chicago.

St. Louis Hillsboro & Southern Railroad, Hillsboro, Mo.—The stockholders have voted to authorize a new issue of \$1,200,000 bonds. The new bonds will replace an issue of an equal amount authorized in August, 1902. These bonds have been canceled.

Susquehanna Railway Light & Power Company.—This company has been formed to acquire and operate electric railway and gas properties. It will purchase the \$1,000,000 common stock of the Lancaster County Railway & Light Company, Lancaster, Pa., and the \$1,649,320 common stock of the United Gas & Electric Company.

The latter company controls 11 gas and electric companies in various cities. The Susquehanna Company will have authorized \$10,000,000 preferred stock and \$10,000,000 common stock.

Syracuse (N. Y.) Lake Shore & Northern Railroad.—An increase in the capital stock from \$2,250,000 to \$3,500,000 has been authorized by the state railroad commission.

Texas Traction Company, Sherman, Tex.—This company has given a trust deed to the Old Colony Trust Company of Boston, Mass., to secure an issue of \$3,000,000 bonds, bearing 5 per cent interest, and maturing January 1, 1937. Of this amount \$2,000,000 bonds are outstanding.

Twin City Rapid Transit Company, Minneapolis.—Earnings for January compare as follows:

	1907.	1906.	1905.
Gross earnings	\$456,837	\$407,865	\$351,121
Expenses	243,097	205,519	175,315
Net earnings	\$213,740	\$202,346	\$175,806
Charges and taxes	115,258	109,708	97,325
Surplus	\$ 98,482	\$ 92,638	\$ 78,481

Underground Electric Company, London.—A claim amounting to \$789,669.20 has been filed by this company against the estate of Charles T. Yerkes. Other claims which were filed at the same time are the following: Speyer & Co., New York, \$367,302.87; Speyer Brothers, London, \$632,698.65.

United Traction Company, Albany and Troy, N. Y.—The earnings for the quarter ended December 31, 1906, with a comparison, are as follows:

	Quarter Ending December 31.		
	1906.	1905.	1904.
Gross earnings	\$472,974	\$434,981	\$431,609
Operating expenses	302,640	283,975	250,418
Net earnings	\$170,334	\$151,186	\$181,191
Other income	1,939	2,118	1,833
Total	\$172,273	\$153,404	\$183,024
Charges	87,481	86,581	86,659
Surplus	\$ 84,792	\$ 66,823	\$ 96,365

Washington (D. C.) Railway & Electric Company.—The pamphlet report for the year 1906, with a comparison, shows earnings as follows:

	1906.	1905.	1904.
Gross earnings	\$3,133,240	\$2,905,907	\$2,644,360
Operating expenses	1,613,096	1,478,466	1,355,822
Net earnings	\$1,520,144	\$1,427,441	\$1,288,537
Other income	44,595	50,553	49,024
Total	\$1,564,739	\$1,477,994	\$1,337,562
Charges	1,041,118	999,455	981,039
Surplus	\$ 523,621	\$ 478,539	\$ 356,523

The increase in operating expenses is largely due to an increased expenditure for maintenance. While the total operating expenses increased \$134,630, or 9.10 per cent, the cost of maintenance increased \$64,612, or 20.59 per cent. This increase in cost of maintenance is partly due to the fact that the properties have been maintained in better condition than heretofore, but more to the large increase in the cost of materials of every nature entering into the construction and operation of such properties.

The surplus after the fixed charges for the year ending December 31, 1906, amounting to \$523,621, has been applied as follows:

To payment of 5 per cent dividend on \$8,500,000 preferred stock	\$425,000
Discount on \$250,000 consolidated mortgage 4 per cent bonds	35,102
Credited to depreciation reserve	50,000
Credited to profit and loss surplus	13,519
Total	\$523,621

There are in the treasury of the company its consolidated mortgage 4 per cent bonds of the par value of \$1,078,600. Of these bonds \$351,600 were, under the plan of reorganization, delivered to the company and have been credited to depreciation reserve; \$227,000 were issued to cover expenses of extensions and betterments paid for out of surplus earnings, and \$500,000 were purchased for investment in open market.

Washington Traction Company, Springfield, O.—Application for a receiver was made at Springfield on March 2 by William J. Ramsay on the ground that the \$800,000 authorized bonds cannot be disposed of and that the company has defaulted in interest on bonds issued to pay old claims.

Wellsburg (W. Va.) Bethany & Washington Railway.—This company has given a trust deed to the Wellsburg Banking & Trust Company to secure an issue of \$200,000 bonds bearing 5 per cent interest and due on December 1, 1936. Of this amount \$110,000 bonds have been subscribed for at par, \$50,000 have been taken by the contractors and the remaining \$40,000 are reserved to acquire 40 acres of coal at a cost of \$1,600, the Bethany Light & Water Company (cost \$7,000) and other property and equipment as it is required. The company has completed over 75 per cent of the roadway of the proposed line from Wellsburg to Bethany, a distance of 7½ miles.

West End Street Railway, Boston.—Application has been made by this company to the Massachusetts railroad commissioners for authority to issue \$500,000 additional common stock. The proceeds will reimburse the Boston Elevated railway for expenditures on the property from April, 1904, to March 31, 1906.

Manufactures and Supplies

ROLLING STOCK.

Kenosha Electric Railway, Kenosha, Wis., is reported as soon to order six single truck cars for city service.

Meridian Light & Railway Company, Meridian, Miss., has ordered five cars from the Southern Car Company.

Rockland Thomaston & Camden Street Railway, Rockland, Me., is building two freight cars of 40,000 pounds capacity.

Chattanooga Railways Company, Chattanooga, Tenn., has ordered 15 cars from the G. C. Kuhlman Car Company.

Rochester Railway, Rochester, N. Y., has placed an order with the G. C. Kuhlman Car Company for 15 cars to be 30 feet in length.

Utah Light & Railway Company, Salt Lake City, Utah, contemplates the purchase of 50 new double-truck cars for city service.

Niagara Gorge Railroad, Niagara Falls, N. Y., is having two cars 38 feet 8 inches in length built by the G. C. Kuhlman Car Company.

Memphis Street Railway, Memphis, Tenn., is reported to have placed an order for 25 high-speed semi-convertible cars for fall delivery.

Citizens' Railway & Light Company, Ft. Worth, Tex., has placed an order with the G. C. Kuhlman Car Company for five cars 30 feet in length.

Johnstown Passenger Railway, Johnstown, Pa., is having twelve 8-bench, 28-foot open cars built by the G. C. Kuhlman Car Company.

Indianapolis & Eastern Railway, Indianapolis, Ind., has placed an order with the Cincinnati Car Company for 10 interurban cars to be 62 feet in length.

Terre Haute Traction & Light Company, Terre Haute, Ind., has ordered 10 single-truck cars to be 22 feet in length from the Cincinnati Car Company.

Denver City Tramway, Denver, Colo., will consider the purchase of additional rolling stock as soon as its contemplated track extensions are well under way.

Columbus Magnetic Springs & Northern, Delaware, O., is having two cars built by The J. G. Brill Company. This road will purchase additional rolling stock late this year.

Public Service Corporation of New Jersey, Newark, N. J., has placed orders since the first of January, 1907, for 49 semi-convertible single-end double-truck four-motor cars with The J. G. Brill Company.

Butler Passenger Railway, Butler, Pa., was reported in our issue of February 2 as having purchased one closed car. This was purchased from The J. G. Brill Company, being mounted on Brill 21-E trucks, with a wheel base of 7 feet 6 inches, with body 20 feet long and for city service.

Illinois Valley Railway, La Salle, Ill., has purchased four new interurban cars from the American Car Company and has just had delivered one 50-foot express car built by the St. Louis Car Company. Negotiations are under way for two additional interurban cars for delivery about the middle of the summer.

Pittsfield Electric Street Railway, Pittsfield, Mass., is having two double-truck open cars built by the Wason Manufacturing Company in addition to the one double truck closed car built by the same company and one double truck snow plow being built by the Russell Car & Snow Plow Company reported in the Electric Railway Review on February 23. The snow plow is of a special design, being constructed along the same line as those now in use upon steam roads.

Roanoke Railway & Electric Company, Roanoke, Va., as reported in the Electric Railway Review of March 2, has ordered from The J. G. Brill Company two full-convertible cars mounted on Brill 27-G1 trucks. The car bodies will be 28 feet 4 inches in length and 39 feet over all; also two Brill semi-convertible cars 30 feet 8 inches in length. The equipment will include Westinghouse air brakes, 4 GE-80 motors and National Brake & Electric Company's brakes. The semi-convertible cars are for interurban use and the full-convertible cars for city use.

Lynchburg Traction & Light Company, Lynchburg, Va., has contracted with The J. G. Brill Company for four full-convertible Narragansett motor cars, mounted on Brill 27-G1 trucks. These cars will be 28 feet 4 inches in length with a length over all of 39 feet, will be equipped with 4 GE-80 motors each and Westinghouse air brakes. A special feature of the cars will be an automatic headlight, the lighting of which will be controlled by the reverse lever of the controller, going away with the three-way switches customary on the inside of the car.

Brooklyn Rapid Transit Company, Brooklyn, N. Y., as previously reported, has placed an order for 200 passenger cars. The 100 surface cars will be built by the John Stephenson Company at Elizabeth, N. J., and the 100 elevated cars will be built by the Laconia Car Company and the Jewett Car Company, each build-

ing 50 cars. The surface cars will cost \$6,000 each and the elevated cars \$14,000. Delivery on the surface cars will be made in July of the present year, while the elevated cars will come during the late fall, the first shipments being due to arrive in October. The elevated cars will be steel framed and of extremely high motive power. Both elevated and surface cars are to be equipped with air brakes, the latter with storm-proof vestibules of the latest design. Seating arrangements in the elevated cars will consist of longitudinal seats along the side except in the center of the car, where four transverse benches will be placed.

Colorado Springs & Interurban Railway, Colorado Springs, Colo., has ordered the building of 6 double-truck closed cars in its own shops. The details will be as follows:

Seating capacity.....36 persons	Width, inside.....7 ft. 3 in.
Weight.....33,000 lbs.	Over all.....8 ft.
Wheel base.....5 ft. 10 in.	Body.....Wood
Length, body.....25 ft. 5 1/2 in.	Underframe....I beam-side sills
Over vestibule.....36 ft. 5 1/2 in.	
Over all.....37 ft. 5 1/2 in.	

Special Equipment.

Air brakes.....Westinghouse	Sanders.....Co. standard
Axles.....Cambria	Seats.....Hale & Kilburn
Heating system.....Consolidated	Trolley poles and attachments
Headlights.....United StatesNuttall
Interior finish.....Oak	Varnish.....Valentine
Motors.....4 GE-67	Vestibule.....Both ends
Steps.....Stanwood	

SHOPS AND BUILDINGS.

Aurora Elgin & Chicago Railway.—This company is erecting a brick building which will be used for an employes' wash-room and for an oil storage house on property located near the present car house at Wheaton, Ill. The employes' room will be provided with shower baths, 75 lockers, etc. The tanks in the oil-house will be so located that barrels of oils may be rolled from the cars and emptied directly into the tanks at the same level. Plans are also being made for an addition to the south end of the car house for a paint and carpenter shop.

Boston & Worcester Street Railway.—This company has purchased 3 1/2 acres of land at South Framingham, Mass., for the erection of a new car house.

Denver (Colo.) City Tramway Company.—This company is making plans for two new carhouses and an entirely new layout of repair shops. A parcel of land, 61 acres in extent, has been purchased, well located on the Denver Northwestern & Pacific (Moffatt) Railroad and the Colorado & Southern Railroad.

Evansville & Southern Indiana Traction Company.—This company will erect a two-story brick building at Princeton, Ind., for a freight and passenger station and car house. The cost is estimated at \$20,000. R. R. Smith, Evansville, Ind., general manager.

Ft. Wayne & Wabash Valley Traction Company.—An option has been taken on some property on Main and Seventh streets, Lafayette, Ind., on which it is proposed to erect a passenger station.

Indianapolis & Louisville Traction Company.—The car house at Scottsburg, Ind., is now nearing completion. The building is of brick and steel construction, 179 by 76 feet in area, and will contain four tracks, with accommodation for 16 cars. The building will also contain offices for the general manager and engineers as well as a room for the trainmen. Plans have been prepared for a two-story brick station building.

Meridian Light & Railway Company.—This company proposes to build a car barn of brick and steel structure 175 by 225 feet in area at Meridian, Miss. The building will also contain a machine shop, carpenter shop and paint shop. A. B. Paterson, president and manager, Meridian, Miss.

Minneapolis Rochester & Dubuque Traction Company.—The citizens of Decorah, Ia., have donated 20 acres of land as a site for the shops of this company, which proposes to build a line from Minneapolis, Minn., to Dubuque, Ia. W. P. Mason of Minneapolis is the promoter.

Omaha & Council Bluffs Street Railway.—It is reported that this company will begin this spring or summer the construction of a large car barn in Omaha to replace the present one at Twentieth and Harney streets, at a cost of \$75,000.

Stuebenville & East Liverpool Railway & Light Company.—It is reported that this company has purchased a tract of land just west of East Liverpool, O., on which to build extensive car barns and repair shops. J. C. Rothery, East Liverpool, general manager.

Washington Baltimore & Annapolis Electric Railway.—It is reported that a contract is to be let this month for a car repair shop at Odenton, Md. Office 801 Maryland Trust building, Baltimore.

TRADE NOTES.

Jewett Car Company, Newark, O., is preparing plans for the erection of an additional erecting shop.

Railway Steel Spring Company, 71 Broadway, New York, has declared its regular semi-annual dividend of 2 per cent on its common stock, payable April 4.

Westinghouse Companies, Pittsburg, are reported to have made announcement that negotiations are under way with the Niagara Lockport & Ontario Power Company to supply the power for a large manufacturing plant which it is stated will be erected at

Lockport, N. Y., by the Westinghouse interests, giving employment to about 5,000 people.

Wason Manufacturing Company, Springfield, Mass., is reported to have confirmed the report that its car building plant has been sold to The J. G. Brill Company, Philadelphia.

American Car & Foundry Company, St Louis, has declared its regular quarterly dividend of 1 1/4 per cent on its preferred and one-half of 1 per cent on its common stock, payable April 1.

Howard M. Post, who recently was appointed advertising manager of the Quincy Manchester Sargent Company, Chicago, has accepted the position of advertising manager of the Western Electric Company.

Eugene H. Lewis, a prominent member of the legal department of the General Electric Company, died in New York on March 1. He was at one time attorney for the Schenectady (N. Y.) Railway Company.

Youngstown Car Manufacturing Company, Youngstown, O., will hereafter handle the industrial car business in the states of Ohio, West Virginia and Western Pennsylvania, formerly conducted under the supervision of the Ernst Wiener Company.

Allis-Chalmers Company, Milwaukee, has received an order from the Bristol Tramway Company, Limited, of Bristol, Eng., for a large vertical cross compound engine. This company has already in use one engine of this type at its Bristol plant.

Wolff Truck Manufacturing Company, Chicago, has been organized to manufacture and deal in rolling stock and motors. The company is capitalized at \$24,000. The incorporators are: George W. Manierre, 96 Clark street, Chicago; Frederick W. Lester and Alvin McElroy.

Humphrey Trolley Wheel Company, Monroe, Mich., has been organized to manufacture a newly patented trolley wheel for electric cars. The officers of the company are: President, Henry L. Humphrey, 371 Chene street, Detroit; vice-president, O. J. Leonard; secretary, A. B. Braydon, and treasurer, N. J. Leonard, all of Monroe, Mich.

Dossert & Co., 242 West Forty-first street, New York, announces that the Western Electric Company has adopted the Dossert solderless joint throughout in the electrical equipment of its new plant at Hawthorne, Ill. It is stated that this mechanical joint saves more than two feet of cable, the cost of which is equal to that of the joint itself.

Siliker Car Works, Limited, Halifax, N. S., reported in the Electric Railway Review of January 19 as having been incorporated with a capital stock of \$125,000 for the purpose of manufacturing street cars, has purchased 20 acres of land in Halifax as a site for its plant, and work will be commenced upon its construction as soon as the weather will permit.

Cleveland Pneumatic Tool Co., Cleveland, has established a new department for the manufacture of mining drills and will make a new pattern of air hammer rock drills. G. H. Hall, formerly with the Gardner Electric Drill & Machine Company, has been placed in charge of this department. A new office has recently been opened by the company at 6 East Sixth street, Chattanooga, Tenn., in charge of R. P. Decker.

Electric Service Supplies Company of Philadelphia and Chicago announces that in addition to the territory of Philadelphia and Chicago, which it already controls, it has been given the territory surrounding Pittsburg for the sale of the full line of Sterling insulating material. A full stock of Sterling insulating varnish, black plastic insulator, etc., will hereafter be carried in stock at its new Pittsburg warehouse.

Robert E. Carrick of Philadelphia, Pa., formerly general superintendent of the Unit Concrete Steel Frame Company of Philadelphia and more recently with Tucker & Vinton, New York, in the capacity of general engineer, has joined the engineering corps of the General Fireproofing Company of Youngstown, O. Mr. Carrick's experience has been extensive in laying out and superintending the construction of reinforced concrete work, and with the General Fireproofing Company, his interest will be centered in the sale and installation of pin-connected girder frames. The type of the girder reinforcement developed in this product is claimed by the General Fireproofing Company to possess an exclusive feature, in that it provides a complete mechanical tie by a link and pin connection over each column or beam intersection, a tie which does not in any way depend upon the adhesion of the concrete to the steel.

J. R. Lovejoy has been appointed general manager of the sales department of the General Electric Company, Schenectady, N. Y. Mr. Lovejoy has long been known to the electrical fraternity, and this title is a formal recognition of the responsibilities with which he has practically been charged for the last two or three years. Mr. Lovejoy was born at Columbus, O., in 1863. After a post-graduate course at the Ohio State University, from which he received the degree of bachelor of science, he entered the employ of the Thomson-Houston Electric Company, of Lynn, Mass., in August, 1886. Here he gained his practical experience and graduated from what was then known as the "expert course" to take up engineering work in the Boston office of the company. Later his time was devoted to executive duties at headquarters, and when the Thomson-Houston Company was merged into the General Electric Company in 1892, he became general manager of the supply department. In 1900 he was also made manager of the railway and lighting departments of the General Electric Company. He is an officer and a director in several subsidiary companies, and is a director and member of the executive committee of the Schenectady

Trust Company, being one of the organizers of that concern. He is a member of the American Institute of Electrical Engineers, the Franklin Institute and the American Society for the Advancement of Science, as well as several organizations pertaining to electrical science. In addition to his diversified business duties, Mr. Lovejoy finds time to take an active part in promoting the welfare of the Mohawk Golf Club of Schenectady, of which he is president. He is also a member of the Mohawk Club of Schenectady and the University Club of New York. For many years Mr. Lovejoy has been interested in the subject of archaeology so far as it is related to implements of the Stone Age, particularly Indian arrow heads, of which he has made a noted collection. Mr. Lovejoy's home and principal office is still situated, as for several years past, at Schenectady.

Baldwin & Rowland Switch & Signal Company of New Haven, Conn., reports a very satisfactory and progressive business for its multiple interlocking recording block signal. Among the recent orders are three sets for the International Railway Company of Buffalo, N. Y., three sets for the Bay Shore Terminal Company of Norfolk, Va., and four sets for the Norfolk & Portsmouth Traction Company of Norfolk, Va. The International Railway Company of Buffalo, N. Y., has been using this signal for two years and is evidently well pleased with it. Among other satisfied users are the following: Consolidated Railway Company, New Haven, Conn., Rochester Syracuse & Eastern Railway Company, Syracuse, N. Y., Auburn & Syracuse Electric Railroad Company, Syracuse, N. Y., Syracuse Rapid Transit Company, Syracuse, N. Y., Altoona & Logan Valley Electric Railway Company, Altoona, Pa., Central Pennsylvania Traction Company, Harrisburg, Pa., Farmington Street Railway Company, Hartford, Conn.

J. G. Brill Company, Philadelphia, as reported in the Electric Railway Review of February 23, has announced the reorganization of its company, the new name being The J. G. Brill Company. The capital stock has been increased from \$6,000,000 to \$10,000,000, one-half of which is preferred 7 per cent cumulative stock and the remaining one-half common stock. The new company owns all the stock of its subsidiary companies and each will be operated separately by the new company. A portion of the shares were reserved to provide for the purchase of another plant and additional working capital. No great change was made in the personnel of the company, the officials being as follows: President, James Rawle; vice-president, John A. Brill; second vice-president and general manager, Samuel M. Curwen; secretary, M. Herman Brill; treasurer, Edward Brill; assistant treasurer, Edward P. Rawle; assistant secretary and general manager sales department, W. H. Heulings, Jr., and secretary to president, J. W. Rawle.

W. S. Barstow & Co., New York and Portland, Ore., have materially enlarged their drafting force to meet the demands of their increasing business. Thomas Richardson, who has had a thorough experience in power plant design, is at the head of the department. During the time he was connected with Westinghouse, Church, Kerr & Co. he was identified with the design of the Kingsbridge power station of the Metropolitan Street Railway of New York and several other power plants. Harold S. Richmond, C. E., a graduate from the Norwich University of Vermont and a post-graduate at the Thayer School of Civil Engineering of Dartmouth College, is in charge of the steel structural designing. Mr. Thayer has been connected with the Boston Bridge Works and Riverside Bridge Company as assistant engineer in the bridge department of the Boston & Maine Railroad and later with the structural department of Westinghouse, Church, Kerr & Co. The drafting department of the company now numbers about 30 men, covering all branches of engineering.

ADVERTISING LITERATURE.

McClintock Manufacturing Company, St. Paul, Minn.—"The McClintock Crossing Signal for Electric Railways" is the title of an illustrated pamphlet recently issued by this company. The apparatus consists of a signal tower, time element, circuit breaker, bell, starting relays and insulated rail sections. A diagram is presented showing the combination for use on single-track lines and a similar diagram shows the arrangement for double-track lines. The apparatus is briefly described.

Cutler-Hammer Manufacturing Company, Milwaukee, Wis.—"A Tale of Two Types" is the title of a pamphlet published for the purpose of placing before electric motor manufacturers and other purchasers of starting rheostats facts concerning the two types of starting boxes known as "ventilated" and "enclosed." The Cutler-Hammer Manufacturing Company is the producer of both types and should, therefore, be in a position to speak advisedly concerning the relative merits of the two types.

Goheen Manufacturing Company, Canton, O.—A very useful engineer's contract book has been published by this company, which will no doubt be found of the greatest value to engineers, managers, contractors, and, in fact, to anyone connected with the contracting business. This book has ruled and printed forms 13 by 23 inches, which have been especially arranged for keeping a complete record of contracts in a form adapted for a convenient reference. The minutest details relating to a contract are found on these sheets, also a blank space for general remarks. Perforations permit the sheet to be easily removed. The book contains contract blanks for street, paving, sewers, sidewalks, pumping machinery, pumping stations, standpipes and foundations, power station buildings, machinery and boilers, electric road overhead construction, electric road track construction, cars and

equipment, electric light and power equipment, underground tubing, underground conduit and contract blanks for the construction of buildings of any description. A particularly advantageous scheme carried out in this book is the placing of complete detailed specifications for the preservation of steel work and general painting with the Goheen Manufacturing Company's products. As many of these books as required may be had for the asking and should be found in every engineers' and contractors' office.

Railway Steel-Spring Company, 71 Broadway, New York.—A handsome catalogue has been issued by this company to show a few of the various types of its springs used throughout the United States and in many foreign countries for locomotive, passenger car and freight car equipment, as well as for street and interurban cars and machinery. Owing to the large number of styles manufactured, it has been impossible to show the entire product of the company, but distinctive types which are standard for various classes of service are shown by engravings from photographs.

Dielectric Manufacturing Company, St. Louis, Mo.—Bulletins Nos. 1 and 2 are the first of a series which are to be issued by this company in the interests of its line of insulating varnishes, paints and compounds. Bulletin No. 1, which is illustrated with engravings from photographs taken in the chemical and electrical laboratories of the company, discusses problems of modern coil impregnation. Bulletin No. 2 is arranged in tabular form and presents condensed data about the Dielectric standard insulating materials, indicating the insulation suitable for particular classes of work and the manner in which it may best be handled.

Ingersoll-Rand Company, 11 Broadway, New York, N. Y.—"Rand Rock Drills" is the subject of catalogue No. 46, which contains 84 pages and has a large number of illustrations. The catalogue matter is specially divided for the purpose of adequately treating the several lines of apparatus. Rand drills are fully described in their various details and full information is given as to sizes, capacities and other parts, together with further data, including prices. Some of the other products of the company are briefly mentioned and a list is presented of the various Ingersoll-Rand publications which may be obtained on application.

International Correspondence Schools, Scranton, Pa.—The fifteenth anniversary of the International Correspondence Schools which was celebrated at Scranton, October 16, 1906, has been recorded in a handsome memorial which contains the addresses of the various speakers and the program which was followed for the occasion. The publication is designed to set before educators, engineers, manufacturers, members of the press and others who might be interested and who were invited but were unable to attend the ceremonies, the methods in text-book preparation, in teaching by mail, and in securing the use of their courses of instruction by the public.

General Electric Company, Schenectady, N. Y.—Type CQ motors of from 1-6 to 20 horsepower are briefly described in Bulletin No. 4486 with respect to design, construction frame, pole pieces, bearing heads and bearings, field coils, armature and commutator and other features. Railway signals, top-mast, direct-connected two and three-position type are the subject of Bulletin No. 4484. A number of illustrations are presented showing this type of signal in use on the Baltimore & Ohio and its points of advantage are also stated. Bulletin No. 4482 issued in the interests of the lighting department is entitled "A Guide to the Design of Medium and Small Capacity Central Station Switchboards." Bulletin No. 4481 describes "Signal Relays" for use in connection with the railway signal apparatus which is a product of the General Electric Company.

WEAR WELL LEATHER PACKINGS.

It is interesting to note how the modern demand for high-class work has led to specialization in the manufacture of even the smallest details of a machine. It was at one time the custom for engineers to cut out their own packing for gaskets, glands, etc., but with the advancement in the designs of modern machinery a greater perfection and nicety of adjustment than could be secured by the older methods are demanded. This is particularly true of the many leather packings, gaskets and washers required by the ever-increasing use of pneumatic and hydraulic machinery, and to fulfill this growing demand for leather packings of superior quality, the Detroit Leather Specialty Company, Detroit, Mich., has taken up the manufacture of "Wear Well" leather packings for such purposes. The necessity of having packings of this nature manufactured by specialists in this particular field will be realized when it is considered that different classes of machinery will require leather of different thickness and flexibility as well as leather which has been treated in a scientific manner to meet the demands of the particular service which it is to fulfill. In order to make packings which will exactly meet the requirements of any service it is necessary that they shall be made to order rather than that the nearest stock size of packing shall be used, as was formerly the custom. It will be readily understood why the old-time home-made washers gave unsatisfactory results when it is taken into consideration that the dies which were used in making them were generally improperly formed. The Detroit Leather Specialty Company makes a study of each case and furnishes packings which in its expert judgment will most satisfactorily meet the stated conditions. These packings are made in all sizes, from the smallest to any size desired. Should, however, any one desire to make his own packings he can secure "Wear-Well" valve leather, which is the company's product, in backs of any thickness from 1/8 to 1/4 of an inch, tanned to meet the requirements of the service specified.

Japanese oak is now being used for ties in California. It hardly seems credible that hardwood timber is so scarce and the transportation facilities so over-

Japanese Oak Ties for California. can be purchased in Japan, and shipped to California to be sold there, duty paid, at a lower price than ties made from local red-

wood. That this is practicable is evidenced by a recent purchase of 1,500,000 Japanese oak ties for the Southern Pacific Railway and about 50,000 for an extension of the Vallejo Benicia & Napa Valley electric road near San Francisco. These ties have now been delivered, and at a lower cost to the purchaser than soft redwood ties of smaller dimensions could have been purchased in the local market. The timber is said to be equal to our best white oak.

Report on Curve Mechanics. The Woodlawn wreck in the New York Central electric zone on February 16, last, has been the subject of an unusual amount of scientific investigation and discussion by engineers under the head of "Curve Mechanics." The object of these investigations has been to ascertain the initial cause of the derailment, but thus far no definite cause has been announced. A theoretical discussion by a board of engineers relating to the differences between the steam and the electric locomotives of the New York Central, the effect on track due to centrifugal force, and to the skewing of the wheel base, is published elsewhere in this issue. The calculations relating to centrifugal force were so simple that there was a general agreement as to the results, but in that portion of the investigation relating to the skewing of the wheel base various elements in the problem of necessity were assumed, and there was not a general agreement as to the results. The numerical results at first given out were subject to correction, and the incorrect figures or formulas were published by a number of technical journals last week. We are pleased to present the report of the board of experts as it has been finally revised; this will be found an interesting investigation of a subject which has received too little attention from

railway engineers and the professors in charge of the railway engineering in our technical schools.

Three-Cent Fares in Politics. Three-cent street railway fares, in the opinion of Mayor Johnson of Cleveland, supply the long-looked-for issue on which the democratic party is to regain the presidency. The following is his view of the situation: "Three-cent fares and universal transfers made me three times mayor of Cleveland, which was once a republican stronghold. The odds against the democratic party in the state and nation in proportion to the population are not any greater than the odds against the democratic party in Cleveland when I entered the political ring." Just what would become of this issue if someone should suggest 2-cent fares or take up his own panacea of free rides, "Ilke elevator service," Mayor Johnson does not say. He does prophesy, however, that "the world will have 3-cent street car fare and universal transfers soon. I want my state and nation to be the first. Japan has already made a start."

Tom Johnson and the municipal ownership enthusiasts have always asserted that Glasgow people were already enjoying 2-cent fares, although for the shortest distances and without any transfers. Although there are really no long hauls in Glasgow, the burghers would as readily think of giving free rides as of establishing 3-cent fares good over all the city

When the single-phase line of the Vallejo Benicia & Napa Valley Railway was first operated, some two years ago, current was distributed at 750 volts on the trolley wire. Later, the operating conditions warranted raising the operating potential to 3,300 volts. With this change some trouble-

Three-Wire Telephone Circuits. some effects made themselves known on the telephone system with which the cars are dispatched. Obviously these disturbances were caused by inductance, since the telephone wires were supported on the poles almost directly between the two sides of a single-phase circuit, the

overhead trolley and the track return. For part of the route the telephone wires were also paralleled by a high-tension transmission line. These conditions, while not uncommon with single-phase roads, were probably more troublesome in this instance because of the unusual design of the overhead construction. The single scheme by which the telephone system was practically freed from inductance disturbances, comprised the stringing of a third wire similar to those of the telephone circuit and about one-half mile long. This half-mile of wire was placed on the poles as close to the operating telephone wires as mechanical details would permit, about 6 inches. The auxiliary wire when well-grounded to the track so disturbed the field in which the telephone lines were that annoying effects from inductance practically disappeared. The simplicity of this method and its effectiveness commend it for trial elsewhere.

LONDON'S LESSON.

Prior to the election of March 2, the London County Council consisted of 83 socialists or progressives, as they have named themselves, 34 moderates and one independent. The result of the election is a distinct reversal of these figures. The new council will contain 79 moderates, 36 socialists and three representatives of organized labor. Thus, by a sudden culmination of long-lasting resentment at municipal extravagance and incompetence, the people have overthrown a socialist majority equal to 69 per cent of the council. The new socialist minority comprises but 36 per cent of the council. The cause of this great change is not found in any single recent event, but lies in the history of a series of related experiments whose present signal failure and folly should be a warning to every community.

The county council was established 18 years ago to govern the immense area surrounding London which has not been admitted to the city proper. From the beginning the control of the council has been in the hands of the socialists. Their defeat now is the sequel to the recent defeat of the socialist element in the city of London. Both events are the result of extreme municipalization carried to a logical conclusion. In the 18 years the debt of London increased to \$515,000,000, and the annual budget of the county and parishes to \$105,000,000. Taxes rose until they approached confiscation. This will be appreciated when it is recalled that taxes in London are paid by householders or tenants and are based upon annual rentals; and that in some London boroughs the tax rate had become 50 per cent of the annual rent, and the average tenant, paying about \$500 per annum for rent, was burdened by taxes in the sum of \$185 yearly. The taxes, together with the enormous amounts obtained by the creation of increased indebtedness, were expended in the establishment or maintenance of municipally-conducted enterprises. Although the acquisition of the properties of the water companies which supply the city of London and the creation of a sewage system may have been legitimate, the cost of these undertakings, \$187,372,610, seems to exceed the value of the results yielded.

The scheme of municipalization had only its beginning in those enterprises. The council proceeded to expend \$55,000,000 in the electrification of tramways and the extension of municipal lines. In return for these expenditures the council can show an inadequate system 121 miles in length. Municipal ferries on the Thames took \$1,520,000, and were operated with an annual deficit of \$250,000 or one-sixth of their total cost. Free billiard-saloons and Turkish baths were maintained at the taxpayers' expense. Public appreciation of the artistic was to be fostered by the free decoration of privately-owned buildings.

Factories owned and operated by the municipality com-

peted with private enterprises, and the latter were taxed to meet losses of these rivals. Socialism, rampant, ran madly to its destruction. The destruction has come before the cost of the experiment became too great to be borne and it will not involve repudiation of debt, as public ownership did in America in an earlier generation. There are evidences that Manchester, Glasgow, Birmingham and other cities that have ventured too far in the direction from which London has turned back are bethinking themselves and preparing to take an inventory. They will do well to strike a balance and to be guided by what it shows. London is not the only city in which tax-fed industry is a failure and tax-feeding, when long continued, an impossible, expensive luxury; it was merely the first to come to knowledge of itself.

THE FUTURE OF THE STEAM BOILER.

Viewed in the light of comparative floor space per unit of output, the steam boiler has been, in the opinion of many engineers, hopelessly distanced by the steam turbine, so far indeed, that prominent engineers have expressed the belief that a further reduction of the floor space per kilowatt output of the turbines would be useless, as it is now difficult to group the boilers in a satisfactory manner to supply the turbines, without the use of long steam mains.

The reasons for the present rather discouraging outlook for the steam boiler is the set opinion engineers have come to accept regarding the amount of heating surface required per boiler horsepower in an economical boiler. This figure, which is at present accepted as a standard, is roughly 10 square feet of heating surface per boiler horsepower, or, approximately eight square feet per kilowatt developed in a condensing turbine using superheated steam. Such large heating surfaces are thus required, that the boilers necessarily cover a considerable floor area, and it becomes difficult to construct single boilers of large capacity, a 1,000-horsepower boiler at present being considered a very large unit. In spite of this, 10 square feet still continues to be a standard on which the capacity of boilers is estimated, and it is often noted that some manufacturers boast of the moderate rating of their boilers, allowing 12.5 square feet of heating surface for each boiler horse power. There is no doubt that these capacities, and the allowance of heating surface now considered as a standard will in the near future be looked upon as a wasteful extravagance. These facts are borne out by some practical experience, and by principles, the proper interpretation of which have been strangely overlooked.

To begin with the practical side of the question, we have only to consider what has been done in marine and locomotive practice—a digression which may seem irrelevant here, but which we feel is justified in that the marine and locomotive engineers have been compelled to attack the boiler problem from a standpoint which has not yet, but will soon arise in stationary practice, i. e., the greatest evaporation in the least space, and for the least weight possible, and combined with these, the utmost economy.

In locomotive practice, there is often developed at the highest speeds, more than one-half indicated horsepower per square foot of heating surface, or what would be equivalent to about one kilowatt per square foot of heating surface—if the turbine is run condensing. Another instance worthy of careful attention is the performance of the steam yacht "Turbina 1," which developed an indicated horse power in the turbines for each .55 square foot of heating surface, and even this exceptional figure was exceeded in some of the trials. Including the auxiliaries, the turbines here required about 17 pounds of steam per indicated horse power per hour, and since a turbine generator can develop a kilowatt-hour on 17 pounds of steam, the result for the present purpose is, a

pounds of steam, the result for the present purpose is, a kilowatt output for each .55 square feet of heating surface, or in other words, 16 times the power developed in our modern stations.

Although, of course, the economy of these boilers under the condition just stated is probably not as high as in a well operated modern plant, the results obtained are much higher than might at first be expected, an evaporation of 7.7 pounds of water per pound of coal being shown by the locomotive boiler, and about 7 pounds per pound of coal for the Yarrow boilers in the "Turbinia 1." The questions which these examples no doubt bring up are, how such results are possible, and what bearing they have upon the subject of stationary boilers.

In these particular cases, the high evaporation secured per unit area, is due to the very rapid circulation of the water through the tubes, and more particularly because of the high velocity of the gases over the heating surface, combined with a high furnace temperature obtained by the use of forced draft. The latest experiments conducted show that as the furnace temperature is increased, the efficiency of the furnace decreases, which is explained in part by the escape of unburned hydrocarbons, owing to the reduced time the oxygen has to combine with the gases, and the reduced air supply per pound of combustible, which also consequently lessens the chance of all the carbon molecules coming into contact with oxygen molecules while they are at a sufficiently high temperature. Hence when the reduction of furnace efficiency is taken into consideration it can be easily understood that the efficiency of the heating surfaces was probably at least as high, if not higher than when the water evaporated per unit of heating surface was less than in the foregoing examples.

The preceding discussion prepares the way for Prof. John Perry's statement in his book, "The Steam Engine and Gas and Oil Engines," that the efficiency of a boiler is constant, regardless of the conditions of firing, rate of combustion, quality of the coal, furnace temperature, or quantity of air supplied to complete combustion, etc., and a further statement, that the capacity of steam boilers can be increased at least ten times, with a probable increase in efficiency as well as capacity.

Such statements should certainly be of the most vital interest not only to engineers, but to the owners and managers of power plants as well. It will undoubtedly seem absurd to most engineers to assert that these statements are fully within reason and will probably in the near future affect most startling savings of space and weight, as well as money in investment and maintenance. Strangest of all, however, is the statement that the efficiency of the boiler is independent of the furnace temperature and quantity of air supplied. For 100 years it has been believed that the efficiency of a heating surface depended only upon the difference in temperature of the water and the hot gases, but, upon careful mathematical investigation this does not appear to be true; and, furthermore, the results of the most careful boiler tests conducted by the United States Geological Survey indicate the truth of the statement in every respect. For the most part, an examination of the curve sheets in the paper read by Professor L. P. Breckenridge of the University of Illinois before the Western Society of Engineers on March 20, 1907, of which an abstract is given on another page of this issue, shows that the efficiency of the boiler remains constant in spite of the variations in the furnace conditions.

Many engineers will probably express the opinion that such high rates of evaporation as would be required to bring about the results suggested by the foregoing discussion would rapidly burn the tubes and heating surfaces and it may be well to call attention to the fact that the evaporation per square foot of heating surface in the firebox of locomotive boilers often reaches 50 pounds, and in some of the loco-

motive boilers used in torpedo boat practice, the evaporation probably often exceeds 70 pounds in the firebox section. Further, the most eminent authorities have stated that no danger of burning the heating surfaces need be feared under a rate of 150 pounds per square foot per hour. It should be distinctly noted, also, that even with the poor circulation in the firebox portion of locomotive boilers, there is comparatively little danger of the sheets being burned, so long as they are kept free from scale. With improved circulation, preferably by mechanical means, there would be absolutely no danger, and, in fact, no doubt with improved circulation, even with an evaporation of 100 pounds of water per square foot per hour, the tubes would last longer than in present practice. A rate of 50 pounds per square foot would correspond to about three kilowatts per square foot of heating surface.

In chart 1, the almost constant efficiency with variations in CO_2 and furnace temperature is clearly shown, as is likewise the efficiency in chart 2 both of which, as well as the many other charts not presented herewith, bear out the statements made.

An explanation of these facts is that as the absolute temperature of the furnace gases increases, the volume increases in the same proportion, since the volume is directly proportional to the absolute temperature, the velocity of the gases would also increase in proportion to the temperature and the time the gas is in contact with the surface will therefore vary inversely as the absolute temperature. The density, however, is inversely proportional to the absolute temperature, and hence there are fewer molecules per unit volume of the furnace gases. Since these quantities all vary and are dependent upon each other, the rate of transfer of heat per unit area of the heating surface remains constant, as will also, therefore, the efficiency of the surface. This is a fact which should have been recognized years ago, and had it been, it is possible that the boilers of today would be comparatively as compact as the turbines.

A point which from an operating standpoint may be of value, is that it was found, at least for the types of furnace now generally employed, that the efficiency of combustion can not be judged by the CO_2 alone, although the most favorable results were obtained when the volume of CO_2 was about 8 to 10 per cent of that of the flue gases. The best method of determining the most economical results is to increase the per cent of CO_2 until CO is found in the flue gases. This, of course, cannot be determined by the automatic CO_2 machines, and requires the service of a chemist, which has been suggested before in these columns.

The conclusions which are, therefore, warranted from the theoretical, as well as from the practical standpoint, are that an excessive furnace temperature, above, say, 2,300 degrees F., will not give an increase in efficiency which is warranted, and that the repairs to the furnace setting and firebrick arches will be greatly reduced by working with a moderate furnace temperature, without any loss in efficiency of the heating surfaces, while the efficiency of the furnace, for reasons previously given, will be materially increased. The fact that the heat transmitted per square foot of heating surface is almost wholly dependent upon the velocity of the gases parallel to the surface, indicates that a greater number of baffles should be employed, thus increasing the velocity of the gases. This also applies to the velocity of the water over the heating surfaces, and no doubt it would be perfectly justifiable to use mechanical means for circulating the water, as tests have shown that the circulation in the best of modern boilers is entirely too sluggish to obtain high rates of evaporation per unit area. The fact that excessive temperatures are not advantageous implies that the grate area should be increased, and mechanical means provided for properly mixing the gases and air so as to insure complete combustion. By these means, the size of the boilers could be greatly reduced with a probable gain in efficiency, besides

the reduced cost of land, interest on the investment, and maintenance charges.

BOOSTER VERSUS END-CELL REGULATION.

Time and again the question of booster versus end-cell regulation is brought before engineers and, from the frequency with which the subject is discussed, it appears that both parties to the argument remain perfectly convinced in their own opinion. Such was the case at the meeting of the Western Society of Engineers held on March 15, 1907, at which Mr. J. M. S. Waring, of the Electric Storage Battery Company, addressed the society on "The Application of the Storage Battery for Lighting, Power and Railway Service."

The paper of the evening dealt with the various applications of storage batteries, and more specifically with different methods of regulation, and of connecting the battery to the line. Storage battery characteristics and the operation of the carbon regulator and boosters were carefully explained in a very simple and concise manner by the aid of numerous diagrams. The question of regulation by the use of boosters or end-cells was discussed by a number of the members of the society. Advocates of the end-cell method brought out the fact that it is difficult to determine the exact booster capacity that will be required, for, if the booster installed is of sufficient capacity to meet the demands put upon it in an emergency—such, for instance, as a heavy short-circuit—then the machine is abnormally large for its ordinary work and requires an excessive investment, on which there is no return; while, if it is just large enough for the normal maximum load, there is serious danger that it will be disabled by a heavy short-circuit or overload; or, if the booster is properly protected by circuit-breakers they will frequently open the circuit, thus causing an interference with the service which the modern central station will, if possible, avoid at any cost. Furthermore, the advantages of the storage battery are seriously imperiled by the booster, because the booster is liable to be damaged or burned out by lightning, since the natural path of the lightning is through the booster to the battery, which in effect serves as an excellent and efficient form of tank lightning arrester.

Of course, besides the economy which may be effected through the use of a storage battery to carry the peaks of the load and thus to reduce the engine, generator and boiler capacity required, one of the chief advantages of the storage battery is to serve as an unfailing reserve. This advantage may be totally lost if a booster is connected to the line between the batteries and the load. The disadvantage of the end-cell method of regulation is that the battery switches cannot easily be automatically controlled to meet sudden demands for power which cause the voltage to drop suddenly. As the battery switch must generally be controlled by hand, the voltage may not be as constant as with the booster method of regulation, and the generators, through carelessness, may be subjected to momentary overloads. It would seem, however, that this disadvantage is counterbalanced by the reduced liability of a complete disablement of the service.

The Stone & Webster Engineering Corporation of Boston, Mass., has plans under way for the construction of an electric interurban road connecting Galveston and Houston, Tex., 50 miles; for building 20 miles of branch lines to towns on Galveston bay in Texas, and also for a 75-mile electric road between New Orleans and Baton Rouge, La., the syndicate having bought the Baton Rouge street railways. Stone & Webster now own the electric street railways in Dallas, Ft. Worth, Houston, Galveston and El Paso and the interurban line connecting Dallas and Ft. Worth. The Texas legislature has passed a bill giving interurban electric railway companies the right of eminent domain. The bill was drawn especially in the interest of the Galveston-Houston line.

ANNUAL REPORTS OF RAILWAYS.

International Traction Company, Buffalo.

In the annual report of the International Traction Company of Buffalo for the year 1906 the president, Henry J. Pierce, emphasizes the improvements which are in contemplation to meet the needs of Buffalo and the other communities which are served by the system. The territory traversed by the 356 miles of railway lines in the system comprises the cities of Buffalo, Lockport, North Tonawanda, Tonawanda, Niagara Falls, N. Y., Niagara Falls, Ont., and about twenty villages and townships. There are over 500,000 people in this territory.

Among the improvements planned are the following:

Construction of a new double track line between Buffalo and Niagara Falls, giving the system four tracks between those two points.

Construction of two new car houses, one on Broadway, Buffalo, at a cost of \$225,000; the other at Hertel avenue, Buffalo, at a cost of \$130,000.

Purchase of 50 new cars for Buffalo city service.

Extensions in Buffalo, Niagara Falls and Lockport.

To carry out these undertakings Mr. Pierce states that it will be necessary, as the company cannot increase its bonded indebtedness, not only to expend the profits of 1907, but also to borrow \$1,000,000 from the banks. While regretting that dividends must be delayed, Mr. Pierce adds:

We believe that we are best serving the interests of the stockholders by maintaining their magnificent property in first-class physical condition, and by making such betterments and extensions as are necessary to keep abreast with the growth of the territory served.

The financial results of the year, with comparisons, are briefly stated as follows:

	1906.	1905.	1904.
Gross earnings from operation.....	\$4,972,688	\$4,484,643	\$4,088,426
Operating expenses	2,884,985	2,483,663	2,412,769
Net earnings from operation.....	\$2,087,703	\$2,000,980	\$1,675,657
Miscellaneous income	69,110	68,562	64,515
Gross income less operating expenses.	\$2,156,813	\$2,069,542	\$1,740,172
Interest, taxes, rentals, etc.....	1,691,959	1,652,376	1,606,052
Net income	\$ 464,854	\$ 417,166	\$ 134,120

In reviewing the growth of business, the relations of the company with its patrons, and the improvements completed or planned, Mr. Pierce says:

This section of the country, already one of the great centers of steam railroad and lake transportation, is attracting the attention of manufacturers by the extraordinary facilities and advantages it affords in which to locate factories whose product is distributed throughout the country. There are unmistakable evidences that the growth of the frontier of western New York will be phenomenal in the near future, and it is already taxing the capacity of the International Traction Company lines to keep pace with its progress.

Believing in the future of Buffalo and its vicinity, and realizing the value of the franchises which the company enjoys, the management has endeavored to establish as perfect a street railway service as is possible under the physical conditions confronting it, with the result that not only have the company's revenues increased, but its efforts are appreciated by the residents of the cities and towns which it supplies with transportation facilities, as is evidenced by the friendly attitude of the people, the press and the municipal authorities.

The property is being operated upon the theory that it is the first duty of public utility corporations to give first-class service in return for the privilege to operate, and in the belief that the corporation so conducted will not only establish itself firmly in the good opinion of the people whom it serves, but will secure a stability which will inure to its own lasting benefit.

During 1906 the physical condition of the property was not only fully maintained, but improved. The new car shops, finished during the year, are as complete as any in the country and afford every facility for the proper maintenance of equipment; a new model substation was established on the east side of Buffalo; 150 new cars, of the most up-

to-date type and costing nearly \$1,000,000, were purchased; 12 miles of track were laid through Fillmore avenue, Buffalo, under franchise obtained in the fall of 1905, and this line will be open for traffic in the early spring.

In view of the fact that a fast electric line is to be built from Toronto by way of Hamilton to Niagara Falls, Ont., in the near future, and as an electric line, now under construction, between Lockport and Rochester will be completed during 1907 (both of which lines are to connect with our system), and as the capacity of our Niagara Falls line is already taxed to the utmost by present travel, a franchise has been secured, and it is proposed to build within the next 18 months a new double track line, over its own right of way, between Buffalo and Niagara Falls, connecting at Tonawanda with our Lockport division.

United Railways of St. Louis.

In the annual report of the United Railways Company of St. Louis for 1906 there is published a summary of the financial results and traffic statistics from 1900 to 1906. In the year 1900 the strike seriously hampered the operations of the company, but a comparison of 1906 with 1901 will show fairly the development of the business. Gross earnings from operation and other income have increased from \$5,783,912.72 in 1901 to \$9,146,348.25 in 1906, or 58 per cent. The figures for the years 1901, 1905 and 1906 are as follows:

	1906.	1905.	1901.
Earnings from operation and other income	\$9,146,348.25	\$8,460,016.01	\$5,783,912.72
*Operating expenses, taxes and depreciation	5,567,411.65	5,318,368.80	3,692,400.58
Surplus over operating expenses, taxes and depreciation	\$3,578,936.60	\$3,141,647.21	\$2,091,512.14
Interest on funded debt, miscellaneous interest and organization expenses	2,377,476.68	2,387,915.47	2,040,932.14
Net income	\$1,201,459.92	\$ 753,731.74	\$ 50,580.00
Dividends on preferred stock	649,160.00	649,160.00	576,210.00
Surplus	\$ 552,299.92	\$ 104,571.74	
Deficit			\$ 525,630.00
*Depreciation—1905, \$421,752.39; 1906, \$455,681.09; none charged in former years.			
Traffic Statistics—			
Revenue passengers	183,237,886	170,009,691	117,546,811
Transfers and passes	81,183,324	74,231,470	46,449,131
Total passengers	264,421,210	244,241,161	163,995,942
Percentage of passengers using transfers	41.81	41.48	36.76
Average Passenger Earnings:			
Per revenue passenger	4.91	4.90	4.86
Per total passenger	3.40	3.41	3.48

The gross earnings and other income in 1906 were as follows:

Passenger receipts	\$8,997,240.90
Advertising privilege	47,500.00
Mail	38,326.00
Express	10,673.28
Rental of power	12,048.62
Interest (on deposits and securities)	26,728.69
Miscellaneous	13,830.76
Total	\$9,146,348.25

Operating expenses were \$4,623,989.68, and taxes \$487,740.88 and charges for depreciation \$455,681.09.

In referring to the depreciation reserve fund the president, John I. Beggs, says that the policy inaugurated in 1905 has been maintained during 1906. Each month five per cent of the gross receipts was carried to a depreciation reserve fund. The entire amount so credited in 1906 was expended on the property, together with \$36,505.02 of the balance left in the account at the end of 1905. The fund therefore amounted on December 31, 1906, to \$178,055.03.

The fire insurance reserve fund was increased during the year by charges against operating expenses of a small percentage in excess of the actual premiums paid. This fund amounted at the end of the year to \$59,172.15. The injuries and damages reserve fund was also increased by charges to operating expenses of an amount in excess of that paid out on account of these claims. This fund stood on December 31, 1906 at \$398,360.62. There were held for investment for the fire insurance reserve fund 500 shares of preferred stock of the company, and for the injuries and damages reserve fund 3,335 shares of preferred stock at the end of the year.

The report discusses at length the acquisition of the St.

Louis & Suburban Railway. The United Railways Company gave 40,000 shares of its preferred stock for the entire outstanding stock of the St. Louis & Suburban, and assumed the \$7,500,000 bonds and about \$447,000 floating debt of the Suburban company.

On July 1, 1907, \$1,500,000 underlying 6 per cent bonds of one of the constituent companies of the United Railways Company will mature. There are reserved for their retirement \$1,500,000 of 4 per cent bonds. The discount at which these bonds will be sold will be charged against the surplus or carried to a suspense account to be charged off during a series of years.

Capital expenditures during the year were as follows:

Track and roadway construction	\$ 619,055.71
Electric line construction	96,970.39
Real estate, buildings, tools and fixtures	235,436.39
Miscellaneous equipment	26,971.82
Power plant buildings and equipment	73,620.94

Less cars and electric equipment of cars sold	\$1,052,055.25
	118,025.84

Total.....\$ 934,029.41

During the year the operation of the union depot power plant was discontinued and part of the machinery sold. A new substation is under construction and when it is completed the Cass avenue power plant will be discontinued. Rotary converters having a combined output of 4,000 kilowatts have been installed in new substations and considerable machinery moved to more advantageous points. In the year about 25¼ miles of track were reconstructed with 9-inch grooved rail laid on concrete and 1.6 miles were laid with 75-pound T-rails.

Union Passenger Terminal and Other Improvements at Portland, Ore.

The Portland Railway Light & Power Company has purchased the block bounded by First, Second, Pine and Ash streets, in Portland, Ore., and will immediately draw up plans and specifications for a large fireproof building five or six stories high for a union passenger terminal and for the general offices of the company. It is planned to use the station as a terminal for all the lines entering the city. Besides the usual terminal and office purposes the building is to be used for the display room of the electric light department, as headquarters for the employes, and for offices to be rented to other electrical and railway interests. The equipment of the Alder street substation is also to be located there.

In regard to other improvements contemplated by the company President H. W. Goode is quoted as follows:

"The power situation is fully taken care of for the next few years by the Cazadero plant, which recently started operations with an immediate capacity of 15,000 horsepower, which can be increased to 25,000 horsepower when required. The company has other plans which are being rapidly matured for power development, which will take care of the future after the capacity of the plant at Cazadero is exhausted.

"At the American Car Company's works, St. Louis, and the General Electric Company's plant at Schenectady, 100 additional cars and their electrical equipment are being manufactured. Forty of these cars will be delivered in Portland by May 1. The rest of the 100 will follow during the present year. The cost of these cars will be between \$400,000 and \$500,000. This new equipment will perfect the service on many lines, on which, owing to the rapid growth of the city, there has been some complaint about overcrowded cars during the rush hours. Meanwhile, about twelve new cars will soon be turned out of the company's own shops, which will be used until the other cars arrive.

"Within about 30 days, the company will begin the work of placing all its wires underground in the center of the city and will also commence laying mains for its steam heating system, a franchise for which was recently granted."

SHOPS OF THE NORTH JERSEY DIVISION OF THE PUBLIC SERVICE CORPORATION.

(Continued from Page 350.)

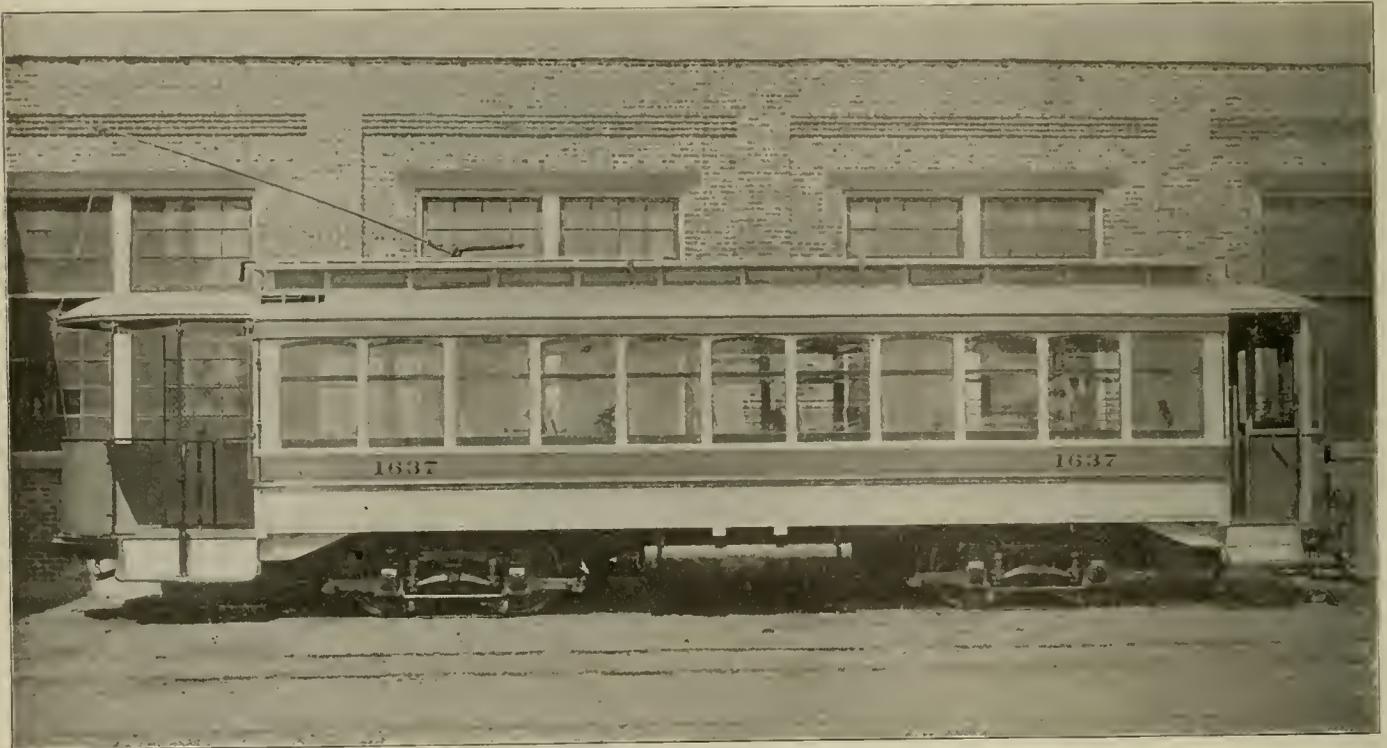

On the balcony of the machine shop on the west side of the old machine shop building is found the armature room. This is a particularly clean and well kept department. It would be thought from an inspection of this room, and judging from the small number of repair parts lying about, that the system is much smaller than it really is. However, this is probably due to the number of machine tools installed for readily and properly handling the work. Each armature is supported on two armature stands. These are built so that the armature may be raised or lowered and conveniently revolved so that the winder has ready access to the work. The soldering irons are all heated in gas furnaces, which are also attached to the stand, handy for the workman.

One of the cuts herewith shows the new field-winding machine, and another the new armature-banding machine. These were designed particularly for the work. The arma-

Also located on the balcony is the taping department. At present this work is done by hand, as the amount of work is not sufficient to require any automatic machinery. Directly under the winding department is the fireproof room and oven for baking and drying the armature fields. This is heated by steam coils underneath the floor. The room also contains dipping vats. One of the accompanying cuts shows the entrance to this room and a number of armatures ready to be distributed to the various terminals. It will be noticed that each is supported on its own armature buggy. The armature buggies strike the observer as being exceedingly convenient, for not only do they protect the wires and insulation but are handy to move about.

Erecting Shop.

Passing from the machine shop to the erecting shop it is noted that the south end of that building is reserved for the carpenter work. An accompanying cut shows a number of the machines in this shop. In connection with this shop there is an exhaust outfit that takes away the shavings to

North Jersey Shops—Standard Car of the Public Service Corporation of New Jersey.

ture-banding machine is driven by worm gear that has a friction brake, and the whole is operated by workmen by foot lever. The wire is held by a reel resting on the frame of the carriage, working parallel with the armature shaft. The tension is obtained by running the wire around and through a series of steel wheels, from which it is led to an adjustable arm. The tension is thereby kept constant and the work is under the perfect control of the operator. Formerly the armatures were banded by the old method, that is, by hand, and much trouble was experienced by the breaking and loosening of the wires. We are informed that the work done on the new machines gives very little trouble. The field-winding machines are also operated by worm and gear and have a friction brake so that the movement of the machine is controlled with a foot lever, leaving the operator free to work directly on the coil. Three of the machines appear in the cut but there are six installed, which easily handle all the work of the system. It may be noted that all of the armature work for the entire division is done in this department. The present field-winding machines are in iron frames.

the boiler room. It was noted that the workmen are installing a new 48-inch sanding machine. There is also a special machine roller for shaping the new steel panels that have been adopted for car bodies.

The erecting shop is equipped with several shallow pits, which are used for doing carpenter work on cars when the work is of a kind that necessitates getting beneath the bodies. It will be noted that the belting arrangement for the carpenter shop is above the floor. This was found necessary on account of the trouble with water in this particular vicinity, which prevented the installation of the driving machinery underneath. However, the machine tools are so well disposed that the belting does not interfere with the progress of the work. The erecting shop forms the second stage of the complete overhauling of the car, which first goes to the truck shop and then, after the motor work, forging and machine work have been finished, is taken out on the transfer table between the buildings and transferred to the erecting department.

It is to be noted that the general arrangement of tracks in the shops provides that all the tracks shall be short. This

makes a particularly convenient layout for handling cars and is an example of what is now generally conceded to be the most modern practice. From the erecting shop cars are taken out on the second transfer table and are passed to the paint shop building. The transfer table is very simple and of substantial design, made up of standard wheels and axles, supporting twin girders of $\frac{7}{8}$ -inch and 8-inch plates that carry heavy trilby rail. The table operates on three tracks and the driving motor is fed from a third rail and this makes a particularly clean and neat arrangement. The transfer table is arranged with direct electrical driven "nigger head," so that cars encountered in the buildings

storage tank runs out and it is necessary to do the washing with city water, but every advantage is taken of the roof water as long as it lasts. The paint shop is heated by direct steam, this being preferred to the hot air that is used in the other buildings. The direct steam system provides sufficient heat to maintain a temperature of over 80 degrees even during zero weather. The fact that ample provision has been made for properly heating the building enables the work of finishing to be satisfactorily carried on at all times.

The paint shop is large enough to accommodate comfortably 70 or 80 large cars and we understand that five or six cars are turned out every day. On the south side of the

North Jersey Shops—Method of Storing Cars Under Canvas in Yard.

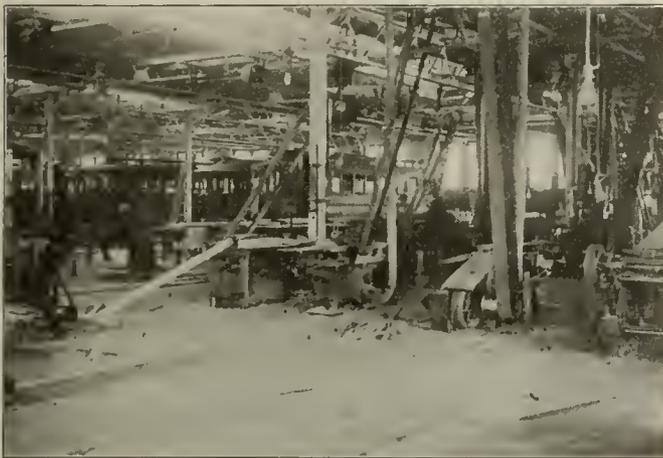

without power or electrical equipment are pulled on and off the table by means of a cable operated by the revolving drum.

Paint Shop.

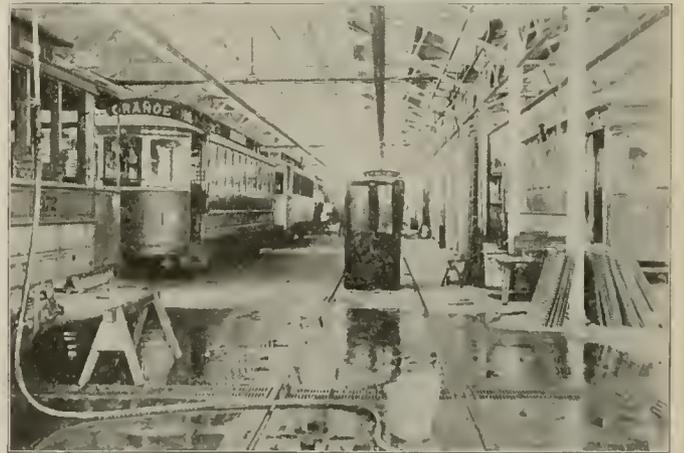

On going into the paint shop one cannot avoid being impressed with the general design of the building with regard to the lighting arrangement. All the light is practically north light and in such abundance that the work is carried on almost as if in the open. Directly across the entire front is a series of washstands so that every car can be washed

building is a section not containing tracks and here the finishing work is done. After the sashes are washed in the vats they are placed on a table that has a revolving frame and when varnished are neatly stored upon the stationary racks that run in rows back to back perpendicularly to the wall. One of the accompanying cuts shows a view of the interior of the paint shop.

All the paints, varnishes, oils, etc., are kept in storage in a separate building and we present herewith a cut showing the effective manner in which the material is stored in

North Jersey Shops—General View in Carpenter and Erecting Shop.

North Jersey Shops—General View in Paint Shop.

down as soon as it enters the building. Over each track is a water pipe with a place for attaching hose.

All of the rain water that falls on the shop buildings is taken to a concrete cistern, from which it is elevated by an automatic electrically driven centrifugal pump to a 20,000-gallon tank, 60 feet high. This tank supplies the water for washing the cars and we are informed by the superintendent that soft water is much preferred for cleaning the woodwork. Not only is it effective in removing dirt, but it also accomplishes this result with the minimum of injury to the car bodies. There are of course times when the supply in the

tanks. One man is in charge of the paints, oils, etc., and these are given out to painters in small quantities, as desired. At night all the varnish, paints and oils are entirely removed from the paint-shop building proper to the storage house. The method of storing paints indicated in this cut cannot fail to commend itself to all who have a considerable amount of painting to be done. The arrangement always excludes inflammable material from the main building as most practicable and reduces almost to a minimum the fire risk from the storage of material. On the south side of Ferry street are the storage barns, where out-of-season equipment is stored. The cars are taken from the

storage barn through the shops, by first going directly across through the machine shop, and then through that building until they come out of the east end of the paint shop, ready for service, or to be taken to their respective divisions. It may be of some interest to note the method of storing cars in the open with canvas covers, as seen in one of the accompanying cuts. We are informed that these cars, after standing outside for an entire season with the canvas covers, are

storerooms at operating terminals, where material is used by inspection and car men.

There is also a complete fireproof oil house. Both storeroom and oil-house are located so that steam cars can be brought into the yard and the contents unloaded directly into the building. The oil-house has a separate room for the storage of waste and has a capacity of two carloads of oil.

One of the cuts presented herewith shows an electric

North Jersey Shops—Method of Storing Paint Supply.

in as good condition as when first stored. For example, the summer car that comes out of the paint shop when finished is often placed in the yard under the canvas cover and when the weather has so moderated that the car is ready to go into service, the varnish is found in practically as good condition as when it came out of the paint shop. The canvas covers are of duck, in two sections, laced together with heavy twine through brass eyelets. The covers cost about \$50.00 per car, and a life of five or six years would make it appear

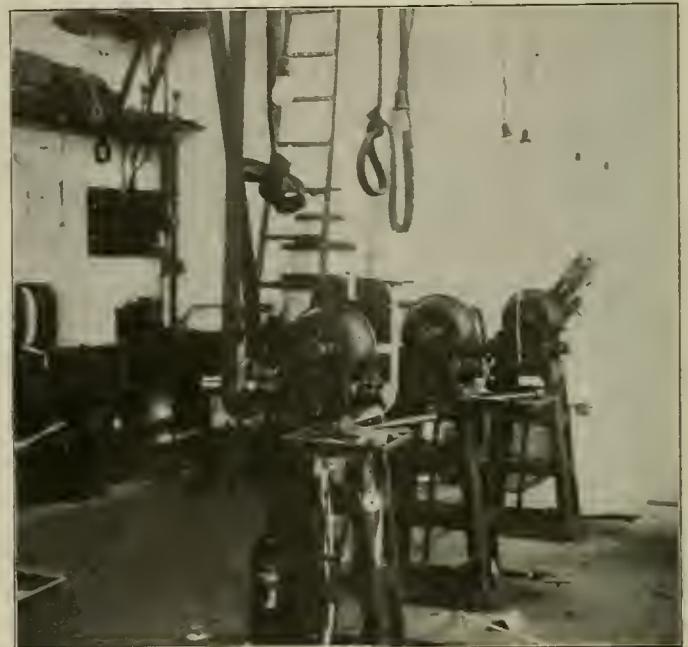

North Jersey Shops—Entrance to Bake-Oven Room, Showing Armatures on Buggies.

locomotive that was built at the shops and that is used for switching cars to and from the steam road racks and elsewhere about the yards. From the view of the Plank Road shops presented in the Electric Railway Review of March 16, 1907, page 346, it is seen that the buildings are adjacent to and have connection with the railroad tracks, making it easy for carload material to be switched directly to the shops. The board fence in the rear of the shop building is 7 feet

North Jersey Shops—Self-Supporting Jib Cranes with Air Hoists.

that the cost of storing with this method is much more economical than if buildings were erected. At the west end of the property is located the general storeroom and iron yard of the shops, and one of the accompanying cuts gives a view of the iron rack in the center of this yard and shows the shelves arranged along the inside of the exterior wall of the yard for holding castings, etc., that are not affected by the weather. From the general storeroom regular supply cars distribute material to the auxiliary shops and small

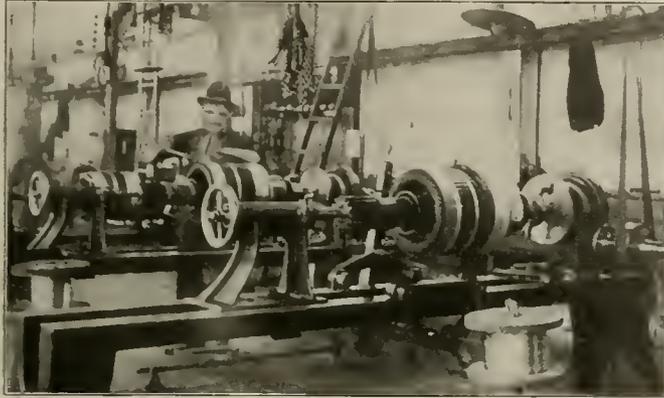

North Jersey Shops—Field-Coil Winding Machines.

high and the posts are run 2 feet above the fence proper, supporting three barbed wires, so that it is difficult for any one to gain admittance to the grounds without going the regular route.

The fire protection of the Plank Road shops is so complete that it deserves more than ordinary mention. All the buildings are equipped with inside 2-inch hose connections and auxiliary fire alarm sets, whereby an alarm can be turned directly into the city department from almost any part of

the property. The interiors are also equipped with numerous automatic fire extinguishers and a sprinkling system. Outside are fire hydrants and a main fire house, equipped with hose cart and reel with 500 feet of hose, a 55-gallon chemical fire engine, hooks, ladders, axes and everything necessary for fighting fire.

The company has organized a regular fire brigade so that every man goes to his post on the sounding of the special

North Jersey Shops—Armature Banding Lathes.

signal, which is a penetrating air whistle. In connection with the sprinkling system, which is of the dry pipe type, there is an electrically-driven centrifugal fire pump, of a capacity of 1,000 gallons per minute, and it is of particular interest that the pump is one of the first of the centrifugal type installed in connection with a sprinkling outfit. On a test it maintained a pressure of 100 pounds per square inch with four hose connections on the line, each equipped with Underwriters standard hose pipes. Besides the fire pump there is a steel storage tank 117 feet high, which contains 50,000 gallons of water. It will be seen that in case of fire and a break in the city main, there would be sufficient water available to put out any ordinary conflagration, besides producing a heavy pressure on the sprinkling lines at all times, giving plenty of leeway to start the pressure pump. The sprinkling system is very neatly arranged. All the heads are on the roof. This idea is effectively carried out with a shop of this particular type, with single floor construction

North Jersey Shops—Switching Locomotive Built and Used at Shops.

and low roof. At each dry valve is placed an electric gong so that if the sprinkling head that is connected with any particular valve goes off, an electric contact is made so that the gong at the valve besides sounding an alarm at the special location also sounds a main gong in the boiler house, where men are on duty at all hours. At the same time an annunciator in the boiler house points out the number of the dry valve that controls the particular head that has exploded. It is evident that as soon as the gong in the boiler

house sounds, the man on duty knows the exact location of the trouble, and he immediately blows the fire whistle, which gives the alarm and gets the shop fire department into action.

We are indebted to Mr. A. H. Stanley, general manager of the street railway department, for the privilege of presenting this article, and to Mr. Martin Schrieber for assistance in compiling the data.

DIRECTORY OF ELECTRIC RAILWAY ASSOCIATIONS.

American Street and Interurban Railway Association. Secretary, Bernard V. Swenson, 29 West Thirty-ninth street, New York.

American Street and Interurban Railway Accountants' Association. Secretary, Elmer M. White, assistant treasurer Birmingham Railway Light & Power Company, Birmingham, Ala.

American Street and Interurban Railway Engineering Association. Secretary, S. Walter Mower, general manager Southwestern Traction Company, London, Ont.

American Street and Interurban Railway Claim Agents' Association. Secretary, B. B. Davis, claim agent Columbus Railway & Light Company, Columbus, O.

American Street and Interurban Railway Manufacturers' Association. Secretary, George Keegan, 2321 Park Row building, New York, N. Y.

Canadian Street Railway Association. Secretary, Allan H. Royce, president Toronto Suburban Railway, Toronto, Ont.

Central Electric Railway Association. Secretary, W. F. Millholland, secretary and treasurer Indianapolis Traction & Terminal Company, Indianapolis, Ind. Next meeting, Dayton, O., March 28.

Colorado Electric Light Power & Railway Association. Secre-

North Jersey Shops—Rack for Holding Iron Supply.

tary, John F. Dostal, Denver Gas & Electric Company, Denver, Colo.

Iowa Street and Interurban Railway Association. Secretary, L. D. Mathes, general manager Union Electric Company, Dubuque, Ia. Next meeting, Clinton, Ia., April 19 and 20.

Massachusetts Street Railway Association. Secretary, Charles S. Clark, 70 Kilby street, Boston, Mass. Meetings held in Boston on second Wednesday of each month, except July and August.

Northwestern Electrical Association. Secretary, R. N. Kimball, Kenosha, Wis. Annual meeting, Milwaukee, Wis., January, 1908.

New England Street Railway Club. Secretary, John J. Lane, 12 Pearl street, Boston, Mass. Meetings held on fourth Thursday of every month.

Oklahoma Electric Light Railway and Gas Association. Secretary, Charles W. Ford, Oklahoma City, Okla. Next meeting, Oklahoma City, April 22 and 23.

Pennsylvania Street Railway Association. Secretary, Charles H. Smith, superintendent Lebanon Valley Street Railway, Lebanon, Pa.

Southwestern Electrical and Gas Association. Secretary, R. B. Stichter. Annual meeting, San Antonio, Tex., May 14, 15 and 16.

Street Railway Association of the State of New York. Secretary, J. H. Pardee, general manager Rochester & Eastern Rapid Railway, Canandaigua, N. Y.

Wisconsin Electric and Interurban Railway Association. Secretary, Clement C. Smith, president Columbia Construction Company, Milwaukee, Wis.

It is announced that the Houston (Tex.) Electric Company will build a clubhouse for its employes, equipped with a library and reading room and patterned after the clubhouse recently built by the San Antonio Traction Company in San Antonio, which has proved a source of gratification both to the men and to the company.

PROGRESS OF THE TRACTION CAMPAIGN IN CHICAGO.

The Citizens' Non-Partisan Traction Settlement Association of Chicago has distributed 50,000 buttons bearing the inscription, "Vote for the Traction Ordinances, C. N. P. T. S. A." A series of four postal cards containing arguments in favor of the ordinances has been prepared, and two of the cards have already been distributed. With the second postal card a "nut-shell" version of the ordinances was distributed. The association has adopted the plan of sending copies of the ordinances to all who raise objections to them and it has been found that many of the objections were based on misinformation.

A new organization called the "Strap Hangers' League" has been formed to advocate the approval of the ordinances. Walter L. Fisher, who was Mayor Dunne's original traction expert, advocated favorable action on the ordinances before a meeting of the league on March 19. Mr. Fisher said in part:

I have said before since this controversy arose, and I have said it for the last 12 months, ever since my official connection with this matter, that the one thing which the city had not established, and the one thing which it was most uncertain as to whether it could establish, was its ability to raise the money necessary to buy this property under the \$75,000,000 ordinance of any other ordinance which the present opponents of this ordinance would advocate and which would be adopted by the people.

The fundamental question that is involved is whether or not under the existing conditions in the money market of the world (because the flurry that we had the other day in Wall street is not confined to Wall street) the city has the ability to finance those securities.

Shall we wait, shall the people of this community permit the present intolerable conditions to continue while the officials of the city find out or attempt to find out the only means by which municipalization is possible under the law?

These ordinances were intended to present a proposition on which the advocates and the opponents of municipal ownership could safely unite without sacrificing the principles or convictions of either one, so that both of them could say, as the mayor said in the Werno letter: "We can provide for first-class service and we can settle the question of municipal ownership when we have established our legal and financial ability to take them over and have made the necessary political provisions that are absolutely essential to any successful management under public control."

These ordinances were drawn on the theory that the time when the city could best purchase—most advantageously purchase—would be at the expiration of the 3-year immediate rehabilitation period. It was not, however, limited to the right to purchase then. If these ordinances are adopted, six months from February 1, 1908, the city can give notice, and on that day it can purchase and take over the properties.

It also can wait the three years, and if the service is then satisfactory, if the financial terms are then working out so every one is content, it can wait until the next year, and the next year, and the next, and it can take advantage of that provision in the law whenever it desires to do so.

The decision of the United States supreme court which holds invalid the 99-year franchises in Chicago has been filed in the federal court of Chicago. The attorneys for the city of Chicago and the Chicago Union Traction Company will argue the question as to whether the entering of the decree will cloud the right of the company to continue the use of certain tracks. Judge Grosscup announced that he will hear the arguments on April 4 and 5.

The New York state board of railroad commissioners has decided to discontinue, at least temporarily, the issuing of the quarterly reports showing statistics as to transportation in Greater New York. These reports have been issued every three months for several years and have been remarkably complete in detail. They have given for each quarter the cash fares, the transfers and the total cash fares and transfers received by each street railroad operating company; the greatest number of passengers carried in one day, the car mileage, and the number of transfer points. The reports have furnished the opportunity of ascertaining just how efficient the service of each company has been. No reason is given for the decision.

NEW YORK RAILROAD CLUB.

An interesting paper by Walter C. Kerr, president, Westinghouse, Church, Kerr & Co., on "The Conduct of Electrification Work" was read before the members of the New York Railroad Club at their meeting held on March 15, 1907. An extract from the paper follows:

Many electrical considerations begin by getting tangled in chaotic, irrelevant discussion, due to thinking of the details first, when consideration should be limited to the broad problem of how the results produced through electrification will compare with the present steam traction. It can be easily, cheaply and quickly determined whether in any case electrification is warranted or not. If not, the job is finished. If warranted, the next step is determination of the main elements and their applicability to the case in hand, leading to the work being authorized and the appropriations approximately made to perform it.

I call attention to certain fundamental differences between electric and steam traction. Steam traction consists of specially differentiated and entirely independent units, which can be very unlike in many ways. Electrification is essentially a system in which there is correlation of the highest order; in which every part of the whole operation is dependent on every other part and its individual operation. A new type of steam locomotive or other steam railway appliance can be tried in a small way before adoption. An electric system must be completely installed, with a large expenditure of money, time, power of decision, and faithful constructive work, in an exceptionally new and rapidly advancing art, before it may exhibit its merits or defects. Those charged with the administration of such work must make profound decision as to how the electrification shall be accomplished, to utilize the best means to safeguard cost, quality, time, hazard and insurance against wide departure from normal performance.

I have time to discuss only a few considerations, which to my mind are important, though not always sufficiently regarded.

The accomplishment of a physical project necessitates logical decisions as to what to contemplate, what to determine, the detail of what shall be designed, and how it shall be designed and specified, the method of construction and finally, the modification of existing methods to the new type of operation. This sequence is often forgotten or never known.

A steam railway may accomplish this in one of three ways: (1) It may create a new department within itself to conduct it. (2) It may associate with it an already established competent organization of engineer-constructors as a department within the road. (3) Or it may employ engineers to make determinations, designs and specifications, and with their assistance let segregated contracts for the work.

No one method may be so good as to be perfect, but it is my belief, as well as my practice, that the second method covers at the present time more desirable features and fewer limitations than any other.

A road cannot quickly and safely create such a department containing needful knowledge and experience, nor is a large department for this purpose, at first, financially warranted.

Such an undertaking requires the correlated work of an organization of engineer-constructors of widely different talent, trained in working co-operatively to a given end. This, too, gives the existing departments of any road time to become practically familiar with such work and shape themselves to later conduct it.

The general contracting process need not be mentioned here, as it is not well adapted to this class of work.

I therefore would summarize my views of the best mode of the conduction of electrification work in the statement that it is for each road to undertake its own work at first hands through the best facilities it can command, which if sufficiently developed within its own organization needs no outside assistance, but when not so developed and, especially in the first instance, it should be through the employment of a thoroughly organized and competent department which for the time being it makes its own.

The Boston Elevated Railway Company, which operates an extensive system of elevated, surface and subway lines in Boston, Mass., has applied to the Boston municipal government and to the selectmen of the suburb of Brookline for permission to carry baggage, express and freight matter over its lines, as a common carrier, under the railroad laws of 1906.

REPORT OF A BOARD OF ENGINEERS ON NEW YORK CENTRAL LOCOMOTIVES AS RELATING TO THE WOODLAWN WRECK.

Since the derailment of an electric train on the New York Central, near Woodlawn, on February 16, an investigation of the forces to which track is subjected by the operation over it of the electric locomotives used by the New York Central and of steam locomotives of the Atlantic type, has been made by a board of experts. The board consisted of representatives of the New York Central, the General Elec-

New York Central Woodlawn Wreck—Electric Locomotive

tric Company and the American Locomotive Company and of Professors Swain and Allen of the Massachusetts Institute of Technology.

The result of the investigation is given as follows:

Comparison Between Steam and Electric Locomotives on a 3-Degree Curve with 4½ Inches Superelevation.

The statement has been published "that there is no science of curve mechanics." While this in a general way is a correct statement, it is nevertheless true that the subject has been quite fully discussed by Wellington in his "Economic Theory of Railway Location" (pages 281 to 313) and the essential elements of the problem and methods of calculating indicated. Experimental determination of values for the various constants entering into the problem is a

(2) Component of slipping in the direction of the tangent of track, due to unequal rail lengths inside and outside.

(3) Net effect of centrifugal force (superelevation of outer rail considered).

The locomotive must be revolved against these forces (1 and 2), and such a pressure applied as will cause the locomotive to follow the curve. The point about which the locomotive revolves with respect to itself as affecting the wheel slippage may be determined mathematically for all practical purposes and the stresses resulting from these two effects can be easily determined by calculation. In determining these, due consideration should be given to the action of the rigid wheel base on the curve in question, taking into account the clearance in the gauge and the clearance between the main drivers and the rigid frame.

It will be appreciated that the radial slip on the front outside driver when rounding the curve is self-contained and of itself does not tend to displace the rail, and that the radial slip on the inside front driver does tend to displace the outer rail acting through the front axle to the flange of outer front driver.

If the clearance between the driving wheel hubs and the locomotive frame is more than the ordinate of the curve at the second axle, the second axle will run to the outer rail until the flange of outer second driver bears against the rail and thus the frame of the locomotive does not have to carry the radial slippage of the second set of wheels.

The centrifugal effect (3) and superelevation of the outer rail are readily calculated and need no explanation.

Thus, with the major elements taken into consideration, it is entirely possible to practically calculate all of the guiding effect necessary.

To solve the problem to the last refinement becomes a complicated and tedious investigation. The slight variation under actual conditions of operation, condition of track, stiffness of parts, etc., introduces constantly changing stresses which would make a solution to the last refinement on any one given condition, of no practical value. With due consideration to the fundamental and major elements, the problem can easily be solved and the guiding effect determined sufficient for all practical purposes.

Considering (a) the condition where the second driving axle bears against the locomotive frame and so transmits the radial thrust of the second axle to the outer front driver, a comparison of the New York Central electric locomotive

New York Central Woodlawn Wreck—Steam Locomotive, Atlantic Type.

very difficult matter and is the reason for the non-existence of a science of curve mechanics.

A partial analysis of the guiding effect provided on steam locomotives shows that the fundamental elements have been considered and the guiding effect determined therefrom are borne out in practice.

The guiding effect provided for electric locomotives of the New York Central is not only theoretically in accord with what is required, but has the same structure and relation of parts as already provided on steam locomotives and operating successfully.

There might be mentioned three fundamentals of "mechanics of curve resistance":

(1) Component of slipping in the direction of the radius, due to curvature.

with the Atlantic type steam locomotive on a 3-degree curve with a 4½-inch superelevation shows that the pressure of the steam locomotive driver against the rail is greater at all corresponding speeds. The resultant shear on the spikes, however, allowing for the friction of the rail on the tie plate, is less with the steam locomotive than with the electric.

The difference between the pressure against the rail and the shear on the spikes is affected so far as the drivers are concerned by the height of the center of gravity under the influence of centrifugal force increasing the vertical pressure on the outer rail. The greater effect of the higher center of gravity of the steam locomotive disappears, however, at the higher speeds by reason of the increasing preponderance of the horizontal force due to centrifugal action. At about 90 miles per hour the shear on the spikes for the steam loco-

would be approximately the same as that of the electric locomotive, but at this speed the steam locomotive would be in danger of overturning.

The maximum shear on the spikes is not necessarily caused, however, by the driving wheel of the locomotives, but at certain speeds may exist at the leading wheel of the guiding truck. Although the pressure of the guiding truck wheel against the rail may be actually less than that of the driver, the weight upon the rail of the guiding wheel is so much less that the resultant shear on the spikes is consequently greater. On the electric locomotive the shear on the spikes, due to the guiding truck, is in excess of that due to the drivers up to about 40 miles per hour. On the steam

of 19 per cent; but, on the other hand, if the comparison is made on the basis of the two forward drivers, bearing against the outer rail of the electric locomotive, the unbalanced pressure is 2,780 pounds, as compared with 4,890 pounds on the steam locomotive, a difference in favor of the electric locomotive of 43 per cent.

The ultimate shearing resistance of the standard spikes used on the curve in question ranges from 14,440 pounds to 17,060 pounds. Assuming a factor of safety of 4, the permissible shear per spike is 3,810 pounds to 4,265 pounds.

The 100-pound rail in use on the curve acts as a continuous girder distributing the stresses over several spikes, but to be conservative, two spikes may be taken as resist-

Steam Locomotive (Atlantic).								
40	7,830	3,200	4,630	6,120	6,260	6,280
50	7,950	3,210	4,740	7,450	6,220	6,720	730
60	8,130	3,240	4,890	11,230	5,460	8,170	3,060
70	8,170	3,330	4,840	15,390	7,570	9,420	5,970
80	8,200	3,430	4,770	21,160	13,020	11,250	9,910	1,820

locomotive the shear on the spikes due to the guiding truck is in excess of that due to the drivers up to about 65 miles per hour, and this shear exceeds that of either the driving or truck wheel of the electric locomotive up to about 57 miles per hour.

Considering (b) the condition where the second driving axle clears the locomotive frame by reason of the end play and so bears directly against the outer rail without transmitting to the leading driver the thrust due to its radial slip, the pressure against the rail of the leading steam locomotive driver as in the condition (a) is greater at all corresponding speeds. The resultant shear on the spikes is less,

ing the unbalanced outward thrust. Consequently at 60 miles per hour we have actual maximum shears with either steam or electric locomotives ranging from 4,440 pounds to 4,890 pounds borne by two spikes, which with a factor of safety of 4, are proper for shears of 7,620 pounds to 8,530 pounds. In other words, the actual factor of safety is approximately 7.

In conclusion, it appears that on the basis of the forward driver only bearing against the outer rail, the electric locomotive imposes slightly greater unbalanced stresses than the steam locomotive, whereas, on the basis of the two forward drivers bearing against the outer rail, the steam locomotive imposes considerably greater unbalanced stresses. There-

New York Central Woodlawn Wreck—Scene of Accident.

however, with the steam locomotive due to the effect of its higher center of gravity.

Under this condition (b) with the electric locomotive the shear on the spikes due to the guiding truck is in excess of that due to the drivers up to about 75 miles per hour. On the steam locomotive the shear on the spikes due to the guiding truck is in excess of that due to the drivers at all speeds and this shear exceeds that of either the driving or truck wheels of the electric locomotive up to 75 miles per hour.

Regarding the stress on the outer spikes of the outside rail, it will be seen from the accompanying tables that for a speed of, say 60 miles per hour on a 3-degree curve with a superelevation of 4 1/2 inches, the maximum shear on the spikes with the forward driver only bearing against the outer rail is 5,820 pounds for the electric locomotive, as compared with 4,890 pounds for the steam locomotive, or a difference

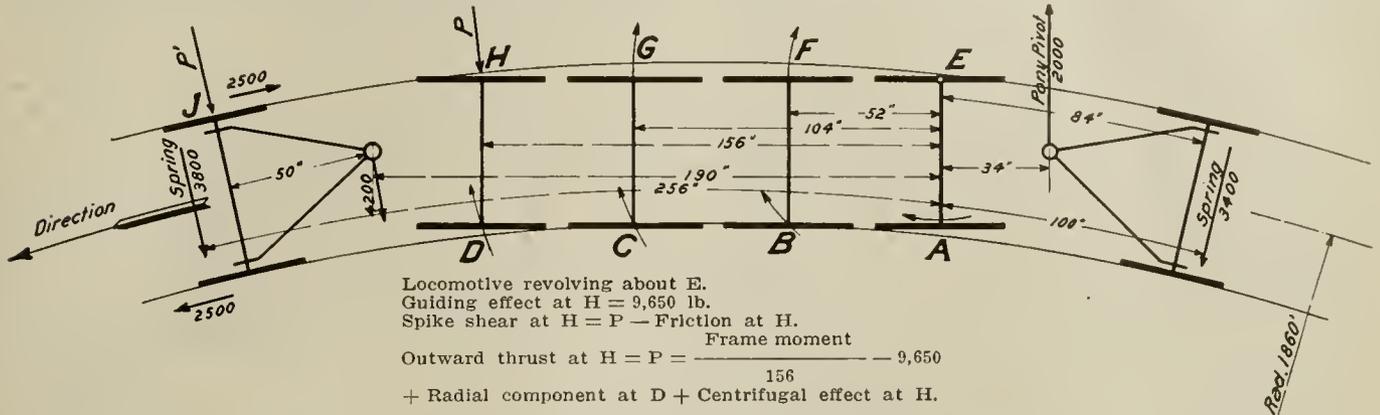

fore, the shearing force on spikes, one on the outside of the outer rail in each tie, with tieplates, on 3-degree curves, properly maintained, with a superelevation of 4 1/2 inches, is far within the limits of safety for speeds in excess of the so-called "equilibrium speed" of about 46 1/2 miles per hour to which the superelevation of 4 1/2 inches corresponds.

Assuming 25 per cent coefficient of friction between wheels and rails and between rail and tie plate, on a 3-degree curve with 4 1/2 inches superelevation, the maximum pressure of truck or driving wheel of electric or steam (Atlantic type), second drivers not bearing against the outer rail, is as follows:

Miles Per Hour.	Against Rail, Pounds.	Resultant Against Spikes, Pounds.
40	Steam truck..... 7,830	Steam truck..... 4,630
50	Steam truck..... 7,950	Steam truck..... 4,740
60	Steam driver..... 11,230	Steam truck..... 5,820
70	Steam driver..... 15,390	Electric driver..... 9,130
80	Steam driver..... 21,160	Electric driver..... 13,000

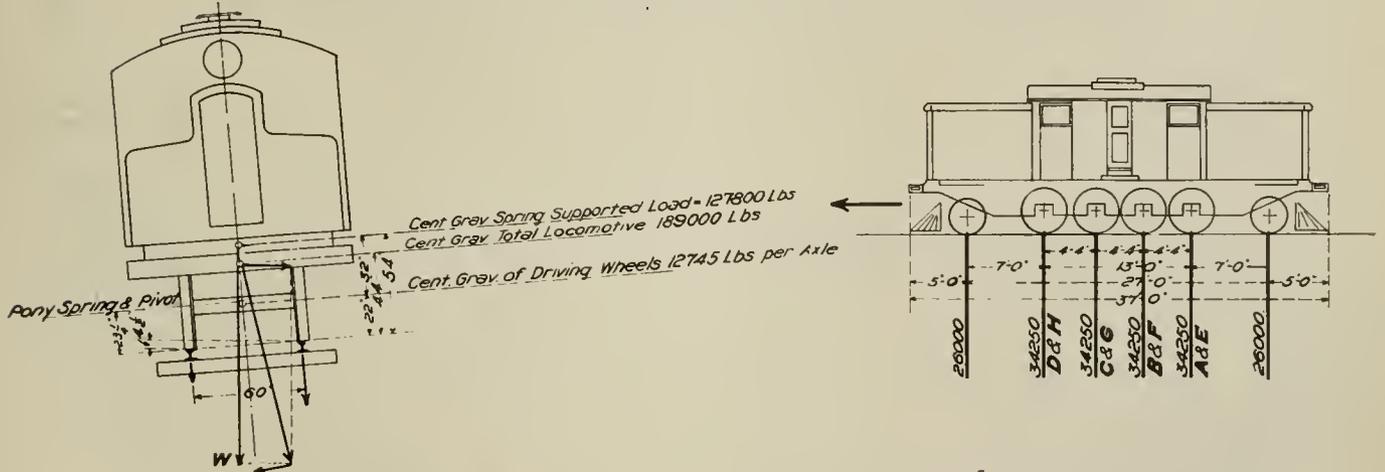

On a 3-degree curve with the clearances provided in the design, the outward thrust of the second driving axle would be carried by the flange of its outer wheel. Therefore the following values are based on maximum pressure of truck

In compliance with your request of February 28, I have made a careful examination regarding the circumstances of the train accident at a curve on track No. 3 near Woodlawn bridge. I have visited the curve and inspected the

Except in four instances, the electric locomotive shows less maximum unbalanced pressure than the steam locomotive.

Opinion of Professor Merriman.

In a letter dated March 4, 1907, to G. W. Kittredge, chief engineer of the New York Central, Prof. Mansfield Merriman says:

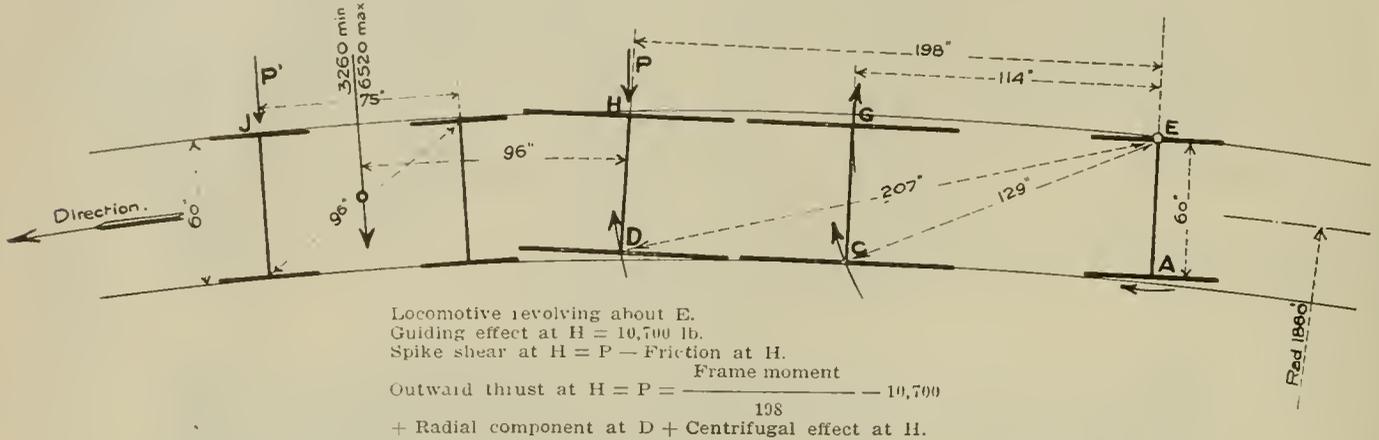

four tracks, noting the behavior of the rails and cross-ties under the passage of both steam and electric locomotives. I have examined the three computations made by Mr. Anderson, Mr. Carpenter and Professor Swain regarding the pressures exerted by the wheels of the electric locomotive against the outer rail of the track, and have also made computations of my own.

All these computations agree in regard to the total centrifugal force exerted by the locomotive and in regard to the diminution of this due to the superelevation of the outer rail, but they differ materially in the results obtained for the pressure which causes the skewing of the locomotive wheel base. This is due to different assumptions made by the computers as to the position of the center of rotation of this wheel base, as to the influence of the movable front axle, and as to the values of the coefficients of friction.

The problem of the forces required to skew a rigid locomotive wheel base around a curve is one of great complexity. I have seen in print only one discussion of it, namely, that given in Wellington's "Economic Theory of Railway Location," but this discussion states general principles only without formulas or numerical computations. In my opinion, a

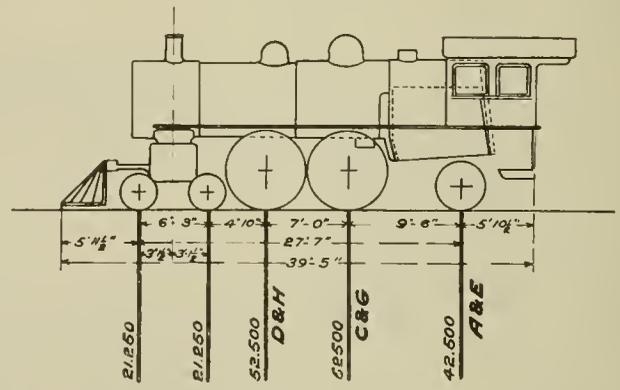

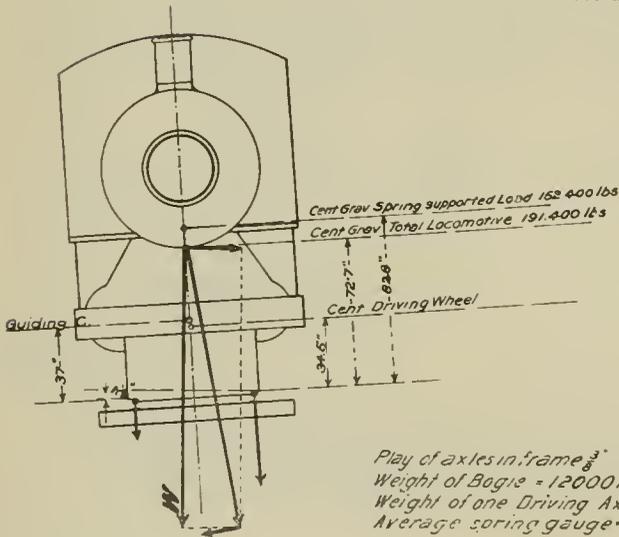

the pressure as distributed over two spikes, the factor of safety is 3.4, which is satisfactory. These computations hence indicate that the accident must have been due to some other cause than the radial pressure developed under the normal action of the locomotive.

In justification of the assumption that the pressure was

definite solution of this problem, on which all experts can agree, cannot be possible until experiments and measurements have been made to determine the facts which now must be roughly assumed.

The computations which I have made or examined indicate that the front outer driving wheel of the electric locomotive may have exerted a pressure against the outer rail on the 3-degree 5-minute curve of from 5,000 to 10,000 pounds at a speed of 60 miles per hour. Taking the highest figure, using 17,000 pounds for the ultimate shearing strength of a spike, as determined by Professor Lovell, and considering

distributed over two spikes, I note that all bridge specifications consider the weight of a wheel to be distributed over three ties, indicating that experience has shown this to be true. Also when tie plates are not used, track specifications require rail braces to be placed against the outer rail of a 3-degree curve on every third or fourth tie, indicating that experience has proved that the radial pressure under a wheel is distributed over at least three ties.

As a professor of civil engineering for twenty-eight years, it has been my duty to instruct students in the principles of railroad construction and maintenance. I have always presented to them the theory of centrifugal force on a curve and of the superelevation of the outer rail, but have never given a discussion of the resistance of the spikes against shearing. I have never seen in print a discussion of the resistance of spikes on the outer rail of a curve and have never heard that such computations have been made by engineers of maintenance of way. Practice in this matter appears to have been the result of experience alone. I do not consider myself negligent in having omitted to present this topic to my classes and I do not think that omission to make

such computations should subject any railroad official to the charge of negligence.

Precautions Taken Before Operating Electrically.

The management of the New York Central took extraordinary care to secure the best results in the design, construction and operation of its electrical equipment, and at this time it is proper to call attention to recite some of the precautions:

The vice-president in charge of electrification associates with himself the best talent obtainable in the country, also the contract for the construction of the locomotives was entrusted to one of the most reputable electric manufacturing companies in the United States with the requirement that associated therewith should be one of the most reputable locomotive manufacturers, so as to secure a combination of the talent of both concerns.

Following the thorough discussion, investigation and decision as to design, the actual construction of the locomotives was limited to one machine, so that after thorough test any needed improvements that were discovered might be incorporated in the remainder of the total order of thirty-five locomotives.

The first completed locomotive was tested on a six-mile experimental track for over two years, covering over fifty thousand miles of actual service, under the constant inspection of the vice-president in charge of electrification and his associates; also of both manufacturing companies and of inspectors appointed by the operating department that was to use the locomotives, as well as by the construction department.

Correction is needed of a wrongful impression given by the public press that the testimony given regarding the shifting of the track in the ballast on one of the curves in the experimental track at Schenectady during high speeds, was an indication of something wrong about the electric locomotive. Exactly the contrary deduction should be drawn. The electric locomotive was purposely driven at speeds of 75 miles per hour around a curve that was elevated for but 60 miles per hour, so as to accentuate any tendency that might exist with the locomotive to spread the gauge. This very high speed caused a centrifugal force sufficient to move the ties in the gravel ballast, but there was absolutely no widening of the gauge under such extreme conditions, thus demonstrating that even with such excessive speeds around insufficiently elevated curves, producing a centrifugal force sufficiently great to shift the track in the ballast and distort the curvature, would still not cause a widening of the gauge on this inferior track. In other words, this test demonstrated that the method of spiking curves in ordinary practice was sufficient to meet even abnormal conditions.

The maximum speeds in miles per hour of these electric locomotives, running light in still air, with 600 volts on straight level track, for different positions of the controller are as follows:

	One Locomotive.	Two Locomotives.
Controller in full series notch.....	28	30
Controller in full series parallel notch.....	50	52
Controller in full parallel notch.....	86	90

HANDLING BAGGAGE IN CONNECTION WITH STEAM ROADS.

The Birmingham Light & Power Company and the city transfer company of Birmingham, Ala., are parties to a system of suburban baggage transfer that is, because of its successful operation, of unusual interest. These two companies have entered into an agreement whereby parcels of baggage received by the transfer company at the depot are given the street railway company for suburban delivery.

All railroad traffic of the country surrounding Birmingham centers at the union station. Passengers whose real destinations are in one of the populous suburban towns invariably purchase tickets from distant points to Birmingham and depend upon the electric cars to carry them to the point they desire to reach. As is customary in cities an agent of the transfer company meets all incoming trains and takes charge of baggage that passengers desire to have delivered either in the city or in the suburbs. If it is for suburban delivery the baggage is taken to the station of the street railway company, loaded into a freight car and afterwards carried to its destination and delivered by the street railway employes. In a similar manner baggage checked from any

point on the electric lines is delivered to the transfer company at Birmingham and thence to the baggage room at the depot. A charge of 50 cents is made for each piece of baggage transferred. One-half of this amount goes to the street railway company for its share of the work.

So thoroughly has the system been developed that during the year it has been in operation only one piece of baggage has been lost. Inasmuch as no provision is made on the electric cars for carrying baggage the system is claimed to be as satisfactory to patrons, so far as the service is concerned, as though baggage interchange arrangements existed between the steam and electric railways.

The checks given as receipts for baggage do not vary in form from those used by transfer companies in other cities. The method of issuing the checks when baggage is received and taking them up when the delivery is made is the same as that in vogue on steam railroads. In addition to the check, however, the electric railway company has a baggage waybill and receipt which latter it is necessary for the recipient of baggage to sign before the delivery is made. This latter provision is merely a safeguard that the company has found advisable to adopt.

SPECIAL SIGNALS AT CAR HOUSES.

On high-speed interurban roads and even in the suburban divisions of city systems it is often necessary to inform motormen of changes in operating conditions beyond certain points in the line which might otherwise be passed at too high a speed. Unless some kind of special signal is in service, the delay incurred in stopping for orders may lengthen the schedule unduly, or in the absence of accurate information as to the track ahead a car may be run too rapidly for safety. If the schedule does not require motormen to stop regularly at all car houses it is highly important that some simple means be installed to signal approaching cars or trains that something unusual is afoot.

This can readily be accomplished by the use of incandescent lamps mounted in waterproof boxes over the track to be governed, colored glass being set in the front of the box to give the indication desired. By connecting four lamps in series in the box, grounding the last lamp terminal, running the other side of the line to the car house office and connecting it with the trolley through a fifth lamp and single-pole switch, a simple and reliable hand signal is made available. The fifth lamp should either be labeled with a pilot designation or glassed with the proper color to avoid mistakes in setting the signals. Several of these lamps and switches mounted on a common slate panel close by the window and private telephone enable the approaching cars to be controlled with ease from the office.

In a recent installation of this kind the car house and shops were located near the bottom of a steep hill and to avoid the danger of a collision between an approaching car and any other car which might be standing at the time on the main line in front of the car house, a yellow caution signal of four lamps was installed at the top of the grade, the fifth lamp and switch being in the office. To bring any approaching car to a full stop outside the shops a couple of lamp signals were mounted over each track, the red indications being controlled in the above-mentioned way from the office panel board. On this particular road cars do not stop at the shops without special signal. Although the line is double-tracked, there are places upon it which are too narrow to allow the simultaneous passage of cars and the largest snow plows used on the road, so it has to be operated as a single-track line in certain places at times. One of these sections of too limited clearance begins near the shops, and to warn motormen of the presence of plows a four-lamp blue signal is installed, the control being in the office alongside the other switches. The reduction of one stop helps the schedule, saves the power cost of accelerating from a standstill and the wear and tear of braking. The lamps do not consume current except while signals are needed, and as someone is on duty all the time at the shops, their operation is a matter of no trouble whatever.

EXTENSION OF A PIONEER SINGLE-PHASE LINE IN CALIFORNIA.

The very satisfactory traffic, both freight and passenger, which the Vallejo Benicia & Napa Valley Railroad Company has enjoyed since it began operating some two years ago has warranted the construction of an extension of the line which will more than double the territory served. The San Francisco Vallejo & Napa Valley Railway Company has recently been organized to build the extension, the grading for which is now practically completed. When the new track is in operation the company will be able to offer excellent service from San Francisco by steamer to Vallejo, thence by the present single-phase electric line to Napa, 17 miles, and by the new extension, 18 miles, to St. Helena.

Track and Roadway.

This extension from Napa to St. Helena will serve an especially fertile and well-populated valley, the terminus, St. Helena, being a well-known health resort with a permanent population of 2,500 people. The roadbed as now graded is practically tangent for the entire distance. The company has a private right of way and the maximum grade is one of but 1.28 per cent for a distance of 1,000 feet. In the entire 18 miles the rise is only 245 feet. The track is of standard construction, with 60-pound rails, and rock ballast. Continuous joints are used, bonded with 10-inch "Protected" rail bonds with 7/8-inch terminals.

Japanese Oak Ties.

It is interesting to note that the ties for the extension were purchased in Japan. They are Japanese oak with 9-inch bearing faces, 6 inches thick and 8 feet long. It is said to be practically impossible to purchase for quick delivery oak ties at any reasonable price. For this reason redwood is generally used. It was found possible to purchase the Japanese ties which are cut from firm oak at a price even less than that paid for local redwood.

Electrical Construction.

The overhead construction for the new line will be similar to the present Westinghouse practice, comprising a No. 000 grooved trolley wire, supported by a catenary messenger hung from large porcelain insulators, these, in turn, being hung from angle-iron bracket arms. The insulation is sufficient for operating at 6,600 volts, but at present a voltage of 3,300 is used. Current is collected by the standard Westinghouse pantagraph trolley with flat sliding contacts. The results obtained with this sliding contact trolley are said to be very satisfactory; the wearing part, or contact plate, is found to give service for about 30,000 miles. No delays are caused by the trolley jumping the wire, neither is there any attention necessary from the conductor.

It is thought that the present current-transforming apparatus as installed at Napa will be sufficient to supply the new extension. This installation includes two Westinghouse motor-generator sets, each of 400-kilowatts capacity. Current is supplied from the high-tension transmission lines of the Bay Counties Electric Company, is stepped down to a suitable voltage for operating the three-phase motors of the motor-generator sets and these regenerate the power as single-phase current, which is, in turn, stepped down by transformers along the line and fed to the trolley wire at 3,300 volts pressure.

New Cars.

With the completion of the extension there will be put into service eight new cars of the Pullman type, which are now being built by the Niles Car Company. Two of the new cars will be of the combination type with baggage and smoking compartments. Each car will be 56 feet long overall and 9 feet wide over sheathing. The vestibules will have swinging doors to form motormen's side-cabs when desired. The interior finish of the car bodies will be mahogany with

an Empire-type ceiling and lamps concealed by inverted holo-plane bowls. The seating capacity of each car will be sufficient for 64 passengers.

The car bodies will be mounted on Baldwin M. C. B. trucks with steel-tired wheels. All the electrical equipment will be supplied by the Westinghouse Electric & Manufacturing Company. Each car will have a quadruple equipment of No. 132A motors (100 horsepower), an oil-cooled auto-transformer, and control apparatus for double-end single-car operation or for multiple-unit operation. To facilitate train operation Gould automatic couplers and Westinghouse A. M. M. air brake equipments with graduated release and quick recharge will be used.

SAFETY OF ELECTRIC LOCOMOTIVES.

At a meeting of the New York Railroad Club on March 15, 1907, Frank J. Sprague in discussing the recent Wood-lawn wreck on the New York Central & Hudson River road, spoke in part as follows:

There was enough power concentrated at the head of this ill-fated train to account for almost anything if not intelligently handled, and yet the same wreck might have occurred whatever the power used. Of course the "deadly third rail," or the use of the direct instead of the alternating current, had nothing whatever to do with this disaster. There were no electrocutions, and what fire there was, whatever the cause, occurred directly over the broken connection of a pinch gas tank and was quickly put out. There is not the remotest evidence that the third rail caused even this slight fire, but there is plenty of evidence that this particular third rail was instantly automatically cut out of service, and that it was impossible to restore it until the wreck was cleared.

Now a word as to this particular electric locomotive, and what is uppermost in every man's mind, because of this accident. As to the machine itself, I feel, and believe that its designers and builders can feel pride in its construction and general performance. Neither its low center of gravity, nor its rigid wheel base, both so gravely referred to in "scientific" articles, were the causes of the accident. Under the existing circumstances perhaps I can only refer to this unhappy affair negatively rather than affirmatively for the various investigations which are under way, and the relations of railroad officials and engineers to the matter forbid my expressing affirmative opinions. But there are some things I think I know, and so far as they affect the design of these locomotives, my practical comment is that I take every opportunity to ride in them, and I doubt if there is an engineer on the road who has been employed in driving them who would not prefer a berth in their cabs than in that of any steam locomotive on the New York Central.

A paper was also presented by W. J. Wilgus, vice-president of the New York Central & Hudson River, in which he said:

Recently very elaborate calculations have been made by the engineers of the two manufacturing companies and of the railroad, and also by Professor Swain of the Massachusetts Institute of Technology, demonstrating the correctness of the conclusions reached as a result of the practical tests above described, as to lack of any undue effect upon the track, and also as regards favorable comparison with steam locomotives. These calculations have of course taken into account the height of center of gravity, as well as all of the other elements that have to be considered in connection therewith.

As to the reflections on the installation regarding the use of the third-rail direct-current system, I cannot too emphatically state the untruthfulness of the articles that have appeared to the effect that the third rail had something to do with the cause of the wreck and injuries to passengers. As a matter of fact, the third rail worked perfectly as to the automatic cutting off of the current by the circuit-breakers and the insulation of the rail from contact with equipment and passengers. All of the evidence before the coroner and board of railroad commissioners shows conclusively that the third-rail system in no manner had anything to do with the accident or the results that followed it.

In ending I would like to state that during the searching investigations of the railroad company and also by the coroner's jury and the board of railroad commissioners, nothing has yet developed that shows that the electric installation was in any way, shape or manner responsible for this great disaster.

EXPERIMENTS WITH CONCRETE TIES.

At the annual meeting of the American Railway Engineering and Maintenance of Way Association at Chicago, on March 19, 20 and 21, the committee on ties presented a report which contained some information on concrete ties. As the American Street & Interurban Railway Engineering Association has issued a circular on concrete railway ties, which was published in last week's issue of the Electric Railway Review, an abstract of that portion of the report of the tie committee of the American Railway Engineering and Maintenance of Way Association which refers to concrete ties is published herewith.

The committee calls attention to three elements very necessary to remember in the consideration of designs to replace wood ties:

(1) An efficient method of fastening the rail to the tie. This is a problem present with the wood tie also, if the life of the tie be considered.

(2) The requirement of a considerable measure of elasticity in any tie. There is always a tendency of the ballast to become unstable and the track to become center bound, and the wooden tie has met the condition, because it is elastic. Neither the steel nor concrete tie offers the same elasticity, and either will require greater care in track surfacing and maintenance.

(3) No metal tie has yet been designed that offers a satisfactory method of insulation, and this, of course, is a serious objection in view of the rapid increase in installation of block signals. It will be found necessary, doubtless, to use fiber as an insulating material, and that wears so rapidly that it will be a source of considerable trouble and expense to attempt to maintain insulating pieces on each tie. Concrete is almost an insulating material and it will probably be practicable to design a concrete tie that will overcome this difficulty. On the other hand, the construction of such a tie will require a great deal of care to prevent contact through the metal reinforcement.

Reinforced Concrete Ties.

The committee presents a report made to J. W. Kendrick, second vice-president of the Atchison Topeka & Santa Fe Railway System, on "Reinforced Concrete Ties," by E. O. Faulkner, in November, 1904:

HARRELL TIE.

This was perhaps the first type of reinforced concrete ties used in America. Thirty were inserted in the Pennsylvania Company's track in 1899, near the Union Station, Chicago, the concrete being molded around a truss of 1-inch rods put together like a trussed brake beam. From first to last they were in service about 17 months, the last tie being taken out in the fall of 1900. Shortly after they were first laid, single ones had to be removed, and this continued at intervals until all were taken out. Some broke in the middle, others gave way at the fastenings or under the track rails, so that toward the end, oak ties had to be sandwiched between them to help out. Later on Mr. Harrell made a number under what he claims to be a better pattern so far as track fastenings, etc., are concerned, and 10 were placed in a switch track of the Western Foundry & Steel Company at Hegewisch, Ill., in August, 1901. Three have since been removed on account of a car derailment breaking them; the rest are still in service in good condition, but being in an industry sidetrack, there is no strain or service test, and under these conditions they should last for many years.

KIMBALL TIE.

This consists of two concrete bearing blocks shaped like a pole tie, each 3 feet long, 9 inches wide, and 7 inches thick, joined by two 3-inch channels, 2 inches apart, placed back to back and molded in the concrete, the bearing of the rail being taken by a cushion block of white oak, 3 inches thick, 9 inches wide, and 18 inches long, secured to the concrete base by bolts, the track rail being spiked to these blocks in the usual way and elm plugs set in the concrete to take care of the additional length of spikes.

Two were inserted in the Pere Marquette tracks at Saginaw in 1900, the blocks being held together by a piece of scrap rail; later, one was taken out and sent to the Roadmasters' convention in Milwaukee in the fall of 1901. It was put in the track in one of the local yards, and has since been lost sight of. The one still in service at Saginaw I found in good condition, excepting that one of the cushion blocks was badly cracked and would soon need renewing. Before being used

these blocks were treated with Avenarius Carbolinum. There was some rust on the old rail connecting the blocks, but nothing to hurt. Two others were inserted in the Saginaw yards in the fall of 1901, but were afterward taken out, though for what reason I could not learn. Eight more were put in the main track at Saginaw; these I found still in service and in good condition, some of the cushion blocks being somewhat sun checked; on removing the ballast from one or two ties I found very little rust on the connecting bars, the spikes were holding all right, and the ties looked well, but the test is not in sufficient numbers to warrant any practical conclusion. The ballast was gravel, and there were no cracks in any of the concrete blocks. Another tie was laid in the Port Huron yard in 1902, but no one knows where it is, or what has become of it. Two were laid in the Walkerville yard, and two near Pelton, Ont., in September, 1903. I am told a derailment occurred on the yard ties, the wheels passing over the wooden cushion blocks without damage, excepting that some slivers were broken off where the first wheels struck them. Ten were also furnished the Nickel Plate in 1903, eight of which were laid east of Euclid avenue station, Cleveland, and two broken. I did not look up any of those inserted in 1903, as the time is so recent. There were 30 furnished the Grand Rapids electric railway for street car use, also one to the Detroit United Railway, which was put in at Gross Point. In 1902, 3,400 feet of the Pere Marquette track in Jefferson street, Bay City, was laid with these ties without the connecting channel bars, the two blocks being laid in cement up to the level of the top of the rails. This piece of track has been widely advertised, and is in good condition; but where railway tracks are laid in cement and in paved city streets it cannot be considered a test, so far as concrete ties for ordinary use are concerned.

ALFRED TIE.

This is one designed by the then chief engineer of the Pere Marquette. Fourteen were put in near the Kimball ties at Saginaw, Mich., in November, 1902, as an experiment, and all removed early in 1904 on account of breaking between rails, the design being faulty. Nine of a new pattern were inserted in the same place in the summer of 1904; of these one is broken close to the track rail and several others already show signs of rail cutting, there being no cushion or protection between the base of the rail and the top of the tie; one has cut in $\frac{1}{2}$ of an inch in three months; others nearly as much. Ten were laid in September, 1904, at Wixom water tank, where engine fires are cleaned, and wooden ties destroyed by cinders. These 10 are said to be in good condition; it was dark when we passed, so that I could not see them personally; 24 more were laid in a sidetrack opposite Saginaw passenger depot in October, 1904, and immediately after laying them a ditch for a drain pipe was dug parallel to the track, within 6 inches of the ends of the ties. Of 87 alongside the ditch, 56 were cracked or broken, some in two or three places, and of the remaining 127 away from the ditch, one was broken close to the inside rail. The ditch extended for some distance, where there were wooden ties in the same track, but none of these were damaged by reason of its location.

BURBANK TIE.

The reinforcement consists of an iron plate and a twisted bar of iron, bent at each end and welded to tie plates, which rest on wooden blocks and support the track rail. I was told there were 147 in the Hecla Mining Company's track, near Bay City, Mich., and two in the Hecla Belt track at one of the crossings in the outskirts of the city. I could not go personally to the mining track, but sent another man, in order to learn how the ties looked; he has since advised me that he could not find a concrete tie in any mining or belt track owned by the Hecla company, excepting the two spoken of, and these I found myself so badly broken after three months' service of switch trains that there is no question about the design being defective.

HICKEY TIE.

The reinforcement here consists of $7\frac{1}{2}$ feet of scrap track rail imbedded in the concrete; outside of this the other features of the tie have been changed from time to time as defects developed. First, the rail fastenings were improved, then it became apparent that on account of track rail cutting into the concrete, some protection had to be furnished, and a tie plate was tried. This has proven insufficient for the purpose, and Mr. Hickey now says a larger cushion of metal or wood must be placed between the rail base and the tie to prevent rail cutting. He has a number inserted in St. Thomas yard (Ontario), also 10 at Kingsmill, east of St. Thomas, in Michigan Central main track, under heavy service, and 6 at Taylor; in all between 35 and 40 ties, most of them having been in over two years, and one, still in good condition, three years. The greater portion are more or less cracked, and some broken, but Mr. Hickey says he will keep on experimenting, and hopes yet to be successful. He is the general roadmaster of the Michigan Central lines in Canada. No derailment has occurred so far on these ties.

BRUNSON TIE.

The reinforcement here consists of some small strips of iron, surrounded by concrete, wooden plugs being molded in the concrete in which to drive the spikes, the track rail resting directly on the concrete. Nineteen of these were laid in Chicago Junction Railway stockyards tracks in September, 1904, near Forty-first and Halsted streets, Chicago. Two months after service I found cracks between the rails in 14 out of the 19, some being cracked in two places. The rail was also beginning to cut into some of them, especially joint ties. Nothing but slow switch train movement passes over them, and

while this is heavy, it can scarcely be said that the test is sufficient to establish the value of the tie. No derailment has yet occurred on any of them.

SEELEY TIE.

This was a concrete tie without any reinforcement whatever, the only iron used being the bolt going through the concrete for rail fastenings. Ten were placed in the tracks of the Toledo Terminal Railway in August, 1903, and the superintendent informed me that they were all taken out again in less than two weeks on account of their breaking, and falling to pieces. Six or eight were also put in a sidetrack on the Lake Shore & Michigan southern, at Air Line Junction, Toledo. I did not go to see these, as the roadmaster said they were badly broken, and would soon come out, adding further that if they had been in main track they would have been removed long before this.

COLORADO & SOUTHERN RAILWAY TEST.

In the summer of 1901 the officials of the Colorado & Southern Railway had three ties made and put in the yard at Argo, near Denver, the reinforcement in each tie consisting of three steel strips $\frac{1}{2}$ inch thick, 4 inches wide and 8 feet long. These ties were broken beyond further use in the spring of 1902 by an engine truck derailment, there being no protection on the outside of the tie to withstand any such shock.

AFLECK TIE.

The reinforcement here consists of a piece of angle iron imbedded in the concrete, with a slight groove for rail seat, in which a wooden shim can be placed if desired, the rail being fastened to the tie by bolts coming up from the bottom. One was placed in a sidetrack at Dune Park, Ind., on the Lake Shore & Michigan Southern, in September, 1903. It is cracked in several places, but, in view of its location, is still considered safe. In March, 1904, 15 more were put in at Chesterton, Ind., but, as they were not entirely satisfactory to the maker, he took them out and put 15 others in in June, 1904. These are still in service, but are all cracked a little. They are also in sidetracks, as the Lake Shore & Michigan Southern officials do not consider it advisable to place them in the main line. The roadmaster says that so far, and as located, they have given fair satisfaction.

The Pennsylvania Lines West of Pittsburg are also testing this same tie, 87 out of an order for 100 being placed in the main line at Emsworth, Pa., in October, 1904. I examined these with the roadmaster a month later, and found six marked for removal before the close of the month, and another one has a broken end. They are on broken rock ballast in a track where heavy traffic and fast trains are continually running over it, the conditions being evidently too severe for the tie in its present shape.

BUHRER CONCRETE TIE.

The reinforcement of this tie consists of one-fourth part of a 30-foot scrap rail, inverted so that its base acts as a surface for the track rail, the rest of the reinforcement being heavily imbedded in concrete somewhat in the shape of a hewn tie, at the bottom, the rails being fastened to the tie by clips. There are 3,222 of these in service on a number of roads, viz.: Ann Arbor, 77; Lake Shore & Michigan Southern, 2,095; Pennsylvania Lines West of Pittsburg, 350; Lakeside & Marblehead, 550; Lake Erie & Western, 20; Chicago & Northwestern, 15, and Sandusky Water Works Company's tracks, 115. Of these, 40 were inserted in 1902, and so far there are only two failures; 707 were inserted in 1903, of which 19 failures have been reported; and 2,415 were inserted in 1904, of which nearly all the failures are on the Pennsylvania lines. This is the most successful of all concrete ties I have seen, and under favorable conditions it certainly makes a fine looking track. I saw marks of a freight car (said to have been loaded) derailment at Milwaukee, the wheels of one truck having passed over several of these ties without damaging them in the least, and I was told of one or two other instances where derailments had occurred, no damage being done to the ties.

In four out of the six roads the ties were in gravel ballast, and no exception could be taken either as to the appearance of the track or the condition and service of the ties. On the Lakeside & Marblehead there are 550 ties inserted on a 12-degree curve in the yard at Danbury, O., and this piece of track has been widely photographed, as evidence of the success of this type of reinforced ties; it is certainly hard to beat, but every condition is favorable, and the ties have only been in service one winter. On the sixth road (Pennsylvania Lines West) it was reported the experience of concrete ties had so far not been satisfactory, and it was not proposed at present to further extend the experiments in this direction. The Pennsylvania Lines West have the Affleck (before mentioned) and the Buhrer ties. Of the latter, 248 were furnished in December, 1903, for insertion in the main track at Emsworth, Pa., which were all put in by March, 1904. In June, of same year, 100 were replaced, and on November 19 following I saw a carload of new ones standing on the sidetrack to replace broken ones. Including this carload it made 469 received since December, 1903, with 116 good sound ties in track in November, 1904, and a balance of 7 remaining in reserve. Mr. Buhrer explained that in the first lot of ties shipped, the concrete in nearly all of them had frozen before it set, and they should never have been used. I can only account for the failures here by the fact that the rock ballast is so rigid as not to conform or give way to the movement of the ties when trains are passing over them, while the gravel ballast does, as I noticed this very clearly while on the Lake Shore & Michigan Southern. These are the only failures of the Buhrer ties worth mentioning, yet if the strength of a chain is no greater than that of its weakest

link," the failures of these ties in rock ballast and under heavy service must materially limit their value, irrespective of success under more favorable conditions.

CHICAGO BURLINGTON & QUINCY RAILWAY TEST.

The engineering department of the Chicago Burlington & Quincy at Chicago is engaged in a series of tests of reinforced concrete ties, having placed a number in a sidetrack at Hawthorne near Chicago about two months ago. The time is yet too recent to prove anything, but as the officials are proceeding in a careful and practical way, the result should go far to establish the possibility of ultimate success in reinforced concrete ties. I believe, however, they will yet have to make further changes in their design to accomplish this.

ULSTER & DELAWARE TEST.

A number of reinforced concrete ties were placed in the Ulster & Delaware track near Rondout, N. Y., in the summer of 1904, on account of the satisfactory service of one tie made and inserted in May, 1903. Tieplates 8 by 9 inches, $\frac{1}{4}$ inch thick, are set in the concrete and support the track rails, which are fastened by bolts coming up from below the reinforcement; this latter consists of a piece of angle iron set in the concrete, the edge coming within $\frac{1}{4}$ inch of the surface. The first derailment on these ties will severely test them, as there is no support for the corners. They weigh 450 pounds each.

There are two or three makes of concrete ties besides those mentioned, which have been put into service on a few other roads during the past summer, but as the locations were somewhat scattered and the experience too recent to expect any result, I did not visit them.

REINFORCED CONCRETE TIES ABROAD.

If there is one continent more than another where we might expect to find concrete ties it is in Europe, where wood is scarce and costly, but so far as I can learn only three tests have been made abroad up to the present time, and they are as follows:

SARDA TIE.

The reinforcement here consists of five metal plates placed vertically in a mold, held by thin bars or wires, and cement poured in around them. Four were inserted in October, 1900, near Bordeaux, and in the summer of 1902 there were more laid, a slight change being made in construction so that rail fastenings could be replaced without damaging ties. Felt tie plates 0.2 inch thick were placed between tie and rail to reduce the shock, but within a year these had worn so that they could not be found. The greatest rolling weight was 14 tons on a single pair of drivers. The weight of the tie was 308 pounds and the cost in our money \$2.80 each. Some of this make of ties were also inserted in the tramway company's track at Perpignan, France, and also some in the main track of the Northern Railway of Spain, but no reports are obtainable as to results. The chief engineer of the French State Railways says the experiment is too recent for definite conclusion, and that as the usual life of wooden ties is fifteen years, a long time must elapse before conclusions can be reached as to whether cement is superior to wood in its power to resist shock, atmospheric changes, and other conditions, and further that so far as economy in track labor or material is concerned, none will be effected unless the cost of concrete ties can be materially reduced.

The Voiron St. Beron Railway (1-meter gauge) has been experimenting with a reinforced concrete tie consisting of three trusses of steel (18½ pounds), a plug of hardwood being imbedded in the concrete to hold rail fastenings. The weight of the tie (length 5 feet 11 inches) is 232 pounds, and a layer of wood or felt is placed on top of the ties under the rail to lessen vibration. Sixty were inserted in March, 1903, at Revol, and at another place a stretch of track has concrete ties alternating with ordinary wooden ones. This gives no test worth anything, but in April, 1904, all were said to be in perfect condition and the company were laying 250 more.

In Germany, a section of the state railways near Briesen is laid with reinforced concrete ties in main and side tracks, under heavy traffic. The rails are fixed to the tie by an automatic locking device in which the grip between the tie hooks and the rail increases in proportion to the weight of the rolling load, the tie hook releasing its tight grip of the rail as soon as the train or car has passed over it, the claim being made that this action gives an elasticity to the roadbed necessary for economical maintenance of equipment. The ties were laid in September, 1897, and are said to be still in good condition.

In Italy, on the Adriatic Railway, experiments have been under way for some years, so that in 1900 a number of ties were put in service at or near Ancona, and, according to latest reports, were giving good service; this is very general, but is all the information I can get. The tie weighs about 300 pounds and costs \$2.30.

On the French railways in Cochinchina a number of concrete ties are said to be in use, having an inverted T section with an enlargement of the stem upon which the track rests (practically an I-beam), but the number said to be in service is so large that I would not care to quote the statement without better authority, which is not available just now.

The following additional data have been obtained by the committee from other sources:

PERCIVAL TIE.

This is a reinforced tie of concrete and bars of iron, the section of tie being somewhat trapezoidal, except that the difference between faces is greater than in the Buhrer tie.

The fastening of the rail is by a screw spike into babbitt sockets poured in the concrete at the time of manufacture. The rail rests on a block of gum 9 by 15 by $\frac{1}{4}$ inches, which forms a

cushion and relieves the concrete from the severe action of the metal rail of limited section which would readily work into it.

A test of these ties in a road of heavy traffic has shown good results for two months. It is not possible yet to tell what the value of the tie will be.

CHENOWETH TIE.

This tie is a simple bar of concrete of the same size and uniform section as the usual wooden tie, the reinforcing material being a winding woven wire sheet, wound in circular manner. The wire used is No. 16 with a ½-inch mesh.

The rail is supported upon a shim of wood acting as a tie plate, through which bolts are set with threaded top. The bolts are set in a similar manner to stone bolts. The clip is used to fasten the rail in place, in a manner similar to the method used in other types of manufactured ties. The ties have been in only a short time, and no results are yet manifest.

HEARING ON MILWAUKEE ELECTRIC RAILWAY SERVICE IS RESUMED.

The investigation of the Wisconsin railway commission into the service of the Milwaukee Electric Railway & Light Company was resumed in Milwaukee on March 19. An account of the previous hearing was published in the Electric Railway Review of March 2, 1907. John I. Beggs, the president of the company, appeared before the commission and indicated the new lines and extensions which, in his opinion, should be built eventually to accommodate the growing traffic.

Mr. Beggs stated that the service is being improved constantly and that extensions are being made. He announced that the company has acquired nine acres of the shooting park and other property at Thirty-eighth and Vliet streets on the State street line, and that large car shops will be built there so that the company can manufacture its own equipment. These shops will replace the Kinnickinnic shops, which will be abandoned. Mr. Beggs said that the Fond du Lac avenue line would probably be extended to the city limits within a year. When this extension is built a large car house will be erected. Thirteen new cars were added last October to the company's equipment, 15 were added in December and 19 in January. These were the last of 100 cars ordered two years ago. Mr. Beggs said that the service appears to be improved now in comparison with November and December because during the short days of those two months people were inclined to crowd on the first cars, but as the days grow longer people were disposed to wait a few minutes for comfortable places.

The expenditure of money on improvements, Mr. Beggs said, is one of his methods for saving bankrupt properties, and he has "provoked people to ride" by improving the service, so that the traffic in Milwaukee has increased from 9 to 10 per cent per annum as compared with a 4 per cent increase in population.

In referring to the decline in the bonds of the company, Mr. Beggs said: "If the present craze continues it will be very difficult for any public utility corporation to continue its improvements." Mr. Beggs added, however, that he thinks there is no danger of a panic.

Abuse of Transfer Privilege.

The city attorney, John T. Kelly, suggested a double transfer system on the north side and Mr. Beggs replied that a single transfer was had enough. He said that clubmen boasted of petty larceny in detailing how they had made a round trip for one fare. Mr. Beggs, as an instance, showed how a business man might take an Oakland avenue car and get a transfer south on the Farwell avenue line at Brady street and Farwell avenue, eat his lunch, and then return down town on the same transfer. Other transfer points where the same difficulty has been experienced were mentioned by Mr. Beggs, who said that the company has no method of keeping a check on transfers and that thousands of fares are lost every day. Mr. Beggs added that even though empty cars are in sight, people will frequently over-

crowd cars on the chance that their fares will not be collected.

All complaints regarding the service of the company are referred to Mr. Beggs and investigated. Mr. Beggs said that he replies in person to 90 per cent of the complaints. "I try to be the worst crank on our system," he added. He said that conductors are instructed to sweep the cars at the end of runs. Ventilation is a problem, as it is difficult to suit all people.

In comparing air brakes and hand brakes Mr. Beggs said that air brakes are used on the St. Louis roads because the cars are heavier in that city than in Milwaukee; and air brakes are used on the interurban lines near Milwaukee because of the high speed at which the cars are run. He favored the continued use of hand brakes on Milwaukee city cars because he believes the air brakes would get out of order. Mr. Beggs spoke also of the flat wheels caused by the use of air brakes. There were 75 flat wheels on 25 interurban cars in December and 22 on 400 Milwaukee and Racine city cars; in January there were 92 flat wheels on interurban cars as compared with 28 on Milwaukee and Racine cars; and in February 72 flat wheels on interurban cars as compared with 24 on the city cars.

New Form of Transfer.

At the hearing on March 20 Mr. Beggs said that a new form of transfer is being prepared which will have the full date printed upon them. The transfers which are in use now do not bear the name of the month.

A statement was filed by the company showing an increase in the number of cars operated of 73 from February 28, 1906, to February 15, 1907. The total number of cars operated on the latter date was 503.

W. B. Tarkington, the superintendent of transportation, explained the difficulty which the company meets in providing men with sufficient regular work to maintain a force large enough to operate all the cars during the rush periods. On March 15 1,062 men were employed, with 40 in training. Three hundred had been employed by the company since 1901. 400 from 1901 to 1905, inclusive, and 320 since 1906. Five hundred and forty-six were employed in 1906, of which a large number resigned.

On March 21 the city attorney announced that he will introduce testimony on the subject of air brakes from Bion J. Arnold of Chicago at a subsequent hearing. N. A. Christensen testified regarding air brakes. The commission will hear the arguments in the case at Madison, Wis., on April 23.

BUFFET SERVICE OF THE FT. WAYNE & WABASH VALLEY TRACTION COMPANY.

During the past year the Ft. Wayne & Wabash Valley Traction Company has provided a buffet service on its limited cars operating between Ft. Wayne and Indianapolis, Ind. The service has heretofore been conducted under the supervision of the operating officials, but on March 1 of this year the buffet concession was let to Mr. E. J. Longfield, a Ft. Wayne caterer, who has other similar concessions in his home city. Under Mr. Longfield's direction the service will be more elaborate than has heretofore been furnished and a large and varied menu will be provided, on the à la carte plan. No spirituous liquors are to be sold.

The buffet compartment is located between the parlor and smoking compartments of the car and is equipped with shelves and cupboards for the storage of provisions, etc. An alcohol vapor stove is provided for cooking purposes. One attendant who acts as cook and waiter accompanies the car. At present only one buffet car is operated, but it is expected that later in the season another car will be added. Under the present schedule the car leaves Ft. Wayne daily at 9:20 a. m. and returns from Indianapolis at 7:40 p. m. The running time between the two cities is four hours and 20 minutes.

TRAIN DISPATCHING ON THE LIMA & TOLEDO RAILWAY.

The Lima & Toledo Traction Company has recently made many changes in its method of dispatching trains by telephone and in the fixtures provided for the dispatcher's office at Lima, Ohio. The movement of trains on the several divisions of the railway operated by this company are now directed from the office located in the tower of the new office building at the intersection of North Main street and Grand avenue.

The dispatcher's desk which is herewith shown was made under the directions of Mr. J. E. Cochran, electrical engineer of the company. It contains many original features designed to facilitate and simplify the dispatching of trains on the several divisions operated by the company and to provide ample room for the train-sheets and other forms essential in recording the movement of trains.

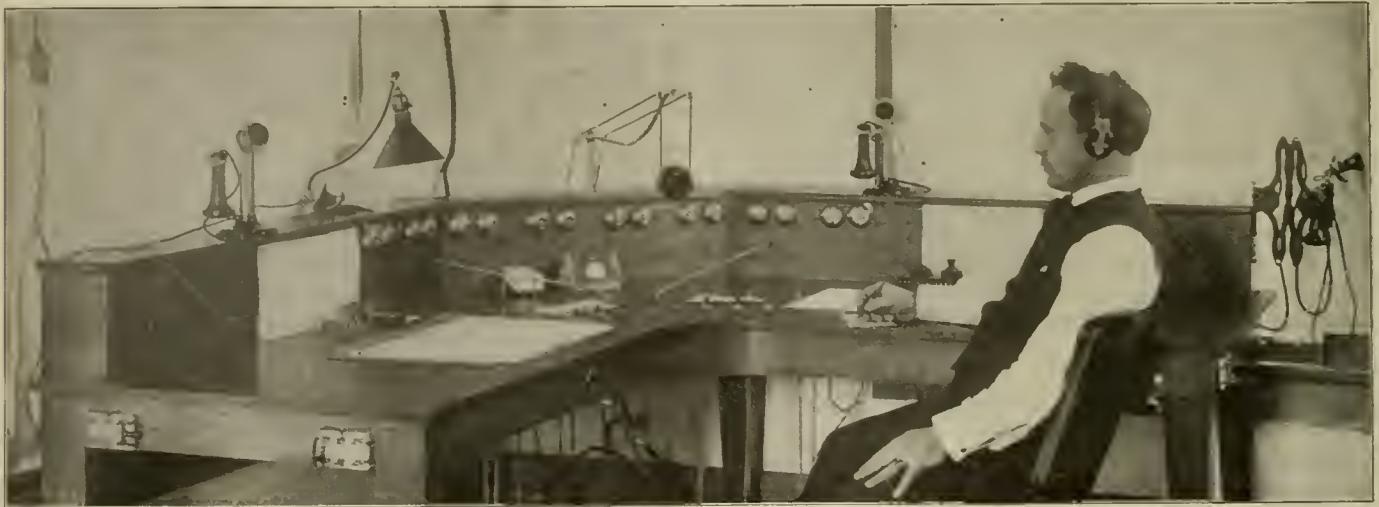

The desk is made of oak and is so constructed that it occupies but a small space in the corner of the dispatcher's room. The top, which is 30 inches above the floor, is L-shaped, the respective wings being 4 feet long and about 3 feet wide. At the rear a box-shaped back is raised 12 inches above the surface of the table. Mounted on the

used when the regular apparatus is out of repair, or when it is necessary to have more than one dispatcher at the desk.

In addition to the company's own telephones there are provided in the office two public telephones, the Bell and the Home, which have local and long distance connections. These are used only in cases of emergency or when the company's wires are not in good working order. Each substation is also provided with the long distance connections which enable the attendants to quickly get into communication with the dispatcher in case of an accident or other unusual occurrence.

Dispatching Lines.

The dispatching wires of the Lima & Toledo Traction Company are about 140 miles in length. These wires are strung on pony-groove glass insulators and are transposed every 800 feet on double-petticoat transposition insulators. No lightning arresters or ground wires are used. The wires are strung for a greater part of the distance within five feet of the high potential, 33,000-volt transmission line and less than 16 inches from the 600-volt feeder cables. The fact that the lines are seldom noisy, are never disturbed by induction and are not interrupted by grounds and short circuits indicates that they are firmly constructed and well insu-

Lima & Toledo Traction Company—Dispatcher's Table and Switch-board in Office at Lima, O.

back are eight sets of magneto bells which are used in place of the usual switchboard drops to indicate that a call is being made. Under these bells are switch-line taps by which the various lines can be connected. Inside of the box at the rear of the table are located the batteries, and generators used on the various lines leading into the dispatcher's office.

On the surface of the table and arranged along the front where the two wings join are eight two-way cams and eight plug taps. These from left to right are connected direct to the line circuits respectively as follows: (1) Ft. Wayne division; (2) city ticket office; (3) general manager's office; (4) master mechanic's office; (5 and 6) future extension; (7) Columbus & Lake Michigan (steam) division; (8) Toledo division.

By the use of the cams and plug taps any two or all of these divisions can be connected and communication between the various offices established. By means of small split switches either the Holtzer-Cabbot automatic generator or the hand magneto generators, both of which are provided, may be used by the dispatcher in placing calls. The switchboard fittings are all of the Kellogg type.

The dispatcher is provided with the regulation telephone head-gear and receiving trumpet and an adjustable mouth-piece. There is also provided at either side of the dispatcher, as he sits at the desk, a desk telephone set which may be

labeled. At sidings and intermediate points, where jack-boxes are located, double-pole switches are provided for testing out line troubles should they occur.

Dispatching Methods.

The Lima & Toledo Traction Company operates electric cars over three separate properties: (1) the Lima city division, (2) the Ft. Wayne division, (3) the Toledo division, and steam trains over the Columbus & Lake Michigan Railroad. The movement of trains over these various divisions is directed by telephone from the Lima office.

All substations and principal agency stations on the electric divisions are connected by telephone with the dispatcher's office. Telephone jack-boxes are stationed 20 poles apart along the entire length of the railways and three additional boxes are provided at switches where cars are scheduled to meet. This provision for the train crews to get in touch with the dispatcher's office at frequent intervals makes an ideal condition for the operation of cars.

The method of dispatching cars as practiced on this railroad does not vary to any extent from that of many other interurban lines in the central states. The standard train-sheet and train order blanks are used.

Before leaving a terminal station the motorman obtains written orders either to run on his schedule or to report for orders at a stated siding. The method of obtaining orders at other than the terminal stations varies somewhat from

that of other railways. When a motorman gets into communication with the dispatcher he reports his train number, motor number and the number of the siding from which he is talking. He is then directed either to take a siding, to wait for a train which he is to meet or to proceed on orders that are then given. In receiving running orders the motorman stands at the telephone and the conductor, with an order blank in his hand, stands immediately behind him. The motorman repeats the orders as they come to him over the wire and the conductor writes down the orders as they have been repeated. The motorman then takes the train order and reads to the dispatcher what has been written. If the order as copied is correct he is given an "O. K.," the time, and the initials of the dispatcher, all of which are written on the order. The order is then posted in the cab and the train proceeds in accordance therewith.

CENTRAL ELECTRIC RAILWAY ASSOCIATION COMMITTEES APPOINTED.

President H. A. Nicholl of the Central Electric Railway Association has appointed the following standing committees for the current year:

Committee on "Lighter Car for Interurban Service": R. C. Taylor, Indiana Union Traction Company, Anderson, Ind.; W. H. Evans, Indianapolis Traction Company, Indianapolis, Ind.; G. E. Tracy, Cleveland & Southwestern Traction Company, Kamms, O.; W. P. Jackson, Central Market Street Railway, Columbus, O.

Committee on "Express Company Contracts with Interurban Railways": A. A. Anderson, Indianapolis Columbus & Southern Traction Company, Columbus, Ind.; George Whysall, Columbus Delaware & Marion Railway, Marion, O.; F. D. Carpenter, Western Ohio Railway, Lima, O.

Subject Committee: E. C. Spring, Dayton Covington & Piqua Traction Company, West Milton, O.; J. L. Adams, Indiana Columbus & Eastern Traction Company, Dayton, O.; J. C. Rothery, East Liverpool Traction & Light Company, East Liverpool, O.; Thomas Elliott, Indiana Columbus & Eastern Traction Company, Cincinnati, O.; C. F. Smith, Findlay Bowling Green & Southern Traction Company, Findlay, O.

Insurance Committee: H. N. Staats, Cleveland, O.; H. J. Davies, Cleveland Electric Railway, Cleveland, O.; Harrie P. Clegg, Dayton & Troy Electric Railway, Dayton, O.

Finance Committee: C. N. Wilcoxon, Cleveland & Southwestern Traction Company, Kamms, O.; George Whysall, Columbus Delaware & Marion Railway, Marion, O.; Thomas McReynolds, Kokomo Marion & Western Traction Company, Kokomo, Ind.; W. B. Wright, Indianapolis & Cincinnati Traction Company, Rushville, Ind.; H. E. Vordemark, Ft. Wayne & Wabash Valley Traction Company, Ft. Wayne, Ind.

Standardization Committee: R. C. Taylor, Indiana Union Traction Company, Anderson, Ind.; W. H. Evans, Indianapolis Traction Company, Indianapolis, Ind.; F. Heckler, Lake Shore Electric Railway, Fremont, O.; M. E. Baxter, Western Ohio Railway, Wapakoneta, O.; W. A. Gibbs, Indiana Columbus & Eastern Traction Company, Newark, O.

Publicity Committee: F. D. Norveil, Indiana Columbus & Eastern Traction Company, Indianapolis, Ind.; George Davis, Electric Traction Weekly, Cleveland, O.; Cale Gough, Street Railway Journal, Chicago, Ill.; L. E. Gould, Electric Railway Review, Chicago, Ill.; Mr. Grimes, Ohmer Fare Register Company, Dayton, O.

Transportation Committee: F. J. J. Sloat, Cincinnati Northern Traction Company, Hamilton, O.; F. T. Hepburn, Lima & Toledo Traction Company, Lima, O.; F. J. Stout, Lake Shore Electric Railway, Norwalk, O.; Charles G. Lohman, Chicago South Bend & Northern Indiana Traction Company, South Bend, Ind.; F. A. Davis, Scioto Valley Traction Company, Columbus, O.

The Levant Herald reports that the Turkish government has prolonged the concession of the "Société des Tramways de Constantinople" until the year 1933, and the company has undertaken to substitute electric for animal traction, and to construct within five years three new lines: To Pera, from the Galata-Sérai Tunnel; from Pancaldi to Tatavla; to Stamboul from the Mosque of Faith. It has also undertaken to double-track the present line from Galata to Ortakeuy.

SHELTER SHEDS ON THE ILLINOIS VALLEY RAILWAY.

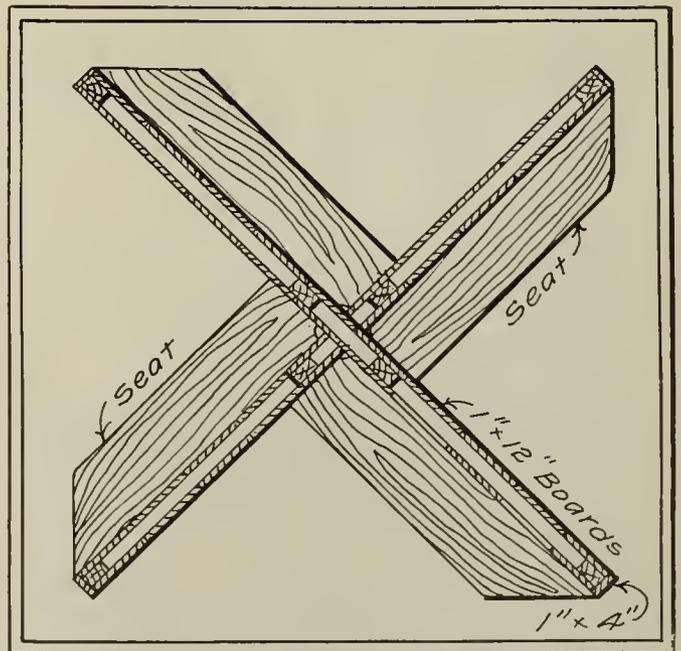

The route of the Illinois Valley Railway is 40 miles long, connecting the cities of Ladd and Seneca, Ill., and passing through the cities of Spring Valley, Peru, La Salle, Utica,

Illinois Valley Shelter Shed—General View.

Ottawa and Marseilles. The road serves a thickly settled mining district which affords good patronage.

At many of the highway crossings the company has erected shelter sheds. The design adopted for the construction of these sheds was obtained through a widely advertised

Illinois Valley Shelter Shed—Section Above Seats.

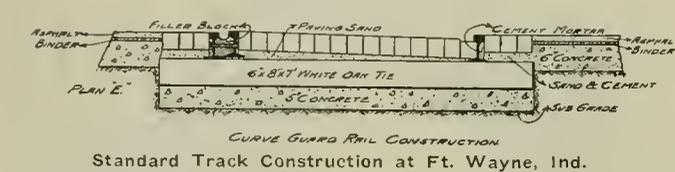

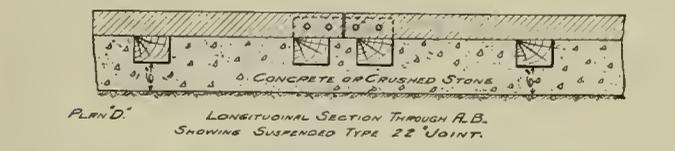

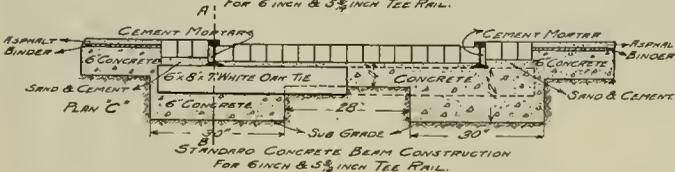

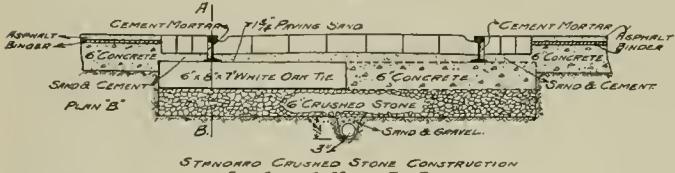

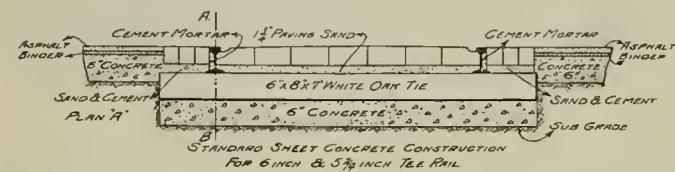

competitive prize contest held some few months ago. The type of shed chosen is practical and yet rather novel. The floor covers a ground space 10 feet square and the shed is 11 feet high to the peak of the roof and 7 feet 6 inches high to the gables. It is constructed entirely of 2 x 4-inch timbers and 1 x 12-inch boards. There are no side walls, but protec-

tion from the weather is afforded by the arrangement of the interior partitions. The shed is divided into four equal compartments by these partition walls which radiate from the center of the shed to its four corners. In each quarter of the shed there is a smooth plank seat five feet long and one foot wide. Other details of the construction are shown in the accompanying illustrations. It will be noted that in stormy weather there are two compartments that will always offer protection from the rain or snow. The roof extends a short distance over the platform surrounding the shed.

STANDARD TRACK CONSTRUCTION IN PAVED STREETS AT FT. WAYNE, IND.

The city council of Ft. Wayne, Ind., has granted the Ft. Wayne & Wabash Valley Traction Company permission to use four different types of track construction in the paved streets of that city. The selection of a desirable type of construction to suit the conditions is left to the company as long as the standards are adhered to.

The types as shown are to be made standard for 6-inch and 5 3/4-inch T-rails. Where the grade of the street is less than one per cent either the sheet concrete construction of Plan A or the crushed stone construction of Plan B may be used. Where the grade is greater than one per cent the concrete beam construction of Plan C may be used. The bill

Standard Track Construction at Ft. Wayne, Ind.

of material per lineal foot of track for these three types of construction is as follows:

Plan A.

- Concrete, 215 cubic yards.
- Nose blocks, 6.6.
- Paving blocks, 24.
- Ties, 30 feet of 5 3/4-inch rail, 10.
- Ties, per 30 feet 7-inch steel, 8.

Plan B.

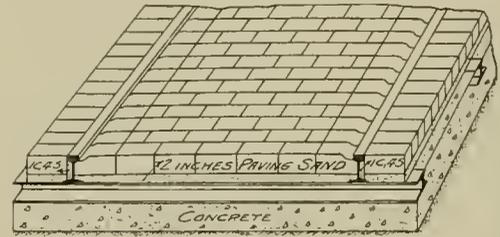

- Concrete, .088 cubic yards.
- Crushed stone, .128 cubic yards.
- Nose blocks, 6.6.
- Paving blocks, 24.
- Ties, per 30 feet 5 3/4-inch rail, 10.
- Tile 30 feet per 30 feet of rail.

Plan C.

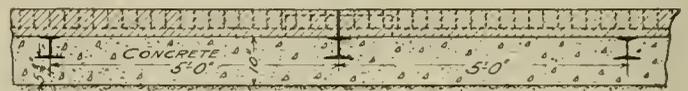

- Concrete, 204 cubic yards.
- Nose blocks.
- Paving block, 30.
- Ties per 30 feet 5 3/4-inch rail, 10.
- Ties, per 30 feet 7-inch rail, 8.

As is shown in the illustration either the Metropolitan groove or the Metropolitan straight paving brick laid flat may be used next to the rail.

Plans D and E show respectively the longitudinal section

of track through A-B with the suspended type of 22-inch joints and the guard-rail construction on curves.

Plan F shows the standard steel-tie construction for 6-inch T-rails.

NEW POWER STATION FOR ROANOKE RAILWAY & ELECTRIC COMPANY.

The announcement has been made by J. W. Hancock, general manager, Roanoke Railway & Electric Company, that this company soon will spend \$225,000 for a new power house, and \$108,000 for new cars and improvements to the roadway and equipment.

The construction plans for the new power house have been ready for some time, but the company has withheld any announcement because it had not found any desirable location for the plant.

A site of about 3 1/2 acres in Roanoke, Va., has recently been purchased from the Norfolk & Western Railway Company. The new plant will be very favorably located on this triangular plot between the tracks of the Tidewater Railroad, the Roanoke river and the Winston-Salem tracks of the electric company. This location, which is near the center of the city, affords excellent opportunity for obtaining coal and an ample supply of condensing water.

The power house will be constructed of reinforced concrete throughout and have a floor space of approximately 100 by 150 feet. The general arrangement of the engines and boilers will be similar to that of many of the large modern stations, provision being made so that the capacity of the plant can easily be increased.

At present five 400-horsepower boilers will be installed and three turbine generating units. One of these will be a 1,500-kilowatt turbo-generator and the others will each have a capacity of 500 kilowatts, making a total of 2,500 kilowatts as the capacity of the present plant. The turbines are to run condensing, the Roanoke river furnishing an unlimited supply of water.

The present capacity of the plant, it is believed, will be more than sufficient to meet the demands of the street railway, lighting and power purposes.

When the contemplated improvements have been completed, the management believe that for its size Roanoke will have one of the best equipped power houses and street railroads in the country.

FUEL TESTS UNDER STEAM BOILERS.

At a meeting of the society held March 20, 1907, Professor L. P. Breckenridge presented a paper entitled, "A Review of the United States Geological Survey Fuel Tests Under Steam Boilers." The work of the testing plant was outlined,

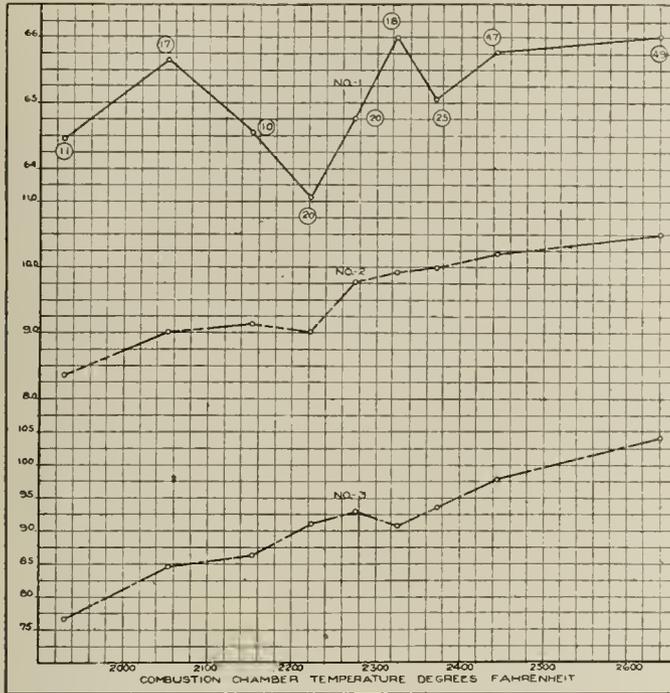

Figure 1.

Curves showing relation between combustion chamber temperature and the following:
 No. 1 efficiency, 72%.
 No. 2 CO in flue gases, samples taken in hood.
 No. 3 per cent rated capacity of boiler developed.
 Classified on combustion chamber temperature as basis.

and the many curve sheets presenting the results of some 500 separate tests were carefully explained. Walter T. Ray and Mr. Kreisinger, who assisted in this work, also added

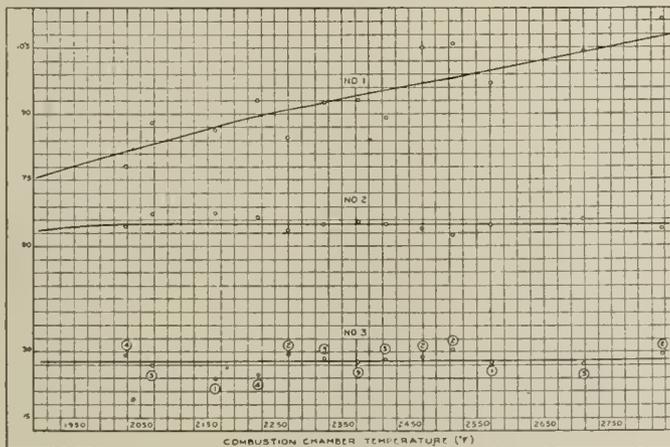

Figure 2.

Curves showing relation between combustion chamber temperature and the following:
 No. 1 per cent rated capacity developed.
 No. 2 efficiency, 72%.
 No. 3 per cent unaccounted for plus per cent loss up stack.
 Classified on combustion chamber temperature (°F).
 Using Illinois and Indiana coals.

much of value to the paper, and to the discussion which followed the reading of the paper.

As the paper was too long to be reprinted in full, an extract of the part of greatest interest is presented herewith with a few of the many instructive charts.

Some of the special investigations made by the Boiler division are given somewhat in detail in this paper. These investigations are:

- (1) Observation of circulation of water through the water tubes of the Heine boiler.
- (2) Experiments with a small multitubular boiler to test the theory of heat transmission through boiler tubes.
- (1) The observation of the circulation of the water in the boiler tubes was made with a specially constructed circulation indicator shown in Fig. 3. This apparatus consists of a four-blade propeller revolving on an axis inside of a boiler tube. To the hub of the propeller is firmly attached a

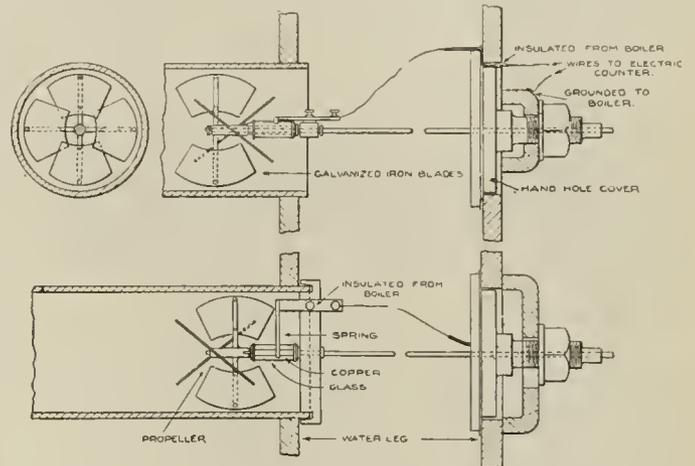

Figure 3.

Assembled view showing location of circulation indicator in boiler.

glass commutator with a single copper strip which has a metallic contact through the axis of the propeller with the boiler. Every revolution this copper strip makes an electrical contact with a steel brush which is insulated from the boiler. One terminal of a low voltage battery is attached to the brush, and the other is grounded to the boiler. A telephone receiver placed in the circuit enables an observer to tell whenever the brush and the copper strip on the commutator completes the circuit, and thus count the revolutions per minute. The blades of the propeller make an angle of 30 degrees with the axis of the propeller, and are 1 1/4 inches wide, the distance across the outside edges being 3 1/4 inches. The boiler tubes are 3 1/2 inches inside diameter.

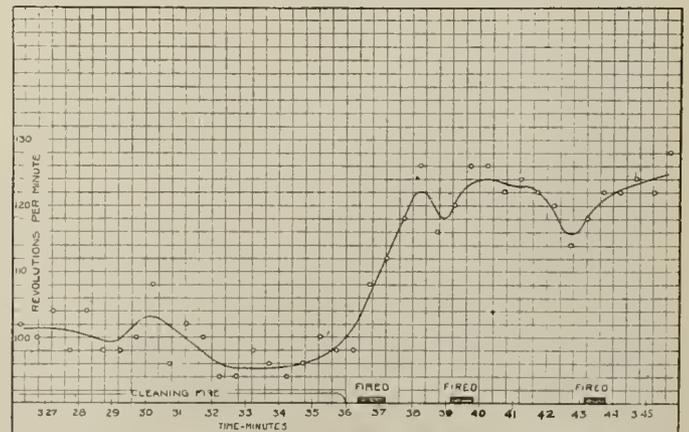

Figure 4.

Observations with circulation counter. Propeller in back of boiler middle tube, third row from bottom. Test No. 379.

The velocity of water as calculated from the dimensions of the propeller is 11.6 inches per revolution, or taking the friction of the propeller into account it may be taken as one foot per revolution.

Chart No. 4 shows the effect of cleaning fires and of firing, on the speed of water circulation in a tube of the boiler, as measured relatively by the circulation indicator. The circulation is quite prompt in its changes and the values obtained vary considerably. The readings were taken by re-

ording the number of revolutions in a 15-second interval opposite time figures, and from such data the revolutions per minute were calculated and plotted on this chart.

The increased circulation of water during and immediately after each firing agrees well with the optical pyrometer readings.

An important point observed is that the circulation rapidly drops behind the amount of steam made (per cent rated capacity developed), especially at high rates of working. Thus at 70 per cent rated capacity the average rate of revolution of the indicator was 80 per minute. At 105 per cent rated capacity the rate of revolution was 102, whereas to be proportional it should have been 120; the speed of circulation fell about 15 per cent short.

This is reasonable, when we consider that, so far as one can make any speculations, the circulating forces are per-

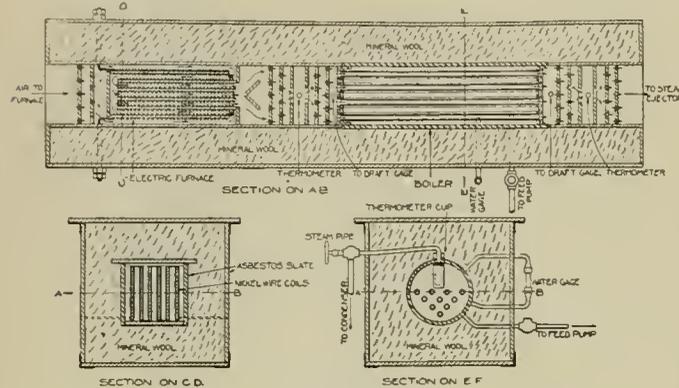

Figure 5.

Apparatus for determining the rate of heat transmission through boiler flues.

haps roughly proportional to the amount of steam generated and entangled with the rising water, while the frictional resistance to circulation is perhaps proportional to the square of the average velocity of circulation.

This failure of circulation to keep up proportionally with demands on it must decrease the efficiency of the boiler at higher rates of working, by allowing a proportionally larger percentage of the water heating surface to be covered with steam bubbles, thus virtually reducing the heating surface.

At a later date, the same circulation indicator was put in the middle tube of the lowest row in the rear end of the boiler; this was one of the tubes mostly enclosed in clay tiles. The numbers of revolutions per minute for various capacities are given in the following table:

Capacity, horsepower	58.2	91.4	118.2	92.2
Revolutions per minute	217	257	273	291
Number of readings	78	8	7	12

In an earlier experiment the same circulation indicator was placed in the third row of tubes from the top of the boiler and it was found that the rate of revolution was very slow indeed. This indicates that the bottom row of tubes was doing far more work than any other row of tubes, and that as we go from the bottom row up, the amount of work done decreases very rapidly.

The probability is that the bottom row of tubes absorbs a large portion of the total heat, mostly on account of conduction through the clay tiles and radiation onto the exposed portion of the tubes in the rear over the hot brick-work. This probability makes it easy to realize that the efficiency of the boiler, as a heat absorber, may well rise far more rapidly with increased furnace temperature, than is indicated by the equation for heat absorption from the gases due to convection only.

(2) An apparatus designed for experiments relating to the laws governing the rate of heat transmission from the gases through the boiler plate, is shown in Fig. 5. It consists of an electric furnace, small horizontal multitubular boiler, a small surface condenser, and a steam ejector for producing draft.

The electric furnace is made of six coils of No. 13 pure nickel wire which is wound around rectangular pieces of asbestos slate $\frac{1}{8}$ -inch in thickness. These coils are placed vertically in a trough of asbestos slate, with a space of about $\frac{3}{8}$ inch between them, and baffled in such a way that the air passes three times through the furnace before it leaves it.

The boiler is 8 inches long and the shell is 4 inches in internal diameter. There are ten copper flues of 3-16-inch internal, and $\frac{1}{4}$ -inch external diameter; this making the thickness of the metal 1-32 of an inch. The heads of the boiler

are covered with a layer of asbestos paper about $\frac{1}{4}$ -inch thick so that only the heating surface of the flues remains effective. The boiler is equipped with a gauge glass, pipe for feeding in water, pipe for pressure gauge and thermometer cup for getting the temperature of the steam. The thermometers used for measuring the temperature of gases entering and leaving the boiler are screened by perforated pieces of asbestos slate from the radiation of the furnace and boiler and also from radiation to the outside. The two screens nearest to the thermometer have only one square hole in the center so that the stream of heated gas is contracted around the thermometer bulb. This precaution makes the thermometer reading represent more nearly the average temperature of the streams of gases. All the boiler connections and the trough around the boiler are covered with hair felt to reduce the radiation losses to a minimum. It is the intention to use in these experiments three boilers of different lengths and to determine the effect of the length of flue on the heat absorption, and also to test flues of different diameters.

The surface condenser is made of two concentric copper tubes; the inner of these is for steam and the outer one for a stream of cooling water.

The steam ejector for producing draft is a standard $\frac{3}{8}$ -inch pipe, placed in the center of a contracted pipe made of galvanized sheet iron which takes the gas away from the rear end of the boiler.

Before a test is started the apparatus is brought to the temperature at which the test is to be run. After starting a test all conditions are kept as nearly uniform as possible.

Chart No. 6 shows the relation of the velocity of air to the rate of heat transmission. The figures near each point indicate the average temperature of air entering boiler for each test. The most striking feature in the chart is that all the points of nearly the same temperature, fall in the same straight line. This means that when initial temperature remains constant the heat transmitted per second is directly proportional to the velocity of air. Another striking feature is that as the temperature of gases entering the boiler rises, the constant temperature lines fall closer together. This means that when the velocity of air is constant, the heat absorption increases at a decreasing rate, as the temperature becomes higher; that is, the heat absorption is not directly proportional to the temperature of the air. The same increase at low temperatures is much more effective than at higher temperature.

There is one objection that might be brought against the results plotted in Chart No. 6, and that is that the water

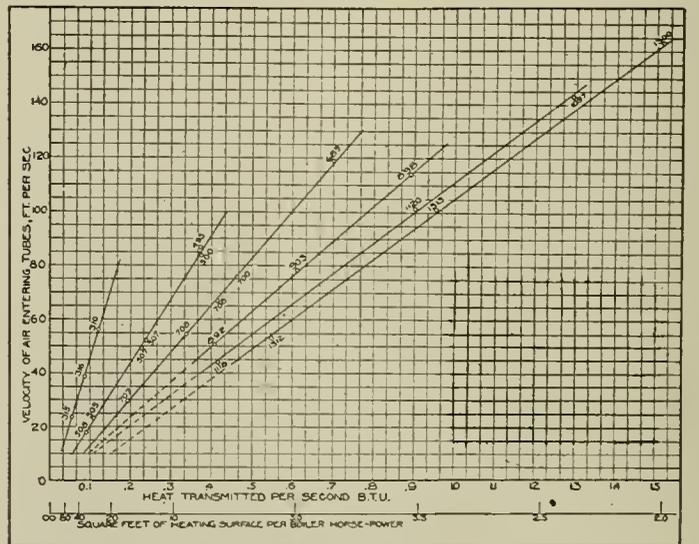

Figure 6.

condensed per second, was used in calculating the velocity of the air. This method of calculation makes the velocity somewhat dependent on the rate of heat absorption and tends to bring the points into a straight line. Experiments are now being conducted with improved apparatus in which the electrical energy used in heating the air is accurately measured and will be used in calculating the velocity of gases, which velocity will then be independent of the water condensed. The fact that the heat absorption increases when the velocity increases remains, although more complete experiments with improved apparatus may show that the relation between heat absorption and velocity of gas deviates slightly from the straight line function.

OPERATING FEATURES OF REACTION TURBINES.

Time Required for Warming Up.

One of the questions which have often been asked regarding the operation of a steam turbine is regarding the time required to bring it up to speed and put on full load, the turbine starting cold. The answer to this question is in general, that the turbine can be started and full load put on it in the time required to warm up and start the air and circulating pumps. This, then, naturally means that a turbine can be started up more quickly than a reciprocating engine, as it does not take as long to warm the small engines driving the air and circulating pumps as would be required to warm the main engines. To illustrate, in an emergency a 5,500-kilowatt turbine was started cold, synchronized and full load thrown on, in a little more than one minute. This is, of course, not desirable, and may cause trouble because of unequal expansion and contraction, but it shows, nevertheless, how little time is required in an emergency.

Under normal conditions the turbine should be warmed gradually and the condensation drained out before sufficient steam is turned on to turn it over, and then the valve should be opened slowly, and the speed gradually increased just as would be done in the case of a reciprocating engine. The normal time for starting a turbine is five to seven minutes, and if that much time is allowed no trouble need ever be feared. A point which should always be remembered is that it is better to give plenty of time for warming before starting, but that should an emergency arise when it is absolutely necessary to get a unit under steam quickly, it is far better to open the throttle wide as rapidly as possible rather than use only a short time for warming. The reason for this will be evident when the expansion of the metal is considered. If too short a time is allowed for warming, the parts entirely surrounded by steam naturally warm first, and the shell, which is far heavier than the rotor and is exposed to the air on one side, will not become warm as quickly as the rotor, and for this reason the shell will heat locally, thus causing it to warp, which is liable to bring the blades in contact with the spindle and the shell. Hence it is better, if absolutely necessary to start up quickly, to turn on full steam pressure as rapidly as possible, as local heating is less likely to occur and therefore also the danger of accidental contact of the blades.

Starting Turbines.

Before starting a turbine the engineer should be sure the water service is in working order, as it is essential that the oil shall be cooled and the glands supplied with water. Otherwise heating of the bearings is likely to occur and the vacuum will not reach the maximum obtainable, as air will leak in through the glands if there is no water service for them. Besides reducing the vacuum obtainable, there will also be a small loss due to the increased work put on the air pump.

Quality of Gland Water.

A point which no doubt would not seem of any serious importance is the quality of the gland water. Although the quantity of gland water is not large, if it contains large quantities of scale-forming salts trouble may arise in time, owing to the deposit of the salts in the shell of the turbine. The temperature of the exhaust steam is sufficiently high to precipitate some of the scale-forming salts on the shell, low-pressure dummy and low-pressure end of the spindle. While the results of this are not very serious, they may cause considerable annoyance. For instance, if the scale does not happen to form evenly all around the rotor, or some of it should crack off on one side, it would probably throw the spindle sufficiently out of balance to cause trouble, and if not attended to, might in time cause the bearings to wear or heat. Further, another way in which the

formation of scale may become apparent is by an overheating of the adjustment thrust block. In a case which recently came to notice the scale had broken off the shell and became lodged in the equalizing pipe between the exhaust pipe and the low-pressure dummy chamber. If this pipe were entirely clogged nearly the entire thrust, which is balanced by the low-pressure dummy, would be thrown on the thrust block, which, not being designed as a thrust block, but simply to maintain the desired clearances, would no doubt seriously overheat. It is needless to say that if the water contains any gritty material in suspension it should be filtered, as it would cause needless wear of the glands, thus increasing the amount of gland water required.

Obstructions in Strainers and Blading.

As a rule strainers are placed in the steam pipe to prevent small pieces of oxide scale or other foreign material from the inside of the steam pipes from entering the turbine blades, but sometimes in spite of these strainers some of the material will work its way through and either be lodged in front of the first ring of guide blades or pass through the turbine without doing any harm, as any object which can pass the small openings in the first row of blades cannot cause any trouble in the rest of the blades. The most serious result of this deposit of scale is the closing of the first ring of guide blades, so that the required volume of steam cannot pass into the high-pressure blading. The consequence is that the auxiliary overload valve opens sooner than it normally should, and the steam consumption per kilowatt-hour will be increased, as the steam entering the second step through the auxiliary overload valve is not expanded completely. A further effect which this may have is the slowing down of the turbine on a heavy overload, which might be sufficient to throw the generators out of step. As stated, the indications which point to this difficulty are the opening of the overload valve before full load, and in an extreme case, slowing down seriously on overloads. The only remedy in these cases is to open the turbine case and remove the obstructions, making sure that pieces of waste, tools, etc., are not left in the turbine when it is closed, as these might cause serious trouble. Slowing down of the turbine recently caused a certain engineer unlimited annoyance and trouble. After examining the valve, blading, condenser and nearly every conceivable part of the turbine he accidentally opened the strainer and found it almost completely closed with scale and dirt. If abnormal slowing down should occur, it would therefore be wise to examine the strainer first before opening up the turbine and looking for an obstruction in the blades. As an obstruction in either place will cause the overload valve to open prematurely, so that alone is not a criterion of where the trouble is located. Choking of the strainer is liable to happen to any type of turbine, as is also to a great extent the trouble from scale-forming water, depending only upon the arrangement of the shell and rotor.

The Effect of Priming.

It has been repeatedly shown that priming of the boilers will not cause any serious damage to a reaction turbine, and even large slugs of water may pass through a turbine, causing no further inconvenience than a slowing down of the turbine until the water has passed out, yet care should be exercised by the attendants to avoid opening up any of the valves on the line to the turbine before the pipes are well drained. For, as stated, though in general no serious trouble is caused by water, it has happened that all the blades have been stripped off the rotor by a large slug of water entering the turbine at a high velocity, and while not highly probable, such accidents can easily happen again through carelessness, and in such cases the attendant can only console himself with the thought of what would have happened had it been a reciprocating engine in place of a turbine.

PIPING AND POWER STATION SYSTEMS.—XXXIV.

BY W. L. MORRIS, M. E.

In nearly every case the condenser discharge line would be located at a higher elevation than the intake, owing to the variation in the level of the water supply at different seasons. If this variation is only four feet, and there is two feet of water in the intake when the water is at its lowest level, then the overflow from the hot well should be six feet from the bottom of the intake, thus making it possible for the discharge waterway to cross the intake waterway and leave at least four feet under the discharge waterway for the intake. Many plants are arranged with the intake and discharge waterway next to each other, a practice the ultimate economy of which is doubtful, there being a slight saving in construction cost which is counterbalanced by loss in operation owing to the rise of temperature of the intake. If a surface condenser is to be installed both waterways should be kept at the same level regardless of the variation in the height of the water supply, and in this case a considerable saving in the cost of construction would result if the two waterways are placed in the same trench.

Class I 9. Branches to and from the Cooling Tower.

The various makes of cooling tower are all quite similar in their general construction and operation. Details shown in Fig. 265 (I 9-1) are common to all makes. The water is distributed over the tower filling at the top and allowed to percolate through the filling downward against the rising current of air. The different forms of filling furnished by the manufacturers of water towers are ordinarily rated at 1 to 1.125 square feet of cooling surface per pound of steam condensed and the cost of the cooling tower materials, not including the foundations, brick lining, motor to drive the fan nor cost of erection, is generally from 10 to 14 cents per square foot of cooling surface. The height of the tower is generally about 32 or 33 feet, measured from the top to the bottom of the metal casing. The metal casing is calked so that the water will not leak through the seams.

The lowest section of the casing would ordinarily be not less than $\frac{1}{4}$ inch and the top section not less than $\frac{1}{8}$ inch

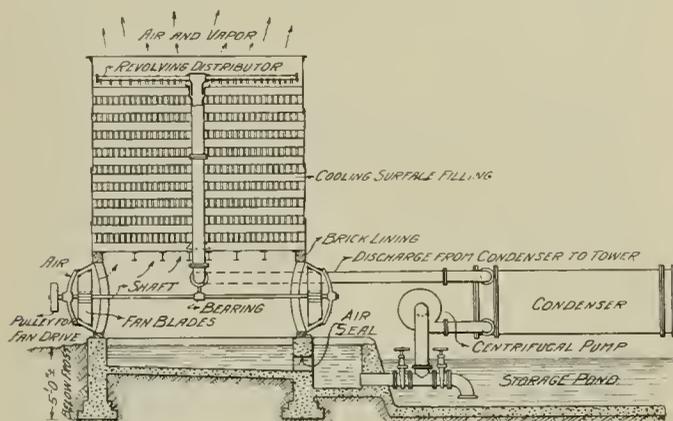

Figure 265-(19-1).

thick. The distributor is supported on hollow brass balls and the bearing surfaces of the sleeves at the end of the discharge pipe are of brass to insure that the distributor will revolve with but very slight pressure at the nozzles. The I-beams shown to support the filling, rest on the brick lining. The air at the base of the tower being under a slight pressure, the water seal shown is required where the water is discharged from the tower to a storage basin as it prevents air from passing through this opening. The size of fan required does not appear to be standardized among the different manufacturers, as those supplied vary from two

8-foot to two 10-foot fans to supply the draft for a tower for 30,000 pounds of steam per hour.

Different manufacturers employ different materials for the cooling surfaces. The most commonly used material is wood, the most satisfactory wood for this purpose being swamp cypress, in surfaced boards 1 inch by 8 inches set on edge about $\frac{1}{2}$ inch apart. Each layer is laid at right angles to the one below it. Glazed tile is also used, unglazed tile being very unsatisfactory due to its moisture ab-

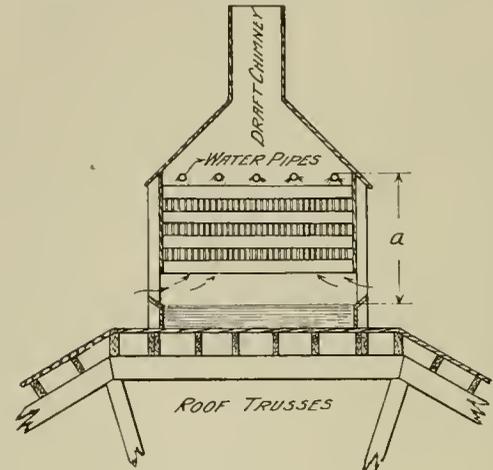

Figure 266-(19-2).

sorbing capacity. This causes the unglazed tile to freeze and crumble in cold weather when the tower is not in operation. Besides simply the loss of money and inconvenience of replacing the tile, it also damages the pumps, owing to the grit carried along by the water, and furthermore the pipes are liable to become clogged with the deposit.

Another material which is quite satisfactory for filling is galvanized wire screening. These are hung from the top in such a manner that they can be easily removed and replaced when they are eaten out. The chief advantage of the wire screen construction is that it offers the least possible resistance to the flow of air through it, making it possible to cool the water by natural air draft instead of by the use of a fan. This, in itself, is quite a saving, as it requires 1 horsepower for each 1,000 pounds of steam per hour which is condensed, or about 2 per cent of the power developed by the main engine. For instance, about 35 horse-power is required to drive the fan for a 2,000-horsepower engine. To avoid the expenditure of this power it would be economy to invest \$125 for each horsepower saved, or, in other words, for a plant as stated, an expenditure of \$4,375 additional for a natural draft tower would be justified. This would be five times the outlay required to pay the difference in cost of the two systems. The saving in power would unquestionably pay the difference in yearly cost of maintaining wire screens in good order. In considering natural draft cooling towers, it should be especially noted what duty would be required of the circulating pumps to determine whether they would require more or less power owing to the elevation to which the water must be pumped.

The ideal system is, of course, to raise the water the least possible distance and, at the same time use natural draft. Figure 266 (I 9-2) shows the cooling tower arranged for natural draft and the distance, *a*, reduced to the least possible. This tower is shown of rectangular construction instead of round, as in Figure 265, as the rectangular form would be more suitable where it is necessary to support it on the roof. The reason for placing this form of tower on the roof is to insure a better circulation of the air and also because the air farther from the ground is somewhat cooler.

(To be Continued.)

RECENT ELECTRIC RAILWAY LEGAL DECISIONS.

BY J. L. ROSENBERGER, LL.B., OF THE CHICAGO BAR.

Burden of Proof Where Gate was Not Securely Fastened.

The burden of proof is on the carrier, the supreme court of Louisiana holds, in the case of *Spurlock v. Shreveport Traction Company*, 42 Southern Reporter, 575, to show why the contract of safe carriage was not fulfilled. Thus, where a passenger fell from the platform of a street car and was killed, in consequence of the gate not being securely fastened, the question being as to whether the gate had been insecurely latched or was unlatched by the passenger himself, the burden of proof lies on the car company. When a question arises as to the working of a mechanical device, for instance, as to whether it was possible for a certain link to stay insecurely on a certain knob, the safer plan is to produce the device itself in court and demonstrate its operation.

Not Required to Do Any Paving Before Laying Tracks.

A franchise ordinance providing that an electric railway company "shall keep paved and in good repair 8 feet in width for single track and 16 feet in width for double track in the center of the streets where its track shall be laid," the supreme court of Illinois holds, *Uhlich's Estate v. City of Chicago*, 79 Northeastern Reporter, 598, that the provision that the railway company shall keep paved a strip in the center of streets "where its tracks shall be laid" does not require the railway company to pave any portion of any street before the time when it proceeds to lay its tracks in that street. And it says that it is confirmed in this view by the fact that the company is given a discretion whether to construct a single-track or a double-track railway, for it is manifest that, before it exercises that discretion, it would be impossible to determine what portion of the roadway the railway company is, by the ordinance, required to pave.

Damages for Expulsion for Refusal to Pay Fare Twice.

There is a wide difference in the opinions of courts of last resort, the court of appeals of Kentucky says, *Camden Interstate Railway Company v. Frazier*, 97 Southwestern Reporter, 776, as to the measure of damages that a passenger is entitled to recover in case of his wrongful expulsion for refusal to pay fare a second time. The courts of a number of states hold that it is the duty of a passenger to pay the extra fare demanded if he has the money, thereby avoiding expulsion; and in such cases the passenger is only entitled to recover the amount wrongfully exacted, in the absence of such aggravating conduct on the part of the persons in charge of the train as would entitle him to punitive damages. These cases are placed upon the ground that it is the duty of the person who has been deprived of a contract right to reduce the damage as much as possible; and that if he has the money to pay the extra fare he should do so, and thus minimize the injury sustained.

Other courts hold that a passenger who has paid his fare and thus acquired a contract right to transportation to the point of destination may stand upon his right and refuse to pay the fare wrongfully demanded, and, if ejected, may recover substantial damages.

This court is disposed to accept as correct the latter view. When it says a passenger has performed his contract by paying to the carrier the correct sum requested for his passage, the carrier has no right to demand that he shall again pay, and, if such demand is made, a passenger is under no duty to minimize the damage that the carrier may have brought upon itself by its wrongful act. The carrier has no more right to wrongfully exact money from a passenger than any other party to a contract has to demand money without legal right. If a party to an ordinary contract should break it, because the other party would not submit to wrongful exactions, there would be no difference of opinion that the

person injured could recover such damages as would compensate him for the injuries sustained. Nor would it be said that the injured party must submit to extortion or unjust demands to relieve the offending party of the damages that he might be subjected to as a consequence of his wrongful act. And this court is unable to perceive why a carrier should occupy a more favorable position in this respect than the ordinary citizen.

Injury to Conductor Putting in Route Sign.

A conductor being directed to take out a car for a certain route and finding that the designation blocks attached to the roof of the car could not be worked was told to put in slat signs. He climbed on the dashboard, rested his weight upon the roof of the car until he got near enough to reach the sign, and then endeavored to place a slat under the band which held the frame. The band came off, and he fell. The appellate term of the supreme court of New York holds, *Carroll v. Union Railway of New York City*, 101 New York Supplement, 745, that the coming off of the band did not establish the negligence of the company. It says that the purpose of the band was to hold the slats or signs, and it could not be inferred ipso facto (by the act itself), in the absence of all evidence, that in getting upon the dashboard the conductor was induced to rely to any extent upon it for support. The mere happening of the occurrence was not proof of liability. Moreover, when it was considered that the band was used only for the purpose of keeping the sign in place, was not its breaking immaterial? Was not the reasonable solution of the plaintiff's own testimony upon this point that for some unexplained reason he lost his balance, and in falling tore off the band, which under no circumstances could have been expected to resist the strain of his weight?

Conductor Dragged Into Pit at Shop.

A conductor was walking behind a car to guide the trolley pole along its wire, when, as he testified, all of a sudden the motorman shot ahead into the car shop, the pole came off, the ropes twisted around his hand and kind of lifted him, and dragged him into a pit inside of the car barn or shop, injuring him. But the second appellate division of the supreme court of New York holds, *Dulfer v. Brooklyn Heights Railroad Company*, 101 New York Supplement, 207, that while the pit was a cause without which there would have been no injury, yet the proximate cause of the injury was the conduct of the motorman, who was a fellow servant of the conductor. Moreover, it thinks that it could not be said that the company in the exercise of due care should have foreseen that in such a situation as was described its motorman might have managed a car so as to carry one in the relative situation of the plaintiff off his feet and cast him down into a pit ten feet within the barn.

Justice Gaynor, concurring, says that the plaintiff testified that he did not know there were pits in the repair shop and was not instructed that there were any, and on this the case was sent to the jury. But it is submitted that this testimony was wholly incredible. It is a matter of common knowledge that pits are necessarily there. We all know it, and yet this court was asked to credit a railroad employe who said he did not know it. Courts should not allow themselves to be imposed on by obvious falsehoods; to do so gives a false notion of the administration of justice, and hegets disrespect for it. The belief that courts can be fooled should be dispelled. Aside from this, the proximate cause was the negligent act of the motorman, his shooting of the car ahead so suddenly and rapidly. Even if the plaintiff knew the pit was there he would have been dragged into it just the same by the rope which entangled his hands. It followed that the failure to inform him that pits were in the shop was of no importance—if the court was to accept his pretense that he did not know it.

News of the Week

Central Electric Railway Association.

Mr. H. A. Nicholl, president, announces that the regular meeting of the Central Electric Railway Association will be held at the Algonquin Hotel, Dayton, O., on Thursday, March 28, 1907. The meeting will assemble at 10:30 a. m. and after a brief business session the following papers will be read: "Track Bonding," by Thomas B. McMath, chief engineer, Indianapolis Traction & Terminal Company, Indianapolis, Ind.; "Car Wheels for Interurban and City Service," by C. Skinner, master mechanic, Scioto Valley Traction Company, Columbus, O.; "Trolley Wheels," by M. M. Baxter, electrical engineer, Western Ohio Railway, Lima, O.; "Car Inspection," by Lees M. Jacques, master mechanic, Ft. Wayne & Wabash Valley Traction Company, Ft. Wayne, Ind.; and the report of the committee on "Express Company Contracts with Interurban Railways." A special car will leave the Traction Terminal station at Indianapolis promptly at 6 a. m. for Dayton and those desiring to make the trip are invited.

Philadelphia Traction Situation.

By a vote of 77 to 76 the house of representatives of the Pennsylvania legislators voted down on March 19 the Fahey bill, which was based on the recommendation of the Retail Merchants' Association that a new law be enacted which would enable the city of Philadelphia to enter into contracts with the Philadelphia Rapid Transit Company in accordance with the plan approved by the directors of the company.

The Trades League has received an opinion from its counsel, J. C. Jones, criticizing the McNichol and Fahey bills, which have been introduced in the Pennsylvania legislature for the purpose of making it possible for the city of Philadelphia to negotiate with the Philadelphia Rapid Transit Company. The Trades League will try to persuade other organizations which have shown any opposition to the Retail Merchants' Association plan to join in the protest against the plan, which has been approved by the directors of the Transit company. At the meeting of the Trades League at which this action was decided upon, a resolution was offered and passed commending the Rapid Transit company for its Market street elevated structure.

Both Car Gates Open in New York.

As the result of an ordinance which went into effect on March 12, an order has been issued by the New York City Railway Company directing that both gates on the rear platform of surface cars running in upper Broadway be kept open between Fifty-ninth and Manhattan streets. The order was brought about at the request of citizens of the upper West Side, who stated that the space between the tracks between the points mentioned is wide enough to give ample standing room for passengers getting on and off the cars, and it was also maintained that the space between the tracks and the curb is so narrow as to endanger the safety of persons waiting to take cars or leaving them hastily, on account of the possibility of being run down by passing vehicles. Oren Root, Jr., vice-president and general manager of the company, is quoted with reference to the new order as follows:

"Passengers are accustomed to leaving the cars by the right gate. They are also accustomed to leaning against the closed left gate. The distance affected by the new order is so short that passengers will never get accustomed to the left gate being open. Enough accidents happen now from people falling from the cars. The accidents along upper Broadway will be more than doubled."

Rapid Transit Affairs in New York.

The rapid transit commission on March 16 began advertising for bids for the construction of the Center street section of the bridge subway loop, known as route No. 9. Bids will be opened on April 11. The work is to be completed in 21 months and the successful bidder must give a bond of \$300,000. A public hearing on the form of contract for the Seventh and Eighth avenue routes will be held on March 25.

Corporation Counsel Ellison on March 18 advised comptroller Metz that the city is in no way responsible for the damages to property along Park avenue caused by the building of the subway. The amount of damages was fixed by a referee at \$350,000 and the property owners brought claims against the city, but the corporation counsel says that the city was not a party to the proceedings to fix the damages and that the responsibility rests with the contractors or the rapid transit commission; that the city is not liable for any of the acts of a commission appointed by the state. The Interborough Rapid Transit Company has expressed a willingness to pay half the amount.

The Retail Dry Goods Association has adopted the report of a committee appointed to investigate the transit problems of the city and has adopted resolutions pledging the association to take an active interest in the future in all questions relating to rapid transit facilities. In view of the growing needs of the city, the association thinks that if the municipality on the one side and the traction capital and experience on the other, would "unite in a common purpose and eliminate the friction habitually arising between them, they could bring about some solution of this vexing problem." In conclusion it was resolved that a committee be appointed from the members of the association, "whose duty it shall be to take up this problem and confer with all the authorities, state and municipal, with all the interests represented in the transportation systems of New York and with all other local organizations and

civic bodies and with full power to discuss and negotiate, formulate and report any plan or plans, looking to that relief, of which the whole people of the city stand greatly in need."

Theodore P. Shonts, the new president of the Interborough-Metropolitan Company, has been conferring with the heads of various civic organizations to learn their ideas as to the improvement of the street railway service. As a result of the conferences it is stated that there will be organized a central civic organization with representatives from 53 civic organizations, and that Mr. Shonts will take up transit problems with this central body.

Officers' Association of the Ft. Wayne & Wabash Valley Traction Company.

The Ft. Wayne & Wabash Valley Traction Company of Ft. Wayne, Ind., which operates an extensive system of about 150 miles of electric railways in northern Indiana, has recently adopted a plan for promoting the general welfare of the company and securing the benefits of co-operation among the official staff, which should be productive of excellent results. The "Officers' Association of the Ft. Wayne & Wabash Valley Traction Company" has been organized, the membership consisting of the heads of the various departments of the company and such other employes as in the opinion of the president of the association may seem desirable. The object of this organization, as stated by the constitution, is the advancement of the welfare and the best interests of the Ft. Wayne & Wabash Valley Traction Company, the attainment of the highest possible operative efficiency and through co-operation and the interchange of ideas, plans and experience the mutual benefit of all members of the association.

The association has the usual officers, the general manager of the company, C. D. Emmons, being ex-officio president of the organization. Regular meetings are to be held on the first and third Monday of each month and an annual meeting is to be held on the first Monday in March of each year.

Transfer Rule Upheld.

The appellate division of the supreme court of New York has decided, in the case of Ketchum v. New York City Railway Company, on March 15, 1907, that the rule requiring the passenger to ask for a transfer at the time of paying his fare is reasonable and that the company may refuse to issue a transfer if asked for at any other time. Justice Scott wrote the opinion of the court, in part as follows:

"That a common carrier of passengers not only has the right, but is bound, to make rules and regulations to insure the safe, effective and comfortable operation of its corporate business is undoubted, and it is equally clear that it is entitled to adopt and enforce rules designed to protect itself against fraud and impositions.

Proceeding to discuss the specific regulation in question in the present case, Justice Scott says that the company is clearly entitled to protect itself against dishonest passengers who might seek to obtain more than one transfer. Continuing, Justice Scott says:

"The evidence shows, and common experience verifies the fact, that at certain hours the defendant's cars are very crowded, and it would be an impossible task to require a conductor to carry in memory every passenger to whom he had given a transfer in the course of a long trip. Under this system the only passenger likely to be inconvenienced because he had not demanded a transfer upon beginning his journey would be one who started without the intention of transferring, and then, during the trip, changed his mind. We see no reason to suppose that such cases would be at all numerous. We are, therefore, of the opinion that the regulation in question, considered with respect to the system now in operation, is reasonable and lawful."

The plaintiff was awarded a judgment of \$62 in the municipal court, which was later confirmed by the appellate term. The appellate division now reverses this judgment.

Iowa Street & Interurban Railway Association.

Secretary and Treasurer L. D. Mathes has announced the final programme of the fourth annual convention of the Iowa Street and Interurban Railway Association, to be held at the Lafayette Inn, Clinton, Ia., on April 19 and 20. The following papers will be read: "The Steam Motor Car—Its Value for Interurban Service," by W. G. Wagenhals, who is the inventor of the car to be described; "Amusements—How Should This Feature Be Handled by Operating Companies," by H. W. Garner, general manager Oskaloosa Traction & Light Company; "Freight Handling by Electric Lines," by H. H. Polk, president Interurban Railway; "Joint Operation of City and Interurban Cars Over City Tracks," by Isaac B. Smith, traffic manager Iowa & Cedar Rapids Railway & Light Company; "Effective Methods of Handling Peak, or Rush-Hour Traffic on City Lines," by E. L. Kirk, general manager Sioux City Traction Company; "Modern Train Dispatching Methods on Electric Railways," by P. P. Crafts, general manager Iowa & Illinois Railway.

This programme is one which will be of great interest and value not only to the members of the Iowa association but to the street railway fraternity in general. The several numbers are in the hands of men who are entirely capable of handling them in an able manner.

The local committee, consisting of Mr. P. P. Crafts, R. M. Howard and Thomas Crawford, have also announced the arrangements which have been made for the benefit of the guests both to this convention and to that of the Iowa Electrical Association, which will also be held at the Lafayette Inn on April 18 and 19. As is customary at conventions, it will be necessary for delegates to double up at the hotel rooms. Rates at the Lafayette Inn are from \$2.50 to \$3.50 a day for each person on the American plan.

Reservations have also been made at the Revere House and the Grand Hotel at the same rates. Space for manufacturers' exhibits, also current for light and a limited amount of power will be provided in the basement of the Lafayette Inn, free of charge. The current furnished will be single-phase, 60-cycle, 110 and 220 volt alternating, and 600-volt direct current. Guests are requested to advise the committee by April 15 of their space reservations and the amount of current required. The committee has provided for several entertainments for the delegates. Badges of all delegates will be accepted for transportation on the Clinton Street Railway, Iowa & Illinois Railway and the Tri-City Railway.

Arrangements have been made with the Western Passenger Association for a rate of one and one-third single-trip fare on the certificate plan, from any part of the state of Iowa and from Chicago, St. Louis and Minneapolis, based on a single-trip rate of three cents per mile.

Paralleling of Steam Roads by Electric Lines.

The appellate division of the supreme court of New York recently gave a decision ordering the state board of railroad commissioners to grant a certificate of convenience and necessity to the Rochester Corning & Elmira Traction Company for building its proposed line connecting the cities named. The certificate had been denied at the time of the application on the ground that the territory was already adequately served by the Erie Railroad. In delivering the decision the court said:

"The question was not whether the through transportation facilities between termini or even between the larger cities were inadequate, but whether the people living along the line of such steam railroad and between its stations required additional facilities. Indeed, between points a long distance apart the trolley roads do not compete with the steam roads. The passengers and freight which the former carry are as a rule carried to the station of the latter. In all essential respects the two serve separate purposes each equally necessary to the convenience of the public.

"This policy has been adopted by the board of railroad commissioners so uniformly that it may be regarded as the settled policy of the state, to-wit: to permit steam railroads to be paralleled by trolley roads, however ample the facilities furnished for travel by such steam roads between terminal points or between principal stations, and so notwithstanding such trolley road may reduce the earnings of the steam roads. The primary purpose of a trolley road is to convey people directly from their homes to the nearby villages or cities or vice versa."

The opinion further states that facilities for through service between Rochester, Corning and Elmira are now reasonably adequate, but the evidence demonstrates that the facilities for local traffic are wholly inadequate; that trains are run infrequently; that the stations are comparatively long distances apart, and that a considerable portion of the territory is not accommodated by existing railroads, which will be more closely paralleled by the proposed railroad than such railroads usually have been by such construction in other parts of the state. The fact that the Erie proposes to electrify its line does not alter the proposition, as electrification will not convert it into a street surface railroad. The opinion continues:

"The passenger trains may run more frequently, but with all the changes suggested, the people along the route will not have such facilities as is understood will be afforded by a street surface railroad. The evidence shows that the population to whom the line of the proposed road would be reasonably accessible averages between 400 and 500 per mile, not including the population of either Rochester or Elmira, and the evidence very conclusively shows that such population has at the present time very inadequate transportation facilities along the greater part of such route. That fact becomes apparent upon examination of the time tables of the existing roads."

Legislation Affecting Electric Railways.

Iowa.—A bill has been introduced in the house which gives automobile lines running on tracks the same status under the laws as electric interurban lines.—Another bill before the house provides that city railways must allow all interurbans the use of their tracks, trolley wires, power, depots and warehouses to enter the city. It provides that if the interurban and the street railway cannot agree as to the terms of the compensation which the interurban is to pay the street railway for the use of its tracks and other property the state railroad commission shall fix the compensation. A bill requiring that the vestibules of street cars shall be enclosed on all sides for the protection of employes has passed both houses of the legislature.

Massachusetts.—It is reported that a bill will be introduced in the legislature to allow interurban electric roads to build elevated structures on which to enter cities.

Minnesota.—A bill introduced by T. J. Brady of St. Paul makes it unlawful for any street car company or its employes in charge of the cars to carry or permit to be carried more than 15 passengers in excess of the seating capacity of the cars.—Two bills for reduced fares have been considered by the committee on express, telegraph and electric railways, one providing for a 3-cent fare in rush hours and another for eight tickets for 25 cents.—Another bill provides that in addition to any liability now existing by law, every street railway company shall be liable to each passenger of such company for damages in an amount to be fixed by the jury for failure to perform any duty owing by it to any of its passengers. The bill provides that this bill shall not affect the liability of such companies under the existing laws nor shall it be construed as in any way limiting the right to recover for personal injuries as now authorized by law.

Missouri.—The house has passed a resolution for a constitutional amendment authorizing the city of St. Louis to issue bonds for the construction of a municipal subway.—The house has defeated the 5-cent fare street railway bill, which was introduced to prevent the St. Joseph street railway from charging a 15-cent fare for a round trip to its park at Lake Contrary.—An ordinance introduced into the St. Louis city council provides for 3-cent fares within the city and five half-fare tickets for 10 cents for children between the ages of 3 and 12 years.

Nebraska.—A committee of the senate has recommended for passage a bill passed by the house creating a state railway commission, whose powers include jurisdiction over street railways, which are declared to be common carriers.

New York.—The senate judiciary committee and the assembly railroad committee will hold a joint hearing on March 27 on the "public utilities" bill. At the same hearing other bills relating to New York rapid transit will be considered, including Senator Foelker's bill providing for a New York city railroad commission, Senator McCarren's bill abolishing the present rapid transit commission and Senator Grady's bill providing for a public utilities commission for New York city, to have charge of railways, lighting and telephone companies. Mr. Grady has also introduced a bill providing for a 5-cent fare and universal transfers within the city limits on lines controlled by one company.—Senator Saxe has introduced a bill providing for the removal of the New York Central tracks from Eleventh avenue. It provides for a subway between Thirtieth street and Sixty-second street, with accommodations for six tracks, all to be constructed at the expense of the company; from Seventy-second street to One Hundred and Twenty-second street and from One Hundred and Forty-sixth street to Spuyten Duyvil the tracks are to be walled up at the expense of the railroad company and covered over at the expense of the city out of the money to be paid by the railroad company for the right of way to be granted west of the present tracks; between One Hundred and Twenty-second street and One Hundred and Forty-sixth street an elevated structure is to be erected to meet the grade and to permit the intervening streets to have a clearance to the river front. Electricity is the motive power provided for.

Pennsylvania.—The bill introduced by Representative Fahey to permit the reorganization of the Philadelphia Rapid Transit Company under the plan proposed by the Retail Merchants' Association has been defeated by the house of representatives by a vote of 76 to 77. The bill provided that any city, borough or township may enter into contracts with any street railway, surface, elevated, underground or motor power company, leasing and operating the franchises and property of such company, within the limits of the municipality or townships, affecting, fixing and regulating the franchises, powers, duties and liabilities of such companies and the regulations and respective rights of the contracting parties.—Another bill introduced by Mr. Fahey, requiring traction companies to secure the right of way from local authorities before being granted a charter, has been amended so that the same provisions shall apply to existing companies desiring to make extensions.—The Homsher bill giving the right of eminent domain to electric railways has been recommitted and a substitute bill has been introduced in the form of an amendment to the general electric railway laws of 1899, providing that in order to avoid dangerous curves, heavy grades, streams, public bridges or grade crossings, companies shall have the right to acquire and occupy private property for the laying of tracks, and shall be empowered to divert their tracks from the highway to the property, and from thence back to the highway whenever and as often as they may deem it expedient to do so.—The strip which may be condemned for ordinary trackage is not to be more than 45 feet wide, and the right of eminent domain is conferred when the owners of at least 51 per cent of the foot frontage of the proposed route give assent to the construction of the line.

Tennessee.—A bill to take the power of assessment of street railways from the railroad commission and to give it to the local tax assessors has been defeated by the senate.—A bill has been introduced in the house which requires street railways to equip their cars with projecting fenders in front, made and attached to the car according to the latest improvements and modern methods of the art.

Texas.—The so-called "Jim Crow" law, providing for separation of races on street cars, has been passed by both houses. In many cities of the state the provisions of this law are already enforced by city ordinances.

Block Signals for Ft. Wayne & Wabash Valley.—The Ft. Wayne & Wabash Valley Traction Company has arranged for the installation of manually operated block signals at points where the interurban cars enter the city of Ft. Wayne.

Service Hearing at Richmond.—The Virginia Corporation commission will hold a public hearing at Richmond on March 27 to hear complaints of the mayor of Portsmouth against the Norfolk & Portsmouth Traction Company on account of alleged defects in the service.

Grand Rapids Railway Increases Wages.—General Manager B. S. Ifanchett of the Grand Rapids (Mich.) Railway Company has announced that at the recent meeting of the directors it was voted to increase the wages of conductors and motormen 10 per cent, effective on June 1.

File Bills Against Yerkes Estate.—The North Chicago Street Railroad Company and the West Chicago Street Railroad Company have filed bills in the United States circuit court in order to secure from the Yerkes estate an accounting of the transactions of the late Charles T. Yerkes with the North Shore Electric Railway

Company and the Chicago Union Traction Company, and his alleged appropriation of funds that belonged to the companies.

Ask for Reduced Fare.—The West End Improvement Club of Council Bluffs, Ia., has filed a complaint with the interstate commerce commission asking that the Omaha & Council Bluffs Street Railway be compelled to reduce its present rate of 10 cents for carrying passengers from Council Bluffs to Omaha.

Pittsburg Railways Company Increases Wages.—An increase of pay for conductors and motormen of 2 cents an hour has been announced by the Pittsburg Railways Company, effective on April 1. Under the new scale the men will receive 25 cents an hour for the first two years, 26 cents an hour for the third year and 27 cents an hour thereafter.

Butte Street Railway Strike Settled.—The strike of the motormen and conductors of the Butte (Mont.) Electric Railway, which completely tied up the street railway service of the city for two days, March 19 and 20, was settled on March 20 when the company agreed to an increase of wages from \$3.00 to \$3.50 a day and the men agreed to return to work on the following day.

To Instal Telephone System.—The Detroit, Jackson & Chicago Railway has decided to instal its own telephone system for car dispatching instead of using a leased line of the Michigan State Telephone Company as at present. Fifty-three instruments have been ordered from the Stro-nberg-Carlson Manufacturing Company of Chicago and a new switchboard will be installed at Ypsilanti, Mich., which will continue as the dispatching headquarters.

Indiana Columbus & Eastern Mileage Book.—A coupon book containing coupons for 350 miles was placed on sale on the Columbus & Zanesville, Dayton & Union and Dayton & Richmond divisions of the Indiana Columbus & Eastern Traction Company this week for \$5. The books are good only on the divisions on which they are sold, and it is expected that all the divisions of the company will be supplied within the next few weeks. The books are good for bearer or a party of two or more, and by use of them the rate is reduced to 13-7 cents a mile. The books also contain coupons for checking baggage.

Evening Course of Instruction in Electrical Engineering.—It has been announced that the regular evening course in electrical engineering was started on March 18, 1907. The hours are from 6 to 10, four evenings a week—Monday, Tuesday, Wednesday and Thursday. The first year's course is physical laboratory work, covering mechanics, heat and light. The second year's course covers the rotary converter and the alternating and direct-current generator and motor characteristics. The third year's course covers alternating current generators and motors, over a very complete range of conditions and uses. The work is in charge of Messrs. Woodworth, Rogers & Nies.

Rental for Tunnel Exits.—The rapid transit commission of New York has filed a certificate to the Hudson & Manhattan Railroad defining the terms of the rental to be paid to the city of New York by the railroad company for exits from its tunnel, now being built under the Hudson river, to be situated in Fourteenth street, near the westerly side of Sixth avenue; Twenty-third street, near the westerly side of Sixth avenue; two on Twenty-eighth street, near the easterly side, and near the westerly side of Sixth avenue. The certificate also defines what space is to be considered and paid for as vault space, and fixes payments to be made for such space at 4 per cent per annum, on the valuation of horizontal area occupied. The mode of calculating payments is based on valuation placed on the adjoining property. Payments to the city are to be begun on the day when the railroad company shall commence actual operations.

Test of Street Railway Fenders and Wheel Guards.—A pamphlet has been issued by the commonwealth of Massachusetts setting forth the result of about 50 experiments made on 10 different makes of fenders, under the supervision of the board of railroad commissioners. The tests were made on dummies for the most part, lying in different positions on the ground between the rails, and only in a few cases were the dummies supported in an upright or standing position. The speed of the car was in general from 3 to 10 miles per hour. While the results of these experiments are interesting, the value is, to say the least, doubtful, though they may possibly indicate the fenders and wheel guards which are absolutely worthless and possibly more a source of danger than a protection to pedestrians. With dummies it is certainly an impossibility, under the most favorable circumstances, to determine their true value in saving life, and they will furnish absolutely no indication as to the effect that they will produce on the limbs of human beings.

Dedication of Engineering Societies Building.—The preliminary plans for the dedication week of the new engineering societies building in New York have been announced. On Tuesday, April 16, there will be formal dedication exercises in the afternoon and a general reception in the evening. On April 17, designated as "Founder's Day," there will be addresses by representatives of the founder societies and institutions. On the afternoon of April 18 there will be a session of the American Institute of Mining Engineers, at which H. T. Hildage will present a paper on "Mining Engineering in New York City," describing the excavation and tunnel work now being carried on by the Pennsylvania. On the evening of April 18 there will be a session of the American Society of Mechanical Engineers, at which Brig.-Gen. William Crozier will make an address on "The Ordnance Department as an Engineering Organization." On April 19, there will be a session of the American Institute of Mining Engineers and an informal smoker for members of all societies.

Construction News

FRANCHISES.

Boston, Mass.—A franchise has been granted to the Boston Elevated Railway for an electric line through the Middlesex Falls Parkway from Union Park in Somerville to Spot Pond. The line will be 4½ miles long and its terminal will be near the Winchester reservoirs and Bear Hill observatory.

Davenport, Ia.—Application for permission to build a street railway in Davenport has been made by Alfred Hurst, Owen McCaffrey and H. M. Tracey. This will be part of an interurban line which it is proposed to build from Maquoketa to Davenport. The franchise if granted will give the company the right to use the tracks of the Davenport & Suburban Railway in Front street between Main and Perry.

Decatur, Ill.—A 50-year franchise to build its line through Decatur has been applied for by the Decatur Sullivan & Mattoon Transit Company. It is stated that arrangements have been made for an interurban station on East William street, and that all right of way has been secured along its proposed line.

Elyria, O.—The Cleveland Southwestern & Columbus Railway Company has made application for permission to lay additional tracks on various streets, including a double track on the new Broad street bridge and for a 25-year extension of its existing franchises.

Janesville, Wis.—H. H. Clough, Madison, Wis., has filed acceptance of the franchise recently granted to the Madison & Janesville Interurban Railway, which proposes to build a line between Madison and Janesville by way of Edgerton and Stoughton. When this is completed a continuous line between Madison and Chicago will be in operation.

Kansas City, Mo.—The Kansas City St. Joseph & Excelsior Springs Railroad is seeking a franchise to cross two streets in Kansas City with the \$3,000,000 bridge which it will build over the Missouri river. It is stated that provision has been made for three other railroad systems to cross the bridge, and that a roadway for pedestrians and teaming traffic will be maintained by means of a toll system. Permission also is sought by the company to occupy certain streets in the north end with its tracks, and to build a tunnel under Locust street from Fifth street to the Belt Line tracks.

Lockport, N. Y.—An application to double track the East avenue line in Lockport to the city line has been made by the International Railway Company of Buffalo. This will form a connection with the proposed electric line from Rochester.

McAlester, Okla.—A 40-year franchise was granted on March 11 to the Choctaw Railway & Lighting Company to build and operate an electric railway in McAlester. The franchise permits the use of T-rails.

Mansfield, O.—An ordinance has been passed by the city council of Mansfield permitting the Mansfield Railway, Light & Power Company to lay its tracks in certain streets of the city, the franchise to be in force until February, 1925. The line must be built by October, 1907.

Mineola, L. I.—The Mineola Roslyn & Port Washington Traction Company has asked for a franchise to construct its line over certain streets later to be determined upon by mutual agreement between the company and abutting property holders. The New York & Long Island Traction Company also will present application for a franchise to operate its line in Mineola.

Mt. Vernon, O.—A franchise has been granted to the Mt. Vernon Electric Railway Company to extend its lines on certain streets for interurban purposes. The ordinance recently introduced granting a franchise to the Mansfield Southern Traction Company was not passed.

North Yakima, Wash.—A 50-year franchise has been granted to the Yakima Intervalley Traction Company for a local street railway in North Yakima and for a system of interurban lines in the Yakima valley; one from North Yakima through Yakima City and the Moxee district to Zillah, and a branch from North Yakima to Wide Hollow. Five miles are to be completed and in operation within a year, 5 miles completed each year for two years thereafter, and the entire system, 60 miles, to be in operation in five years. The line ultimately will extend to Priest Rapids on the Columbia river. It is stated that steel rails and other materials are en route from the East, and that actual construction will be started by April 1. W. A. Bell of North Yakima is interested.

Pittsburg, Pa.—The Pittsburg Railways Company has been granted franchises for several extensions to its lines. The Federal Street & Pleasant Valley line will be extended along Robinson and Lacock streets, forming a loop. The Washington avenue bridge measure, which opens the way for a short line to Pittsburg from Avalon to Bellevue over the Union bridge, has been passed by the council. The company also was granted a franchise to operate its line in Woodland avenue from Brighton road to Shady avenue. A 30-day extension in which to complete its Nunnery and Spring Hill lines was granted.

Portland, Ore.—The Portland & Mt. Hood Railway Company has been granted a franchise for terminal facilities in the east side of the city and to lay tracks on the principal streets. This is in con-

nection with the interurban line which will be built to the base of Mt. Hood; from there a cog line will run to the summit and a hotel will be erected on one side of the mountain for the accommodation of tourists. The estimated cost is about \$2,000,000 and several years will be required to finish the road. It is stated that work will be started inside of two months. Dr. McCorkle of Portland is interested.

Richmond, Ind.—The Richmond (Ind.) & Hamilton Interurban Railway has made application for a franchise to build its line from Richmond, Ind., to Hamilton, O., through Boston and Darrtown in Butler county, Ohio. It is stated that the right of way has been secured and financial backing assured by the State Trust & Loan Company of St. Louis, Mo. Herman Duhme, Sr., Wyoming, O., is interested.

St. Louis, Mo.—The ordinance granting the St. Louis Electric Terminal Company, a subsidiary of the Illinois Traction Company, a franchise for lines from the Mississippi river to the heart of the city, was passed last week by the city council. The ordinance is now before the house of delegates for consideration.

Schofield, Wis.—The Wausau Street Railroad Company has been granted a 35-year franchise in Schofield for the Wausau-Stevens Point line.

Seattle, Wash.—The Seattle Electric Company has applied for franchises for the new extensions to South Park and Ranier Beach. Action will be taken by the county commissioners on April 17.

Troy, N. Y.—The Trojan Railway Company, incorporated in New York on March 15, has applied for a franchise to build its 1½-mile line in several of the streets of Troy. The United Traction Company also is seeking permission to extend its lines in Troy. The board of contract and supply has the applications under consideration.

Washington, Pa.—A franchise has been granted to the Pittsburgh Railways Company by the East Washington borough council to lay its tracks on East Beau street. It is stated that the road will be completed by the middle of September.

Yonkers, N. Y.—The Bronx Yonkers & White Plains Railroad has been granted a franchise for a line from Yonkers to White Plains, 11 miles. Practically all of the necessary consents of property holders have been obtained.

RECENT INCORPORATIONS.

Belt Line Street Railway.—Incorporated in Pennsylvania to build one mile of road in Ellwood City, Lawrence county. Capital stock, \$6,000. George W. Young, president.

Bolivia Railway.—Incorporated in Connecticut to construct and operate public utilities in South America and to build and maintain railroads, steamboat lines, telegraph and telephone systems. Capital stock, \$10,000,000. Incorporators: Jacob G. Metcalf, Lake-wood, N. J., president; Edward W. Burdick, Englewood, N. J., vice-president; H. Starr Giddings, New York City, secretary and treasurer.

Georgia Electric Railroad.—Incorporated in Georgia to extend the present Brookwood line of the Georgia Railway & Electric Company to Buckhead, Ga. Its incorporators include several stockholders of the latter company. It is stated that as soon as the new bridge over the railroad at Brookwood is completed and the present county line to Buckhead has been widened, work on the new line will be started and possibly cars be in operation next fall. By its completion a direct line from Buckhead to Atlanta will be afforded. Incorporators: P. S. Arkwright, Thomas K. Glenn, G. W. Brine, H. N. Hurt, S. E. Simmons, W. H. Glenn, Atlanta, Ga., and R. E. Cullinane, W. B. Stovall, F. M. Sisk and W. H. Wright.

Index & Northern Railroad.—Incorporated in Washington to build an electric line from Index to Mineral City, 16 miles. Capital stock, \$1,000,000. Incorporators: C. F. Naething, New York; John S. Jurey and T. E. Ellis of Seattle.

Prairie State Traction Company.—Incorporated in Illinois to build an interurban electric line from Whitehall and Roodhouse to Pana, Ill., through Athensville, Scottville, Palmyra and Girard. Principal office, Whitehall; capital stock, \$6,000. Incorporators: A. P. Grout, Winchester; Jett A. Kirby, Jerseyville; E. S. Greenleaf, Jacksonville; H. C. Morrow and H. O. Tunison, Whitehall; James Walker, Scottville; Scott Etter, Palmyra; W. H. Bowen, Alton, and George Morrow, Athensville, Ill.

Puget Sound Skykomish & Eastern Railway.—Incorporated in Washington to build an electric road from Index to Galena, 10 miles. Capital stock, \$500,000. Incorporators: Nicholas Rudibeek, E. H. Guie and S. P. Eckl.

Trojan Railway.—Incorporated in New York to build and operate an electric street railway in Troy, N. Y. The line will be double-track and will be built in what is known as the North End. It will traverse the following streets: From Second avenue on East Eighth street to Fourth avenue, north to Tenth street, east to Sixth avenue, north to Twentieth street and thence to Second avenue, about 1½ miles. Incorporators: Joseph A. Powers, president; J. Thomas Dennin, vice-president; A. R. Joy, secretary; Andrew L. Draper, treasurer; John Flynn, Daniel J. Halpin, Thomas O'Connor and C. A. Roemer, all of Troy; Henry A. Fitzsimmons of Waterford, and others.

Walsenburg & Western Railway.—Incorporated in Colorado to build an electric railway to connect various points in Huerfano, Costilla and Saguache counties. Capital stock, \$100,000. Incor-

porators: E. W. Griffith, L. E. Rowland, F. E. Guy, George C. Barnard and F. J. Jackson, all of Denver.

Waumandee Railroad.—Incorporated in Wisconsin to build a railroad from Waumandee to either Cochrane or Fountain City, Wis., about 12 miles. Capital stock, \$125,000. Incorporators: R. S. Cowie, J. M. Smythe, Whitehall; F. C. Richmond, Arcadia; B. L. Van Gordon, Taylor, and G. O. Linderman, Osseo.

TRACK AND ROADWAY.

Alabama City Gadsden & Attalla Railroad.—This company is reported to have ordered rails for 18 miles of extensions. J. D. Gaboury, general manager, Gadsden, Ala.

Alfarata Electric Street Railway, Alexandria Pa.—This company, which was incorporated last December to build an electric railway from Alexandria to Tyrone Forge, Pa., has elected the following officers: John Phillips, president; Henry Knede, vice-president; Samuel Spyker, secretary; W. G. Kanaga, treasurer.

Algiers (La.) Railway & Lighting Company.—It is reported that 14 carloads of T-rails have been delivered for the construction of the line from Algiers to Gretna, La. The girder rails for the city lines are being shipped. The ties and poles, which have been treated by the American Creosote Works at Southport, La., are on the ground, and it is expected that the line will be completed by June 1. R. S. Stearnes, 222 Elmira avenue, New Orleans, general manager.

Atlanta Macon & Griffin Electric Railway.—This company has engaged Arthur Geister, 29 Broadway, New York, to investigate the subject of water power to furnish electricity for the operation of the railway which will connect the towns named in the title. It is stated that work on the construction will begin about April 1. W. J. Kincaid of Atlanta is president.

Alton Jacksonville & Peoria Railway.—Work on this line from Alton to Peoria via Jacksonville, Ill., has been in progress for some time and track is now being laid north from Alton. It is the intention to complete the line to Jacksonville this year; beyond that point the route has not yet been located. Eighty-five pound rails are being used, with the intention of handling freight. A. O. Outten of Jerseyville, Ill., president; Robert Curdie of Alton, secretary.

Batavia Medina & Ontario Railway.—The Orleans Construction Company of Buffalo, N. Y., has a contract for building a single-track railway from Olcott to Batavia, N. Y., via Somerset, Lyndonville and Medina.

Beaumont (Tex.) Traction Company.—It is expected that the construction of the extension of the Park street line to the Joachimi addition, about 2 miles, will be completed in about three weeks. The track is all laid.

Beloit Traction Company.—The first carload of rails and special work has arrived for the 6-mile city system this company is to build this spring at Beloit, Wis. It is expected to have the road in operation by July 1.

Biltmore, N. C.—A corps of surveyors is now engaged in making a preliminary survey for an electric line to run from Biltmore to Montreal, N. C., 18 miles, connecting at Biltmore with a line from Asheville. It is stated that financial arrangements have been made and that construction will begin at once.

Boston, Mass.—Bids will be received by the Boston Transit Commission until April 4 for constructing section 6 of the Washington street tunnel.

Brighton & Newcastle Railway.—This company is now surveying the route for an electric line from New Brighton to Newcastle, Pa., with a branch to Ellwood City and Wampum.

Bruce & Farish Interurban Railroad.—This company has been organized in Los Angeles, Cal., to build an electric railway through the fruit section and will be ready to let contracts some time during May or June. The officers are: Wainwright Mollisai, president; Frank Ferriss, vice-president, and F. L. See, secretary. The capital stock is \$700,000. Surveys are now being made, although the route has not yet been announced.

Brunswick & Middletown Electric Railway.—This company, recently incorporated at Brunswick, Md., to build an electric line from Brunswick to Middletown via Petersville, now has a corps of engineers making a preliminary survey of the road. William Schnauffer of Brunswick is one of the incorporators.

Calgary, Alta.—It is reported that the city council has decided to build a municipal street railway 12 miles long with an equipment of 12 cars. W. L. Thorold, city engineer.

Canadian Pacific Railway.—It is reported that this company has become interested in the West Kootenay Power & Light Company of Roslyn, B. C., and will utilize the power thus developed in the electrification of several of its mountain divisions.

Canton & Youngstown Railway.—This company has let a contract to the Collins Construction Company of Chicago for the construction and equipment of an electric single-track line, connecting the cities of Canton and Youngstown, O., with a spur from a point north of Congress Lake to the city of Akron, in all about 65 miles of track. The road has three terminals with a population of 50,000 and upward, each. The average population served, per mile, including terminals, is over 3,200, and the road opens up between Akron and Youngstown a new country not now having trolley facilities. A large part of the bond issue has been provided for. Herman C. Raff, 63-65 Wall street, New York, is interested.

Chattanooga Railways.—It is stated that this company will build an electric railway line up Lookout mountain. Surveys have been made. D. J. Duncan, Chattanooga, Tenn., general manager.

Chester (Pa.) Traction Company.—By a decision of the Pennsylvania Supreme Court this company must depress its tracks on the Chester and Darby pike for a distance of about 6 miles out of Chester, to the level of the highway.

Chicago Lake Shore & South Bend Railway.—President J. B. Hanna, South Bend, Ind., has announced the plans for terminal arrangements at Kensington, Ill., where connection is to be made with the Illinois Central Railroad, running into Chicago. Both roads will build terminal stations at Kensington, connected by a subway, and through tickets will be sold. The road is now under active construction from South Bend, Ind., and 15 miles of track-laying has been completed.

Chicago South Bend & Northern Indiana Railway.—It is reported that this company is making arrangements to operate a joint through limited cars from South Bend to Warsaw, Ind., by way of the Winona Interurban Railway. This will require a change in a curve near Goshen.

Cincinnati Bluffton & Chicago Traction Company.—This company is now surveying a line through Wayne county, Indiana, which will run from Bluffton to Portland, Winchester and Richmond, Ind.

Cincinnati Northern Traction Company.—This company is now making preparations for building a new line over a private right of way from Middletown to Hamilton, O., which will be 1½ miles shorter than the present line. Surveys have been made and work is to begin within 10 days. The J. C. Carland Construction Company of Toledo has the contract and agrees to have the work completed by December. The grading involves about 200,000 cubic yards of excavation and filling. The only town to be left out in the change of route is Engleside. C. A. Alderman, chief engineer, Hamilton, O.

Columbus & Lake Michigan Railroad.—Engineers in the employ of the Schoepf syndicate are engaged in making surveys for the entrance of the road into Defiance, O., preparatory to electrifying the road this summer. Much of the track is to be relaid and the roadbed is to be improved.

Consolidated Railway Company, Harford, Conn.—This company is said to be contemplating the construction of an electric road from Dayville through Allawaugan and Ballouville to Pineville, Conn.

Dallas Consolidated Electric Street Railway.—Work is now in progress on the Colonial avenue extension of the Ervay street line and the first two blocks of track have been laid and several curves installed.

Davenport, Ia.—J. E. Voorhies and J. T. Lannigan of Monticello, Rev. M. S. Murphy of Castle Grove, L. Matthews of Manchester, T. B. Miller of Stanwood, A. C. Cole of Olin and George Escher of Tipton, are interested in a proposed line from Davenport to Manchester, Ia., and have secured a right of way from Davenport to Lime City, 25 miles, and a committee of the Davenport Commercial Club has been appointed to take steps toward the formation of a company.

Eastern Pennsylvania Railways Company.—It is announced that this company will soon begin the construction of several extensions, including lines from Minersville to Branchdale and Tamaqua, and possibly to Tremont and Tower City; also from St. Clair to Frackville. Many of the lines running out of Pottsville are to be rebuilt and improved. W. E. Harrington, general manager, Pottsville, Pa.

Evansville Henderson & Uniontown Traction Company.—This company proposes to build an electric railway about 25 miles long through Henderson and Uniontown, Ky., and Evansville, Ind. T. Bethell of Henderson, Ky., is the promoter.

Galion Mt. Gilead & Delaware Railway.—It is reported that this company is meeting with success in securing the right of way for its proposed line from Galion to Delaware, O.

Girard Electric Coal Belt Railway.—A company has been organized at Pittsburg, Kan., with the above title to build an electric railway from Girard east to Mulberry, Kan., through a coal mining territory. President, James McFarland; vice-president, J. A. Wayland; secretary, L. H. Phillips; treasurer, Howard C. Leonard.

Goldfield, Nevada.—It is reported that Los Angeles capitalists, including A. Benham of the Los Angeles & Santa Monica Electric Railroad, are contemplating the construction of an electric road from Goldfield to Tonopah.

Greenfield, Mass.—The construction of an electric railway from Greenfield to Northfield, Mass., is now under consideration by the citizens of this town. The road will be 13 miles in length, and the cost is estimated at \$300,000. C. H. Webster and F. W. Williams of Northfield are interested.

Illinois Traction Company.—Bids are to be opened this week for the grading on the Springfield-Jacksonville line, amounting to about 300,000 cubic yards. The contract will call for finishing the grading by August 1. Surveys have been completed and practically all of the right of way has been secured. It is expected to have the line completed in October.

Indiana & Ohio Traction Company.—It is reported that about \$85,000 has been subscribed of the \$100,000 capital stock of this company, which proposes to build a line from Richmond, Ind., to Hamilton, O., and to secure entrance to Cincinnati over the tracks

of the Cincinnati Northern Traction Company. A. C. Lindemuth of Richmond, Ind., is interested.

Indiana Columbus & Eastern Traction Company.—After a conference with the city authorities of Richmond, Ind., Hugh McGowan of Indianapolis, announced that the company would build a new line through the wholesale district for freight service and that the company would also apply for a franchise for the Dayton & Western division, which has been operating without one.

Indianapolis Crawfordsville & Western Traction Company.—It was announced at a meeting of the directors on March 6 that work on the road is progressing rapidly and that the track will be ready for the operation of cars between Indianapolis and Crawfordsville by June 1, the date that was set some time ago for the opening of the line. The Electrical Installation Company of Chicago are the engineers and contractors.

Indianapolis Huntington Columbia City & Northwestern Railway.—J. E. Sweatt of Russellville, Ky., superintendent of construction, writes that this line is now in construction from Huntington to Goshen, Ind., 66 miles; that it is expected to extend the line ultimately to Indianapolis. Track has been laid this year from Syracuse to Vawter Park, 4½ miles. The line has been surveyed from Huntington to Goshen, 60 miles, and grading has been completed from Vawter Park to Benton, 10½ miles. M. V. Ryan of Utica, N. Y., is the contractor; Thomas A. Bell, St. Louis, Mo., president; D. L. Horner, Upland, Ind., chief engineer. The headquarters of the company are at Syracuse, Ind.

International Railway, Buffalo, N. Y.—President H. J. Pierce in his annual report states that this company proposes to build during the present year an extension through Elmwood avenue and Chippewa, Franklin, Mirgan, Genesee, Pearl and Seneca streets, Buffalo; also a 1-mile extension in Niagara Falls to Riverdale cemetery; an extension of a double-track line for a mile through East avenue, Lockport; an extension of about ½ mile on Delevan avenue, Buffalo.

Inter-Urban Railway, Des Moines, Ia.—We are officially advised by Frank S. Cummins, chief engineer, that this company is not planning any extensions this year which will require the use of any new material, or any contract work.

Iowa City, Ia.—The permanent right of way survey for the Davenport-Iowa City interurban has been completed. The surveyors have been working inside the city limits of Iowa City. They state that the line of the road is almost ideal for easy construction work.

Johnstown, Pa.—The Westinghouse Electric & Manufacturing Company is reported to be preparing specifications and estimates for the complete electrical construction and equipment of an electric railway from Johnstown to Westmont, Pa. Surveys are now in progress.

Kentucky Central Traction Company.—The survey for the line between West Point and Elizabethtown, Ky., was completed last week and nearly all of the right of way has been secured. It is stated that the line will be built this year and extended later to Lincoln Park and Bowling Green. G. J. Lampton, of Louisville is one of the promoters.

Lima & Toledo Traction Company.—C. F. Heidley of Leipsic has secured the right of way for the extension from Leipsic to Toledo as far as Waterville and is now at work between that point and Toledo. It is reported that the Schoepf syndicate is negotiating with the Wabash Railroad Company for the purchase of a part of that company's abandoned crosstown right of way into Toledo, which would give the Lima & Toledo an independent entrance to the city.

Little Rock & Hot Springs Electric Railway.—Financial arrangements are being made for building this line from Hot Springs to Little Rock, Ark., and it is stated that New York men have agreed to take three-fourths of the stock if the remainder can be subscribed locally.

Mansfield & Wooster Electric Railway.—It is reported that financial arrangements are being made for this line which is proposed to connect Mansfield and Wooster, O., 41 miles. Surveys have not yet been made, but a part of the right of way has been secured. Samuel L. Kinsey of Pittsburg, president.

Mt. Hood Railway & Power Company.—This company, which is backed by E. P. Clark and others of Los Angeles, Cal., has surveyed several alternate lines from Portland to Mt. Hood, Ore., and men are now engaged in securing right of way. The success of their efforts will determine the route chosen to a great extent. Plans are being prepared for a \$1,000,000 power plant on the Sandy river. Eighty-pound rails will be laid. F. C. Finkle, Los Angeles, consulting engineer.

Monterey Fresno & Eastern Railway.—It is reported that this company has let a contract for the grading of the entire line from Monterey to Fresno, Cal., 140 miles. Grading is to begin April 1 and be rushed to completion. An order for 13,500 tons of steel rails has been placed with the Lackawanna Steel Company, Buffalo, N. Y. The company will also operate a steamship line between Monterey and San Francisco.

New York Northern Railroad.—This company has been organized with headquarters at Watertown, N. Y., to build an electric railroad from Watertown to Oswego, 56 miles, through Houndsfield, Adams, Henderson, Ellisburg, Sandy Creek, Richland, Mexico, New Haven and Scriba. It is also proposed to extend the line later from Watertown to Carthage and possibly north to the St.

Lawrence river. The territory proposed to be served is at present without railroad facilities. Foster P. Rhines, president, Frank Barry secretary, Watertown.

Northern Traction Company.—Two miles have been graded, between Hibbing and Chisholm, Minn., on this line, which is to run from Hibbing to Biwabik, Minn., connecting the towns of the Mesaba range.

Okanogan Electric Railway.—Reports from Riverside, Wash., are that the electric road, projected by A. M. Dewey of Spokane, which was to be built from Nighthawk to Brewster, Wash., has changed its route and is being surveyed from Nighthawk via Loomis, Fish lake, Johnson Creek valley, across the government's Okanogan irrigation project to the new town of Omak, on the Okanogan river, across the latter, through Omak pass on the south half of the Colville reserve to the mouth of the Spokane river, and thence on to a terminus in Spokane.

Philadelphia & Garrettford Street Railway.—This company, which operates cars from Sixty-third and Market streets, Philadelphia, to Clifton Heights, has decided to continue its line to Collingdale. A loop will be made at Collingdale, and the cars will return again to Sixty-third street and also connect with the elevated line at Sixty-ninth street. Work on this extension will be commenced shortly.

Pittsburg & Butler Street Railway.—The line from Butler to Mars, Pa., is now ready for operation and between Mars and Pittsburg the work is being completed so rapidly that it is expected to have the line in operation by about May 1.

Rochester Railway.—It is reported that the engineering department has in preparation plans for the construction of about 20 miles of additional track in different sections of Rochester, N. Y.

Sacramento Electric Gas & Railway Company.—C. W. McKillip, assistant manager, Sacramento, Cal., writes that this company has recently completed an extension of the Highland Park line from Twenty-fourth and Bonita avenue to Oak Park, via Curtiss Oaks, 6,400 feet. Sixty-pound T-rail is used, laid on 6 by 8 inch by 8-foot ties on a foundation of 6 inches of rock covered with earth.

San Antonio (Tex.) Traction Company.—General Manager W. B. Tuttle has announced that a 2-mile extension is to be built to the North Flores street line, taking in Beacon Hill, Treasure Hill and other suburbs in the northern part of the city. The rails have been ordered. The company is now awaiting rails for the double-tracking of the Hot Wells line, the extension of the San Pedro line and other smaller extensions.

Somerset Water Light & Traction Company.—This company has recently completed and put in operation a new line from Somerset to Ferguson, Ky., a new town just south of the city. W. G. Hunter of Somerset, president.

Southern Light & Traction Company, Natchez, Miss.—W. B. Moorman, superintendent, writes that this company proposes to build an extension from Natchez to the National Cemetery, $\frac{3}{4}$ of a mile.

Southeastern Traction Company.—Surveyors are at work east of Cambridge, O., locating the line which this company proposes to build between Wheeling, W. Va., and Zanesville, O.

Texas Traction Company.—An order has been placed with the Carnegie Steel Company for the 80-pound steel rails for the line from Dallas to Sherman, Tex., 64 miles, delivery to begin this summer. The company has four grading outfits at work between Sherman and McKinney, and now that the engineers have completed the work of locating the line south of McKinney, grading forces will this week be put to work between that point and Dallas, and the grading pushed to completion by the time the rails begin to arrive. J. F. Strickland of Dallas is president; F. A. Jones, Dallas, chief engineer.

The City Traction Company, Grafton, W. Va.—This company has been organized with John T. McGraw of Grafton, president, to build a street railway $2\frac{1}{2}$ miles long.

Toledo & Chicago Interurban Railway.—Orders have been placed for the rails and ties to be used on the extension from Auburn to Waterloo, Ind., and as soon as the material is on the ground it is expected to begin construction. Surveys are being made from Waterloo west to Kendallville, paralleling the Lake Shore & Michigan Southern Railway. It is planned to build a spur from Brimfield to Albion and Rome City. F. B. Perkins, general manager, Kendallville, Ind.

Toledo Fostoria & Findlay Railway.—This company, which now has a line in operation from Findlay through Fostoria to Ploverville, O., is now planning to build on to Toledo this spring, a distance of 17 miles. It is expected to enter the city over the Lake Shore Electric Railway tracks, probably from Cronillard's Corners. The company has advertised for bids for ties and is planning to push the work. J. E. Reeves of Canal Dover, O., is president.

Tulsa Street Railway.—Tracklaying on the street railway in Tulsa, I. T., has been commenced. It is the intention to have two miles completed and in operation by May 1. C. H. Bosler, president.

United Railways & Electric Company, Baltimore, Md.—It is reported that this company will erect a power house near Bay Shore Park to cost about \$100,000, and two substations, one on West Lombard street and the other on Hartford avenue. C. O. Vandevanter, chief engineer.

Utah Light & Railway Company.—It is reported that this company is preparing plans for the construction of a substation in Salt Lake City. O. A. Hannonid, electrical engineer.

Walla Walla Valley Traction Company.—I. W. Anderson, president of the Northwestern Gas & Electric Company, which has acquired the property, states that the work of erecting poles and wires and laying the track is progressing rapidly and that cars should be operated over the line from Walla Walla to Milton and Freewater, Wash., in 60 days.

Washington Baltimore & Annapolis Electric Railway.—Every effort is being made to have this line completed between Baltimore and Washington by July 1. The main line between Baltimore and Washington, about 40 miles, will be double-tracked the entire distance and 80-pound rails will be used. The Annapolis Washington & Baltimore steam road, which extends from the main line at Odenton, Md., to Annapolis, 14 miles, is being electrified and the 56-pound rails are being replaced with 80-pound steel. Most of the grading has been completed and rapid progress is being made on the five bridges. There will be no grade crossings on the line and few curves. Construction crews have been at work night and day for about two months on the grading in several deep cuts and on the concrete subways under railroad crossings. The Baltimore terminus is at Park avenue, Marion and Liberty streets, where a large terminal station is being erected. Power will be received from the Potomac Electric Power Company of Washington. The Roberts & Abbott Company of Cleveland has the general contract for building the road. The offices are at 801 Maryland Trust building, Baltimore.

Washington Water Power Company, Spokane, Wash.—The stockholders have recently voted to increase the capital stock from \$5,000,000 to \$10,000,000, and it is announced by Henry M. Richards, president, that the money is to be expended in betterments and extensions of the railway lines. The company operates 72.5 miles of road, 54.5 of which are in Spokane.

Winona Interurban Railway.—R. M. Murray, chief engineer, Winona Lake, Ind., writes that this company, which has a line in operation from Warsaw to Goshen, Ind., is now building from Warsaw south to Peru, 44 miles, via Mentone, Akron, Gilead and Chili. The track is laid and the overhead work completed from Peru north to Chili, 10 miles, and grading has been completed to Gilead, 7 miles from Chili. Grading is now in progress between Gilead and Warsaw. The overhead construction is of the bracket type. The power house at Winona Lake is completed and substations will be erected at Mentone, Gilead and Brownell. Allis-Chalmers-Bullock power equipment is used. Contracts are to be let for 34 miles of copper wire. The ties are being furnished by the Standard Tie Company, the rails by the Carnegie Steel Company, and the overhead material by the Electric Service Supplies Company. The roadbed is 16 and 22 feet; maximum gradient, 2 per cent, and maximum curvature outside of cities and towns, 3 degrees. The rails are 70-pound A. S. C. E. section. The bridges for the line are nearly completed. H. J. Heinz, Pittsburg, Pa., president.

POWER HOUSES AND SUBSTATIONS.

Boston Elevated Railway.—This company will have installed in its Lincoln wharf station, on Atlantic avenue, the largest direct-current engine-type generators ever constructed. These generators will have a capacity of 2,700 kilowatts at 600 volts, when operated at a speed of 75 revolutions per minute. These machines will have 32 poles and the armatures will have an open slot winding, with the armature coils securely held in place by wedges, which thus facilitate the replacing of coils should any become damaged and obviate the use of band wires. The brushes will be oscillated parallel to the shaft by the standard Allis-Chalmers oscillator, which prevents the wearing of ridges in the commutator face and keeps it always in perfect condition.

Gray's Harbor Railway & Light Company.—This company will spend about \$250,000 on improvements during the coming summer. A large power house will be constructed near Electric park, midway between Aberdeen and Hoquiam, Wash. It is stated that work on the new improvements will be begun at once. Jay D. Cray, Aberdeen, Wash., is general manager and purchasing agent.

Mount Hood Railway & Power Company.—This company has announced that it will begin work at once on two power houses which are to have a combined capacity of 80,000 horsepower. The first plant to be installed will have a capacity of 25,000 horsepower and the cost is estimated at \$1,000,000. The work of locating the site of the reservoir and flume-ways and preparing the power house site is now progressing. The point of diversion of the Sandy river to the power house reservoir will be one mile above Kyler's narrows, near Marmot. It is intended to finally build another plant of 30,000 horsepower, and increase the first plant from 25,000 to 50,000 horsepower. As soon as the plans for the first installment of 25,000 horsepower are completed the contracts for the machinery will be let. These power houses will furnish power and light, besides supplying the power for a railroad up Mt. Hood, which it is estimated will cost \$1,500,000 and will be completed in about two years. The project, it is said, has been successfully financed and is backed by E. P. Clark, Los Angeles, R. C. Gillis, Los Angeles, and A. P. Flening, Pasadena, Cal. Mr. F. C. Finkle is consulting engineer of the company.

Springfield Street Railway Company.—It is announced that this company will spend \$150,000 for improvements during the coming summer. About \$125,000 of this will be spent for a new feed wire for the Belmont avenue line and \$25,000 for the installation of a private telephone system. Some minor improvements will also be made to the power houses. The 2,000-kw. generator which was burned out a few days ago is being repaired and will soon be in service. H. C. Page, Springfield, is general manager.

Personal Mention

Mr. Alexander K. Cuthbert has been appointed express agent of the United Traction Company, Albany, N. Y., succeeding Mr. Charles H. Armatage.

Mr. Frank T. Edson, who has been acting as tax agent for the Ft. Wayne Van Wert & Lima Traction Company, has had his jurisdiction extended over all of the Scheopf lines.

Mr. Allen Jones has been appointed superintendent of the Monroe (La.) Street Railway, which is owned and operated by the municipality, succeeding Mr. B. L. Jakeway, resigned.

Mr. L. W. Harrington, who was recently appointed soliciting passenger and freight agent of the Columbus Delaware & Marion Railway at Columbus, O., has added to his duties those of claim adjuster.

Mr. A. J. J. Pfeiffer has been appointed general manager and chief engineer of the Calcutta Tramways Company, Limited, succeeding the late Mr. Martyn Wells. Mr. Pfeiffer was for a time connected with the Thomson-Houston Company and has had charge of the equipment of several important roads in Europe.

Mr. C. M. Thomas, formerly a public accountant at Cincinnati, O., has accepted a position with the accounting department of the Indiana Columbus & Eastern Traction Company at Cincinnati. Mr. Thomas was auditor of the Muncie & Portland Traction Company at Portland, Ind., while that line was under construction. He was also at one time traveling auditor for the Chicago Cincinnati & Louisville Railway Company.

The directors and executive officers of the Public Service Corporation of New Jersey invited some of the friends of Mr. A. H. Stanley, the retiring general manager of the street railway department of that corporation, to a farewell dinner in his honor at the Waldorf-Astoria, New York, on Friday evening, March 23. Mr. Stanley leaves for London about April 1 to become general manager of the United Underground Electric Railways Company.

Mr. Charles H. Armatage has been appointed traffic manager of the United Traction Company and its subsidiary companies, with headquarters at Albany, N. Y.; effective on March 14. The duties of traffic manager heretofore have been combined with those of the operating department, but on account of the expansion of its passenger and freight business the company has deemed it advisable to separate the two departments. Mr. Armatage is well known in the local street railway circles of Albany, having been identified with the railway systems there for several years, and for the past six months has served as superintendent of the express department of the United Traction Company.

Mr. A. V. Schroeder has resigned as division superintendent of the Illinois Traction System at Decatur, Ill., to become general manager of the La Crosse Water & Power Company, with headquarters at La Crosse, Wis. This company, which is a holding corporation for several subsidiary companies, is now building a 30-mile interurban line between La Crosse, Wis., and Winona, Minn., which, when completed, will form part of an extensive interurban system that is to be developed in the two states. It also is building a large dam across the Black river in Wisconsin, which will furnish power for its lines and for commercial purposes. For some time prior to his present appointment Mr. Schroeder was superintendent of the Springfield (Ill.) Light Heat & Power Company, resigning about a year ago to accept the position of superintendent of the McKinley properties at Decatur. He will assume his new duties on April 1.

Obituary.

John C. Reilly, well known as a pioneer street railway and business man of Pittsburg, died of heart trouble at the Kirkwood hotel, Camden, S. C., where he recently had gone for his health, aged 63 years. Mr. Reilly was born in Pittsburg on February 20, 1844, and received his education in the parochial schools of that city. He entered the employ of the Pennsylvania Railroad Company when a young man, where he remained for eight years. He later became identified with the livery firm of Burns & Reilly and while engaged in that business established a line of omnibuses from which has been developed the present street railway system of Pittsburg. Mr. Reilly, associated with Thomas S. Bigelow and James D. Callery, built the first street car lines in that city, and when they later were taken over by the Pittsburg Railways Company, he became a director in the former company, which position he held at the time of his death. He also was president of the Washington National Bank, which he organized, a director in the City Insurance Company, and member of several clubs.

The General Electric Company, Schenectady, N. Y., has just purchased 700 acres of land for a factory site east of the city of Erie, Pa., and extending from the Lake Shore Railroad to the lake front. As soon as the weather permits the work of erecting the buildings will be started. Approximately 400 acres of the land will be set aside for residential sites for the employees. It is the intention of the company to inaugurate and carry out a systematic and consistent plan, which will result in the building of comfortable and attractive homes on this portion of the property. The company does not intend to abandon any of its present plants or to divert to Erie any considerable portion of the work now being done by the other factories, but the rapid growth of the business and the demand for increased output requires additional manufacturing facilities.

Financial News

Atlantic City (N. J.) & Suburban Traction Company.—Holders of the securities of this road have been notified that an assessment of about \$20,000 is necessary and that the bond interest must be met in script instead of cash.

Chattanooga Railways Company.—Directors have been elected as follows: Howard S. Graham, John Graham, C. P. King, L. H. Parsons, S. W. Foulkes, F. H. Treat, of Philadelphia, and Frank Spurlock of Chattanooga. The following officers have been re-elected: John Graham, Philadelphia, president; C. P. King, Philadelphia, vice-president; W. H. Lawton, Philadelphia, secretary and treasurer; and D. J. Duncan, general manager.

Cedar Rapids (Ia.) & Marion City Railway.—The capital stock will be increased from \$400,000 to \$450,000.

Columbus (O.) Railway & Light Co.—This company has leased from the Columbus Traction Company all the property of the Central Market Street Railway Company including track, rolling stock, stations, substations, all machinery, etc., also all franchises, rights of way, etc., and all property that may be acquired during term of this lease, 50 years, renewable for 50 additional years, and for 50 additional years from January 1, 1907; the lessees agree to pay the interest upon \$500,000 of 5 per cent 20 year first mortgage bonds to the Continental Trust Company, trustee, and a sum sufficient each year to pay the dividends at the rate of 5 per cent upon \$250,000 preferred capital stock of the lessor company, and to pay dividends upon \$500,000 common stock as follows: 1 per cent on January 1 and July 1, respectively, in 1908, and on January 1, 1909, 1½ per cent on July 1, and January 1, 1910, 2 per cent on July 1, 1910, and January 1, 1911, 1¼ per cent on April 1, July 1, and October 1, 1911, and quarterly thereafter on January 1, April 1, July 1, and October 1, of each year and to pay such dividends respectively on 5 days before they become due, first installment being payable December 26, 1907, and the lessee shall pay to the Continental Trust Company, trustee, a sum equal to 5 per cent of the gross earnings of the railway to create a sinking fund to secure the payment of the said \$500,000 bonds.

Columbus Urbana & Western Traction Company, Columbus, O.—It is reported that control of this company will be sold to the Columbus Magnetic Springs & Northern Railway Company of Delaware, O.

International Traction Company, Buffalo.—William Salomon & Co. of New York, offer for sale \$570,000 of an authorized issue of \$600,000 of 4½ per cent car trust certificates dated June 15, 1906, and maturing \$30,000 semi-annually on June and December 15, until June 15, 1916, inclusive, at prices yielding 5½ per cent interest. The bonds are secured by equipment valued at \$825,000.

Lincoln (Ill.) Street Railway.—Control of this company has been purchased by F. H. Schott of Chicago, who will form a new corporation, the Lincoln Railway & Light Company, with \$150,000 capital stock.

Rockland South Thomaston & Owl's Head Street Railway, Rockland, Me.—The property and franchises of this company were sold at receiver's sale on March 8 to Moses Well & Sons of Philadelphia for \$13,925.

San Bernardino Valley Traction Company, San Bernardino, Cal.—At the annual meeting of stockholders on March 12 the following directors were re-elected: A. C. Denman, Jr., E. D. Roberts, George M. Cooley, W. DuB. Brookings, J. S. Wood, Henry Fisher, J. H. Fisher, E. S. Graham and O. D. Collins. A. C. Denman, Jr., has been elected president; George M. Cooley, vice-president; J. S. Woods, secretary, and E. D. Roberts, treasurer.

Springfield (Ill.) Consolidated Railway.—The following directors were re-elected on March 16: H. D. Walbridge of New York city; C. M. Clark of Philadelphia; William Jarvis of Louisville, Ky.; Bluford Wilson, E. W. Payne, P. B. Warren, Emil G. Schmidt, William H. Brown and Charles Ridgely of Springfield. Officers were elected as follows: President, H. D. Walbridge; first vice-president, Bluford Wilson; second vice-president and general manager, Emil G. Schmidt; secretary and treasurer, William H. Brown; assistant secretary and assistant treasurer, George E. Hardy.

Springfield (Mass.) Street Railway.—An issue of \$300,000 additional stock to liquidate outstanding debt and to provide for improvements has been authorized by the Massachusetts board of railroad commissioners. The new stock is to be sold at \$170 per share.

Washington Water Power Company, Spokane, Wash.—The stockholders have voted to increase the capital stock from \$5,000,000 to \$10,000,000, and it is announced by Henry M. Richards, the president, that the money will be expended in betterment of the electric railway system and the extension of several lines. The directors were re-elected as follows: William A. White, George H. Southard and Frank Lyman of New York; H. M. Richards, D. L. Huntington, J. D. Sherwood, Thomas G. Thomson, J. P. M. Richards, A. B. Campbell, J. N. Glover and Huber Rasher of Spokane. The officers of the company re-elected for the year are: President, Henry M. Richards; first vice-president, A. B. Campbell; second vice-president and general manager, D. L. Huntington; treasurer, H. E. Perks; secretary, H. L. Bleeker. The corporation has 72.5 miles of railroad, 54.5 miles of which are in Spokane. Its power transmission lines reach 225 miles, the longest being to the Coeur d'Alene Mining camps, 110 miles.

Manufactures and Supplies

ROLLING STOCK.

Topeka Railway, Topeka, Kan., is figuring on the purchase of eight new cars.

International Railway, Buffalo, N. Y., expects to purchase during the present year 50 additional cars.

North Shore Electric Railway, San Francisco, Cal., is reported in the market for 20 high-speed interurban cars.

Mississippi Valley Electric Railway, Nauvoo, Ill., now under construction, is in the market for new equipment.

Union Traction Company of Kansas, Independence, Kan., has ordered two cars from the American Car Company.

Rockford & Interurban Railway, Rockford, Ill., is building in its shops at Rockford four express cars for interurban use.

Marion Bluffton & Eastern Traction Company, Bluffton, Ind., is in the market for a large city or a small interurban car for immediate delivery.

Southern Kansas Railway, Light & Power Company, Cherryville, Kan., is reported in the market for new equipment. R. C. Rollings is president of the road.

Cedar Rapids & Marion City Railway, Cedar Rapids, Ia., is building four 30-foot, 8-bench, open cars at its own shops. The car floors have already been laid and the work of assembling the bodies is being rushed.

Memphis Street Railway, as reported in the Electric Railway Review of March 16, has placed an order with the American Car & Foundry Company for 25 high-speed semi-convertible cars for September delivery.

Pittsburg McKeesport & Greensburg Railway, Greensburg, Pa., has ordered four double truck cars from the St. Louis Car Company. The length of the car bodies will be 34 feet and will be 46 feet 2 inches long over bumpers. They will have a seating capacity of 52 people and are for interurban service.

Columbus Railway & Light Company, Columbus, O., has purchased from the G. C. Kuhlman Car Company 10 double-truck cars. These will be 28 feet in length inside, 42 feet long over all, equipped with longitudinal seats and General Electric air brakes. These cars are for delivery by June 1.

San Francisco Vallejo & Napa Valley, Napa, Cal., as reported in the Electric Railway Review of February 9, has placed an order with the Niles Car & Manufacturing Company for eight new cars of the Pullman type, two of which will be combination smoking and baggage cars. The cars will be 56 feet long, 9 feet wide over sheathing and will have a seating capacity of 64 passengers. The interior of the car bodies will be finished in mahogany. They will be equipped with Baldwin trucks and the entire electrical equipment will be supplied by the Westinghouse Electric & Manufacturing Company, including a quadruple equipment of No. 132A motors (100 horsepower), air brakes and Gould automatic couplers.

Meridian Light & Railway, Meridian, Miss., as reported in the Electric Railway Review of March 16, has placed an order with the Southern Car Company of High Point, N. C., for five semi-convertible cars for May and June delivery. The specifications and special equipment will be as follows:

Length—	Weight	18,000 lb.
Body.....20 ft. 8 in.	Wheel base.....	7 ft. 6 in.
Over vestibule.....	Body	Wood
Width—	Curtain fixtures	Acme
Inside.....7 ft. 5 in.	Curtain material.....	Pantasote
Over all.....8 ft. 2 in.	Trucks	Brill 27-E
Seating capacity.....		
		32 persons

Niagara Gorge is having two Brill semi-convertible cars built at the Collinwood shops of the J. G. Brill Company, the order for which was placed the latter part of 1906. The cars are for delivery in May, and will have a seating capacity of 44 persons. The specifications and special equipment will be as follows:

Wheel base.....	4 ft. 6 in.	Width, inside.....	7 ft. 11½ in.
Length of body.....	30 ft. 8 in.	Over all.....	8 ft. 2 in.
Over vestibule.....	35 ft. 4½ in.	Body and underframe....	Wood
Over all.....	40 ft. 1 in.		

Special Equipment.

Brooklyn Rapid Transit Company, Brooklyn, N. Y., as reported in the Electric Railway Review of March 16, has placed an order with The J. G. Brill Company for 100 passenger cars of the semi-convertible type for surface use, to be built at Elizabeth, N. J.; also 100 semi-convertible cars for elevated service, 50 of which will be built at Laconia, N. H., by the Laconia Car Company, and 50 at Newark, O., by the Jewett Car Company for delivery during

October, November and December. The specifications call for the following details:

100 Surface Cars.			
Seating capacity.....	38 people	Width, inside	7 ft. ½ in.
Weight	33,000 lb.	Over all	8 ft. ½ in.
Wheel base	19 ft. 5¾ in.	Height, inside	8 ft. ¾ in.
Length of body.....	28 ft.	Track to trolley base.....	
Over vestibule	37 ft. 2 in.	8 ft. 11¾ in.
Over all	38 ft. 3¾ in.	Body and underframe....	Wood

SHOPS AND BUILDINGS.

Chicago City Railway.—This company is building a car storage house at Thirty-eighth street and Cottage Grove avenue, which will be 235 by 368 feet in area. The William Crilly Company has the contract.

Cincinnati Traction Company.—This company has recently purchased the property and is now preparing plans for the construction of an addition to the present car barns on Vine street.

Columbus Delaware & Marion Railway.—This company has taken an option on property on Gay street, Columbus, O., on which to erect a freight station.

East St. Louis & Suburban Railway, East St. Louis, Ill.—It is reported that this company will erect a 1-story car shop at Granite City, Ill., to be of brick and reinforced concrete construction, composition roof, iron and steel work, skylights, etc., at an estimated cost of \$50,000.

Georgia Railway & Electric Company.—This company has secured the first floor of the new Atlanta Birmingham & Atlantic office building on Walton and Fairlie streets, Atlanta, to be used as a freight and passenger terminal station for the suburban and interurban lines.

Grand Rapids Railway.—This company is negotiating for the purchase of property on the West Side, in Grand Rapids, Mich., on which to erect a \$75,000 car house. It is stated that work will be started as soon as the property is secured.

Illinois Traction Company.—A contract has been let for the construction of a car storage house at Decatur, Ill. Other contracts are to be let within a few days for a storehouse of brick and concrete construction 150 by 200 feet in area, and a general repair shop of brick and steel construction 250 by 350 feet in area. This building will contain an armature room and a machine shop and will be provided with 12 tracks. To the rear of the repair shop will be a blacksmith shop 50 feet square. An oil storage house and several smaller buildings will also be erected on the same site, which was purchased some time ago. L. E. Fisher, general manager, Decatur, Ill.

International Railway.—This company will build this year a new car house on Broadway, Buffalo, at a cost of \$225,000, also a car house on Hertel avenue, Buffalo, at a cost of \$130,000.

Lehigh Valley Transit Company.—This company has let a contract for a new office building and carpenter shop at Allentown, Pa. The building will be of cement block and about 100 feet

square. The section devoted to office purposes will be three stories high. The company's new car house on Madison street will be ready in a few days.

Mississippi Valley Electric Railway, Nauvoo, Ill.—This company, which was recently incorporated to build a line from Keokuk and Ft. Madison, Ia., to Nauvoo, Ill., is in the market for equipment and supplies.

New Bedford & Onset Street Railway.—The Massachusetts railroad commission has granted this company a permit for a spur track in Marion, Mass., that will enable it to build its proposed freight and express station in a central part of the village.

Newcastle & New Wilmington Street Railway.—This company has secured a site for a terminal station at Newcastle, Pa.

Pacific Electric Railway, Los Angeles, Cal.—This company is building a carpenter and paint shop at Sherman, Cal.; also a passenger and freight station at Beverly.

Toronto & York Radial Railway.—This company has purchased a block of land on Yonge street, Toronto, Ont., on which to erect a large passenger and express station to handle the large traffic which is expected when the new line to Lake Simcoe is opened in a few weeks.

TRADE NOTES.

Armin Schotte has recently accepted a position with W. S. Barstow & Co., of New York and Portland, Ore.

Allis-Chalmers Company, Milwaukee, Wis., has opened a branch office at 316 Godchaux building, New Orleans, La.

F. P. Boas has been appointed superintendent of field work of the Eureka Automatic Signal Company, Lamaqua, Pa.

General Electric Company, Schenectady, N. Y., has declared a quarterly dividend of \$2 a share on the stock, payable April 15.

E. M. McIlvain, formerly president of the Bethlehem Steel Company, has been elected president and general manager of the Robins Conveying Belt Company, Park Row building, New York.

Emil Callman & Co., manufacturers of insulating varnishes and compounds, formerly located at 299 Pearl street, have removed to larger and more convenient quarters at 100 Washington street, New York.

Ralph W. Bacon, formerly superintendent of the structural department of the Bethlehem Steel Company, has resigned to accept the position of general superintendent of the Robins Conveying Belt Company of New York.

C. W. Lytle, superintendent of the Pittsburg plant of the American Steel Foundries, has been appointed district manager to succeed Harry Wright, who was recently elected president of the Ohio Steel Foundry Company, at Lima, O.

Pressed Steel Car Company has removed its western office from the Fisher building to the fourteenth floor of the Old Colony building, Chicago, where J. H. Mitchell, manager of sales of the western district, will make his headquarters in the future.

George K. Preston, secretary to A. C. Dinkey, president of the Carnegie Steel Company, Pittsburg, has been appointed assistant to the first vice-president of the company to succeed Homer J. Lindsay, whose death was recently reported in these columns.

Meredith Construction Company, Terre Haute, Ind., has been incorporated with an authorized capital of \$20,000 to build steel bridges, viaducts, subways, steel structures, etc. The directors of the company are Fred C. Meredith, Lawrence M. Stoff and Paul J. Meredith.

W. J. Dolan, who was formerly connected with the Remington Typewriter Company, and later with L. P. Smith Brothers of Syracuse, N. Y., has accepted a position in the sales department of the Dayton Pneumatic Tool Company, with headquarters in Pittsburg, Pa.

Allis-Chalmers Company, Milwaukee, has closed a contract with the New York New Haven & Hartford Railroad for all the air-brake equipments required on the electric cars controlled by this road. This contract covers electric railways in thirty cities and includes about 4,000 cars.

W. S. Morehouse, formerly with the A. S. Cameron Steam Pump Works, New York, has accepted the position of manager of works with the Green Fuel Economizer Company, Matteawan, N. Y. Mr. Morehouse is a graduate of the Worcester Polytechnic Institute, is a member of the American Society of Mechanical Engineers and of the American Foundrymen's Association.

J. G. White & Co., New York, have increased their capital stock from \$3,000,000 to \$5,000,000 to provide working capital to handle properly a largely increased business. At the present time the company has \$20,470,000 of contracts on its books, none of which has been completed. The regular quarterly dividend of 1½ per cent on the preferred stock has been declared, payable April 1.

Yale & Towne Manufacturing Company, 9 Murray street, New York, has recently awarded contracts for building extensions to its press shop and cabinet lock department at Stamford, Conn. The press shop extension will be one story high, approximately 80 by 150 feet, resting on 40-foot piles, with brick walls and timber roof with sawtooth skylights. The floor will be of reinforced concrete designed for a live load of 250 pounds. The cabinet lock department extension will be one story high 42 by 80 feet of wood con-

struction, with gravel roof and concrete foundation and retaining wall.

Narragansett Machine Company, Providence, R. I., is extending its main building, which, when completed, will have a ground measurement of 250 by 60 feet. The addition will be used entirely by the fender and steel locker department. Since the Consolidated Car Fender Company moved its offices to the plant of the Narragansett Machine Company, the fender interests have reached such proportion that an addition to its plant was thought advisable.

Columbia Brake Shoe & Foundry Company, Cincinnati, O. reported in our issue of March 9 as the new name of the Columbia Foundry Company, will devote its exclusive attention to the manufacture and sale of brake shoes for steam and electric railways. The company state that already they have become standard on several railways and that in the near future the foundry will be doubled, and the capital stock of the company increased in order to meet the demand for its products.

Foote, Pierson & Co., New York, will about April 15 move their offices and business from 82-84 Fulton street, where they have been located for the past twenty-three years, to 160-162 Duane street, corner Hudson street, where they will occupy the entire five floors. This will provide room of more than double its present quarters. New and improved machinery will be installed, enabling the company to handle a much larger volume of business than heretofore. The company are well known manufacturers of telegraph instruments, fire alarm apparatus, measuring and testing instruments and a large variety of electrical specialties.

B. F. Sturtevant Company, Boston, reports the following recent sales of mechanical draft apparatus: Scranton Railway Company, Scranton, Pa., for maximum output of 6,000 horsepower; Lowell Gas Light Company, Lowell, Mass., for burning coke breeze in connection with 500 horsepower marine boilers; apparatus for Mexican Central Railway, Tampico, Mex.; Washburn Brothers Company, Glasco, N. Y.; Hitchings & Co., New York, and the Monarch Supply Company, Toronto, Ont. Among the sales for its rotary type high pressure blowers are: Equipments for the Union Manufacturing Company, New Britain, Conn.; John Russell Cutlery Company, Turners Falls, Mass.; Greer Filter Company, Hamilton, O.; Riverside Boiler Works, Boston, Mass.; and the Andrew McLean Company, Passaic, N. J.

Railway Steel Spring Company, New York, at the annual meeting of its stockholders held on March 7 re-elected its retiring board of directors with the exception of George G. McMurtry, who was chosen to fill the vacancy of Charles Scott, Jr., resigned. The income account of the company for the year ending December 31, 1906, as compared with 1905, is as follows:

	1906.	1905.
Net earnings	\$ 2,341,120.19	\$ 1,949,993
Interest on Latrobe plant bonds.....	215,587.48
Balance	\$ 2,125,532.71	\$ 1,949,993
Dividend, preferred (7 per cent).....	944,979.00	944,977
Balance for common.....	\$ 1,180,553.71	\$ 1,005,016
Dividend, common (4 per cent).....	539,988.00	539,988
Surplus	\$ 640,565.71	\$ 465,028
Account Latrobe plant purchase.....	450,000.00
Final surplus	\$ 190,565.71	\$ 465,028
Previous surplus	2,045,899.16	1,580,571
Total surplus	\$ 2,236,464.87	\$ 2,045,899

ADVERTISING LITERATURE.

General Storage Battery Company, 42 Broadway, New York, has issued a convenient printed manuscript containing instructions for the installation and operation of transportable batteries. The instructions are issued by the operating department and should be of particular value to all who have the handling of storage batteries.

Kinnear Manufacturing Company, Columbus, O.—"Car Barn Doors" is the title of a well-executed pamphlet describing and illustrating the Kinnear steel rolling fireproof door as used for this purpose. A description of the general features of these doors appeared in the daily edition of the Electric Railway Review at the time of the Columbus convention.

John B. Watson, Drexel Building, Philadelphia.—Bulletin No. 31 describes a great variety of electric railway rolling stock and power machinery, some new and some which has been taken from service for various reasons and can therefore be obtained on advantageous terms. Each item is fully described and many cars are illustrated with engravings from photographs. The same pamphlet announces that this dealer has on hand a large number of steel bridges which have been removed from steam railways on account of increased weight of motive power and rolling stock.

American Conduit Company, 140 Nassau Street, New York.—This company has issued cards containing interesting information concerning the insulating conduits for railway and power house work which it manufactures, with drawings showing the detailed construction of the jumper system used by the Pennsylvania Railroad. The company has also issued convenient tables from which the cost of stone, sand, labor and cement per cubic yard of concrete at the various proportions in which the materials are to be mixed, can be determined at a glance, with a range of assumed probable costs of these materials per cubic yard as a basis.

The papers and discussions at the meeting of the Central Electric Railway Association at Dayton, O., on Thursday of this week were all on subjects of the greatest interest to the practical men who are directly responsible for proper operation and maintenance of track and equipment. Reference to the report of this meeting, which appears elsewhere in this issue, will indicate a number of the questions to which special attention is now being given. The exchange of data as to the results of tests and the defects developed in service shows that there is need of further investigation before conclusions of wide application can be drawn. The association has an important field for its work and the interest manifested by the active members representing the shop and track departments of the electric railways is extremely gratifying.

The proposed trolley location for the new lines of the Denver & Interurban Railway, as described in the Electric Railway Review of March 9, 1907, page 321,

Placing the Trolley Wire Off-Center. The cars of this road will take current direct from the trolley wire at 11,000 volts pressure and steam locomotives will draw freight trains over a portion of the route. By reason of these conditions it is proposed to support the trolley wire (No. 0000, grooved) 22 feet above the tops of the rails and not over the center of the track but above a line just outside one rail. Thus can a short bracket-arm be used and the poles still be more than the usual distance from the nearest rail. The catenary wires, insulators, brackets and, in fact, the trolley wire and all its supporting members will largely escape the smoke and steam from locomotive stacks. With the trolley wire at one side, the lives of trainmen on box cars will not be endangered, because even though the wire should sag for some reason it would still be out of reach of the employe unless he should make a deliberate attempt to reach for it. This offset-trolley construction is in use abroad

and its introduction here seems to be warranted where double service is to be operated.

One of the most resourceful subjects for discussion in steam engine literature has been that of the reduced economy of steam boilers on the heating surfaces of which scale has formed. According to circumstances, and the motives of the speaker or writer, the loss in economy of a boiler having one-sixteenth inch of scale—of any character—has been stated at anywhere from 2 to 20 or even 30 per cent; the general opinion, if there has been any, as stated in the technical papers and textbooks, is probably about 15 per cent loss for each sixteenth inch of scale. In the earlier discussions of boiler scale, the effect on the economy of the boiler has always been considered as affected simply by the thickness of the scale without any thought as to its composition, or structure. The tests made by Prof. Edward C. Schmidt on this subject are of most vital interest to all users of steam boilers, and, as might be expected, from a large number of tests, it has been found that the loss in economy of the boiler is affected more by the structural form of the scale than by its composition or thickness. The reasons for these results should be evident when the extremely low conductivity of steam and water in a stated condition are considered. Nearly all solids have a fairly high conductivity, while the more porous materials, as our knowledge of pipe coverings should lead us to infer, have a much lower conductivity. The only criticism which might be made of Professor Schmidt's experiments is that the thickness of scale employed was rather too slight, and the temperature range too limited. In spite of these facts, however, the experiments are of great value, as they indicate clearly that the resistance to the transmission of heat is dependent more upon the structural formation of the scale than upon its chemical composition and thickness. The indications are, so far, that the lighter and more porous scale presents the greatest resistance to the transmission of heat, as the hollow

spaces permit the formation of small globules of superheated steam, which is one of the most effectual heat non-conductors known. The loss with different thicknesses of scale was not sufficiently defined to permit of any definite conclusions, but from the light which has been thrown on the subject, the loss to be expected from one-sixteenth inch of scale may roughly be taken at, say, 8 per cent.

It is not general practice to ascertain and record the exact weights of new cars. Especially is this true when new rolling stock equipment is assembled at the purchaser's shops. There are perhaps those who find it satisfactory to adjust and readjust the brake-rigging on new cars until the wheels do not slip under a test application of the brakes, but a decidedly more accurate and workmanlike adjustment could be had if the exact weight of the car were known. If the weight as used in calculating the lever-arms of the rigging happens to be inaccurate, then there results the necessary varying of the air pressure, which again confuses the solution of the problem of correct braking percentage and uniform applications for all the cars of one system. To those who would consider accurate records of the weights of rolling stock as "extra refinements," we would suggest that the saving in brake shoes and wheels would undoubtedly be a coveted item were the cautions observed.

The preparation and maintenance of an up-to-date set of feeder diagrams including both positive and negative lines, is of so much consequence in the operation of a large city trolley system that it is a little surprising that so many interurban roads have failed to realize the advantages of doing the same thing. To be sure, the feeder arrangements of most interurban lines are extremely simple, but this very fact makes it all the easier to rough out in a loose leaf book or on tracing cloth the essential particulars of the current supply, including the number, length and size of overhead and return circuits, the location of section insulators, switches or circuit breakers, and the positions of adjacent telephones. Diagrams of this kind in interurban railway practice are exceedingly useful in more ways than one, and if they are made up in sizes which can be comfortably carried in the pocket, so much the better. Even in single phase practice it is advantageous to have diagrams at hand for ready reference showing the size of transformer taps where such exist, the location and cross section of copper return cables, the points in the catenary messenger wire where repairs may have been made, localization of trolley breaks, etc. On direct current roads it frequently happens that the growth of traffic requires the installation of additional feeder capacity differing in size from the original layout, and it is most essential that an accurate record be maintained of all such changes. Otherwise, mistaken conclusions are liable to be drawn in studying the conditions of power distribution and consumption. Nothing short of a complete and correct diagram showing the exact number of feet, the kind of wire and the size, including the trolley, at all points of the road should be sought. The line and track foremen, the electrical engineer's department and the superintendent all would find these data time-saving and helpful. It would be useful not only in regular operating work, but in placing quick orders for repairs, and in making the annual inventory of the road's physical property. The arrangement of interurban feeders may be simple, but it is surprising how many varieties of copper and aluminum sometimes find their way into the overhead circuits of a single road.

THE PARALLELING OF STEAM RAILWAYS BY ELECTRIC RAILWAYS.

The decision of the appellate division of the supreme court of New York state ordering the state railroad commission to grant a certificate of convenience and necessity to the Rochester Corning & Elmira Traction Company, which was reported in the *Electric Railway Review* of March 23, 1907, page 403, is perhaps most interesting and important for the strength of its reasoning. The certificate had been denied at the time of application on the ground that the Erie Railroad already met all the transportation needs of the territory in which the electric company proposes to operate. In the abstract, there would seem to be little in the law to prevent an electric railway company from building alongside of a steam railway as well as anywhere else. But New York has a statute which prohibits a railroad corporation from constructing a road until the railroad commissioners certify that "public convenience and necessity" require it. It is this statute which called for this decision.

Connecticut also has a statute, section 8 of chapter 169 of the public acts of 1893, which provides that no street railway shall be built or extended from one town to any other in the public highways, so as to parallel any other street railway or steam railroad, without a judicial finding that public convenience and necessity require its construction. The supreme court of errors of Connecticut says, in re the application of the Shelton Street Railway Company, 69 Connecticut Reports 626, that in this statute the "public convenience and necessity" sufficient to "require the construction of such street railway," means a condition existing at the time of the application, in respect to the applying railroad, the mode of public travel, the manner in which those needs are to be supplied, and the probable effect of the proposed road upon the whole question of adequately supplying those needs, as well as in respect to the road proposed to be paralleled, that, in the judgment of the trier, will justify the interference with private rights involved. Railroad companies chartered by the legislature have expended large sums of money in the construction of their roads, which are practically wasted unless the road can be used without loss for the transportation of passengers and freight. It is obviously for this reason that the provisions of section 8 were incorporated into the general act, and so a legal right given to existing roads to protection against a certain kind of parallel road, when the construction of such road is not shown to be, under all the existing conditions, of public convenience and necessity. For the protection of such legal rights an existing road may apply to the courts.

In the case of the Chicago & Milwaukee Electric Railroad Company versus the Chicago & Northwestern Railway Company, 211 Illinois Reports, 352, 5 Street Railway Law, 266, it was conceded that a railroad company cannot appropriate or condemn a strip off of the right of way of another railroad company longitudinally. But the court was disposed to the view that the authorities announcing the doctrine that one railroad company cannot condemn longitudinally the right of way of another, had reference only to the right of way of the width which the railroad company is authorized by the statute to condemn. A 50-foot strip of land owned by the railway company and adjoining its 99-foot strip, but being no part of it, was not exempt from condemnation on the theory that it was part of the right of way. If it were within the 99-foot strip, it would be exempt, whether actually needed by the owner for railroad purposes or not, so long as the owner was engaged in the business for which it was chartered. Being outside the 99-foot strip, the question of its exemption depended upon other considerations. It being evident that the railway company owning it did not need it then, and would not need it in the immediate future, while the electric railroad company needed it then for a present public purpose, for which it had the power to acquire a right of way by condemnation, the remote and uncertain needs of the railway com-

pany owner must yield to the present and certain right of the electric railroad company.

These decisions, taken together, state pretty fairly the law on this subject, if they do not make it. They are also equitable and just, and leave comparatively little to be desired as far as they go. Monopolies, it must be remembered, are in general obnoxious to the law and to the courts. But the latter believe, as the supreme court of Illinois said in the case of the Central City Horse Railway Company versus the Fort Clark Horse Railway Company, 81 Illinois Reports, 523, that competition, an honest, healthy competition, is productive of good. At the same time, the court adds that the law affords no aid to that kind of competition which claims the right to crush a competitor in order to advance a rival interest.

THE INFLUENCE OF STEAM PRESSURES IN TURBINE OPERATION.

There are certain considerations, both in the design and operation of reaction steam turbines, which cast a doubt on the advisability of selecting the highest pressures. The tendency in design has been very much, for a time at least, toward the increasing of steam pressures, a practice which without question was the natural result of the experience gained with multiple stage expansion in reciprocating engines. Also, the theory of the turbine, if not minutely investigated, leads to the too broad conclusion that the steam turbine is particularly well adapted to the use of extremely high pressures. This is, however, not a fact, if all things are considered, the truth being that the turbine is more particularly adapted to the economical use of low-pressure steam, while, within reasonable limits, the reverse is true of the reciprocating engine.

A statement which may at first appear rather broad, and at the same time novel, is, that the cost of construction of a steam turbine is inversely proportional to the square root of the initial steam volume, and that the efficiency is to a measurable degree also a function of the volume. The reasons for this are that the diameter of the high-pressure spindle is directly proportional to the square root of the initial steam volume, and the work done by each ring of blades is directly proportional to the square of the blade velocity, and hence, the number of rows of blades in the high-pressure turbine is inversely proportional to the initial volume. Further, the cost in excess of a certain fixed cost for the governor bearings and shell is nearly directly proportional to the number of blades in the turbine. While these are the principal reasons for the statements made, there are many others of minor importance which would take far more space to explain than can be given at this time, and for the present they are not essential to the argument, though they have been given due weight in the comparisons presented herewith.

A glance at some of the tendencies of reaction turbine design and practice bear out these statements, as, for instance, the design of the double-flow turbines, in which the high-pressure spindle is entirely dispensed with, and is replaced by a high-pressure impulse turbine, the exhaust of which is utilized in the usual low-pressure reaction turbine. In marine practice, a similar condition is found, as well as in a large part of the European reaction turbines installed in stationary practice. In these cases, what is equivalent to the employment of an impulse turbine is obtained by using low steam pressure, or throttling the high-pressure steam, thus further superheating it, and causing the desired increase in volume. Further, the fact that small reaction turbines are not constructed for moderate speeds is another indication of the truth of the principles stated, for in the latter case the cost of construction with small steam volumes is prohibitive. In all these cases, the chief object is the reduction of the cost of construction, and, incidentally, a small gain in efficiency. It should be borne in mind that it is the low-pressure end of

the turbine which is most efficient and produces the largest results for the least money.

Of course, increasing the steam pressure will also decrease the steam consumption of the turbine, for, with a given terminal pressure, more heat units are converted into work, but this alone cannot be considered, for the relative economy of the boiler, and the increased cost of boilers, piping and turbine must be considered as well. The more rapid deterioration of the boilers and piping under high pressure must also be borne in mind, though these cannot easily be reduced to actual figures.

An operating feature which is worthy of the most careful consideration is the reduced danger of accidental contact of the blades when low steam pressure is used, partly because of the reduced length of the shell which reduces the difficulties experienced from unequal expansion and contraction and warping, but chiefly because of the greater stiffness of the spindle, which materially lessens the "whipping." As a certain thickness of the metal of the spindle is required to hold the blades, and this thickness must be greatly exceeded in spindles of small diameter and considerable length to give the desired stiffness, the spindle will be considerably lightened by the use of low-pressure steam, thus reducing the pressure on the bearings, which will consequently be subjected to less wear, and assist in assuring that the shaft always rests on an oil film.

An examination of all the information available shows that the evaporation per pound of coal is about 7½ per cent higher in a boiler operating at 100 pounds per square inch gauge pressure than in a boiler working at 285 pounds gauge, provided that all the other conditions except the steam pressure are the same in both cases.

In the accompanying table are shown the comparative results of turbine and boiler combined for pressures of 100, 150, 225 and 285 pounds gauge. The superheat in each case is 100 degrees F. The steps for arriving at these figures are not given here for lack of space, but it will suffice to say that they are based on the principles set forth, and from them they can easily be deduced.

Gauge pressure, pounds.....	100	150	225	285
Relative evaporation of boiler. Water per pound of coal.....	1.03	1.00	.97	.955
British thermal units, theoretically available in turbine. One pound, absolute, back pressure.....	317	339	367	381
Initial volume of one pound of steam in cubic feet.....	4.6	3.2	2.35	1.85
Relative steam consumption of turbine..	1.04	1.00	.98	.94
Relative cost of construction of turbine..	.90	1.00	1.10	1.20
Relative diameter of high-pressure spindle	1.24	1.00	.84	.72
Relative length of high-pressure spindle..	.65	1.00	1.50	2.15
Relative stiffness of spindle to resist "whipping"	6.4	1.00	.177	.037
Relative coal consumption of turbine and boilers combined.....	.99	1.00	1.00	1.01

As will be observed by an examination of the table, all results have been compared with the turbine and boiler operating at 150 pounds per square inch gauge pressure, as this is probably the most generally used pressure at present. A further examination shows that the cost of the turbine designed for 100 pounds gauge pressure would be but approximately 90 per cent of the 150-pound turbine, while the turbine designed for 285 pounds would cost about 20 per cent more, while, when all is taken into consideration, the coal consumption for the low-pressure turbine would probably be about 2 per cent less than that for the turbine built for 285 pounds pressure. The most vital point to be observed, however, is the relative lengths and stiffness of the spindles, that of the low-pressure turbine being but about one-fourth as long, and 150 times as stiff, as that of the turbine designed for 285 pounds pressure. This alone would be a great inducement to use lower steam pressure, as it would permit slightly smaller radial clearances, and at the same time reduce the danger of accidental contact.

There is, however, an increase in economy with reduced pressure, not only in coal consumption, but through a great reduction in boiler piping and turbine costs, which means

reduced depreciation and maintenance, while the cost of repairs should also be far less than when high pressures are employed. The reduction of maintenance charges and increased safety of operation of the turbine are the principal points of advantage, since the increase in economy is not of itself sufficient to induce the adoption of lower pressures. The only object of going into the cost and economy of the turbine so completely is to show that there need be no fear of reduced economy by reduced steam pressure. Low pressure and higher superheat are the lines along which the reaction turbine should develop, and, in some designs of turbine, an increase in the degree of superheat will show far greater gains than indicated here, as the "water-brake" action which detracts from the efficiency at certain loads would almost if not wholly disappear. It is not intended in the suggestion regarding the use of superheat to advocate the extremely high temperatures sometimes found in practice, but simply as the temperature of the saturated steam decreases with diminished pressure, the degree of superheating may be increased an amount equal to the difference in the saturation temperatures.

ELECTRIC RAILWAY EXPRESS AT BOSTON.

The application of the Boston Elevated Railway Company to the Boston city government for the right to carry freight and express matter on its system, points the way toward a general realization in Massachusetts of the possibilities of the electric roads in the work of handling light merchandise. The large urban systems of the east have been somewhat conservative in their attitude toward the express business, perhaps because of the importance of their dense passenger traffic and the lack of uniform practice on other roads doing a parcel business in other parts of the country. The influence of local suburban express companies has also been hostile to this enlargement of scope by electric roads.

Experience in light freight handling in the middle west has shown how valuable such a service can be in the vicinity of large cities, and in New England there is now a decided tendency toward the establishment of such traffic. In Massachusetts a number of companies have applied to the municipal authorities for consent to carry freight, and are doing so under the regulations of the railroad commission. The Old Colony Street Railway is distributing many parcels in the territory between Brockton, Providence, Fall River and New Bedford to the great convenience of the public and the larger employment of its equipment. At Conway, Mass., an electric line connecting with the Fitchburg division of the Boston & Maine Railroad is empowered by a special charter to carry every kind of freight. It has been pointed out that it is a great saving to the inhabitants of that hilly region to have their coal and other heavy merchandise hauled by electricity, and there is no doubt that in this case the public interest is served by the granting of the fullest transportation privileges. In Maine, the Atlantic Shore Line is handling important electric freight service in the region between Portsmouth, Dover and Kennebunkport, and the Boston & Worcester's grant of permission to do a freight business is one of the most recent developments in the field.

Obviously a freight-carrying privilege is worth comparatively little to an electric road unless it can receive and deliver merchandise at some fairly central point in the terminal cities in which its passengers are deposited. The attitude of the large urban companies in large measure decides the feasibility of express service in any thickly settled locality. The objection that such service is liable to interfere with the regular passenger traffic does not hold much weight, for the reason that the freight service can generally be deflected from the main lines of city travel, and a large part of the business can be handled in the night or early morning. The present methods of hauling farm and market gar-

den products into cities in the early morning by horses and wagons whose routes parallel the idle tracks of many trolley lines are entirely out of touch with the progressive spirit of the times.

The private local express company is really a development of the system whereby individuals go shopping for their neighbors and return home laden with bundles; it is relatively expensive, infrequent and on the whole unequal to the demands of the times for speed. The use of the trolley lines as light freight carriers enables orders to be filled much more rapidly, and to this extent cuts into the perquisites of the local expresses; but it is certain that the enlargement of facilities for freight handling by electric cars is such a public benefit that it is poor policy to stifle competition by refusing electric roads freight-handling rights in the interests of the horse-drawn expresses. Doubtless it is wise in most cases to limit the matter which can be handled to materials other than explosives and bulky or very low-grade freight which can always be most profitably hauled on the smoother profiles of the steam railroads, but a liberal elasticity in the list of light merchandise which is permitted for trolley transit, works to the lasting convenience of the shipping public.

LIABILITY FOR PLATFORM AREAS.

The full bench of the supreme court of Massachusetts recently ruled that the Boston Elevated Railway Company is liable for damages in case of injury to its passengers resulting from crowded platform areas, with particular reference to the Sullivan Square terminal. It was claimed that the platform was too small for the accommodation of the passengers who could be and were delivered upon it, and the company was criticized for "continuing to assemble on its platforms at certain hours of the day such large crowds, necessarily going in opposite directions, that those on the outside, in spite of all they can do, are carried off the platform into the trench in which the tracks are laid."

Peculiar rulings on transportation service have often been made by this court, and this one seems to be no exception. The one substantial fact which persons outside the street railway business never seem to be able to grasp is the physical impossibility of handling all the traffic of a great city in the rush hours without crowding of streets, stations and cars. The public as a whole simply cannot realize the burden which the common desire of everybody to go home within an hour or two of the same time throws upon even the best organized transportations systems. A company may spend hundreds of thousands of dollars upon its extra rolling stock, its stations and its operating organization; it may employ scores of inspectors with police powers to cope with the avalanche of travel which chokes its lines between 5 and 6 p. m. on business days, but no known method exists of enforcing courtesy in the individual passenger. The Sullivan Square terminal is probably the largest single electric railway station in the world, and its liberal dimensions are the object of instant comment of transportation experts. If it were to be rebuilt it is doubtless true that the experience of nearly six years of operation would suggest the importance of separating opposing streams of passenger movement—and the plans for the Dudley Street and Forest Hills terminal changes suggest this; but considering the volume of traffic which has passed through this station in the past six years the low accident record is certainly one for congratulation. Far more than 500,000 persons a week pass through Sullivan Square terminal, and if a traffic of this magnitude is at times congested by the typical American desire to annihilate the distance between surface cars and trains connecting by free bodily transfer on the same level, the mere matter of a few square feet more or less of platform space is not going to solve the problem.

ANNUAL MEETING AND DINNER OF THE NEW ENGLAND STREET RAILWAY CLUB.

One of the most efficient and active technical societies in the country composed of street railway men is the New England Street Railway Club, which held its seventh annual meeting and dinner at the Hotel Somerset, Boston, on Thursday of the present week. The club has a membership of 620 and the attendance at the dinner reached the exceptional number of 400. Nothing could more certainly indicate the importance of the industry and the scope of its operations than the high character and ability of the men who were gathered together on the occasion.

The business meeting of the club was held in the afternoon and was devoted chiefly to the election of officers, which resulted as follows:

President—Henry C. Page, Springfield, Mass.

Vice-Presidents—M. C. Brush, Newtonville, Mass.; Horatio Bigelow, Norwich, Conn.; J. Brodie Smith, Manchester, N. H.; F. H. Foote, St. Albans, Vt.; D. F. Sherman, Providence, R. I.; E. A. Newman, Portland, Me.

Secretary—John J. Lane, Boston, Mass.

Treasurer—N. L. Wood, Boston, Mass.

Executive Committee—Paul Winsor, Boston, Mass.; W. D. Wright, Providence, R. I.; C. H. Hile, Boston, Mass.; John F. McCabe, Worcester, Mass.; E. A. Sturgis, Boston, Mass.; Charles C. Peirce, Boston, Mass.; George C. Ewing, Boston, Mass.

The new president, Henry C. Page, has been engaged in street and electric railway work for many years. He is about 43 years of age, and 22 years ago went to work for the Lynn & Boston Street Railway, running a car from Chelsea to Boston. He served for three years as conductor, and was then rapidly promoted until he was placed in complete charge of the schedule arrangement and car dispatching of the company. He made such a success of this that, after the Boston & Northern Street Railway Company was formed, taking over many lines, he soon became its general superintendent, in charge of 450 miles of track. His particular success on this road lay in his method of handling employes, and his arrangements of the schedules. About four years ago he took the position of general manager of the Berkshire Street Railway Company at Pittsfield, Mass. He remained there until June, 1905, when the Consolidated Railway Company secured the property, as well as the Springfield Street Railway, and Mr. Page was appointed general manager of the latter system, which position he now holds.

The dinner and social features in the evening were in charge of two committees, a committee of arrangements, of which Charles C. Peirce was chairman, and a reception committee, of which M. C. Brush was chairman. This is equivalent to saying that matters were well arranged. Readers of the Electric Railway Review know that Mr. Peirce has no equal in either arranging or entertaining. The efforts of both committees were made all the more effective by the assiduous labors of J. J. Lane, the secretary of the club and the editor of its publication, the Street Railway Bulletin.

The after-dinner speaking was serious and impressive. John I. Beggs, president of the American Street and Interurban Railway Association, discussed the relation of the work of the club and similar bodies to that of the American association and its affiliated organizations. He also spoke with emphasis of the present attitude of the public toward street railway corporations, and of the need which the present crisis creates for the most careful attention on the part of street railway managers to see to it that no cause should be given for dissatisfaction on the part of the public.

Hon. George T. Blackstock of Toronto, who made such a profound impression with the speech which he delivered at the Philadelphia convention in 1905, was the next speaker. He delivered an oration, rather than a post-prandial speech, which was remarkable for its finished diction, wide range of thought and lofty spirit. It dealt with the commercial and political relations between Canada and the United States

and with the need for the prosperous people on the North American continent to think more of the other things in life than mere money making and pleasurable dissipations.

Rev. Willard Scott, D. D., of Worcester, Mass., showed that he was a witty man of the world, as well as an earnest teacher of religion, by a speech that taught moral lessons while at the same time it kept his auditors smiling when they were not shaking with laughter.

Guy Murchie, of the legal department of the Boston & Worcester, presided gracefully as toastmaster. The evening closed with a rising vote of thanks to Chairman Peirce and his assistants for the successful manner in which they had provided for the entertainment.

MEETING OF THE CENTRAL ELECTRIC RAILWAY ASSOCIATION.

The regular meeting of the Central Electric Railway Association was held at the Hotel Algonquin, Dayton, O., on March 28. The first session was called to order at 11:25 a. m. by the president, H. A. Nicholl, about 70 members of the association being present.

E. C. Spring made a short address congratulating the new president, to which Mr. Nicholl made an appropriate reply, and the association then proceeded to the regular order of business. After minutes of the meeting held at Indianapolis on January 24, last, had been read and approved, T. B. McMath read a paper entitled "Track Bonding." This paper and a summary of the discussion upon it will be found on page 422.

The next business was the paper on "Car Wheels," by C. Skinner. This paper and an abstract of the discussion will be found on page 423.

The session was then adjourned until after lunch. On again calling the meeting to order at 2:40 p. m., the chair announced the appointment of committees as published in the Electric Railway Review for March 23, 1907, page 395, and also the appointment of the following executive committee: H. A. Nicholl, Indiana Union Traction Company, Anderson, Ind.; E. C. Spring, Dayton Covington & Piqua Traction Company, West Milton, O.; C. C. Reynolds, Terre Haute Indianapolis & Eastern, Indianapolis.

The paper on "Trolley Wheels," by M. Baxter, was then read. This paper and the discussion will be found on page 425.

L. W. Jacques then read a paper on "Car Inspection," which, together with the discussion, will be found on page 421.

A. A. Anderson (Indianapolis Columbus & Southern), chairman of the committee on "Express Contracts," reported that because of lack of time only a progress report could be submitted.

George Whysall (Columbus Delaware & Marion) stated that his company recently had made a contract with the Wells-Fargo Express Company on a tonnage basis, but with an increased allowance according to valuation of shipments, which gave his company 1½ times local freight rates on local business and regular freight rates on through business. Employes operating express cars were paid by the express company, and wages of employes operating cars used jointly were equally divided between the express and the railway companies.

R. C. Taylor (Indiana Union Traction Company), chairman of the committee on "Lighter Cars," reported progress, and stated that a request for data as to capacity, weight, etc., of cars now used would soon be issued.

H. N. Staats (Cleveland), chairman of the committee on "Insurance," submitted the following report, which was accepted and ordered filed:

During the past two years extensive investigations have been made relative to the best plans for promoting the interests of traction companies and electric light and power companies, along the lines of insurance.

As a result of these investigations, the American Rail-

way Insurance Company of Cleveland, O., has been incorporated and organized with a capital and surplus of \$500,000. The officers and directors of the company are men representing railway, light and power companies, and the business of the company will be confined exclusively to these interests.

In addition to the American Railway Insurance Company there has been incorporated the Traction Mutual Insurance Company and the Electric Mutual Insurance Company. These companies will co-operate with the American Railway Insurance Company.

In the opinion of your committee, all the members of the Central Electric Railway Association may be profitably consolidated into one organization, to the extent, at least, of the insurance of their properties against destruction or damage by fire. We approve the plan of insurance adopted by the companies named and recommend the earnest co-operation of every road connected with the Central Electric Railway Association.

The chair then announced that the next meeting of the association would be held at Indianapolis on May 23 next.

W. H. Evans (Indianapolis Traction & Terminal) suggested that the association take up for consideration the proper standards for brakeshoes, wheel treads and flanges, axles, and journal boxes, and the committee on "Standardization," of which he is chairman, was instructed to report at the meeting in May.

Adjourned.

INDICTMENTS FOR NEW YORK CENTRAL WRECK.

The grand jury which has been investigating the wreck near Woodlawn on the New York Central & Hudson River road on February 16, has voted three indictments for manslaughter in the second degree against the company, A. H. Smith, vice-president and general manager, and Ira A. McCormack, general superintendent electrical division. The penalty, if found guilty, is 15 years imprisonment or a fine of \$1,000, or both, for the officials, and a fine of \$5,000 for the corporation. In its presentment the jury makes the following statements:

The wrecked train left the track at the middle of a curve under the Woodlawn bridge, the immediate cause being the spreading of a rail on the outer edge of the curve, following the shearing of the spikes on the outside of said rail.

In the morning of February 16 the engineer of an electric locomotive train passing around the said curve at a speed of about 60 miles an hour, noticed a roughness of track at the point where the rail subsequently spread, sufficient to cause him to report it. An ordinary inspection by track walkers later in the day failed to locate the defect. Subsequent trains passed over the said point of track at normal speeds and no roughness was observed. No subsequent train seems to have exceeded a speed of 50 miles an hour at that point until the Brewster express arrived.

The fatal train was traveling at a speed which calculations by the experts from the company that made the locomotives (based on the distance required to bring the locomotive to a standstill) show to have been at least 60 miles an hour, and which has been estimated by competent observers as high as 70 miles.

After more than a month of careful investigation by experts from the New York Central & Hudson River Railroad and other companies, no defect in roadbed or rolling stock has been discovered which could have caused a wreck at normal speed. The evidence leaves no doubt that the disaster was directly due to some combination of circumstances developed and made disastrous by excessive and abnormal speed.

The curve in question was constructed and safe for a normal speed of about 46 miles an hour. The company had made no calculation to ascertain, and had no definite knowledge of, how much higher speed could be attained without passing the limits of safety. There were no rules in existence to limit trains to the speed known to be normal and safe. Instead, reliance was placed on the judgment of engineers not to exceed safe speeds.

This, it is claimed, has been the best railroading practice for years. With steam locomotives an experienced engineer could easily estimate his speed, and readily feel when he was going around a curve faster than the normal or so-called equilibrium speed.

The safety of this practice depends manifestly upon having trained and experienced engineers. The new electric locomotives have a much lower center of gravity and run with

greater smoothness than the steam locomotives. On this account men not experienced with them tend almost invariably to underestimate their speed, and their action at excessive speed on curves is much less noticeable. They are capable of drawing trains at a speed highly dangerous on the said curve.

If the question of safety in speed was to be left as before to the engineers, it was essential that such engineers should have experience with their engines sufficient to train them to form a competent judgment.

Prior to the installation of a fast passenger electric locomotive service between New York and Wakefield, but one experimental or dummy train was run over the route on schedule. With the exception of the engineer of that train, it seems that none of the engineers who were to operate the new locomotives had been over the route on schedule time in an electric locomotive before being put in charge of a train required to run on schedule time and carrying passengers.

The course of instruction for such engineers had required only four days' practice on a trial track about 2½ miles in length.

Many of the engineers had apparently never ridden on an electric locomotive at a speed even approximating that required by the schedule. While all of them had probably had experience with steam locomotives, they were put in charge of fast trains carrying passengers drawn by electric locomotives at a time when they knew nothing, by experience, of the speed capacity of such locomotives.

The engineer of the wrecked train had not received sufficient instruction to enable him to form a judgment of any value as to the speed at which he was running his train. The disaster was a natural result of such carelessness. This matter should not have been left entirely to the discretion of the company.

DIRECTORY OF ELECTRIC RAILWAY ASSOCIATIONS.

American Street and Interurban Railway Association. Secretary, Bernard V. Swenson, 29 West Thirty-ninth street, New York.

American Street and Interurban Railway Accountants' Association. Secretary, Elmer M. White, assistant treasurer Birmingham Railway Light & Power Company, Birmingham, Ala.

American Street and Interurban Railway Engineering Association. Secretary, S. Walter Mower, general manager Southwestern Traction Company, London, Ont.

American Street and Interurban Railway Claim Agents' Association. Secretary, B. B. Davis, claim agent Columbus Railway & Light Company, Columbus, O.

American Street and Interurban Railway Manufacturers' Association. Secretary, George Keegan, 2321 Park Row building, New York, N. Y.

Canadian Street Railway Association. Secretary, Allan H. Royce, president Toronto Suburban Railway, Toronto, Ont.

Central Electric Railway Association. Secretary, W. F. Millholland, secretary and treasurer Indianapolis Traction & Terminal Company, Indianapolis, Ind. Next meeting, Dayton, O., March 28.

Colorado Electric Light Power & Railway Association. Secretary, John F. Dostal, Denver Gas & Electric Company, Denver, Colo.

Iowa Street and Interurban Railway Association. Secretary, L. D. Mathes, general manager Union Electric Company, Dubuque, Ia. Next meeting, Clinton, Ia., April 19 and 20.

Massachusetts Street Railway Association. Secretary, Charles S. Clark, 70 Kilby street, Boston, Mass. Meetings held in Boston on second Wednesday of each month, except July and August.

Northwestern Electrical Association. Secretary, R. N. Kimball, Kenosha, Wis. Annual meeting, Milwaukee, Wis., January, 1908.

New England Street Railway Club. Secretary, John J. Lane, 12 Pearl street, Boston, Mass. Meetings held on fourth Thursday of every month.

Oklahoma Electric Light Railway and Gas Association. Secretary, Charles W. Ford, Oklahoma City, Okla. Next meeting, Oklahoma City, April 22 and 23.

Pennsylvania Street Railway Association. Secretary, Charles H. Smith, superintendent Lebanon Valley Street Railway, Lebanon, Pa.

Southwestern Electrical and Gas Association. Secretary, R. B. Stichter. Annual meeting, San Antonio, Tex., May 14, 15 and 16.

Street Railway Association of the State of New York. Secretary, J. H. Pardee, general manager Rochester & Eastern Rapid Railway, Canandaigua, N. Y.

Wisconsin Electric and Interurban Railway Association. Secretary, Clement C. Smith, president Columbia Construction Company, Milwaukee, Wis.

The Société Anonyme Westinghouse of Paris, France, has closed a contract for the electrification of an important portion of the Italian State Railways, the main line from Genoa to Milan.

FT. WAYNE & SPRINGFIELD SINGLE-PHASE RAILROAD.

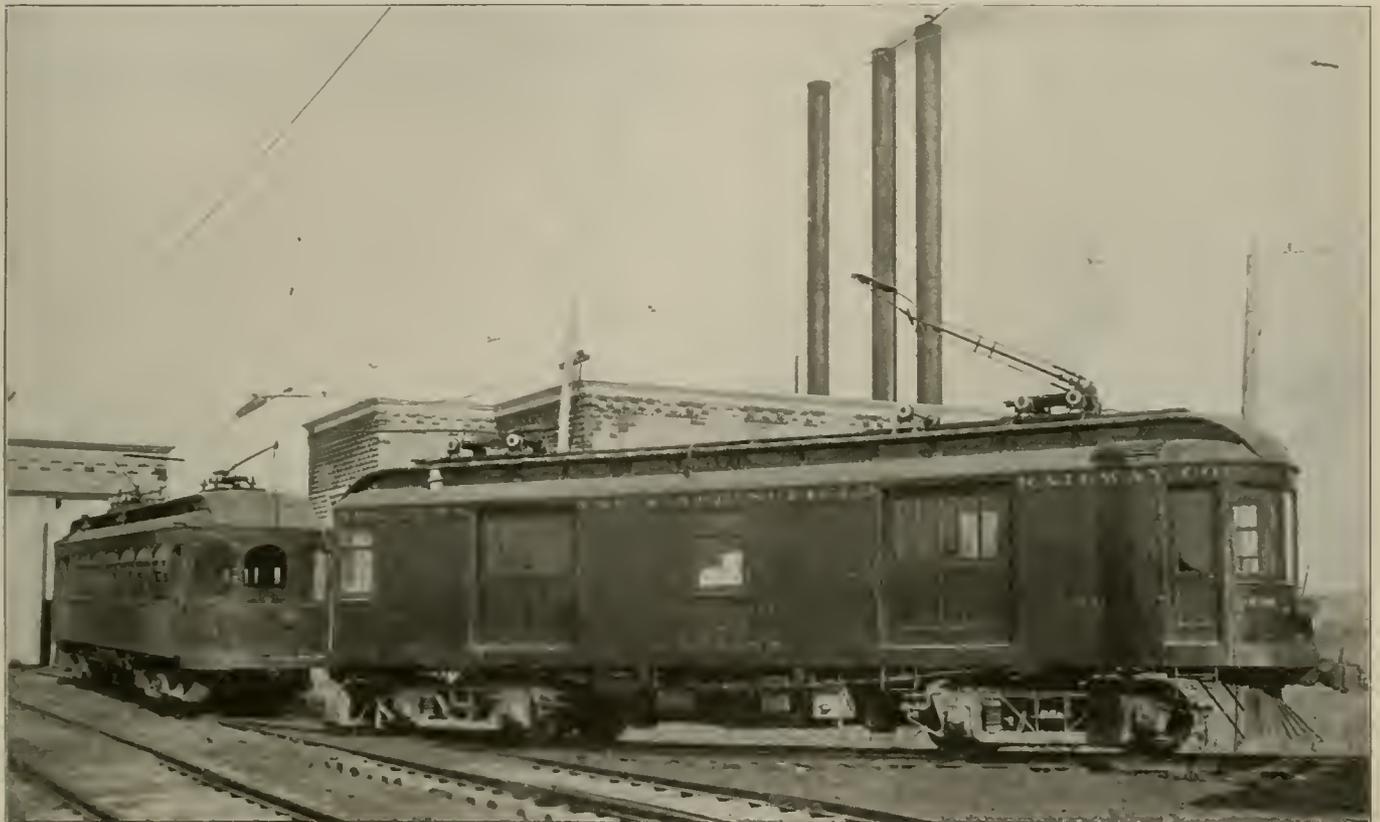

The first division of the Ft. Wayne & Springfield Railway Company's line has been completed and cars are now operating between Ft. Wayne and Decatur, Ind. This company was originally organized to construct and operate an electric railway from Ft. Wayne, Ind., to Springfield, Ohio, but it was later decided, because of subsequent railway development in western Ohio, to build from Ft. Wayne south to Portland, Ind., a distance of 50 miles. Though the route was changed, the original name was retained, and the line now in operation comprises the first division of the railway as it is to be built under the revised plans. The construction of the second division will soon be under way from Decatur to Portland, where connection will be had with the Muncie & Portland Traction Company's new line, which was described in the *Electric Railway Review* for October, 1906, page 929.

of the subgrade. The upper dressing is composed of a substantial gravel which was obtained from the company's own pit located about midway between the present terminals. Concrete was used exclusively in the bridge abutment and waterway construction. There are eight bridges of the deck girder type and one 155-foot span truss bridge on the line. The latter spans the St. Mary's river at a point a short distance from the power plant. Each bridge is of 100 tons capacity.

The tracks are laid with 70-pound A. S. C. E. section steel rails on standard ties. The rails are joined mechanically by standard six-bolt splice bars and electrically by the Ohio Brass Company's No. 0000 soldered bonds.

Power House.

The power house and car barns are situated on a 14½-acre tract of ground, owned by the company, located just

Ft. Wayne & Springfield Railway—Showing Cars Standing in Front of Power House.

The line is operated electrically by single-phase alternating current with a line pressure of 6,600 volts. The overhead work is of the latest type of catenary construction and the line throughout is well designed. The franchises which the company holds run for 50 years. The line is located favorably for controlling a healthy freight and passenger traffic. The city of Ft. Wayne, the northern terminus, with its suburbs has a population of 61,000 and Decatur has a population of 5,000. The estimated population adjacent to the right of way between Ft. Wayne and Decatur is 13,000, making a total estimated population of nearly 80,000 to be served by the line. In addition to this, the company is drawing a large patronage from the four other interurban lines radiating from Ft. Wayne.

Track and Roadway.

The completed section of the Ft. Wayne & Springfield Railway, 21.6 miles long, parallels the old Piqua pike and is almost wholly located on private right of way from 30 feet to 100 feet in width. The maximum grade on the line between Ft. Wayne and Decatur is 1.8 per cent and the greatest curve

is five degrees. Much care was given to the construction north of the city of Decatur. The east, north and south walls of the power house are constructed of concrete blocks moulded in sections 8 by 12 by 24 inches in area and are provided with interior air chambers. There were 7,200 blocks used in the power house construction. These were made by day labor at an average cost of 15 cents each. They were mixed in the proportion of one part cement to two parts sand and were cast in an Ideal concrete block machine. After the material was delivered to the machine, which was located near the power house site, it took four men to make the blocks at the rate of 100 a day. It required about ten days of good weather to dry the blocks sufficiently to allow them to be placed in position in the walls of the building. They were laid in cement mortar. The west wall of the structure is sealed up with sheet steel, and is designed to allow for future extensions of the building. All the material except the cement was obtained entirely from the property owned by the company.

The power house occupies a floor area 78 feet by 103

feet in dimensions. The boiler room is 42 feet by 68 feet in area and the balance of the building is divided into an engine and a transformer room.

Boiler Room.

The boiler room equipment consists of three Stirling boilers of 227-horsepower rated capacity each. They are arranged in two banks and work under a steam pressure of 150 pounds. Each boiler is provided with an iron smoke-stack 42 inches in diameter and 85 feet high above the grate surface. Two Platt Iron Works boiler-feed pumps, 7 and 4½ by 10 inches, are located between the two banks of boilers. They receive supply-water either from a 3,000-gallon storage tank or direct from the heater.

At the rear of the boilers is located a 1,000-horsepower Cookson heater, a storage tank 8 by 10 feet, and a condenser pit 6 by 10 by 24 feet. In the pit, the top of which comes

dividing the building into two fireproof parts. The engine room floor is elevated 6 feet above that of the boiler room. The foundations supporting the engines and generators are of concrete. The generating equipment consists of an 18 and 36 by 36-inch Buckeye engine of 675-horsepower capacity, which is operated at 125 revolutions per minute. It is direct connected to a Westinghouse single-phase, alternating-current generator of 450 kilowatts capacity. There are also located here a belt and an engine-driven exciter of 22½ kilowatt capacity each. The former is driven by a belt from the fly-wheel and the latter is driven by a Westinghouse junior engine.

Alternating current is generated at a line pressure of 6,600 volts and is fed direct into the trolley wire. No feeder or auxiliary wires have been provided and as the line loss is but slight it is not expected that they will be necessary to

Ft. Wayne & Springfield Railway—Catenary Construction on Tangent.

up flush with the floor of the boiler room, is located a jet condenser and a 6 and 8½ by 6-inch service pump, which supplies the storage tank. The water supply is taken either from the well or from the discharge of the condenser.

Water is obtained from the St. Mary's river, about 100 yards from the power house. A main service pipe, 15 inches in diameter, leads from the river to a well, 25 feet deep and 10 feet in diameter, which is located in front of the boiler room. An 8-inch suction pipe leads from the well to the condenser.

The main steam header, 10 inches in diameter, is located along the dividing wall between the engine and boiler rooms. The steam pipes leading from the boilers pass with quarter-bends overhead direct into the header. From the header the steam is led by 3 and 7-inch pipes with quarter bends to the engine. The steam exhaust, 14 inches in diameter, is arranged so as to allow the engine to be worked either condensing or non-condensing. All pipes are covered with the Phillip-Carey 85 per cent magnesia.

Between the boiler and engine rooms a partition wall, built of concrete blocks, extends from the floor to the roof

maintain the desired pressure when the road is extended to Portland.

At the south side of the power house a transformer room 14 by 30 feet in area has been provided. In this room is located one Westinghouse 200-kilowatt step-down transformer, which is used in reducing the line pressure from 6,600 to 550 volts alternating current for use on the trolley wire within the corporate limits of Decatur.

Overhead Lines.

The overhead construction is of the catenary type and is composed of a No. 0000 grooved trolley wire suspended from a 7/16-inch galvanized iron wire cable which in turn is supported by T-shaped iron brackets. The hangers supporting the trolley are connected to the catenary cable every 10 feet by ½-inch iron rods clamped to the trolley and cable respectively by screw clamps and messenger clips. Ordinary span-wire construction is used. The poles used in the pole line construction are in 30, 35 and 40 foot lengths, except in towns, where they are 55 and 60 feet long. In addition to the trolley wire these poles carry telephone and signal

wires. The cars are dispatched by telephone, the dispatcher's office being located at Decatur.

At Ft. Wayne, where the company's cars enter onto the city tracks of the Ft. Wayne & Wabash Valley Traction Company, the direct current of the city line is used. Substantial line circuit breakers and a dead-line span 200 feet in length

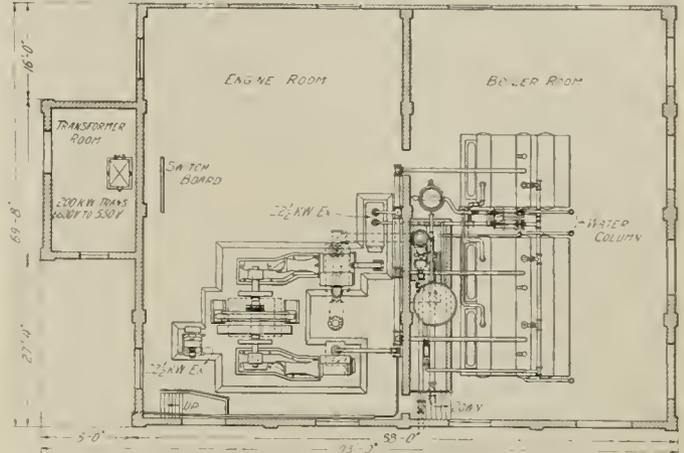

tion. After the circuit breakers have been passed and the switches are again opened, the car is allowed to continue its journey.

Car Barns.

The car barns, rectangular in shape, occupy a floor space 31 by 151 feet. The walls are 24 feet high. This building is also constructed of concrete blocks and is so designed that

Ft. Wayne & Springfield Railway—Car Barn and Power House.

Ft. Wayne & Springfield Railway—Plan of Power House.

are provided where the connection is made. Westinghouse type-A oil switches are used for cutting the current in or out on the dead piece of trolley. This precludes the danger of the high voltage overlapping onto the low voltage direct-current construction. A similar arrangement is made at Decatur, where the low voltage for city operation is substituted

an addition can be built onto the west or south sides without interfering with the general layout. Two tracks enter the building from the east side. Concrete pits are provided under both tracks at the front of the building. The shops are equipped with a 22-inch lathe, a 16-inch shaper, a 22-inch

Ft. Wayne & Springfield Railway—Catenary Construction on Curves.

Ft. Wayne & Springfield Railway—Cut-out Boxes and Line Circuit Breakers.

for the high voltage. In running in either direction cars are brought to a stop with the trolley bow or wheel on some part of the dead section. After the car circuit and the current collector have been changed either for direct-current or for alternating-current operation (according to the direction the car is going), current is thrown into the dead sec-

tion. After the circuit breakers have been passed and the switches are again opened, the car is allowed to continue its journey.

Equipment.

The car equipment at present consists of three three-compartment passenger cars 53 feet in length and one express car 48 feet in length over all. The cars are each

equipped with four Westinghouse No. 106 alternating-current quadruple motors, each of which has a rated capacity of 75 horsepower. They are designed to operate successfully with either alternating or direct current. The baggage car is mounted on Peckham and the three passenger cars on Baldwin trucks of the heavy M. C. B. type. Westinghouse air-brakes and multiple-unit alternating-current and direct-current train control are used. The cars are equipped with the bow trolley for high voltage, alternating-current operation and with the trolley pole and wheel for direct-current and low voltage alternating-current operation.

The work of building from Decatur to Portland, the second division of the railway system, will begin early this spring. The right of way for this division has already been secured.

Personnel.

The general offices are located at Decatur, Indiana. The organizers of the company and the officers are: President and general manager, W. H. Fledderjohann; vice-president and general counsel, John H. Koenig, St. Mary's, O.; secretary, B. A. Fledderjohann, New Bremen, O.; treasurer, M. H. Wilson, Cleveland, O.; general superintendent, T. W. Shelton; superintendent of construction, Edwin Fledderjohann.

FIVE-CENT FARES.*

The five-cent fare with universal transfers is virtually the American idea of the street car fare, and will undoubtedly prevail in this country for many years to come. The wage-earner in America is better able to pay a five-cent fare than his European brother is the three-cent fare. The use of the "zone" system would never be popular in America, as it tends to congestion, misery and disease, by breeding tenement houses. In this country the enterprising laborer and artisan, with his home in the suburbs of the city, is carried to and from his work regardless of distance, for five cents. Whereas, under the foreign zone system he would have no alternative than the restricted slum district in the zone in which he worked.

All people do not ride of necessity. The short ride may be termed a luxury. The long ride is, however, a necessity. Shall we reduce the price of the luxury and raise the price of the necessity? To do so would be un-American.

Everything which enters into the daily life of the average citizen almost without exception, has risen in value during the past few years, excepting street car fares, which in reality are being reduced (although the fare may remain at five cents), for the reason that as the city grows, the lines are extended and a longer haul is given by the transportation company.

The great question of wages is the basis of the cost not only of the operation of the railway, but of its construction, and practically, all the materials and machinery which it requires in its equipment.

Take by way of comparison Denver, Colo., and Glasgow, Scotland. Wages of the trainmen in both of these cities are above the average paid in their respective countries, being as follows:

Glasgow	14 cents
Denver	27 cents

That which is true of the trainmen is true of all other forms of labor. The amount paid for one hour's labor in Denver would buy practically two in Glasgow. (Glasgow is cited as it stands at the head of municipally managed tramways of the world.)

Do the citizens of Glasgow get a corresponding reduction in fares? From the last report it appears that the average rate of fare paid per passenger per mile is 0.9 cents. The average rate of fare charged in Denver during the same period is exactly the same rate.

The maximum ride in Denver for five cents is 15 miles, while in Glasgow it is but 5.8 miles. The lowest rate of fare in Glasgow per passenger mile is 0.8 cents, and in Denver 0.3 cents.

In Glasgow no transfers are issued, while in Denver the universal transfer system prevails, and 14,000,000 passengers availed themselves of them during the past year.

In European cities where lower fares prevail there are fewer miles of railway for the population served. Denver has 26 different routes of street car lines with a population

of 200,000, while Glasgow, with a population of upwards of 800,000 has but 12 lines of railway.

Regarding the subject of taxation. The city of Denver is receiving more in gross taxes annually from its street railway than Glasgow. The amount of taxes paid per capita for the population served is:

Denver	90 cents
Glasgow	17 cents

Of course there may be some special lines here and there throughout the country where very heavy travel is continuous and where the haul is comparatively short. Such individual lines might possibly be operated at a profit on a three-cent fare, but these lines are few and far between, and generally the company which has one or two such lines have many others which are not nearly so profitable, and still others which do not pay expenses, and these lines simply sustain the others.

Therefore the writer does not anticipate the possibility of any marked reduction in street car fares in America in the near future unless the owners are willing to operate them at a loss or the scale of wages in America falls to the level that prevails over the waters.

STATIONS ON THE BRIGHTON BEACH LINE OF THE BROOKLYN HEIGHTS RAILROAD COMPANY.

In the December issue of the Electric Railway Review was published an illustrated article on the Brighton Beach line of the Brooklyn Heights Railroad Company, which for a distance of 6,400 feet from Church street to Fiske Terrace is being reconstructed as an open cut between concrete retaining walls and from Fisk Terrace to Coney Island is being elevated on an embankment. The reconstruction work was undertaken primarily as a problem in grade crossing elimination. Plans have now been prepared by the company for the various express and local stations to be erected along the reconstructed route.

On the open subway from Church avenue to Fiske Terrace these stations will have their platforms at track edge and these will connect by wide stairs with the station structures which are to be bridged over the tracks and at street level. Such structures will include the local stations at Beverly Road and Avenue C and the large express and local station which will extend from Foster to Newkirk avenues. The buildings will be steel framed, copper sheathed and roofed in a deep red Spanish tile. Inside the stations will be finished in oak, made most commodious and equipped with public toilets, ticket offices, waiting rooms and news stands. Electric bell and light signals will give sufficient announcement of coming trains to enable passengers to wait in the stations above the tracks.

The platforms are 8 feet wide and 300 feet long to accommodate eight-car trains without difficulty. They have been built at car-floor level and are reached by short and easy flights of stairs from the waiting rooms. A canopy protection extending their entire length affords sufficient protection from rain and bad weather.

On the south or embankment section of the new work local stations are to be built at Manhattan Terrace, Elm avenue, Avenue U and Neck Road, with express stations at Kings Highway and Shore Road. In these cases the stations are entered below the tracks, the waiting rooms and stations proper being at street level and beneath the girder bridges that will carry the railroad over the highway intersections.

The train platforms will be of the same dimensions as those along the open subway, island platforms being used for the express stations. From each of these stations broad stairs lead down through the concrete retaining walls of the dirt fill to the station buildings, which are built of a handsome grade of repressed brick on the outside and lined with a decorative design of porcelain tile on the inside. Floors will be tiled and the only wood used in the construction will be that which goes into ticket booths and news stands. The entire building will be clean, sanitary and attractive.

A special design of station is to be built at Fiske Terrace where the new road comes from the open cut up upon the embankment. At all stations passengers will pay their fare before entering the trains, the present system of fare collection by conductors being entirely abolished. Overhead wires are to come down and third-rail operation substituted before the opening of the new line early in the coming summer.

*By John A. Beeler, vice-president and general manager Denver City Tramway Company, in "Public Service."

CAR INSPECTION.*

BY LEE W. JACQUES, MASTER MECHANIC, FORT WAYNE & WABASH VALLEY TRACTION COMPANY.

Car inspection, as applied to street railway and interurban service, is to be considered one of the most important points with which the electric railway men have to contend. It should be considered from several different standpoints, viz.:—Safety to the public, maintenance of proper schedules and economy in maintenance of equipment. Proper inspection is the greatest insurance, both to ourselves and to the public, and the only way in which a satisfactory degree of safety can be assured.

As regards the maintenance of proper schedules, inspection greatly reduces the liability of cars failing while in service, and lessens the chances for the public to express opinions regarding the poor service that electric railways maintain for the different city and interurban lines. Poor service has a tendency to make the public, in general, think that electricity is not as reliable as steam, when applied to transportation.

When inspection, as regards the maintenance of equipment, is considered from an economical standpoint, the old adage that "a stitch in time saves nine" is expressly applicable. Inspection of electric cars should be similar to that of locomotives on steam lines, and not like the inspection of railroad cars or coaches, as each individual electric car has its own motive power, in which a small defect may cause serious trouble and much expense and delay.

Accidents, such as the burning out of controllers and derailments caused by broken flanges, etc., can generally, with proper and thorough inspection at frequent intervals, be avoided.

At the present time, especially in the east and the middle west, electric lines handle, daily, many more people than the steam lines; therefore, we should be equal, or superior, to them in the inspection and maintenance of equipment, and have facilities by which each car can have thorough and complete inspection at frequent intervals.

On many of the city lines cars are allowed to run several days without complete inspection. This is generally owing to the crowded condition of shops and pit rooms, as many of the older city lines are still using the same shops, or portions of them, that were used when horse cars were in service. These shops are centrally located in a majority of cases, and floor space and pit rooms cannot be obtained, owing to the excessive price of adjoining grounds. Consequently, the cars cannot all be run over the pit each night, but have to be divided for inspection alternately; and it is sometimes several nights or days before all the cars are inspected. To a large extent this explains why so many cars fail while in service, interrupting schedules and giving great dissatisfaction, both to the management and the public.

Another point to be considered is that most of this work has to be done at night when it is necessary to use torches or extension lights while inspecting all parts under the cars, and an inspector is much more liable to miss defective parts than he would be in daylight. Most street railways, and also other industries, do not think night work can be carried on as economically as day work, which is true to a great extent; but as most city lines have only a few extra cars and limited room, an additional night force, with a competent and wide-awake foreman and inspector, seems to be the only solution.

We believe the inspector should be jointly responsible with the foreman for the condition of the equipment and also the manner in which repairs are made. He should be thoroughly familiar with the different types of equipment he is required to inspect, and it should be his duty to carefully inspect each car underneath as soon as it arrives over the pit; and, if conditions warrant, to complete the inspection of controllers and car bodies afterward, in order to allow room on the pit for the next car. After completing his inspection, he should make a report on a blank form furnished for this purpose. He should also know that the work has been done before the car is allowed to enter service, and should promptly report to his foreman any errors made in repairs.

Shop condition is another point to be considered. When building new shops, would it not be well to consider the fact, that although central location may be sacrificed, considerable advantage would be gained by securing plenty of room for storage, repairs and inspection? Another important fact that is quite likely to be overlooked is the advantage of complete inspection. The cars would pass over the pit each night and the inspector would be allowed time to go over them thoroughly. One or two pits could be located in places where

cars would pass over them. If a car is found to be in good condition it could be taken to a place for storage; and if not it could be taken to a pit room for proper repairs. This would greatly facilitate both inspection and repairs; and also save much time in shifting to get defective cars where they can be repaired.

Interurban shops and barns are generally located in small towns where land is not so expensive, but unless the shops are very modern, conditions are much the same as in cities, as the buildings in most cases are too small to accommodate the increase in equipment that the business now demands. In other words, the present large equipment now used for interurban service, has outgrown shop facilities. However, as these cars are less in number and not so closely scheduled, there is much better opportunity to give them necessary inspection.

At the present time, with the high speed that is required of these cars, their frequent and careful inspection is of the greatest importance, as there are many defects that would not only delay schedules, but might result in serious accident and loss of life. Inspection of interurban cars should be the same as with the smaller equipment, only, of course, more time would be required.

In addition to shop inspection each night, I would suggest that the motorman could be of great service if put through a practical shop course and taught where he would be likely to find the defects, and the best manner in which to correct them. On most interurban lines the schedule allows considerable time to lay over at the end of each trip, and if the motorman was required to inspect and to do light repairs, he would soon become quite proficient. He should provide himself, or be provided, with suitable over-clothes and tools for this work, and he might be the saving of many delays and possibly serious accidents that could be caused by broken or sharp flanges, loose tires, etc., which can readily be detected in daylight. If motormen were placed on the same level and held responsible, as locomotive engineers are in steam railroad service, and were given the proper training, there would be many less failures and interruption of schedules than there are now; and no doubt, in certain cases, accidents would be avoided. This should be the motorman's duty as well as handling the car; however, his defect report to the shop-men should in no way interfere with their inspection.

Many roads contend that it is not necessary for motormen to know too much about electrical equipment, and simply teach them to cut out motors, replace fuses and brushes and make other minor repairs. There are some good arguments in favor of this, especially in city services where motormen are quite likely to attempt to make repairs of which they have little knowledge and thus to delay schedules and damage the equipment; but in interurban service, more time could be given to their training and more shop experience afforded, so that they would soon be able to detect many small defects that are now overlooked. At the end of the runs, providing the schedules permitted a lay-over, as most of them do, motormen could make a thorough inspection of all parts of the car that can be easily reached. Many times a motor brush will stick in the brush-holder or there will be broken brushes, loose brush-holders, etc., which can be easily detected and would cause many unnecessary interruptions by pulling the car in for knocking the circuit breaker or blowing fuses. The damage to commutators, brush-holders, etc., should be considered; and in many cases repair bills would be greatly reduced. There are also many other light repairs, such as tightening loose bolts on the trucks or brake rigging which can easily be accomplished. Frequently the loss of a cotter pin in certain parts of the brake rigging will cause the loss of a pin and the result is, the car has no brake. This is generally found out at a point where a stop is very essential, and the newspapers publish an account that the air brakes failed to work, giving full details of the accident.

By a thorough system of car inspection each time the car comes to the shop, and by having motormen thoroughly competent to inspect and to make light repairs at the end of each trip, an unsafe or dangerous condition in cars would not be likely to occur, and we would have the best possible safeguard against any liability of accident, either to the public or the equipment, thereby saving the claim and mechanical departments financially to a great extent. The more frequent and thorough the inspection is by thorough and competent men, the less is the liability to damage suits, and the more economical is the service.

Discussion on Car Inspection.

The discussion on this paper turned largely upon the proper uniforms for the motormen of interurban cars.

F. A. Bundy (Lima & Toledo) said that motormen would

*Read before the Central Electric Railway Association, Dayton, O., March 28, 1907.

take an interest in making careful inspections and were willing and anxious to make the light repairs that were sometimes necessary, provided doing so would not ruin their uniforms. He believed that if the motormen wore overalls and jumpers the best results would be secured.

E. C. Spring (Dayton Covington & Piqua) and George Whysall (Columbus Delaware & Marion) opposed this on the ground that the repair shops should not be spread over the entire road, and that with proper shop management and inspection there was no need for motormen making repairs or inspections of cars that would require them to soil their uniforms; also, they believed men in overalls do not present a good appearance.

W. H. Evans (Indianapolis Traction & Terminal), A. A. Anderson (Indianapolis Columbus & Southern) and C. Skinner (Scioto Valley) approved of overalls for motormen as their experience had been that the clothes question was a very important one; a motorman wearing a comparatively expensive uniform would not go under a car to make some slight repair because it meant the ruin of his uniform, a matter of \$20 or \$25 to him. Mr. Anderson had introduced the overall and jumper uniform on lines entering Indianapolis and said he believed the men presented a better appearance in neat washable clothes than in the shabby cloth uniforms, which cost 12 or 15 times as much and were not renewed and cared for. Mr. Skinner said that the Scioto Valley motormen considered their washable uniforms good enough to wear any place.

In concluding the discussion Mr. Skinner explained that on his line the motormen carefully inspected their cars at each end of their runs. The motormen were carefully instructed by the inspector of air brakes and the electrician and were given practical lessons in assembling dismantled car equipment.

TRACK BONDING.*

BY THOMAS B. MCMATH, CHIEF ENGINEER, INDIANAPOLIS TRACTION & TERMINAL COMPANY.

The earliest track bonding that came to my attention was that of old tram rails laid on wooden stringers. This was done by drilling a $\frac{3}{8}$ -inch hole in the tram near the end of the rail. The bond used was of No. 4 galvanized iron wire. A rivet was started in the hole, about two turns of the wire were taken around the rivet, and then the rivet was set. In speaking of this work some time ago a statement was made that no pains were taken to get good contact. This is the general opinion of present critics. I do not think this was ever the case. Frantic efforts were made to pour solder on the wraps of wire around the heads of those rivets. The head of the rivet was under the rail with a clearance space notched out of the stringer; the end of a rail was raised for installing the bond. The difficulty of the work was increased by the fact that a mule car ran every 10 minutes. It might be added that the contempt of the mule driver for new methods of propulsion and the conceit of the expert applying the bonds found expression in plain language.

The next track bonding effort in my knowledge retained the galvanized iron wire feature, but a wire was run the full length of the track and connected with each joint bond; but even in this type of bonding an effort was made at good contact, as all wire splices were soldered.

The failure of bonding during these periods was not hard to explain. The entire track construction was so weak that the failure to secure a proper return was largely chargeable against the track as well as the defect in capacity of the bond. At this time, while the tram rail was still in use, the $\frac{4}{2}$ -inch girder rail was considered standard construction for horse car work and, it was expected, would be satisfactory for electric cars if only bonded.

The channel pin was generally used with wire bonds and was the first efficient terminal. It was first used with galvanized iron wire up to No. 0000.

This type of bonding held its own in popularity and efficiency until superseded by bonds concealed under the fish plate. The popularity of this type was largely due to the possibility of using all scrap wire from feeders and trolley as bonds. Its efficiency was due to its easy application by un-

skilled workmen; its failure due to the ease with which the copper on exposed track could be stolen.

With the 6-inch girder rail, however, a much better bond was used, known as the Chicago bond. The bonds used by the writer were solid, with No. 0 wire with a large base at the terminal end, and the terminal was threaded. After the terminal was put through the rail a brass nut was put on and pulled tight.

Contact was provided by milling the rail around the hole with a special tool, the large contact being provided by the boss against the milling surface. Special pains were taken to insure contact, as a strip of solder was introduced under this boss and, after heating with a torch, the nut was given an extra turn; and, finally, the end of the thread was riveted to prevent the nut from coming loose.

The next bond which came to my notice was the No. 00 Atkinson Horseshoe, about $2\frac{1}{2}$ inches long. This was presumably applied with a single screw compressor; but in reality a large majority of these bonds were driven in and riveted with a hammer. This bond gave a good result on account of the increase in capacity and because of the fact that it was used on good firm joints. On loose joints, however, the shortness of length and the lack of flexibility soon destroyed the contacts. The No. 000 and No. 0000 Washburn & Moen bond, known as the Crown bond, was the next. This bond had a hollow terminal, which was expanded after its insertion in the rail by a tapered steel plug. These bonds proved to be good. The point of failure was generally in drilling a hole of the exact size needed for the terminal, and the limited expansion the plug would give. The result was loose terminals. There are bonds of this description in track at Indianapolis that test fair now after six to seven years' use.

The standard bond in use in Indianapolis is a No. 0000 10-inch flexible bond with a $\frac{7}{8}$ -inch compressed terminal. With this type of bond the chief difficulty is the connection of the flexible strand or ribbon wire with the terminal. Each manufacturer claims that his process is the best. But all are affected by the personal errors of workmen in manufacture. Certain heat conditions, together with proper manipulation at the exact moment, are essential to production of the good bond. Individual wires badly burned, and wires practically cut through in the process of forging, are frequently found in all these bonds. I know of no practical test that can be applied to ascertain conditions at the merging of the strands into the terminal. In sawing terminals open with a hack-saw, the condition of the surfaces exposed does not prove contacts, as the drag of the saw teeth in a material that flows as readily as soft copper will cover and smooth over irregularities.

If the terminal is quartered by hack-saw cuts down to the flat and these quarters are spread and flattened back by sharp, heavy blows with a hammer, the test may demonstrate the ductility and hardness of the material and may show some measure of the contact between the ribbon wire and the head in cases where the head was originally a separate piece.

For testing all contacts of ribbon or strand wire with the terminal the following is suggested: Hold the head firmly in a vise; after cutting the strands some two or three inches from the head and bending them back against the terminal, take the individual wires and separate them from the head by a strong, sharp jerk. This will show relatively the reduction in area, brittleness and possible defect.

The manufacturers do not pay sufficient attention to smooth terminals. Frequently terminals are so rough that an appreciable flow of material under compression will be required to bring cavities into contact.

A serious difficulty in bonding is the drilling of holes in the rail. New twist drills will bore an exact hole, but if they are ground by hand they will not bore true holes. A tool grinder is therefore essential. A Yankee tool grinder in the shop, or one of the portable tool grinders now obtainable, should be used exclusively for bits. A portable grinder costs about \$15 and, if fastened on a hand car, a wagon bed or even on a block of wood, can be conveniently carried. If the grinder is attached to a piece of board and nailed to a pole or a tie, grinding can be accomplished easily.

In one instance, after carefully bonding some three miles of track, I found at the end of three months that 15 per cent of the bonds were faulty and I am convinced that defectively ground hits were responsible. The original holes were drilled with a Ludlow electric track drill after the track was laid, and the holes were drilled dry so that no oil or dust could prevent contact. The bonds were immediately applied with good compression. It was decided that one of the bits used had evidently, due to defective grinding, drilled a hole nearly $\frac{1}{8}$ of an inch large. The only defective bonds were consecutive along one side of a track, and the holes were found to be too large.

It is necessary to insist on the use of the tool grinder, as men claim they can grind better by hand. Investigation

*Read before Central Electric Railway Association, Dayton, O., March 23.

has shown that all claims of better grinding by hand were due to a wire edge left by the tool grinder which prevents good cutting. The wire edge can be easily removed by the back of a knife blade. If one man is made responsible for the field grinding he will understand the necessary kinds of grinding and will take pride in doing the work well.

The writer has never personally used plastic bonds. His experience with solders of low melting temperature, containing bismuth and mercury, demonstrated sufficiently that such alloys will granulate and disintegrate in time. Soldered bonds are a success when carefully applied. They give good contact and are hard to remove. Good track with firm joints are necessary for the success of a soldered bond.

The use of a bond brazed to the rails by means of an electric brazing device gives the best contact that can be obtained. This process of brazing, however, includes the merging of the ribbon wires into a solid mass for a terminal, which is the most delicate part of bond manufacture. The forging of a bond can be entrusted only to a workman of the highest skill. Railway companies will find it difficult to do work themselves with such a machine unless they are able to find and to keep an operator who possesses the requisite skill.

In Indianapolis there are 40 miles of track with cast weld joints which also provide the electric contact. These joints have been tested several times and show excellent contact. There is about 1 per cent of open joints which have been bonded after five to six years of service.

It is frequently impossible to bond all joints in special work for the reason that the compressor cannot be applied. Long bonds must be used to connect all pieces that would leave open joints. In addition it is best with complicated layouts to use long bonds to jump the entire piece of special work. The size and the number of such long jump bonds depend on the amount of return current to be carried. Long bonds can be made with terminals spliced and soldered to the wire or cable.

Manufacturers charge more for two terminal ends than for a 30-inch cable bond, which, if cut in two, will provide the desired terminals. The reason for this is the manufacturer's secret.

The general rule in cross bonding is to use a cross bond every 500 feet and at both ends of all special work. Double track should be bonded across at least every 1,000 feet. A bond made 66 inches long will suffice for both track and "devil" strip cross bonding.

Bond testing can be done with very simple instruments. The double voltmeter is sufficient. This is wired to knife-edge terminals; one reading is taken through the joint and the other through a similar length of rail. A comparison of the drops shown by each meter will give the relative conductivity of joint and rail. A joint showing three times the resistance of an equal length of solid rail is frequently permitted. Greater resistance indicates that the bond should be renewed. The expense of removing and replacing the pavement, however, frequently prevents proper attention to poor bonds.

It is a slow and tedious task to go over any length of track with a bond tester. Sufficient attention, however, is not generally given to the condition of bonding. A bond supervisor should be employed on all roads, and no other duties should be imposed which will prevent him from making proper inspection. A good bond supervisor will undoubtedly be termed a crank by construction gangs, thus proving his efficiency.

A test car for the general inspection of bonding would be a good investment for roads with considerable length of track. Such a car has made trips over Indiana and Ohio roads. The car gave the general conditions, but registered more open joints than actually existed, as any break in contact between the wheel of the car and the rails will also register as an open joint. In spite of any local defect which may be missed or any non-existing defect which may be registered, the car would show the conditions of bonding at a lower expenditure per mile than any other method.

Discussion on Track Bonding.

A. A. Anderson (Indianapolis Columbus & Southern) asked as to whether Mr. McMath objected to the use of oil in drilling for bonds.

Mr. McMath replied that he did not, provided the oil were wiped off—the cleaner the metal the better—and he suggested the use of emery cloth to cleanse the surface of the hole.

G. H. Kelsay (Indiana Union Traction) stated that in installing bonds recently under the direction of the manufacturer he had used oil and cleaned the holes with gasoline.

W. H. Evans (Indianapolis Traction & Terminal) sug-

gested the use of drills of high-speed steel, which required neither water nor oil as a lubricant.

In response to a question by Mr. Kelsay as to efficiency of brazed bonds, C. N. Wilcoxon (Cleveland & Southwestern) stated that about 15 months ago the Electric Railway Improvement Company had installed bonds for one line of rails on two short divisions aggregating 14½ miles in length. These were of No. 0000 section and brazed. A recent inspection showed that out of 1,200 bonds installed only 7 were defective; of these 5 had broken strands and 2 had one terminal loosened. Later 523 brazed bonds had been installed on track in brick paved streets, where the rail joints were badly worn, and only 27 had proved defective in a recent inspection, which the speaker considered a very good showing.

George Whysall (Columbus Delaware & Marion) gave the cost of installing American Steel & Wire Company's double terminal bonds as from 8 to 10 cents each. In installing 1,000 of these bonds he has experienced trouble in drilling the holes nearer the ends of rails without oil. In a later installation of 1,000 of these bonds oil had been used and the holes cleaned with a cheesecloth swab dipped in gasoline. The speaker believed the principal difficulty in bond installation was that mechanics' work was expected from common laborers.

CAR WHEELS FOR INTERURBAN AND CITY SERVICE.*

BY C. SKINNER, MASTER MECHANIC SCIOTO VALLEY TRACTION COMPANY.

I wish first to state that I have interpreted this subject to mean, "Wheels for Heavy Interurban Cars, Operated over Both Interurban and City Tracks," and in the treatment of the matter at this time I have in mind only the operation of high-speed equipment weighing 40 tons or over per car.

I am fully satisfied that in the selection of wheels for this class of service, the specifications of the Master Car Builders' Association should be adhered to as nearly as possible. It may be, and in our case was, necessary to reduce the size of the wheel flanges somewhat in order to operate over city streets, and I believe the flange dimensions may be safely reduced to 1½ or 1 inch in depth and to 1¼ or 1½ inches through the throat, but I am firmly of the opinion that the 4-inch tread is essential to safe tracking and to obtain proper efficiency in braking, with heavy equipment.

My experience has been that the flangeless brake shoe is best for service in which heavy cars are operated over grooved rail in city streets, for the reason that the flange wear, already excessive, should not be increased by the use of a flanged shoe. We have demonstrated by practical tests that the wear on the wheel flange by the adhering of a brake shoe to the flange of the wheel reduces the possible length of time between tire turnings, by nearly 30 per cent. Therefore, in the operation of heavy equipment at high speed, with flangeless brake shoes, we need a fairly wide tread to obtain sufficient braking power.

The question of safety in tracking is an extremely important one. I believe all will agree that no system of inspection, no matter how thorough, can be depended upon to detect a wheel that is loose and working at the axle fit, at just the time it occurs. Therefore, why reduce the factor of safety from this not unusual trouble, especially when we have to meet a condition in operating over city tracks that greatly increases the liability of wheels to loosen on the axle fit? Recognizing the desire and expediency of having interurban companies operate their cars over the tracks of city companies within the limits of municipalities, I believe that in the operation of this same heavy equipment at high speeds outside of city limits, safety must be the first consideration. I will give a brief resume of the experience of the Scioto Valley Traction Company with the wheel question. This company commenced operation in July, 1904, and until about December 1, 1904, operated on its own T-rail tracks exclusively, not entering Columbus over the city tracks until the latter date.

The records from which data were obtained for this report cover ten 60-foot passenger cars of this company, weighing 42 tons each, and equipped with 36-inch steel tired wheels, having M. C. B. tread with flange 1 inch deep by 11-16 inches thick through the throat. (This was found to be the max-

*Read before Central Electric Railway Association, Dayton, O., March 28.

imum size of flange which could be operated over the groove rail tracks in the city of Columbus).

The accompanying illustration shows the exact wear on flanges of a pair of wheels removed from one of the cars on March 22, 1907; this pair of wheels having been placed under this car November 8, 1906, with tires newly turned to the dimensions mentioned above. The mileage made by this pair of wheels during this interval was 28,000 miles. This wear was, however, somewhat abnormal, as we average about eight months between turnings, or about 48,000 miles. The first five months of our operation, you will recall, was over T-rail, and I would call particular attention to the fact that during that time, our wheel flanges showed no perceptible wear. Since December 1, 1904, or during a period of about 27 months we have been obliged to remove and turn 93 pairs of wheels for no other cause than worn flanges. The distance covered in going in and out of the city of Columbus is seven miles, about one half of which is grooved rail with 1 1/4 inch groove.

In looking at the illustration, you will observe the excessive wear on the inside of the flange. This wear, coming at the angle it does, shows a very severe wedging tendency, which finds its weakest point at the wheel and axle fit. The inertia from the swaying of the heavy car and from climbing the inside of the groove where the track is out of alignment, make it very difficult to maintain an immovable wheel at this fit. In less than two months after commencing operation over the city tracks, we had a large number of loose wheels, that is to say, they had moved out of gauge on the axles notwithstanding that it afterward took from 45 to 60 tons hydraulic pressure to move the same wheels in the shops. We replaced these wheels at from 90 to 125 tons pressure, and have been fairly successful in keeping them tight.

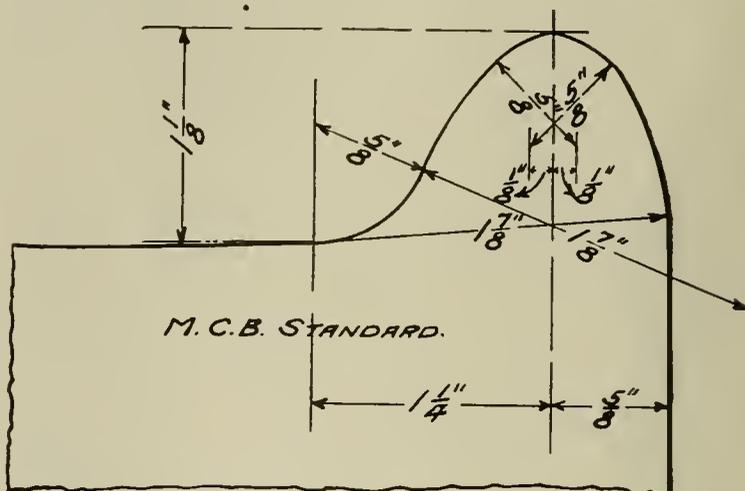

Judging from our experience, I should say that wheels for this class of service should be pressed on at about 90 tons, with a minimum of 70 tons. I have handled wheels of identically the same design on steam railroads for a number of years, using 40 tons as a maximum pressure, with no trouble from loosening.

Although over half of the wheels under the cars covered in this report have been refitted on account of becoming loose, we find it necessary to maintain the most rigid inspection of our wheels. We keep a trained inspector whose principal duty it is to gauge each pair of wheels each day a car is in the shops, which is every alternate day. The spread is measured by a solid immovable gauge and a written record is made of the position of the wheels on the axle. This report is turned into my office, where it is carefully checked with the former records. It is not unusual even now to find a wheel loosened, notwithstanding the enormous pressure at which we put them on.

Some idea of the excessive wear of flanges due to the cause mentioned may be shown by comparison with the life of the same wheel under equipment of equal weight on steam railroads; it is not unusual to obtain a mileage on steam

back to back of wheels accurate, and that the minimum was 4 feet 6 inches.

Replying to an inquiry, Mr. Skinner said he had found no marked difference in the wear of wheels on the gear end of the axle, and that in the drawing submitted the lesser wear was on the gear end. This was contrary to the experience

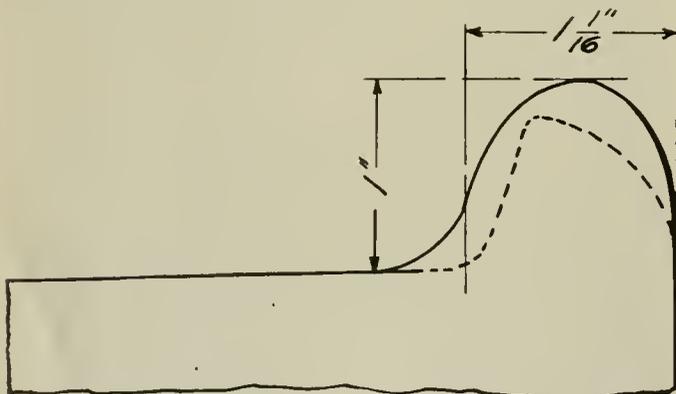

Wheels—M. C. B. Standard Wheel Flange—Full Size.

of a number of speakers, who stated that the wheel on the gear end of the axle showed the greater wear.

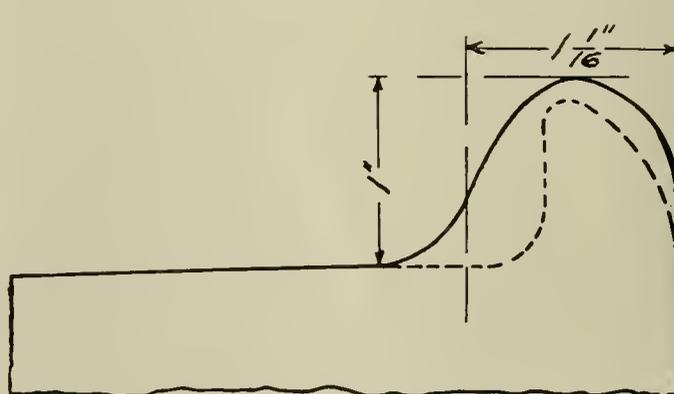

George Whysall (Columbus Delaware & Marion) attributed the trouble with wheel wear on his road largely to the varying gauges of special work in Columbus, which were from 4 feet 3 1/4 inches to 4 feet 9 inches.

F. A. Bundy (Lima & Toledo Traction) stated he found the principal wear on the gear end of the axle, and that steel tires would not run 50,000 miles before the flange wore to 1/2 inch in thickness. In turning worn wheels he made the wheel on the gear end a little large, and did not attempt to bring the flange up to standard gauge. The question of the effect of cars riding on the side bearings having been raised, Mr. Bundy said that this would not account for the result on his road, as there was a clearance of 3-16 to 1/4 inch on his cars.

W. H. Evans (Indianapolis Traction & Terminal) suggested that there might be a difference in wheel wear ac-

Wheels—Flange as Worn—Gear End of Axle—Full Size.

Wheels—Flange as Worn—Non-Gear End of Axle—Full Size.

roads of about 200,000 miles between turnings, while our average is 48,000 miles.

Discussion on Car Wheels.

T. B. McMath (Indianapolis Traction & Terminal) called attention to the drawing submitted by Mr. Skinner and said that with grooved guard rails wheels with 7/8 by 1 1/2 inch flanges would wedge, and tend to produce the effect shown. He considered it very important to have the gauging from

ording as the motors were inside or outside hung, and that the play in pedestals and boxes was an important matter. He also urged the need of careful measurement of wheels to insure that they are properly mated and properly centered on the axle; incompetent or unreliable help should not be employed in this work. In his practice tapes were used for measuring wheels, as he considered calipers unreliable. In turning steel tires the gear end wheel was left from 3-16 to

$\frac{3}{8}$ inch greater in circumference. The speaker considered a vertical flange $1\frac{1}{8}$ inches deep more dangerous than a smaller flange of the proper contour. He believed a 4-inch tread better than narrower ones and stated that in Kansas City no difficulty had been experienced in substituting $3\frac{1}{2}$ -inch treads where $2\frac{1}{2}$ -inch treads had been used before.

Mr. Bundy replied that if the equipment were uniform a wide tread would cause no trouble, but that if different treads were used there would be difficulties in running over switches.

TROLLEY WHEELS.*

BY M. BAXTER, ELECTRICAL ENGINEER, WESTERN OHIO RAILWAY COMPANY.

This paper is intended to deal with trolley wheels for interurban cars. Much time and expense can be saved by using trolley wheels designed for the particular service, and it pays to test them out thoroughly.

When testing a new wheel there should be kept not only car-mileage record of wheel, spindle and bushing, but also the record of complaints from the conductors. It should be known whether the wheel held to the wire and ran quietly. The wheel should be examined when it comes off the test to learn whether it met with accident or was entirely worn out. Spindle, lubricant, bushing and the flange of the wheel should be examined especially to see if the wheel wore true.

It pays to keep a complete record of every wheel used, and this can be done with little cost by the barn man who looks after the trolleys. Each wheel should be stamped and a record made of the date when it went into and came out of service, giving number of the car on which it was placed. This record can be completed by the man who takes care of the car-mileage.

If a record of all wheels is kept some of them will not be allowed to lie along the right of way to be picked up and sold, and we will get them to our own scrap pile. Very often where an extra pole and wheel are carried on a car the trainmen in their haste to make quick repairs and get their car back on time after a trolley wheel accident, will throw the old pole and wheel on ground, expecting the work car crew to pick it up some day.

If a record is kept the manager will know if the wheel manufacturer is keeping his product up to standard. If he learns of some other road, under similar conditions, which claims good results from a trolley wheel test, he will know if he cares to try that wheel.

Many delays on the road from trolley wheel trouble can be done away with by having a good man to inspect the wheels. This inspection should be made every day or after every 500-mile run. Much attention should be paid to the contacts and the collecting springs of wheels. These contacts and springs should be kept clean and in good shape so that the current will not depend upon the spindle for a path to the trolley pole. If it does the lubricant will soon dry out and the spindle or hub will be ruined.

Oftentimes a wheel is condemned when the real cause of the trouble may not be in the wheel. The cause may be in the trolley stand or the adjustment of the wheel in the harp.

To have the life of a wheel increased where double trolley wires are used and where the wheel has a tendency to wear only on one side instead of in the center, the trolley stand should be adjusted so that it will swing freely, but not too freely, for the high-speed road cannot make time with a too sensitive trolley stand. The tension of the wheel on the wire should be watched closely.

Many roads today are making their own trolley wheels from scrap that accumulates on their property. They claim a saving of about 30 per cent.

Discussion on Trolley Wheels.

After reading his paper Mr. Baxter requested that those present who had had experience with graphite bushings, and who made their own trolley wheels, and also those who had had experience with sliding trolleys, would give the results.

George Whysall (Columbus Delaware & Marion) stated that with ordinary care, that is, lubricating the trolley wheels at night only, Kalamazoo wheels made about 2,200 miles; lubricating them once during the middle of the day increased the life to an average of 6,500 miles, and in one case he had got 9,000 miles out of a wheel. He believed, however,

that the cost of the time required to give the extra lubrication was not compensated for by the longer life of the wheel. With the Hensley wheel he secured a mileage from 3,000 to 3,500. Until about two weeks ago the tension used with these was from 40 to 45 pounds 19 feet above the rail. Considerable trouble had been experienced by the trolley wire breaking near the ears. With the tension reduced to from 35 to 40 pounds the trolley wheel would leave the wire and some broken poles resulted. A tension of 40 to 45 pounds would keep the wheel on the wire at the speeds used, which are 40 miles on the average, with a maximum of 60.

Mr. Baxter said that a roller bearing trolley stand obviated the difficulty in regard to the wheel leaving the wire.

F. A. Bundy (Lima & Toledo) said that in applying oil to lubricate the Kalamazoo wheel the graphite bushing was spoiled and that good results from the use of graphite could not be expected under this condition. He had difficulty in keeping the Holland wheel on the wire. With the Hensley wheel twice the life had been secured by using a ball bearing base. Some difficulty had been experienced from scoring of the wheel hub, which he believed to be due to the wheel not being thoroughly cleansed from sand. With his average conditions, with lubrication every alternate day, Hensley wheels made from 3,200 to 3,300 miles. Mr. Bundy considered that the trolley wheel question was a very serious one and that the difficulties experienced were due to attempting to pass 500 to 800 amperes through a small contact area. He considered that a new contact device was necessary, one which would give sufficient area to carry the current needed. He had found that even with tension as high as 50 pounds 19 feet from the rail the trolley wheel would leave the wire if the retriever were not in perfect order, and that a lighter tension, 30 to 35 pounds, with a ball bearing base, kept the wheel to the wire better than the heavier tension and ordinary base. He suggests the use of metal molds for casting trolley wheels, to insure cleaner castings and greater symmetry.

J. E. Cochran (Lima & Toledo) stated that he had 65 miles of No. 000 trolley wire with clinch ears and had found no breaks at the ear, although there had been a few cases of the wire breaking between the poles. Examination showed the wire pitted and burned as badly 12 inches from the ear as at the ear. He believed that the trolley wheel, which had served very well for transmitting 125 amperes, was entirely unsuitable for transmitting 400 to 800 amperes, and that with speeds from 40 to 60 miles an hour there was certain to be arcing at the trolley wheel, which would burn the wire.

Mr. Whysall said that much of the trouble with trolley wheels leaving the wire was due to track and not to the wheel or the wire. A slight variation in the surface of the track caused a comparatively large movement at the height of the trolley wire.

G. H. Kelsay (Indiana Union Traction Company) criticized the design of trolley wheels, stating that many of them were not well balanced and that a wheel not perfectly balanced would cause pounding in the bearing and shorten its life. He believed that a light pole and a light wheel, together with a proper adjustment of the stand, would greatly improve matters. On the Indiana Union Traction lines there were a good many breaks in old trolley wire. This wire was of figure 8 section with clinch ears, 4 or 5 inches long, and the breaks occurred at the ears.

Replying to an inquiry concerning experience with bow trolleys on single-phase lines, Mr. Crouch of the Westinghouse company stated that aluminum sliding trolleys had given from 4,000 to 5,000 miles on 3,300 volt lines, and a greater mileage on 6,600 and 11,000 volt lines.

A. A. Anderson (Indianapolis Columbus & Southern) stated that the trolley tension used with the bow trolley, when he was on the Indianapolis & Cincinnati line, was 20 to 25 pounds, less pressure being necessary than with the

*Read before Central Electric Railway Association, Dayton, O., March 25.

wheel. Mr. Crouch gave the tension with the pantagraph type sliding trolley as from 15 to 20 pounds.

T. W. Shelton (Ft. Wayne & Springfield) stated that his road had been designed with a view to using the bow trolley, but that it was at present operated with trolley wheels, taking current at 6,600 volts. He had no difficulty with the wheel. Mr. Shelton considered that the catenary suspension was the safest, but called attention to the need of considering the difference in the coefficients of expansion of copper and steel, and stretching the copper wire tight; otherwise with higher temperatures there would be very marked sags in the copper wire, as it expanded more for a given rise in temperature than the messenger cable.

The discussion closed with some comments upon iron trolley wheels, Mr. Bundy stating that he had removed iron trolley wheels because he found them covered with copper and felt sure that the trolley wire was being worn rapidly.

VALUES OF TIES OF DIFFERENT MATERIALS.

In Bulletin No. 75 of the American Railway Engineering and Maintenance of Way Association Mr. W. C. Cushing, chief engineer of maintenance of way, Pennsylvania Lines West of Pittsburg, Southwest System, gives a series of tables showing the cost delivered which a white oak tie, lasting 10 years, must reach before it will be economical to use other kinds of tie; how long ties of different materials must last in order to be as economical as white oak costing 70 cents and lasting 10 years; and the first cost which can be paid for different kinds of ties in order to be as economical as white oak costing 70 cents and lasting 10 years. Mr. Cushing states that some of the data used are costs established from actual practice and from reliable information given, while in other cases assumptions have been made from the best information available, and from these apparently trustworthy premises the following deductions have been made:

With white oak ties costing 70 cents delivered on the railroad, it is economical at the present time to buy inferior woods at a price not to exceed 50 cents, have them treated with zinc-chloride or zinc-tannin, lay them in the tracks without the use of tie-plates (except where it is necessary to use them on oak ties) and use a standard railroad spike. A life of ten or eleven years has been found to be a maximum for such ties without the use of tie-plates and better fastenings, and if the life of 10 years is not attained, there will be that much loss to the company.

When a white oak tie reaches a cost of 86 cents or 87 cents delivered on the railroad, it will be economical to use the zinc-creosote process, or straight creosote costing 30 cents, if the tie costs 46 cents delivered on the railroad and will last 16 years; or, it will be economical to use straight creosoting costing 85 cents for treatment if the tie can be made to last 30 years, which is French practice, before the oak tie reaches a cost of 80 cents delivered on the railroad. In both of these cases, it is assumed that tie-plates, wood screws and helical linings are used because ties cannot be made to last more than ten or twelve years without the use of proper fastenings, since, otherwise, the tie will be destroyed by mechanical wear. It is necessary, therefore, to use improved fastenings when we expect to obtain a life of ties greater than ten or eleven years.

It will also be economical to use a steel tie costing \$1.75 delivered, if it will last 20 years.

When the white oak tie reaches a cost of 90 cents delivered on the railroad, it will be economical to use either ties of inferior woods treated with zinc-tannin if a life of 14 years can be obtained, the improved fastenings being used; or a concrete tie costing \$1.50 if it will last 20 years.

When the price of white oak ties reaches \$1 it will be economical to use a steel tie costing \$2.50 if it will last 30 years, a concrete tie costing \$2.25 if it will last 30 years, or an inferior wood tie treated with zinc-chloride if a life of 12 years can be obtained.

With ties of inferior woods costing 46 cents delivered on the railroad we must obtain a life of from 18 to 20 years, whether treated with zinc-chloride, zinc-tannin or zinc-creosote, to make them as economical as white oak ties costing 70 cents. It is assumed, of course, that they must have the most approved fastenings in order to attain an age as great as that.

With inferior woods costing 46 cents delivered on the

railroad, and if the creosoting costs 30 cents, it will be necessary for us to obtain a life of 21 years in order to make them as economical as white oak ties costing 70 cents delivered.

With inferior wood ties costing 46 cents delivered, and with the creosote treatment costing 85 cents as in French practice, it will be necessary for us to obtain a life of 36 years from the ties in order to make them as economical as white oak ties costing 70 cents delivered.

With steel ties costing \$1.75 each delivered, it will be necessary for us to obtain a life of 28½ years in order to have them as economical as white oak ties costing 70 cents delivered. This price is a little less than the cost of the Buhrer steel ties in the tracks at Emsworth.

With concrete ties costing \$1.50 each delivered, it will be necessary for them to last 28 years before they will be as economical as the white oak ties costing 70 cents delivered.

With steel ties costing \$2.50 delivered and concrete ties costing \$2.25 delivered, which are approximately the prices of the Seitz steel tie and the Buhrer concrete tie, in the tracks at Emsworth, it is necessary for them to last over 50 years each in order to make them as economical as the white oak ties costing 70 cents delivered.

In order to make treated inferior woods as economical as white oak costing 70 cents delivered, when the treated ties are equipped with proper fastenings in order to make them last as long as has been found practicable by experience, we can only afford to pay for the ties delivered on the railroad, 10 cents each when treated with zinc-chloride; 20 cents each when treated with zinc-tannin, or creosoted at 30 cents; 23 cents each when treated with zinc-creosote, and 29 cents each when creosoted in accordance with French practice.

In order to make them as economical as white oak ties costing 70 cents delivered, we can only afford to pay \$1.48 each for steel ties which last 20 years, and \$1.79 each when lasting 30 years.

In order to make them as economical as white oak ties costing 70 cents delivered, we can only afford to pay as first cost of concrete ties delivered, \$1.15 each, if they last 20 years, and \$1.57 each if they last 30 years.

We know nothing about the life of concrete ties, and it is at least very desirable to experiment with them for yard and side tracks even though we do not use them in the main tracks, because they might lie undisturbed in yard tracks for many more years than they would in main tracks.

When white oak ties are costing 70 cents delivered (about present prices), we can afford to buy inferior oak and other hard woods at 45 cents to 50 cents (present prices), and have them treated with the zinc-tannin or zinc-chloride processes, and only use common spike fastenings.

Trials of an Exhaust Steam-Turbine Plant.

Glück Auf, of January 19, reports the trials of an exhaust steam-turbine plant recently installed at the pits I. and II. of the Zeche Zollverein, in the Ruhr Basin. About 35,300 pounds of exhaust steam are available per hour, supplied by two hauling engines and by the fan engines, constructed respectively by the Gute Hoffnungshütte and the Maschinenfabrik Hohenzollern. The exhaust turbine was also built at the Sterkrade Works of the Gute Hoffnungshütte, and the thermal storage tank, of the Rateau type, by the Maschinenbau A. G. Balcke, of Bochum. The steam feed in the turbine is controlled by a throttle valve actuated by a hydraulic relay which is connected with the oil-pump, so that on failure of lubrication the steam is at once cut off. The turbine runs at 1,500 revolutions, and is coupled with a triphase generator for 1,000 kilowatts at 1,000 volts; it also drives the exciter, of 16 kilowatts. The feed-pipe from the thermal tank is joined by a branch from the boiler steam system. The trials were conducted during night time, and the small amount of additional boiler steam used was not especially determined. The figures of the subjoined table of results refer to the kilowatts at the terminals of the triphase generator; the exciter current is deducted, and the power absorbed by the condensers is not included. The following are the chief data of the four trials, which were conducted by the Steam-Boiler Association of the collieries of the Dortmund district:

Number of trial.....	1.	2.	3.	4.
Length of trial—hours.....	1½	1	1	1
Barometer—inches of mercury.....	30.2	30.2	30.2	29.93
Vacuum—per cent.	93.46	92.24	92.32	88.29
Revolutions	1,491	1,499	1,496	1,481
Kilowatts	433	728.4	960	1,112
Condensed water—pounds per hour.....	17,730	25,600	31,200	35,130
Steam consumption—pounds per kilowatt-hour	40.98	35.1	34.7	31.6

department may get competitive prices on the various supplies for which the storekeeper has made requisition. It will be noted that this quotation sheet is ruled for the following information: Quantity, description of articles, price, unit on which price is based, and discount.

When quotations have been received they are transferred

to the requisition blank, shown in Figure 1, being entered under the heading "Quotations Made By." The purchasing agent then completes the information on the requisition blank by designating from which of the quoting firms the materials are to be ordered, how they are to be shipped, and later the order number and its date are transferred to this form.

The original requisition, exhibiting all the information for which it is ruled, is then given to an office assistant who makes out the orders for the material.

When supplies are to be purchased from local firms, copies of whose price lists the purchasing agent has, a form with a heading as shown in Figure 3 is used. Such orders are made in triplicate. One copy (pink) is sent to the local firm, which will fill the order; another copy (yellow, punched

red ink on this order; "To insure prompt payment make all invoices in duplicate, give order and requisition number, and mail same day deliveries are made, if possible."

The form which is forwarded to the storekeeper, Figure 3, exhibits a list of the articles which are supplied by the

The form which is mailed to the local supply dealer is a formal order exhibiting only a statement of the material and the quantities that it is desired to purchase from this firm. The following notice is printed in

weight and amount of the freight and the number and initials of the car in which the material is shipped.

When orders on foreign firms are sent a "hustler" slip as shown in Figure 5 is made out. The reverse of this slip (not shown) is ruled for indicating any remarks necessary. If in due time no acknowledgment of the order has been re-

LONG THROUGH ROUTES OFFERED BY CHICAGO TRACTION COMPANIES.

The result of the campaign which has been carried on for the approval of the Chicago traction ordinances has been to make the traction question the vital issue of the election which is to take place on April 2.

One of the principal advantages which the people of Chicago will receive, if the ordinances are approved, will be the establishment of through routes which will permit long rides for one fare from one part of the city to another. There is published herewith a map showing the proposed through routes. The descriptions of these routes, as stated in the ordinances, are as follows:

Route No. 1: Beginning at Indiana avenue and Fifty-first street; north on Indiana avenue to Eighteenth street; west on Eighteenth street to Wabash avenue; north on Wabash avenue to Lake street; west on Lake street to State street; north on State street to Division street; west on Division street to Clark street; north on Clark street to Evanston avenue; north on Evanston avenue to Devon avenue; west on Devon avenue to Clark street; returning by the same route.

Route No. 2: Beginning at Halsted street and Seventy-ninth street; east on Seventy-ninth street to Vincennes road; north on Vincennes road to Wentworth avenue; north on Wentworth avenue to Archer avenue; east on Archer avenue to Clark street; north on Clark street to Division street; west on Division street to Clybourn avenue; north on Clybourn avenue to Belmont avenue; returning by the same route.

Route No. 3: Beginning at Lake avenue and Fifty-fifth street; west on Fifty-fifth street to Cottage Grove avenue; north on Cottage Grove avenue to Twenty-second street; west on Twenty-second street to Wabash avenue; north on Wabash avenue to Harrison street; west on Harrison street to Dearborn street; north on Dearborn street to Washington street; west on Washington street to La Salle street; north on La Salle street to Illinois street; west on Illinois street to Wells street; north on Wells street to Clark street; north on Clark street to Howard avenue; returning by the same route.

Route No. 4: Beginning at Seventy-fifth street on South Chicago avenue; north on South Chicago avenue to Cottage Grove avenue; north on Cottage Grove avenue to Twenty-second street; west on Twenty-second street to Wabash avenue; north on Wabash avenue to Washington street; west on Washington street to La Salle street; north on La Salle street to Illinois street; west on Illinois street to Wells street; north on Wells street to Chicago avenue; west on Chicago avenue to Larrabee street; north on Larrabee street to Lincoln avenue; north on Lincoln avenue to Bowmanville (Foster avenue); returning by the same route.

Route No. 5: Beginning at Seventy-seventh street and Vincennes road; north on Vincennes road to State street; north on State street to Van Buren street; west on Van Buren street to Kedzie avenue; returning by the same route.

Route No. 6: Beginning at Seventy-seventh street and Vincennes road; north on Vincennes road to State street; north on State street to Washington street; west on Washington street to Desplaines street; north on Desplaines street to Milwaukee avenue; north on Milwaukee avenue to Armitage avenue; west on Armitage avenue to Forty-fourth avenue; returning by the same route.

Route No. 7: Beginning on State street at Thirty-ninth street; north on State street to Madison street; west on Madison street to Sixtieth avenue; returning by the same route.

Route No. 8: Beginning at Jackson Park avenue and Sixty-third street; west on Sixty-third street to Halsted street; north on Halsted street to Evanston avenue; north on Evanston avenue to Graceland avenue; returning by the same route.

Route No. 9: Beginning at Sixty-ninth street and Ashland avenue; north on Ashland avenue to Twelfth street; west on Twelfth street to Paulina street; north on Paulina street to Lake street; east on Lake street to Ashland avenue; north on Ashland avenue to Clybourn place; east on Clybourn place to Southport avenue; north on Southport avenue to Clybourn avenue; returning by the same route.

Route No. 10: Beginning at Seventy-first street and Western avenue; north on Western avenue to Belmont avenue; returning by the same route.

Route No. 11: Beginning at North avenue and Clark street; south on Clark street to Madison street; west on

Madison street to Ogden avenue; southwest on Ogden avenue to Fortieth avenue; returning by the same route.

Route No. 12: Beginning at Clark street and North avenue; west on North avenue to Wells street; south on Wells street and Fifth avenue to Adams street; west on Adams street to Clinton street; south on Clinton street to Harrison street; west on Harrison street to the intersection of Halsted street and Blue Island avenue; southwest on Blue Island avenue to Western avenue; returning by the same route.

Route No. 13: Beginning at Forty-eighth avenue and Archer avenue; northeast on Archer avenue to Halsted street; north on Halsted street to Evanston avenue; north on Evanston avenue to Graceland avenue; returning by the same route.

Route No. 14: Beginning at Forty-sixth avenue (Forty-eighth avenue when the steam railroad tracks on Forty-sixth avenue are elevated) and Twelfth street; east on Twelfth street to Ogden avenue; northeast on Ogden avenue to Randolph street; east on Randolph street to Fifth avenue; north on Fifth avenue and Wells street to Clark street; north on Clark street to Diversey boulevard; returning by the same route.

Route No. 15: Beginning on Twenty-first street at Douglas Park; east on Twenty-first street to Halsted street; north on Halsted street to Canalport avenue; northeast on Canalport avenue to Canal street; north on Canal street to Polk street; east on Polk street to Fifth avenue; north on Fifth avenue and Wells street to Clark street; north on Clark street to Diversey boulevard; returning by the same route.

Route No. 16: Beginning at State and Thirty-ninth streets; thence north on State street to Lake street; west on Lake street to Austin [Sixtieth] avenue; returning by the same route.

Route No. 17: Beginning at Sixty-third street and Kedzie avenue; north on Kedzie avenue to Chicago avenue; east on Chicago avenue to California avenue; north on California avenue to Belmont avenue; returning by the same route.

Route No. 18: Beginning on Evanston avenue at Graceland avenue; south on Evanston avenue and Halsted street to Madison street; west on Madison street to Sixtieth avenue; returning by the same route.

Route No. 19: Beginning on Chicago avenue at Sixtieth avenue; east on Chicago avenue to Milwaukee avenue; south on Milwaukee avenue to Lake street; east on Lake street to State street; south on State street to Sixty-third street; returning by the same route.

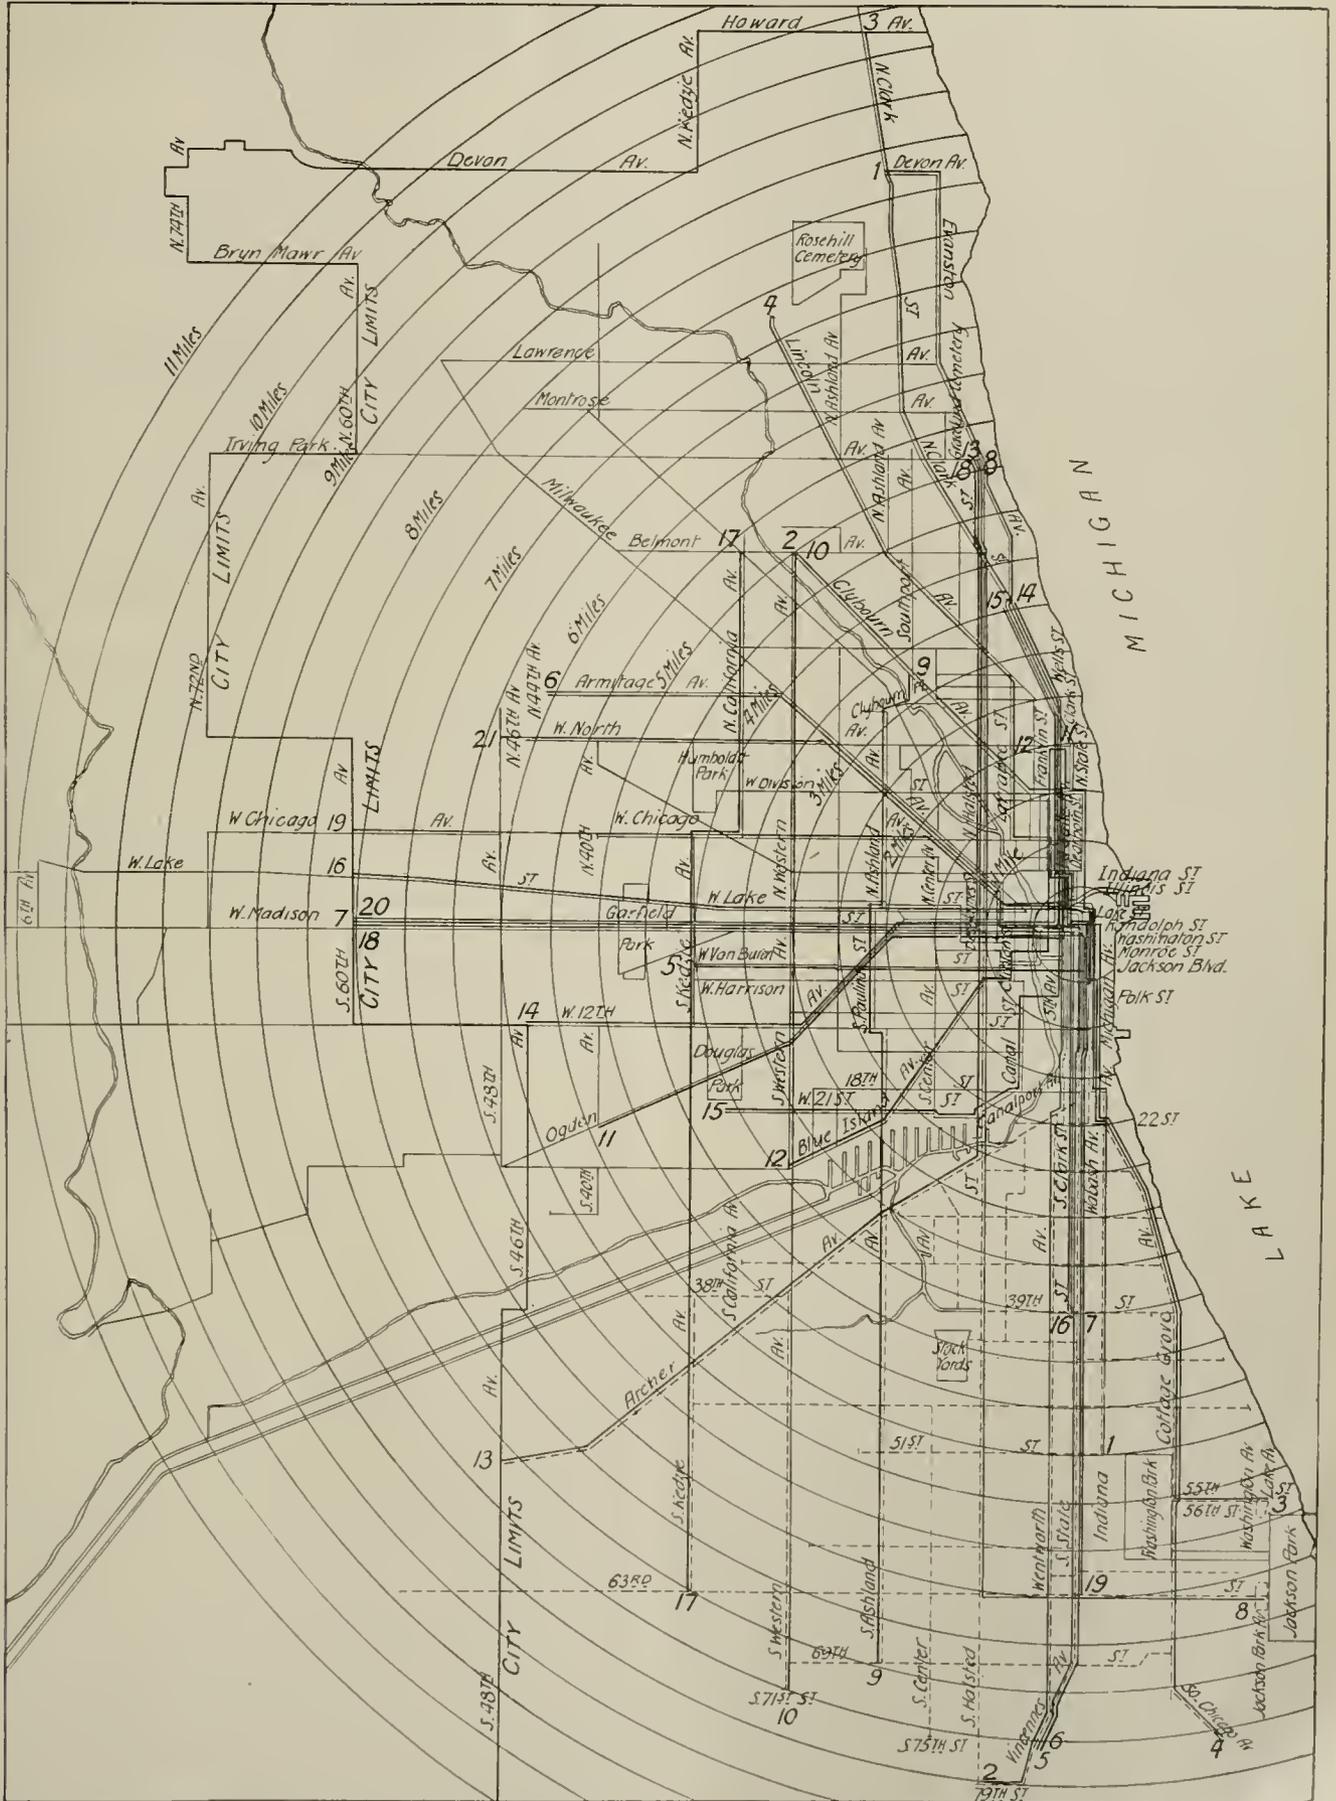

Route No. 20: Beginning on Madison street at Sixtieth avenue; east on Madison street to and around the State street loop [Franklin, Washington, State and Madison streets]; returning by the same route.

Route No. 21: Beginning on North avenue at Forty-eighth avenue; east on North avenue to Milwaukee avenue; south on Milwaukee avenue to Lake street; east on Lake street to and around the State street loop [Dearborn, Randolph, State and Lake streets]; returning by the same route.

CONFERENCE ON MUNICIPAL OWNERSHIP AND PUBLIC RELATIONS.

On March 22 C. D. Wyman of Boston, W. Caryl Ely of Buffalo and Henry A. Robinson of New York, representing the committees on "Municipal Ownership" and "Public Relations" of the American Street and Interurban Railway Association, and B. V. Swenson, secretary of the association, attended a joint conference of the corresponding committees of the associations representing electric light, gas, telephone and railway interests. There was an extended general discussion on the subject of municipal ownership and the relations of corporations to the public and to the state. No definite action was taken. It is announced that both of the committees of the American Association will probably issue within the next few weeks a series of questions to be answered by the street railway companies of the country. The data obtained in this way will be used as a basis for the reports which will be presented by the committees at the 1907 convention.

The Northern Texas Traction Company of Ft. Worth, Tex., which operates the interurban line between Ft. Worth and Dallas, as well as city lines in both cities, is equipping its interurban cars with steel wheels.

Map Showing Through Routes Proposed in Chicago Ordinances Which Are to be Voted Upon April 2.

DISAGREEMENT ON VALUATION OF CLEVELAND ELECTRIC RAILWAY.

An important crisis in the Cleveland street railway situation was reached on Monday, March 25, at the meeting of the city council when President H. E. Andrews of the Cleveland Electric Railway and President A. B. DuPont of the Municipal Traction Company announced that after two months of negotiating they had completely failed to agree on the valuation of the property of the Cleveland Electric Railway. Mr. Andrews submitted an estimate placing the present value of the outstanding stock of the company at \$105 per share, while Mr. Du Pont valued it at \$45.10 per share.

The presidents of the rival companies have been in almost daily conference, assisted by a large force of engineers and accountants, in the endeavor to determine upon the valuation, since January 10, when, following the decision of the supreme court that the Cleveland Electric company's franchise in Central avenue and Quincy street were invalid, the Municipal Traction Company offered to take over the property as a holding company on the same basis as that on which it now operates the Forest City Railway. The plan, in brief, is to lease the property at a rental of 6 per cent on the actual value of the physical property and franchises plus one-ninth, with a provision for ultimate redemption of the stock at 110. The road is to be operated on a 3-cent fare basis and the Cleveland Electric is to receive a security franchise under which it may operate its lines in the event of failure of the holding company plan.

It became known last week that negotiations had been suspended owing to a failure to agree and at the council meeting on Monday night both presidents submitted reports containing their estimates of the valuation and showing the basis on which the calculations were made and on which they disagreed.

Mr. Andrews stated that in making the examination the plan used by the commission which recently appraised the Chicago street railways, of which Mr. Du Pont was a member, had been adopted. He said:

In preparing the preliminary estimates of the value of the physical property, only the cost of labor and material was included, less depreciation, with the intention of adding later the customary percentages for administration, engineering, carrying charges, etc., aggregating, as an average in the case of the Chicago valuation, 20 per cent of the cost of the material and labor.

The value of the unexpired grants was arrived at in accordance with a plan dictated by Mr. Du Pont following the method used in Chicago.

The result for physical and franchise value thus obtained aggregated approximately \$30,500,000, to which, under the proposal of the Municipal Traction Company, one-ninth should be added, making a total of \$33,888,888.88; from this sum the funded and unfunded debt of the company, as of January 1, 1907, should be deducted, leaving a net result of \$24,547,888.99, which, divided by the number of shares of stock of the Cleveland Electric Railway Company outstanding, would show a present value approximately of \$105.00 per share.

During the last week of the negotiations, I suggested that Mr. Du Pont confer with Mayor Johnson with a view of learning whether the method of valuation adopted met with his approval, and was informed that it did not. Whereupon, a day or two later, a surprising proposition was submitted in writing by Mr. Du Pont, providing that no valuation should be given long time grants in Glenville, Collinwood, East Cleveland, Cleveland Heights, Newburg, Newburg Heights, South Brooklyn or Lakewood, nor to certain grants in the city of Cleveland. The proposition also contained an estimate of physical value which did not include all of the various items making up that value, and particularly excluded any consideration for any charges for management, superintendence, engineering, interest on cost during construction, contractors' profits, and other items which were included in the Chicago estimate, and in the Detroit estimate prepared by Professor Bemis and others, and which are usual charges in the construction of any railway, and are as necessary to, and as much a part of, the cost of construction as the cost of rail or any part of its track equipment is.

We are perfectly willing to abide by an arbitration based

upon such methods of valuation as were adopted in Chicago by an impartial commission, of which Mr. Du Pont was one; but cannot consider any offer by the Municipal Traction Company for a lease based upon a value which does not include proper charges for the items of cost enumerated above in making up physical value, and can consider no adjustment which does not contemplate the value of the property operated as a whole, as was the assumption in Chicago.

Mr. Du Pont's report was as follows:

Upon the valuation of many items of physical property, the dates of expiration for most grants and the method of valuing physical property, we were able substantially to agree. The conclusion here expressed, of course, includes such agreed values; but neither Mr. Andrews nor his company are bound by the conclusion as a whole nor the details entering into it.

The total value of the physical property and unexpired franchises of the company is \$17,908,314.24. Adding to this one-ninth, we have \$19,898,126.93, which makes for the outstanding stock a value of \$45.10 per share, redeemable on the suggested plan at \$49.61.

The value here given includes \$1,533,566.84 as the value of the street paving done by the company, though I am informed that this paving is now the property of the city.

Nothing is included for contractors' profits, brokerage, commissions or interest during construction, for two reasons: First, such items are not properly a part of the physical property; and second, if these items are not adequately covered by the bonus of 21 per cent, which is the basis of the suggested plan for determining the redemption value of the stock, any extra allowance on that account should be made by the council.

The value of the physical property has been determined independently of the length of the franchises, and no deduction has been made from the amount so determined by reason of unprofitable grants. To all franchises I have assigned full value. Where, however, lines are composed of portions having different dates of expiration, the later in date being remote from the center of the city, and through unprofitable territory, I have assigned no value to the outlying portion after the expiration of the inlying connection. Such grants are operated even now at a loss and are, in fact, a burden upon the inside lines, and, of course, are not susceptible of profitable operation after the expiration of the inside connection.

The conclusions here stated with detailed figures and reasons were submitted to Mr. Andrews on March 13 with a request that we discuss them in detail and that he suggest any revision that he thought just, with his reasons. I submitted also a schedule of disputed items now allowed, with my estimate of their value in dollars to the company as a basis for further discussion if reasons for allowing them could be advanced, professing myself entirely willing to consider such reasons. I have had no summary of the conclusions reached by Mr. Andrews, nor of the aggregate of his claims, and to my report to him I have had no reply except a verbal comment that we were apparently too far apart to make further conferences useful.

The council took no action but voted to call a public meeting for Wednesday, March 27, to discuss the reports, and invited both presidents to be present. A resolution was then passed requesting the Cleveland Electric company to report to the council at its next meeting the daily receipts and daily car miles since January 10 for the Central and Quincy avenue lines on which the franchises have expired and which have been operated since January 10 for a three-cent fare under an agreement to pay the city any surplus above the actual cost of operation.

The truce agreed to by the companies on January 11 under which all active hostilities have suspended, is still in force, although it may be terminated by either company on 24 hours' notice.

At the public meeting on Wednesday morning Mr. Du Pont submitted a communication to the city council stating that the Municipal company was willing to enter into any lease approved by the council and to operate the lines in the interest of the city and without profit to itself. He also submitted a further explanation of the failure to agree to Mr. Andrews' valuation. A general discussion ensued, in the course of which Mayor Johnson made the surprising statement that in the event of the holding company taking

over the Cleveland Electric lines the city lines should be operated for a 3-cent fare, but that on the outlying suburban lines a 5-cent fare should be charged. The mayor appointed a committee of five to meet with him and the city solicitor to formulate some plan of arbitration, both companies having favored such a plan. The committee will meet on Saturday.

BROOKLYN RAPID TRANSIT COMPANY CLAIMS OVERTAX.

Colonel T. S. Williams, vice-president of the Brooklyn Rapid Transit Company, appeared before the New York State tax commission at Albany on March 22 to protest against the amount of the company's tax assessment for 1907. He declared that the assessments on the company's properties exceed by \$130,000,000 the normal value of its securities, that the increase in the company's assessment was greater than that of the other New York companies, and showed how great increases had been made in previous years.

Colonel Williams submitted a statement in which he said in part:

The total assessment is \$39,436,000, an increase of \$20,905,000 or 54.26 per cent over the final assessment of last year. No other large street railroad system in Greater New York has had its assessments so greatly increased. The increase in the assessment of the Interborough company is 33 1/3 per cent; of the Manhattan Elevated Railroad Company 23 per cent; of the New York City Railway Company 33 1/2 per cent.

A comparison of the increase of earnings of the Brooklyn Rapid Transit system for the preceding year, with the increase of the other companies, does not reveal any justification for an increase in its assessments so far out of proportion with the increase in the assessments of these other companies. The net surplus of the entire system showed an increase of only 4.45 per cent over that of the previous year, and this would have been turned into a decrease had the full amount of taxes assessed been charged during the year.

The increase in the assessment follows an increase of 30.35 per cent in the final assessment of last year over that of 1905, and of 15.55 per cent in the assessment of 1905 over that of 1904. The assessment is 149 per cent greater than that of the year 1900, the first assessment of Governor Roosevelt's commission under the new law. When the validity of the law was established our corporations were the first of the large public service corporations promptly to comply therewith, by paying up in full the taxes assessed, with accumulated penalties, to and including the year 1904, less such deductions as the law entitled them to, with the exception of a few assessments in the suburban districts which are still in litigation, but the amount of which formed a small part of the total.

The direct assessments, state and local, against our property as for the year 1907 already made, are as follows:

Tracks on private rights of way.....	\$ 5,285,800
Parcels on real estate.....	9,238,555
Local capital stock	89,450,000
Special franchises	59,436,000

Total

At last year's tax rate this represents a tax of \$2,512,744.

But this is by no means the extent of our burden. We must pay in addition under other laws a state tax on our gross receipts, a state tax on our privilege to be corporations, a local tax on our receipts, a state tax on our cars, license fees for conveying our passengers across the Brooklyn and Williamsburg bridges, our proportion of the cost of maintaining the state railroad commission, the cost of municipal inspectors, the cost of new paving, the cost of carrying policemen and firemen free and many other impositions, the aggregate of which, if no greater than the amounts actually paid last year, will be \$1,119,612, or a total burden of taxation of \$3,632,356.

This is equal to 18.69 per cent of our gross earnings from all sources for the last calendar year. It is 61.09 per cent of our net earnings, including in expenses only the taxes paid and charged, not assessed, and excluding any charges for capital expenditures. No corporation ever has carried, or ever can carry, such a burden.

In taxes \$2,362,000 represent at last year's tax rate \$236,000,000 worth of property. That is, any holder of \$236,000,000 worth of taxable property would contribute \$2,362,000 toward the public revenues. But this is \$97,000,000 more than the par value of all our outstanding stocks and bonds. With the exception of our oldest company's stock, all of which represent dollar for dollar of actual property and has

never yielded more than a fair return, this is \$130,000,000 more than the market value on January 1 of all our outstanding stocks and bonds.

As to upwards of \$1,100,000 of these taxes, they are beyond the discretionary power of public officers—fixed by law or contract and only changed by revision of law or contract. As to about \$1,000,000 more, the lawfulness of their imposition is hedged about with the safeguards which all real estate and personal property have for their protection, the laws prescribing the method of their assessment and assuring general uniformity and equality, exceptions to which can be readily marked.

But as to the additional assessment of \$59,436,000 which your board has imposed—covering mostly as it does an indefinite, intangible property, already taxed, as we have shown, to a very large amount—there is no method prescribed by law for its determination, no adequate standard of comparison with the assessment of similar properties, no rule of guidance except the intelligence and fairness of the three officers who constitute your board.

We contend that the assessments are excessive further because your board has failed to take into consideration that very large part of the revenues of these companies which come from private rights of way and other sources than the right to operate cars on public streets and places.

DES MOINES FRANCHISE DECREE FILED.

The final decree enjoining the city of Des Moines, Ia., from tearing up the tracks of the Des Moines City Railway Company or from interfering with the company in the enjoyment of its franchise, which the court holds is perpetual, has been rendered by Smith McPherson, judge of the United States circuit court at Des Moines. The language of the decree is plain in declaring that the rights vested in the company by the contract are perpetual except that the exclusive feature of the franchise expired on January 1, 1898. An account of the decision was published in the Electric Railway Review of March 2, 1907. An abstract of the final decree rendered on March 23 follows:

The court decrees that the complainant, the Des Moines City Railway Company, has succeeded by purchase to all the rights granted under the ordinance of December 10, 1866, the said ordinance being one of the said city of Des Moines, entitled, "An ordinance authorizing the construction and operation of certain street railroads in and along the streets of the city of Des Moines," and the said ordinance as subsequently amended and modified, and as ratified and confirmed by said city, constitutes and is a valid and existing contract between the complainant, its successors and assigns, and the defendant, the city of Des Moines; and that the rights vested in the complainant, its successors and assigns by said contract are perpetual, except only as set forth in section 10 of said ordinance by which under said section 10 the exclusive feature was expired by limitation of time. And the court decrees that except as to said exclusive feature recited in said section 10, that the rights vested in complainant, the Des Moines City Railway Company, its successors and assigns, by said contract are perpetual.

It is further decreed that the resolution passed by the city council on December 21, 1905, is hereby canceled, the same being in violation of the rights of complainant company and of the obligation of the said contract.

And it is further ordered that the defendant, the city of Des Moines, and its city council, and mayor, and city solicitor, and all officers of said city, and those hereafter officers of said city, and each and all of them now holding office in said city, and all servants, agents and employes, and all successors in office be, and they are hereby perpetually enjoined from enforcing, or attempting to enforce, said resolution, and from in any manner disturbing, impeding or interfering with the free use and comfortable enjoyment by said Des Moines City Railway Company, its successors or assigns, of any rights, privileges and franchises vested in complainant herein, and vested in any corporation or company or person from whom complainant by purchase or otherwise has acquired rights. And the said ordinance of December 10, 1866, and all amendments thereto save and except the exclusive feature of section 10 thereof, shall be preserved perpetually to the complainant, its successors and assigns.

It is reported in the Des Moines papers that as the case will be appealed by the city to the United States supreme court the company will take no action toward making important improvements or extensions until a final decision is rendered.

MILWAUKEE ELECTRIC RAILWAY SERVICE.

C. N. Duffy, auditor of the Milwaukee Electric Railway & Light Company, was one of the witnesses in Milwaukee on March 21 when the Wisconsin railroad commission heard evidence in the case of the city of Milwaukee against the Milwaukee Electric Railway & Light Company. Mr. Duffy, in showing the disadvantages under which the Milwaukee company labors, said as many cars are being operated as it is practical to operate with the present trackage. Mr. Duffy testified that in February the company carried 7,134,180 passengers and operated the double-truck cars 916,890 car miles. Only 18.53 per cent of the car-seat mileage was used. Mr. Duffy said:

There were only 7.78 passengers carried to a car mile. Out of 397 cars possessed by the company 372 cars were put in service. That is, out of a car capacity of 100 per cent during the month, 93.7 per cent was put in use. No other road in the United States can show such a record. It must be remembered that when the last 75 cars were put in service, 35 old cars had to be taken off. This left only about 40 new cars for service improvement. Taking 5:20 to 6:20 at night as the busiest time of the day, if 372 cars are put in service, and only averaged 60 passengers to the car, it means that 22,320 passengers are carried in one hour or 372 in one minute. Three hundred and seventy-two cars an hour means six cars in one minute and one car in every 10 seconds. I think the capacity of the streets is about reached.

Statistics were presented by Mr. Duffy showing that during the congested period in the evening it devolves upon the company to move 22,320 passengers in an hour, which means one car every 10 seconds. Mr. Duffy stated that in all negotiations with the company the city ought to consider that the franchises will expire on December 31, 1934, and that proper provision should be made for depreciation and the changes forced by evolution. He traced the evolution from the use of mules for cars to cables and then electricity, and suggested that the present power plant might be superseded in time by other more useful methods of supplying power.

N. A. Christensen testified for the city of Milwaukee, saying that out of 65,000 cars in operation in the United States 27,000 are equipped with air brakes. Mr. Christensen denied that cold affects air brakes seriously, stating that air brakes are being used in Stockholm, Sweden, and Montreal, Canada, and that they will be used in Winnipeg. He said that it was as easy to apply the air as to draw water from a faucet. He stated that air brakes do not get out of order easily and that they do not cause flat wheels. The ignorance of operators in adjusting the brakes, he declared, was responsible for the flat wheels.

ANSWER TO PETITION FOR REDUCED FARE.

The West End Improvement Club of Council Bluffs, Ia., has filed a complaint with the interstate commerce commission asking that the Omaha & Council Bluffs Bridge Company be compelled to reduce its present rate of 10 cents for carrying passengers from Omaha, Neb., to Council Bluffs, Ia. John L. Webster, attorney for the company, has filed an answer to the complaint, in which it is claimed that:

The defendant company being a street railway company and not a commercial railroad is not subject to the provisions of the act to regulate commerce, and the rates of fare upon said line of street railroad is not subject to regulation by the interstate commerce commission; that it is not at the present time engaged in the transportation of passengers from Omaha to Council Bluffs, as its line is leased to the Omaha & Council Bluffs Street Railway Company, which operates the line and fixes the rate of fare.

The defendant for further answer avers that a fare of 10 cents from Council Bluffs to Omaha is a reasonable and not an exorbitant or extortionate charge, and in support whereof more particularly avers as follows:

That the distance from the business portion of the city of Council Bluffs to the business portion of the city of Omaha, being the points between which nearly all the passengers arrive and depart who travel upon the said line of road, is

a distance of six miles, and that a fare of 10 cents for the journey is but 1½ cents per mile.

That all passengers whose travel is limited to points within the corporate limits of the city of Council Bluffs only pay five cents for each ride, and the fare of 10 cents is only charged to passengers who travel from the corporate limits of one city to a point within the corporate limits of the other city, including the transportation over the bridge between Council Bluffs and Omaha.

That between the business portion of Council Bluffs and the Missouri river, or the east end of the bridge, there is a large area of sparsely settled territory along which very few persons enter upon or depart from the trains, and that the distance from the east end of the bridge to the business part of Council Bluffs is about three miles. To reduce the fare to five cents, including transportation over the bridge, would mean that the passengers would be permitted to travel from the center of the city of Council Bluffs to the center of the city of Omaha for a gross fare of five cents, which would be less than 1 cent per mile, and which would not yield sufficient revenue to pay the cost of operation and maintenance.

That it is usual and customary at all points on the Missouri and Mississippi rivers to charge a fare of not less than five cents additional to other charges for transportation to cross bridges over said rivers, and that such at all times and places has been regarded as not excessive, nor unreasonable.

The defendant further denies that the fares charged are extortionate or discriminatory, and denies that a fare of five cents would yield sufficient remuneration for the entire transportation of a passenger from Council Bluffs to Omaha, and denies that the complainant, or any of its members, or other persons are subject to the payment of unjust or unreasonable passenger fare for transportation over the said line of road, and denies that the defendant is guilty of any act of discrimination, prejudice or disadvantage in violation of the interstate commerce act, or any of the provisions thereof.

FORM FOR RECORDING PILE-DRIVING PROGRESS.

On the new line of the Winona Interurban Railway between Winona Lake and Peru, Ind., a number of waterways will be crossed with the track supported on pile bents. That the engineering department may be advised of the progress in driving piles and have available a permanent record of the details of the work, the accompanying form has been devised by the chief engineer, Mr. R. M. Murray.

The original records are made in blueprint form on pages 8 by 13 inches suitable for loose-leaf binding. Each page

PILE RECORD										
WINONA INTERURBAN RY. CO.								Division		
Bridge No.				At				Date		
Bent No.	Piling	Length	"W"	"D"	"P"	Penetra-	Gutoff	Remarks		
						tion				
Pile No1										
Pile No2										
Pile No3										
Pile No4										
<hr/>										
Bent No.										
Pile No1										
Pile No2

Pile No4										

"W" - Weight of hammer
 "D" - Drop of hammer - last blow
 "P" - Penetration

Inspector.
F-121

Form for Recording Pile-Driving Progress.

contains blank spaces enough for recording the necessary data for six pile bents, each comprising four piles. The data recorded are the kind of piling, length, weight of the driving hammer, drop of the hammer under the last blow, penetration with last blow, total penetration, height at which pile is cut off, and remarks. One blank is filled out for each trestle and forwarded by the piling inspector to the chief engineer's office, where they are permanently filed.

PIPING AND POWER STATION SYSTEMS.—XXXIV.

BY W. L. MORRIS, M. E.

If a surface condenser is used, the relative height of the tower with respect to the condenser is of no importance in determining the power required to handle the circulating water, as the high suction and discharge columns balance each other and the power required for circulating the water is simply determined by the distance *a*. A surface condenser, using water thus cooled would require about 40 pounds of circulating water per pound of steam condensed, and if a centrifugal pump belted to the main engine shaft were employed its efficiency would be about 40 per cent. Hence 100 foot pounds would be expended in raising the required volume of water 1 foot. Assuming the engine to be using 18 pounds of steam per horsepower per hour, the power needed to circulate the cooling water would be 1,800 foot pounds per hour, or 30 foot pounds per minute, approximately, or .001 horsepower for each engine horsepower, for each foot the water is lifted in the distance *a*. This would justify an expenditure of \$0.125 per horsepower for each foot of *a*. If the plant had a 1,000-horsepower unit, the expenditure of \$125 for the reduction of each foot of the distance *a* would be justified.

A jet condenser can be used with economy in conjunction with a cooling tower only when the tower is located so that the hot well discharge will flow without any appreciable loss of head directly on to the cooling surface filling, and the circulating pump raises the water from the basin of the cooling tower up and into the injection pipe to the lower end of the column of water which the vacuum will support.

The design shown in Fig. 265 would require about a 30-foot lift and the jet condenser about 7 feet, making a total of 37 feet which the water would have to be raised. This would require approximately .037 horsepower per horsepower of the main engine. If the water could be taken from the cooling pond the loss of head through the tower would be eliminated, thus making the power required for the condenser but 0.7 horsepower per 100 horsepower of the engine.

The surface condenser is better suited for operation with the cooling tower, as it can be located at almost any elevation and avoid any head loss other than that required at the cooling tower and the friction head of the piping system. There are many installations, however, using elevated cooling towers and the suction type of jet condenser, as shown in Fig. 267 (19-3). This makes a very inefficient installation. The head on the injection pipe is entirely wasted,

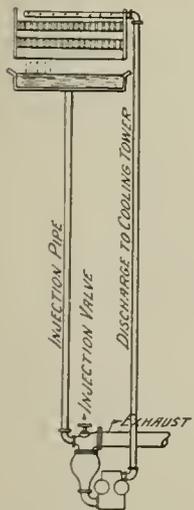

Figure 267-(19-3).

being resisted by closing the injection valve at the condenser. The distance from the pump to the outlet at the top of the cooling tower is frequently as much as 60 feet. Assuming 18 pounds steam per horsepower-hour of the main engine and 40 pounds of circulating water per pound of steam condensed, and a pump requiring 120 pounds of steam per horsepower per hour and having an efficiency of 60 per cent, we find that the circulating pump requires 24.2 pounds of steam for each 100 pounds of steam delivered to the main engine. In other words, the condenser pump requires as much steam to operate it as is saved by operating the engine condensing. It may be that a slight economy is secured in such an instance, due to the auxiliary exhaust steam being delivered to the feed water heater, but the question is, why is not apparatus which is suited to each particular installation employed? By using a surface condenser and the distance *a*,

10 feet, the steam consumption of the condenser pump would be but 1.6 as great as in the preceding case, or about 4 pounds of steam for each 100 horsepower delivered to the engine. This steam, however, would be condensed in the heater and the heat returned to the boiler, thus a very good return on the investment in the cooling tower, condenser, etc., would be secured.

The heat required to operate the pump would be about four times 46 British thermal units and the engine 100 pounds at 913 British thermal units, or $\frac{184}{913} = .2$ British thermal units for the condenser for each 100 British thermal units required by the main engine.

The most conspicuous loss in the operation of condensing machinery in conjunction with cooling towers is that

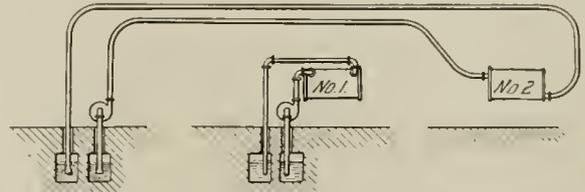

Figure 268-(19-4).

occasioned by the long water line between the cooling tower and the condenser, these lines invariably having a large number of turns and restricted passages. In fact, this difficulty is also conspicuous in the condenser, and in receiving bids on the condenser, as this point should be given careful consideration, as the difference in cost of different apparatus may be deceiving, the higher price being oftentimes the cheaper when the cost of operation is considered. If the lines between the cooling tower and the condenser are long, it is always good practice to increase their size, as the fixed yearly cost on the difference on the investment is less than that saved in the operation. Pipe bends should be used in place of elbows, as each elbow in a 12-inch line, for instance, is equivalent to about 40 feet of pipe. The piping is oftentimes made more compact by using elbows of short radius, etc., as shown in Fig. 268 (19-4) for condenser No. 1, but the resistance in the line of piping is thereby increased. The loss by friction of water flowing through the system shown in No. 2 is no greater than that shown in No. 1. The losses occasioned by short radius ells and square ends at the pipe inlets and outlets makes the avoidable losses of No. 1 amount to about 300 feet of pipe if it is 12 inches in diameter. This saving is sufficient in itself to permit running the line to the top of the roof or an outdoor cooling tower and not show so great a friction loss as that of the short connected system shown in No. 1.

The amount of water lost by evaporation in the cooling operation varies; systems using cooling pans with air circulating under them require less than that necessary for boiler feeding, being as low as 1/2 pound loss by evaporation for each pound of steam condensed. This system requires a very large pan surface, as its operation is dependent upon radiation only. Systems in which the air is passed through the water require much less surface, as the heat is taken up by evaporation as well as by radiation. This style of water-cooling will lower the temperature as much as 15 degrees below that of the surrounding atmosphere, a reduction in the temperature of the water of as much as 50 degrees. With 50 degrees difference in temperature the amount of cooling water required would only be about 20 pounds per pound of steam condensed. If the loss is 7 per cent, then 1.4 pounds of cooling water would be evaporated for each pound of steam condensed. In regular practice it has been found that the water fed to the boiler is sufficient at all times to provide for the evaporation, this being due possibly to the

fact that when the load is very light the fans would not be used, thus reducing the loss by evaporation, the cooling by radiation to the air passing through the tower by its natural draft being then sufficient to cool the water. In cold weather it is generally necessary to draw off a portion of the cooling water, as the evaporation is then less than the water fed to the boiler.

Class J1—Condensation and Air Line from Condenser.

Surface condensers and elevated jet condensers can easily be arranged to separately remove the air by what is termed a dry vacuum pump. Such a pump is designed to handle air only, and the usual construction is similar to the crank and fly wheel type of air compressors. The piston speed of this type of pump is generally high, 400 feet per minute being approximately the normal speed. The clearance is reduced to the least possible amount and in many other ways the pump is designed especially for compressing air, and if by accident even a small amount of water is drawn into the pump, it is liable to be damaged. The total piston displacement of a dry vacuum pump is generally greater than the total displacement of the water circulating pumps, but seldom exceed it by more than 50 per cent. The amount of air discharged by a dry vacuum pump is only a small portion of the piston displacement, and because of the expansion of the air contained in the clearance spaces, compression, resistance of the valves, ports, etc., the quantity discharged varies from 10 to 15 per cent of the piston displacement.

The different types of condensers either permit or require a different method of handling the air or, more correctly speaking, the non-condensable vapor. In a jet condenser, these vapors are mingled with the circulating water and if the water contains organic matter, the volume to be handled would be very much greater than in a surface condenser. Though the elevated jet type of condenser would have the greater amount of air to remove, it requires less special provision for removing the air than the surface condenser.

There are many elevated jet condensers which are maintaining a vacuum of 25 and 26 inches, which have no provision made for the removal of air other than that of the downward flowing column of cooling water, having only centrifugal pumps to maintain the vacuum. Condensers of this type are generally constructed the same as an ejector with the water and the steam meeting in a restricted passage, both having a downward flow at the point of meeting. Owing to the velocity of the mixture of steam and water through the restricted passage, the air which reaches a condensing chamber is carried downward through the tail pipe together with the circulating water and is discharged into the hot well.

The velocity of the water in the tail pipe varies from 250 feet to 500 feet per minute, being greater in large than in small condensers. By using a dry vacuum pump on large size condensers, it is possible to maintain a high vacuum, say, 26 or 27 inches, and requires only sufficient water to condense the steam, thus increasing the temperature of the hot well water, which is desirable if it is to be used for boiler feeding.

(To Be Continued.)

A remarkably long life has been shown by three boilers which were installed in New York in 1863. When last inspected they were pronounced in good condition and the original pressure was allowed. This speaks volumes for the care they have received.

Mr. R. W. Hutchinson, Jr., whose technical work, "Long-Distance Electric Power Transmission," has just been published by the D. Van Nostrand Company of New York, has an article in the March issue of Public Service on "The Question of Municipal Ownership." Mr. Hutchinson is on the staff of the National Brake & Electric Company of Milwaukee.

RECENT ELECTRIC RAILWAY LEGAL DECISIONS.

BY J. L. ROSENBERGER, LL. B., OF THE CHICAGO BAR.

Rising in Open Car to Get Conductor's Attention.

A woman passenger on a small open car occupied an end seat. The evidence showed that she rose from her seat to attract the attention of the conductor while the car was in rapid motion and swaying and rocking violently, as it had been for some time, and stood near the side of the car, facing the rear, until she was thrown to the ground when the motion was checked by the application of the brakes. She had one hand on the back of the seat on which she had been sitting, while the other hand hung by her side. She had traveled over this portion of the road before on the same day, and previously, and knew the condition of the track to be uneven, so as to cause the car to jolt and sway. Upon this undisputed evidence the supreme court of Rhode Island holds, *Cottrell v. Pawtucket Street Railway Company*, 65 Atlantic Reporter, 269, that the woman was not in the exercise of due care, and that a verdict for the company was properly directed.

Construction of Franchise Grants.

The supreme court of the United States says, in *Cleveland Electric Railway Company v. City of Cleveland and Forest City Railway Company*, 27 Supreme Court Reporter, 202, involving rights under city ordinances, that the rules of construction which have been adopted by courts in cases of public grants of this nature by the authorities of cities are of long standing. It has been held that such grants should be in plain language, that they should be certain and definite in their nature, and should contain no ambiguity in their terms. The legislative mind must be distinctly impressed with the unequivocal form of expression contained in the grant, "in order that the privileges may be intelligently granted or purposely withheld. It is a matter of common knowledge that grants of this character are usually prepared by those interested in them, and submitted to the legislatures with a view to obtain from such bodies the most liberal grant of privileges which they are willing to give. This is one among many reasons why they are to be strictly construed."

Choosing or Not Using Fenders Under Ordinance.

Where, by valid municipal ordinance, street cars are required to be equipped with fenders of an approved make, the supreme court of appeals of West Virginia holds, *Ashley v. Kanawha Valley Traction Company*, 55 Southeastern Reporter, 1016, that it is negligence per se (by itself) to operate such cars without such equipment. At the same time the court says in this case that it would not do to show only the violation of the ordinance. It must be shown that such violation was the proximate cause of the injury—that, if the car had been equipped with fenders, as provided by the ordinance, the injury would not have occurred. This was proper to be shown to the jury. It was, however, urged by the company that the evidence in this case showed that there were two kinds of fenders of an approved make, one projecting out in front of the car and the other hanging underneath the front part of the car, and that, this being so, the company would have the right to elect which of the two kinds of fenders it would use, and that, if it should use the last mentioned, the injury would have occurred the same as if no fender had been used. These were questions of fact to be submitted to the jury. If it could be shown that the accident would not have occurred if the car had been equipped with such fender as the ordinance prescribed, and that the car was not equipped with such fender, then this would be negligence sufficient to charge the company. But, upon the other hand, if it could be shown that the accident would have happened if the car had been equipped with such fender, the same as it did when not so equipped, then the omission to provide

such fender would not be the proximate cause of the injury, and the company could not be held liable for failing to so provide them. Evidence tending to show either of these theories was admissible.

Statutory Liability for Negligence.

Section 2864 of the revised statutes of Missouri of 1899 reads: "Whenever any person shall die from any injury resulting from or occasioned by the negligence of * * * any officer, agent, servant or employe whilst running any * * * car, * * * the corporation * * * in whose employ any such officer, agent, servant, employe * * * shall be, at the time such injury is committed, * * * shall forfeit and pay for every person * * * so dying the sum of \$5,000." It was contended, in the case of *McQuade v. St. Louis & Suburban Railway Company*, 98 Southwestern Reporter, 552, that although this section applies to street railroads, the ground of recovery by a person not a passenger is confined to common-law negligence, and does not extend to an injury from a failure to discharge a duty imposed by municipal ordinance. But the supreme court of Missouri, division No. 1, says that it finds no such limitation in the statute. It says that the right of action given by the statute is for negligence; not for negligence as defined by the common law, but as well for negligence that may arise from a failure to discharge a duty imposed by statute or municipal ordinance. The statute makes no distinction, and the court can make none. It contains no such limitation as was contended for, and the court cannot put such a limitation upon its comprehensive terms.

Grants Expiring With Main Line and Consolidation.

In the case of the *Cleveland Electric Railway Company v. City of Cleveland and Forest City Railway Company*, 27 Supreme Court Reporter, 202, the supreme court of the United States says that, in 1891, the right was granted to construct and operate a second or additional track upon a portion of what now appears to be Garden street. It was provided in that ordinance that the right therein granted should be for and until the expiration of the grants for the company's main line. From this the question arose, What was the meaning of the expression "main line" as used in this connection? The ordinance allowed a second or additional track in a street which the company then had the right to use, and was using a single track. So far as that extended grant was concerned, the main line was the rest of the Garden street branch. It could not be possible that it was intended to limit the right to use the second or additional track, in the portion of the street mentioned, to a different time than that which existed with relation to the first track laid down by the company in the same street. Of course, the two grants were meant to terminate at the same time.

Again, the court says that at this time the grant to the company's Euclid avenue line had been extended so that it did not expire until July 13, 1913. Can it be supposed that the council intended that this short length of road, in which a second or additional track was to be laid, was to be operated with two tracks until 1905 and after that with one track until 1913? The court thinks such a construction is not permissible, and that what is meant by the language, "main line," in that ordinance, means the line which is the main line with reference to the extension therein granted; namely, the Garden street branch, and not the Euclid avenue line.

Of a grant of 1885, the court says that it was not made to terminate with the grant for the main line, as that main line might thereafter be extended, but it referred to that grant as it then existed, and it was to be measured by such existing grant, and not by any subsequent extension which might be granted to the Euclid avenue line.

Nor does the court think the time for the termination of the Garden street branch was in any degree affected by the

consolidation of the various roads in 1893, the communication from the railway company, through its vice-president, stating distinctly that it "does not claim any rights greater than the constituent companies forming the organization, and that it intends to obey all ordinances to which each and all the constituent companies were subject." Its intention to issue transfer checks, so as to have a continuous ride for one fare, gave no greater rights to the company than it theretofore had, nor did the resolution of the council, consenting to the consolidation on condition that but one fare should be charged for a continuous ride, give any greater rights to the consolidated company than each of the constituent companies had theretofore enjoyed.

Boys Not Excused from Looking for Cars.

It has been held that a railroad track itself is a sign of danger. It has been held that the danger of going upon such track without looking at all is one so apparent as to be within the easy comprehension of a child of 11½ years of age. A boy, raised in a city and living for years in proximity to steam and street railway tracks, knows as well that a car will kill or maim him if it strikes him as he does that he will get burned if he pokes his hand in the fire; so that the law, the supreme court of Missouri, division No. 1, says, in the case of *Deschner v. St. Louis & Meramec River Railroad Company*, 98 Southwestern Reporter, 737, does not excuse a boy of his age in not using his eyes in so simple a matter as looking for the approach of a car when he is about to enter upon a track laid for cars, and on which they, to his knowledge, run with more or less frequency. But whether he should look twice—that is, a second time, after waiting for one car to pass, to see if another is not closely following it, is a question for the jury. The judgment of a boy must not be measured by the same yardstick with which the law measures the judgment of a man. To make a man out of a boy seems to be the somewhat miraculous work of time and nature, but the court considers it beyond the power (and should be beyond the disposition) of the law. So that, if a boy 11½ years old acts with the prudence of the ordinarily prudent boy of that age, under like circumstances, it is well enough.

Care Required Crossing Electric Railways in Country.

In considering the question of contributory negligence in the case of *Phillips v. Washington & Rockville Railway Company of Montgomery County*, 65 Atlantic Reporter, 422, where the plaintiff was injured while riding a horse across the defendant's track, the court of appeals of Maryland says that it must be borne in mind that the injury did not occur on the streets of a city, but in the open country, where a higher rate of speed in the movement of electric cars is permissible than is allowable along the more crowded thoroughfares of a town. More caution was therefore demanded of a person in crossing a track of an electric railway in the country than would have been necessary in the city. The use of no greater caution in the open country than would have been requisite to constitute ordinary care and prudence in the city would not have been due care and caution on the part of the individual in approaching and going upon an electric railway crossing in the country. An act which would be prudent in the city might be glaringly negligent in the country, and hence the standard by which contributory negligence is to be measured in the two instances necessarily varies with the changed conditions existing in the two dissimilar localities. No two ordinary minds could differ as to the characterization of the plaintiff's act in crossing the tracks with his back turned towards the approaching car. It was obviously negligent, if not reckless, to attempt such a thing. The result that was most likely to follow that conduct did happen, and the consequences must be borne by the person so guilty of incaution or heedlessness.

News of the Week

Convention of Iowa Associations at Clinton.

The plans for the annual convention of the Iowa Electrical Association and the Iowa Street and Interurban Railway Association, which are to be held at Clinton, Ia., on April 18, 19 and 20, have been developed in accordance with the increasing importance of the lighting and the railway properties of that state. In addition to the instructive papers and the discussions, which are being prepared by members of the association, a local committee at Clinton is making elaborate arrangements for the entertainment of the delegates and visitors. The manufacturers' exhibit will be illustrative of the latest devices for lighting and railway purposes.

The local committee on arrangements consists of P. P. Crafts, general manager of the Iowa & Illinois Railway Company; R. M. Howard, general manager of the Clinton Street Railway Company, and Thomas Crawford, manager of the Clinton Gas Light & Coke Company. This committee is giving much attention to the minor details of the arrangements which will aid in making delegates and visitors comfortable during the convention. In addition to this committee a citizens' committee consisting of 25 representative business men has been named to help receive and entertain the guests.

Aside from the exhibits and business meetings, there will be much to interest railway men. The Elks' and the Wapsie club rooms will be thrown open to the visitors during the convention. The following diversions are among the events that have been arranged for by the local committee:

Thursday evening, formal "smoker" at the Lafayette Inn.

Friday afternoon and evening, association's inspection trip to Davenport over the Iowa & Illinois Railway; the party will visit the power houses in Clinton and Davenport and the substations on the interurban line. Lunch will be served at the Commercial Club in Davenport.

Good shows will be provided at the theaters each night.

Boats will be provided for trips up the Mississippi river.

Many other amusement features will be arranged during the week of the convention.

Delegates' badges will be accepted for transportation on the Clinton Street Railway, the Iowa & Illinois Railway and the Tri-City Railway.

Stenographic service, etc., will be accorded the visitors at the offices of the local railways and lighting companies.

The headquarters of the association will be at the Lafayette Inn, where all meetings will be held. About 2,000 feet of floor space in the basement of the inn has been provided for exhibitors, free of charge, so that the only expense to visitors will be for fitting up booths. Each exhibitor will attend to the placing of his display, though the local committee will aid in making arrangements for teams to be used in hauling the exhibits from the freight houses to the exhibit halls. A number of manufacturers and supply companies have already made reservations and others are daily asking for them. All reservations should be made before April 15. The exhibit halls are spacious, well lighted and well ventilated. The hotel accommodations are good. Reservations can be made through Mr. Crafts, chairman of the local committee. It is expected that upward of 400 people will attend the convention.

Rapid Transit Affairs in New York.

The rapid transit commission on March 25 approved and sent to the board of estimate and Corporation Counsel Ellison the form of contract for the Seventh and Eighth avenue subway route. Before taking this action the commission held a public hearing on the terms of the contract, and while there were objections to some of the provisions, and particularly to the power reserved by the board of accepting a bid for an alternate route, which would merely run south to the Battery, from a junction at Forty-second street with the existing subway, the commission voted to make no changes in its original plans.

The contract has now only to be approved by the board of estimate and the corporation counsel before bids are asked for.

Mayor McClellan and the rapid transit commission are said to be anxious to carry out their plans for the new subways, plans upon which nearly three years' work has been spent, before there is a possibility of interference by the passage of Governor Hughes' public utilities bill. Under the provisions of this measure the new commission which would replace the rapid transit commission would have to be appointed within 30 days, and the new body would have the power to undo all that has been mapped out by the present board. If a special meeting is called this week, as expected, the advertising of bids for that subway and the Lexington avenue route could begin on Saturday and the awards made three weeks later.

Counsel to the commission also presented to the board the draft of the contract and specifications for the construction of the second section of the bridge subway loops. This section will extend from Canal street to Broome street. The board decided to hold a public hearing on the provisions of the contract as now prepared on April 11.

It is expected that there will be keen competition in the bidding for the construction for the bridge subway loop. Half a dozen large contracting firms have staffs of men at work in the office of the rapid transit commission on the detailed plans and specifications. It is understood that the commission expects to receive bids from the Degnon Contracting Company, the Cranford Contracting Company, William Bradley, John Shields and the McBean Company, as well as other concerns. The Degnon and Cranford

companies are now employed in building two sections of the subway extension to Brooklyn.

There will also be some out-of-town competitors. An application has also been received from a corporation outside of the city for access to the plans and specifications. The bids will be opened on April 11.

The so-called Steinway or Belmont tunnel, the extension of the present subway under the East river at Forty-second street, will be opened for traffic on August 1, according to a recent announcement. The air pressure in the south tube is to be shut off this week, as the tunneling is completed and the north tube is expected to be completed in 30 days.

After six months of effort the Interborough Rapid Transit Company, which is to operate the East River tunnel from the Battery to Brooklyn, has bought a piece of property in Joralemon street, Brooklyn, for the plant to ventilate the tunnel. Work will be started at once on the shaft from the tunnel to the surface. Through this the electric power cables are to be stretched from each end of the tunnel to the transformer station, in Willow place.

Legislation Affecting Electric Railways.

Illinois.—The senate has passed a bill granting the right of eminent domain to electric interurban railways and to electric companies for the stringing of high-tension wires.

Indiana.—A law passed by the legislature provides that interurban railroads running through a city of 35,000 population or more "shall provide and maintain in said city suitable waiting-rooms," with closets and conveniences, which shall be kept open "not less than one hour next preceding the arrival of all passenger cars or trains that are allowed by schedule." Another law which has been passed provides that any one who offers to tip the porter or waiter in a dining car, Pullman car or interurban car while a passenger thereon, is guilty of bribery. The penalty is a fine of from \$25 to \$100.—The legislature has passed a law requiring steam and electric railway companies to pay a \$1,000 license fee for selling liquor in buffet or dining cars.—A law has also been passed which permits electric railway tracks to be built through the parks and along the parkways and boulevards of a city.

Iowa.—The house has passed the senate bill providing that the front ends of all street cars shall be equipped with vestibules covering three sides of the platform, for the protection of motormen.

Michigan.—A bill has been introduced creating a state railroad commission with greater powers than those now possessed by the railroad commission. The bill provides for the control of electric roads by the commission, except lines wholly within the limits of cities or towns, and for the exchange of freight with steam roads. The exchange of freight is, however, to be only on lines where the electric equipment and facilities are up to a fixed standard, to be determined by the commission. The commission is not given authority to regulate the fares on an electric line, because to do so would be impairing franchise provisions in many cases.

Minnesota.—A bill has been introduced in the house that prohibits any street railway from admitting to its cars more than 15 passengers above the seating capacity of the car.

New York.—Assemblyman Stern of New York has introduced a bill providing that street car transfers may be demanded at any time after the fare is paid. This is aimed at the practice established by the New York City Railway Company of giving transfers only when the fare is paid. A recent decision of the appellate division of the supreme court upheld this regulation of the company.

North Carolina.—The legislature has passed a law, effective on April 1, requiring street railways to provide separate seats for white and colored passengers, fixing a fine for expectorating on the floors, and providing that passengers riding on platforms may not secure damages if injured.

Pennsylvania.—The house has finally passed by a vote of 143 to 30 the Fahey bill which was defeated last week but was reconsidered. The bill was drawn up by the Retail Merchants' Association of Philadelphia and is designed to solve Philadelphia's transportation problem by providing a basis for co-operation between the city and the Philadelphia Rapid Transit Company. The bill provides that "it shall and may be lawful for any city, borough or township, of the one part, and any street passenger railway company, surface, elevated or underground, or motor power company, leasing and operating the franchises and property of such company within the limits of such cities, boroughs or townships, of the other part, to enter into contracts with each other affecting, fixing and regulating the franchises, powers, duties and liabilities of such companies, and the regulations and respective rights of the contracting parties. Such contracts may, inter alia, provide for payments by the companies to the local authorities in lieu of the performance of certain duties, or the payment of license fees or charges imposed in favor of such city, borough or township, by the charters of the respective companies, or by general law or ordinance for the appointment, by the local authorities, of a certain number of persons to act as directors of such company, in conjunction with the directors elected by the stockholders of such company; and, further, may provide for the ultimate acquisition by the local authorities, upon terms mutually satisfactory, of the leaseholds, property and franchises of the contracting companies."—The house has also passed a bill prohibiting a railroad corporation from purchasing or guaranteeing the stocks, bonds or other securities of, or leasing or purchasing the franchises of, any street passenger railway owning or controlling a parallel or competing line. Violation of the act is made a misdemeanor and the officers

or directors of an offending corporation may be fined \$5,000 and imprisoned for three years.—The house has passed on second reading the Homsher bill, giving to electric railway companies the right to carry light freight and express. An amendment to make the carrying of freight mandatory on the companies was defeated and a substitute adopted which provides that the transportation of freight and express matter shall be subject to such reasonable regulations as shall be prescribed by the local authorities.

Rhode Island.—A bill has been introduced in the house of representatives by Representative Rattey, of Central Falls, which provides that it shall be unlawful for any electric railway company operating cars in this state to operate them from October 15 to May 1 without vestibules so constructed as fully to inclose the platform of said cars, and any railway company violating these provisions will be deemed guilty of a misdemeanor and fined not more than \$200 nor less than \$50 for each offense. This bill is now before the judiciary committee of the house.—Another bill now before the judiciary committee considers the cities of Pawtucket and Central Falls, and the towns of Cumberland and Lincoln as one town or city transfer zone and permits a passenger to ride between points in this district on the cars operated by the same corporation for a 5-cent fare.

South Dakota.—The legislature has passed a law allowing the extensions of charters of street railways for a period of 30 years in cities of 10,000 or more population, if authorized by three-fifths of the voters of the city. The normal charter life under the laws of the state is 20 years.

Annual Inspection Trip of Purdue Engineering Students.—Junior students of the various engineering departments of Purdue university made a trip of inspection to Chicago and vicinity on March 26 to 28.

Canadian Society of Civil Engineers.—At the meeting of the electrical division of the Canadian Society of Civil Engineers, on March 14, a paper on "Effect of Armature Reaction in Synchronous Motors and Rotary Converters" was presented by B. T. McCormick.

Philadelphia Traction Situation.—The Fahey bill, which will enable the city of Philadelphia to contract with the Philadelphia Rapid Transit Company, was reconsidered by the house of representatives of the Pennsylvania legislature on March 26, and was finally passed by a vote of 143 to 30.

Noiseless Car Wheels to be Tested in Detroit.—F. W. Brooks, general manager of the Detroit United Railway, writes that the reports that this company is making a test of paper car wheels in the endeavor to eliminate noise are erroneous. The company has arranged to make a test of the Hogeland car wheel, patented by George H. Bryant and manufactured by the Hogeland Noiseless Wheel Company, Chicago. The wheel is made either steel or cast, and between the center and the tire is placed a layer of felt, which it is claimed will lessen noise.

Indianapolis Merchants to Cease Refunding Fares.—The Indianapolis Merchants' Association has decided to discontinue the custom of refunding railroad fares to out-of-town customers who purchase \$25 worth of goods or more. In 1900, when the association adopted the plan of rebating railroad fares in order to advertise the city there was only one interurban line entering the city. Now there are 10 interurban lines and 19 steam lines entering the city and the plan of refunding railroad fare to purchasers of \$25 worth of goods has become so burdensome that the association will discontinue the plan and will seek to advertise the city in some other way.

Chicago City Railway Offers Wage Increase if Ordinances Pass.—President T. E. Mitten of the Chicago City Railway Company has issued a notice to all trainmen of the company promising a substantial increase of wages immediately after the ratification of the settlement ordinances, to be passed on by a referendum vote at the city election on April 2. The present scale is 19 cents per hour for the first six months' service, 24 for the following six months and 25 cents thereafter. The new scale, to be effective on April 1, is 23 cents, 25 cents and 27 cents. The notice states that the management makes the announcement at this time in order to contradict statements now being circulated to the effect that a reduction in wages would follow the ratification of the ordinances at the polls.

Increases in Wages.—The Seattle Electric Company has granted its conductors, motormen and gripmen an increase of wages of approximately 10 per cent, effective on April 1. This will make an increase of nearly 25 per cent over the wages paid a year ago. According to the new scale the men will receive from 25 to 22 cents an hour, according to length of service.—The Sacramento Electric Gas & Railway Company has increased the wages of its conductors and motormen three cents an hour, effective on April 1. The men will thus receive from 27 to 30 cents an hour, according to length of service.—The Pittsburg Railways Company has announced an increase of wages of 2 cents an hour for motormen and conductors, effective on April 1. The new scale is from 25 to 27 cents an hour, according to length of service.—T. M. Ellis, general manager of the Rockford & Interurban Railway, Rockford, Ill., has announced an increase in the wages of conductors and motormen of one cent an hour, effective on May 1. The company increased the wages of its employes last October. Prospects of good business the coming summer and appreciation of the increased cost of living are given as the reasons for the addition to the scale. The men now receive from 16 to 20 cents per hour according to length of service. Employes on Interurban runs receive 20 cents.

Construction News

FRANCHISES.

Buffalo, N. Y.—An amended franchise for the extension of the Elmwood avenue line of the International Railway has been passed by the council correcting the description of the route in the franchise recently granted calling for the widening of a portion of the Elmwood avenue line, and other minor changes. The franchise is for 25 years.

Canyon City, Colo.—Permission to use several of the streets of this city for its proposed line has been granted to the Canyon City & Royal Gorge Electric Railway, which will build an interurban line from Canyon City to outlying points in Fremont county.

Eveleth, Minn.—Application has been made by the Mesaba Traction Company for a franchise to build its line through Eveleth. The road as proposed will be built from Biwabik to Hibbing, Minn., about 40 miles, with possibly an extension later to Duluth. A franchise already has been granted in Virginia, Minn., and it is planned to construct the line between Eveleth and Virginia this summer. F. B. Myers, Biwabik, is president.

Galion, O.—The Galion Southern Electric Railway has been granted a franchise by the council for the construction of its proposed passenger and freight line through Galion. The length of the line from Galion to Mt. Vernon, O., will be about 35 miles, and it is said that negotiations for the financing of the road are well under way.

Hamilton, N. Y.—The franchise applied for several weeks ago by the Utica & Southern Railway for the construction of its line through Madison and Broad streets has been granted. It is stated that right of way along practically the entire route has been secured and that work on the road will be started this spring.

Indianapolis, Ind.—The state board of forestry has granted to the Indianapolis & Louisville Traction Company right of way through the state forestry reservation near Henryville. The grant, which gives the company about three and a quarter acres, will not be effective until the signatures of the attorney-general, auditor of state and the governor have been obtained.

Ligonier, Ind.—T. A. Redmond, Kendallville, Ind., representing the Kendallville & Goshen Traction Company, has obtained a franchise to operate a line in the city limits. This is a part of the Toledo & Chicago Interurban Railway which will extend its line from Kendallville to Goshen. Work on this road's extensions both east and west is to be pushed as early as possible and when completed a through service between Goshen and Bryan will have been established. F. E. Perkins, Kendallville, Ind., general manager.

Michigan City, Ind.—A franchise was granted on March 25 to the Chicago Lake Shore & South Bend Railway which is building an electric line from South Bend to this city, to enter Michigan City with its interurban line.

Mineola, L. I.—The Mineola Roslyn & Port Washington Traction Company has been granted a franchise to build an electric line through Roslyn, Mineola and Port Washington, L. I. The company which will build the line is composed of Cleveland capitalists. Work on the line will commence in a few weeks and be pushed as rapidly as possible. The New York & Long Island Traction Company's petition for a franchise was not passed.

Port Jefferson, N. Y.—The highway commissioners have granted a franchise to the Suffolk Traction Company for a line from Ft. Jefferson to Patchogue, and work is to begin immediately.

Portland, Ore.—The franchise granted some weeks ago by the city council to the Portland & Mt. Hood Railway and recently vetoed by the mayor, was passed over his veto on March 21. It is stated that much of the material is on hand and that work will be started about April 1.

Sapulpa, I. T.—A franchise has been granted to Tulsa capitalists for an electric railway from Sapulpa to the oil fields, about eight miles. The road will touch Keifer and the Glenn oil pool.

South Bend, Ind.—The Goshen South Bend & Chicago Railway is seeking entrance into South Bend on Main street, and has applied for a 25-year franchise. It is stated that the line is financed and that enough material is on hand for the construction of 25 miles of road. Several miles of line out of La Porte already have been completed.

South Bend, Ind.—The Kalamazoo Elkhart & South Bend Traction Company has been granted an amended franchise for its line through the city. It provides for the construction of the road within two years with the deposit of a \$5,000 bond and \$2,000 in cash to guarantee its construction within the specified time.

Sulphur, I. T.—W. Lyle Dickey of Tulsa, I. T., representing an eastern syndicate, has secured a franchise to build and operate a street railway system in Sulphur. It is stated that this will be part of an extensive interurban system covering Oklahoma and Kansas.

Toronto, Can.—The Hamilton Grimsby & Beamsville Electric Railway, in a bill brought before the railway committee of the Canadian legislature, has asked for a 5-year extension of its

franchise in order to complete its line from Beamsville to St. Catherines. Action on the bill has been deferred.

Troy, N. Y.—The United Traction Company has been granted a franchise for an extension of its street railway system in Troy.

Waterloo, Ind.—The Toledo & Chicago Interurban Railway has applied for a franchise in Waterloo. It is stated that work will commence on this extension about the middle of April or the first of May. F. B. Perkins, Kendallville, Ind., general manager.

Watsonville, Cal.—The Ocean Shore & Eastern Railway, which proposes to build from Santa Cruz to Watsonville, has obtained a franchise for a single-track line to this city. J. D. Harvey of San Francisco is president.

Winona, Minn.—An amended franchise is now under consideration by the city council in place of the one applied for several weeks ago by the La Crosse Water & Power Company, which proposes to build an extensive interurban system in Minnesota and Wisconsin. The new franchise provides for the operation of that portion of the line between Winona and Galesville by December 1, 1908, with a clause protecting Winona as to rates between Winona, Galesville and La Crosse. The council also is given power to cause the company to build an additional mile of track in Winona for every 2,500 increase in population.

York, Pa.—Since the York Street Railway Company has refused to agree to an amendment advanced by Mayor McCall proposing that the company shall pay to the city three per cent of one-seventh of its gross receipts from its county and interurban business, the ordinances which would have given the company a franchise on several streets of York have been defeated at a special session of the common council. The company, it is said, will make no further move to obtain perpetual franchises until council reorganizes for the fiscal year.

RECENT INCORPORATIONS.

Derry & Goff's Falls Street Railway.—This company has applied for a charter in New Hampshire to build an electric line from Derry to Goff's Falls, N. H., eight miles, connecting at the latter point with the Goff's Falls Litchfield & Hudson Railway. Capital stock, \$50,000. Incorporators: Roswell Annis and James F. Cavanaugh of Manchester; Charles N. Greenough and Frank N. Young of Derry.

Grand Central Traction Company.—Incorporated in Indiana to build, equip, operate, maintain, purchase or lease electric railroads between Indianapolis and Evansville, a distance of 172 miles. The articles provide for the construction and operating of heating, lighting and power plants and the furnishing of heat, light and power to the cities and towns connected by said line; also, for the construction and operation of telegraph and telephone lines to be used in connection with operating the road. The articles provide for the construction of a branch line from a point on the main line east of Bloomington to Terre Haute and intervening towns. Capital stock, \$250,000. Incorporators: Ora W. Blickenstaff, M. P. Carter, W. D. Whitney and D. H. Morgan, all of Indianapolis, where the offices of the company are located.

Hannaford Valley Railway.—This company has filed an application for charter to build an electric line from Tacoma to Centralia, Wash. Preliminary surveys have been made. Capital stock, \$650,000. Incorporators: E. B. Cox, president, Seattle, Wash.; A. W. Mackie, Ballard, Wash.; John Stewart, H. W. Treat, Alexander McLaren and P. H. Smith.

North Dakota Railway.—Incorporated in North Dakota to build an electric railway from the cement plant in Olga township to Edinburg, N. D., connecting with the Great Northern at the latter point. It is stated that all of the stock is held by farmers along the line. The road will handle passengers and freight and it is said that a business of \$30,000 annually is assured by its construction. Capital stock, \$200,000.

Southern Electric Construction Company.—Incorporated in Indiana to build a railway from Washington, Daviess county, to Martinsville, Morgan county; also to construct and operate light and power plants. Capital stock, \$100,000. Incorporators: T. Denoon, Chicago; John F. Noel, South Bend, and Orman H. Gabel and W. H. Clinton, Indianapolis.

Tekoa & St. Mary's River Railway.—Incorporated in Washington to build an electric line from Tekoa to a point on the St. Mary's river, in Idaho, a distance of 50 miles. Capital stock, \$500,000. Incorporators: T. J. Mahony, E. C. Dowell and William Hoare.

Terre Haute Indianapolis & Eastern Traction Company.—This company, incorporated recently with nominal capital stock, has filed amended articles with the secretary of state of Indiana whereby the capital stock is increased from \$4,500 to \$25,000,000. The stock is divided into \$250,000 shares of par value of \$100 each, \$12,500,000 being common stock and \$12,500,000 being preferred stock. By the filing of these amended articles the gigantic traction merger of the Indiana lines controlled by the Dolan-Morgan-McGowan syndicate, was completed. According to the articles, the merger embraces the Indianapolis & Eastern Traction Company, the Richmond Street & Interurban Railway, including the Connersville branch, the Indianapolis & Martinsville Traction Company, Indianapolis & Northwestern Traction Company, Indianapolis & Plainfield Traction Company, Indianapolis & Western Traction Company, and the Indianapolis Coal Traction Company. The amended articles also provide for acquiring other lines and building extensions to the lines already controlled, and the construction of several new lines. The company will also generate

and distribute electricity for heat, light and power purposes to the 130 or more towns and cities connected by this system. The extensions provided for in the articles which the company proposes to build are a line from Sullivan to Vincennes, a line from Terre Haute to Danville, Ill., a line from Terre Haute to Paris, Ill., a line from Martinsville to West Baden via Bloomington, a line from Crawfordsville to Williamsport, a line from Thorntown to Lafayette and a branch line from Bloomington to Terre Haute. When these extensions and the lines now under course of construction are completed, the syndicate will control nearly 400 miles of electric railroad in Indiana. The syndicate has leased for a period of 99 years and assumed control of the Terre Haute Traction & Light Company, including the interurban properties between Terre Haute and Clinton, Terre Haute and Brazil and Terre Haute and Sullivan, together with the local company's lighting equipment. The leasing company assumes all the liabilities of the Terre Haute Traction Company with a guarantee of 6 per cent on \$500,000 preferred stock, assumes a mortgage of \$3,366,000 with 5 per cent bond security and guarantees 2 per cent on \$2,000,000 common stock for three years and 3 per cent for the succeeding years. It is understood that Hugh J. McGowan will be made president of the company. Mr. McGowan states that the holding company contemplates no action relative to a consolidation with the Indiana Union Traction Company, the Ft. Wayne & Wabash Valley Traction Company, nor any of the traction properties recently secured at South Bend and Evansville by the Murdock syndicate. The fee received by the secretary of state for the filing of the amended articles of association was \$25,100, the largest fee ever received by the state for incorporating an interurban system.

Wyandotte & Lawrence Railroad.—Incorporated in Kansas to construct and operate an interurban railway between Lawrence and Kansas City, Kan., through Douglas, Johnson, Leavenworth and Wyandotte counties, about 38 miles. Steam, electricity or gasoline will be used. Capital stock, \$510,000, with \$170,000 preferred and \$340,000 common. Incorporators: Benjamin Schrierle, J. E. Wherrell, F. K. Schuepbach, H. C. Downs and E. Y. Blum, all of Kansas City, Kan.

TRACK AND ROADWAY.

Akron Barberton & Western Railway.—It is reported that this company's line from Barberton to Wadsworth, O., is nearly ready for operation. The overhead work is now being completed.

Altoona & Logan Valley Electric Railway.—It is reported that the East Altoona extension will begin next month, and that the right of way has been secured.

American Electric Railroad.—This company, which proposes to build from Des Moines to Council Bluffs, Ia., has been voted a 5 per cent tax at Greenfield. Work is to begin by July 1 and be completed by March 1, 1909. C. W. Baker of Des Moines, president.

Atlanta & Carolina Railway.—It is reported that early in April construction will begin on this company's proposed line from Atlanta to Conyers, Lithonia and West Point. The capital stock has been increased to \$5,300,000. Franchises and right of way have been secured.

Baton Rouge (La.) Electric & Gas Company.—This company has been purchased by Stone & Webster of Boston, Mass., and General Manager C. H. Kretz recently appeared before the city council and announced that the new owners would immediately begin to reconstruct and improve the entire system. New 6-inch rails are to be laid over the entire system, which amounts to about four miles, and new trolley wire for the entire line has been shipped. Nine new cars are to be placed in operation, which, being longer than the old ones, will necessitate lengthening some of the curves and switches. The rails are to be laid on ties embedded in concrete. As soon as the work of rehabilitation is completed it is the intention to apply for franchises for several important extensions.

Bellingham, Wash.—It is reported that S. L. Shuffleton, engineer of construction for Stone & Webster of Boston, has completed estimates for the construction of the proposed electric line from Bellingham to Skagit county towns.

Canton Youngstown & Akron Railway.—The Collins Construction Company, 92 LaSalle street, Chicago, Ill., is now preparing for active construction work on 65 miles of electric railroad from Canton to Youngstown, Ohio. This contract includes the construction and equipment complete in every detail. The company is now taking bids for all classes of material and equipment needed for the complete construction and equipment of the road, consisting of concrete work, trestle work, drain pipe, steel bridges, ties, steel rails, rail joints, frogs and switches, boilers, turbine generators and accessories, power house building, car barn and shops, poles, brackets, trolley wire, transformers and all accessories for the complete overhead work; passenger coaches, freight motors and motor equipment. The estimated cost is \$2,000,000.

Central Pennsylvania Traction Company.—Material is being distributed for the double-tracking of the Sixth street line from Emerald street to Division street, Harrisburg. The company will also rebuild its line between Steelton and Oberlin, laying a heavier rail.

Chicago Kenosha Milwaukee & Lake Geneva Railway.—Surveyors are now engaged in locating the right of way through Kenosha for the proposed line to Lake Geneva and preparations are being made for beginning condemnation proceedings.

Chicago South Bend & Northern Indiana Railway.—Jeup &

Moore of Indianapolis are making preparations for beginning the survey of the extension from Michigan City, Ind., toward Chicago via Gary. Work is now in progress between Michigan City and South Bend. Samuel Riddle, South Bend, general manager.

Coos Bay Gas & Electric Company.—Seymour H. Bell, treasurer and general manager, Marshfield, Ore., writes that this company, which owns gas and lighting plants in several cities on Coos Bay, is building an electric line from Empire City to Marshfield, Ore., 10 miles, via North Bend. The route has been surveyed and grading has been completed from North Bend to Porter. Grading is now in progress from North Bend to Marshfield, four miles. There will be about two miles of trestle work on the line. The company is in the market for part of the equipment, including cars with mail and express compartment and double-end control. Henry Hewitt, Jr., of Tacoma, president; Ed Rigg of Marshfield, chief engineer.

Covington & Southwestern Traction Company.—A trust deed mortgage has been filed at Crawfordsville and Covington by W. G. Ruhl, president, in favor of the Trust Company of America of New York, and the Union Trust Company of Indianapolis for \$1,250,000. The mortgage covers the property, rights of way, franchises, etc., of an electric line to be constructed by this company between Covington and Crawfordsville, with a short branch line through the Green Creek coal mining district. President Ruhl states that the road will be constructed of heavy steel, so as to carry on the business of transporting coal from the mines in Park county to adjacent markets. The work of constructing the 45 miles of track in the system will begin on April 1.

Dalton & Scranton Railway.—F. W. Day, general manager, has announced that the first 12 miles of the road from Scranton to Lake Mineola, Pa., would be in operation by May 1. The track is nearly all laid and the overhead work is completed.

Davenport, Ia.—A. Hurst of Hurstville, Ia., who is interested in an electric line from Davenport to Dubuque, Ia., 83 miles, writes that the company is not yet organized. Surveys have been completed from Maquoketa to Dubuque, 40 miles, and the section from Davenport to Maquoketa, 43 miles. The route includes De Witt, Delmar, Maquoketa and La Motte.

Denver & Interurban Railroad.—This company, which is building the Colorado & Southern's electric line from Denver to Boulder, Colo., has begun work on the city lines to be built in Ft. Collins, and it is stated that seven miles are to be put in operation this year.

Evansville & Southern Indiana Railway.—Manager R. R. Smith has agreed after a conference with the Evansville (Ind.) board of public works to relay the tracks on Main street when the city is ready to repave the street. Seventy-pound rails will be used, laid on a concrete foundation, with a special paving brick.

Ft. Dodge Des Moines & Southern Electric Railway.—Grading has been resumed on this company's line from Ft. Dodge to Des Moines, Ia. About 20 miles at the northern end remains to be graded. The work on the southern end is nearly completed, although no wire has been strung, and construction trains are now in operation from Fraser to Flint Junction, near Des Moines. J. L. Blake of Des Moines, general manager.

Ft. Wayne Toledo & Eastern Railway.—The residents along the right of way of this proposed line between Ft. Wayne, Hicksville and Bryan, O., have been asked to subscribe a bonus of \$30,000 before the bonds can be underwritten.

Holyoke (Mass.) Street Railway.—This company will rebuild the Elmwood and Oakdale lines and substitute groove rails for the ones now used. The company will also double-track the Northampton line from Mountain Park to Smith's Ferry.

Huntington Beach Company.—S. H. Finley, engineer, writes that this company is now securing right of way for an electric line from Santa Ana to Huntington Beach, Cal., 10 miles. The line has been surveyed, although no definite arrangements have been made for beginning construction.

Indianapolis & Cincinnati Traction Company.—President Charles L. Henry of Indianapolis has announced that the proposed line to Cincinnati will run from Connersville by way of Liberty, College Corner and Oxford.

Indianapolis & Western Traction Company.—The W. P. Junclaus Company of Indianapolis has begun the construction of a modern 2-story terminal station for this company at Greencastle, Ind. The tracklaying in the city is almost completed and the overhead work is now being pushed with a view of putting the line in operation as soon as possible.

Iowa & Missouri Traction & Power Company.—J. W. Andrews, Keosauqua, Ia., chief engineer of this company, which has made surveys and proposes to build a line from Fairfield, Ia., to Memphis, Mo., 52 miles, has prepared a comprehensive report as to the feasibility of extending the line north through Jefferson, Kiota, Millersburg and Marengo to Cedar Rapids, with branches from Millersburg to Oskaloosa and from Marengo to Vinton, a total of 178 miles. The report states that the line could be built for \$4,500,000, or about \$25,000 per mile, and includes data on population and probable traffic. The report has been submitted to business men's associations in the various towns. It is stated that the construction of the first section, from Memphis to Fairfield, is assured.

Lancaster & Eastern Street Railway.—Engineers of this company, which is operated by the Conestoga Traction Company of Lancaster, Pa., last week began surveying a line from Christiana to Coatesville, Pa., 12 miles. The company now has a line in

operation from Lancaster to Christiana, 20 miles, and when the link to Coatesville is completed, as it is expected to be by January 1, through connection to Philadelphia will be made possible. H. W. Crawford of Lancaster, chief engineer.

La Porte, Ind.—The report that the Murdock syndicate, which owns the Chicago South Bend & Northern Indiana Traction Company of South Bend, Ind., will build a line south from La Porte to Logansport, has been denied by Samuel T. Murdock of Lafayette, Ind.

Meadville Conneaut Lake & Linesville Electric Railway.—The grading for this line has been completed from Meadville to Harmonsburg, Pa., and the rails are laid to within one mile of that place. It is expected that the road will be in operation by June 1.

Milwaukee Northern Railway.—F. W. Walker, vice-president, Port Washington, Wis., writes that this line will extend from Milwaukee to Sheboygan and Fond du Lac, Wis., 112 miles. The route includes Thiensville, Cedarburg, Grafton, Port Washington, Cedar Grove, Sheboygan, West Bend, Barton, Kaukana, Campbellsport and Fond du Lac. The entire route has been surveyed, and 20 miles from Cedarburg to Milwaukee has been graded. Five miles of track from Cedarburg south toward Milwaukee has been laid this year and grading is in progress between Port Washington and Cedarburg, 10 miles. Overhead work is under construction from Port Washington to Milwaukee, 30 miles. Overhead construction will be of the bracket type on tangents and of the span type on curves. Substations are under construction at Port Washington, Cedarburg, Browdeer and Milwaukee. The power house is under construction at Port Washington. The equipment will consist of three 1,000-kilowatt, 3-phase generators driven by gas engines and producer gas. The substation equipment will consist of two 400-kilowatt rotary converters. The equipment is to be furnished by the Allis-Chalmers Company, the Power Mining Machinery Company, the Westinghouse Electric & Manufacturing Company, the Niles Car & Manufacturing Company, New York Car & Truck Company and the American Locomotive Company. All bridges on the line will be of steel with concrete abutments, and the road will be built on private right of way with no grade crossings of railroads. Seventy-pound T-rails will be used, except in Milwaukee, where 95-pound T-rails will be used. W. A. Comstock of Alpena, Mich., is president and F. W. Walker of Port Washington is vice-president and chief engineer.

Milner, Idaho.—Maj. Fred R. Reed is said to be interested in a company to build a large power plant at this place and an electric railway from Milner to Gooding, about 50 miles, at a cost of about \$1,000,000.

Newark Martinsburg & Mt. Vernon Traction Company.—Actual construction work on this line has begun and President Chilcote says that cars will be running next fall. The line will connect Newark with Martinsburg, Gambier, Mt. Vernon, Londonville and Wooster, where it will connect with the Cleveland Southwestern & Columbus, and give a direct line to Cleveland from Columbus by way of Newark.

Ocean Shore Railway.—John B. Rogers, chief engineer, San Francisco, Cal., writes that this company is now building an electric interurban line following the coast line of the Pacific Ocean from San Francisco to Santa Cruz, a distance of 80 miles. The road is being built for both freight and passenger service and will be double-tracked and of the highest type of construction throughout. It is expected to have the first section of the road from San Francisco to Half Moon Bay ready for operation by June 1. About 70 per cent of the grading on the entire line is now completed and 85 per cent of the bridge work. About 20 miles of track have been laid between San Francisco and Mussel Rock and from Santa Cruz to Davenport. Contracts for building the line have been let to the Rialto Construction Company from San Francisco to Ocean View, eight miles; to Willitt & Burr, the Ransome Construction Company and Mahoney Brothers from Ocean View to Mussel Rock, 4½ miles; to the Ransome Construction Company, Lewis Moring and Antonelli & Bandman from Mussel Rock to San Pedro Mountain, eight miles; to the Ransome Construction Company from San Pedro Mountain to Wadse Beach, 41 miles, and to Shattuck & Desmond and Pratcher & Chadwick from Wadse Beach to Santa Cruz, 21 miles. Within city limits the road occupies almost entirely private right of way, with overhead or subgrade crossings at the principal intersecting streets. The maximum grade is 2 per cent except in a few instances, which will be eliminated later. The maximum curvature is 16 degrees except the entrance to the San Francisco terminal, which is 20 degrees. Seventy-pound rails are used. There are no bridges on the line of importance except the viaducts in San Francisco and Santa Cruz. Nearly all of the cross drainage is handled through semi-circular tunnels, running under and around high fills. The largest of these fills contains 220,000 cubic yards of material, the highest fill is 93 feet. Grading around San Pedro Mountain will cost \$160,000 per mile. The overhead construction will be of the center-pole catenary type. The power house is now under construction and General Electric equipment of 7,000-kilowatt capacity will be installed. Franchises and land for terminals have been secured at both terminal cities. J. Downey Harvey, president, San Francisco, Cal.

Ocean Shore & Eastern Railway.—E. V. Kenfall of San Francisco, auditor, writes that surveys are being made for an electric railway from Santa Cruz to Watsonville, Cal., via Soquel, Aptos, Pleasant Valley and Freedom, a distance of 19 miles, parallel to the Pacific shore line. Construction is to begin in 90 days. The company is allied with the Ocean Shore Railway, which is now constructing a line from San Francisco to Santa Cruz. J. Downey Harvey, president; J. B. Rogers, chief engineer, both of 52 Eleventh street, San Francisco, where the offices of the company are located.

Oneonta & Mohawk Valley Railroad.—It is reported that this company is considering the extension of its line from Richfield Springs to Springfield Center, N. Y., at the head of Otsego Lake, a distance of about nine miles.

Oregon Electric Railway.—Surveyors in the employ of W. S. Barsto & Co. of Portland, Ore., are now locating the line from Garden Home to Forest Grove, Ore., a branch from the proposed Portland-Salem line.

Pacific Electric Railway, Los Angeles, Cal.—It is reported that the survey for the extension of the new Covina line to Pomona, Cal., has been ordered. The Covina line, which is 22 miles long, is expected to be in operation in six weeks.

Pacific Traction Company.—Several carloads of rails have arrived for the line from South Tacoma to Steilacoom and American lakes and the work is to be rushed to completion this spring. B. T. Felt, general manager, Tacoma, Wash.

Pasadena La Canyada & Los Angeles Railway.—It is reported that this company will soon make application to the city council of Pasadena, Cal., for a franchise for an electric railway, which is to connect the three cities named in the title. The company was incorporated last year with a capital stock of \$100,000, and it has the following officers: George E. Smith of Pasadena is president; C. G. Compton, Long Beach, Cal., first vice-president; A. H. Green, Los Angeles, second vice-president; H. M. Orr, Los Angeles, secretary and treasurer.

Portland, Ore.—It is reported that the Harriman interests, who recently purchased the Corvallis & Eastern Railroad, propose to construct an electric instead of a steam road from Portland into Clackamas county.

Reno, Nevada.—It is stated that surveys are being made for an electric line from Reno south to Steamboat Springs, 12 miles. Colonel Hopkins of Reno, who is promoting the road, states it will be completed in four months, and will be extended later on to Carson City.

Rochester Corning & Elmira Traction Company.—The New York railroad commission, acting under an order from the appellate division of the supreme court, has granted a certificate of public convenience and necessity for building the proposed line from Rochester to Elmira.

Selma (Ala.) Street & Suburban Railroad.—It is stated that this company has bought a tract of land on Oakmulgee Creek, 10 miles from the city, upon which to erect a power plant. It is also stated that the city lines will be extended to this point and thence to Summerfield, 10 miles.

Sparta-Melrose Electric Railway & Power Company.—This company, recently incorporated to build an electric railway from Sparta to Melrose, Wis., 28 miles, has elected the following officers: President, G. S. Cromwell; vice-president, James A. Cole; secretary, Howard Teasdale; treasurer, W. A. Sholes, all of Sparta, Wis. It is stated that construction will begin May 1.

Tampa & Sulphur Springs Traction Company.—The material is on the ground for the \$30,000 bridge which is to be built across the Hillsborough river connecting Tampa and West Tampa, Fla., by the Virginia Iron & Bridge Company. The company is building a line from Tampa to Sulphur Springs.

Tennessee-Georgia Interurban Railway.—Samuel D. Divine states that financial arrangements have been made for building this road from Chattanooga to Chickamauga Park, and that surveys will be started immediately.

Texas Traction Company.—This company, which is building a line from Dallas to Sherman, Tex., has ordered 9,000 tons of rails.

Toledo Wabash & St. Louis Railway.—It is reported that a syndicate of Toledo capitalists have formed a company with \$6,000,000 capital stock to build an electric line from Toledo to St. Louis. It is stated that the company has been financed and that the road will pass through Defiance, Ft. Wayne, Indianapolis and Terre Haute, Ind. A power plant at Miami has been purchased which will furnish power to operate the line between Toledo and Defiance. The first section from Toledo to Defiance is to be finished within nine months. The right of way has been secured. The second section will be from Defiance to Ft. Wayne and the third from Ft. Wayne to Indianapolis by way of Muncie. The fourth section will be from Indianapolis to St. Louis. Construction is to be of the highest class throughout and 70-pound rails are to be laid. The officers are: C. D. Whitney, president; George G. Metzger, vice-president; J. P. McAfee, treasurer, and F. L. McAfee, secretary.

Tri-City Railway.—This company has begun work on the extension of its double-track line on Brady street, Davenport, Ia., from Central Park to the city limits.

West Penn Railways, Connellsville, Pa.—W. E. Moore, general manager, writes that the rumor that this company would build an extension from McKeesport to Glassport, Pa., is unfounded, as the company has never considered such an extension.

POWER HOUSES AND SUBSTATIONS.

Metropolitan Street Railway, Kansas City, Mo.—A contract has been awarded to Turner Brothers of Kansas City for constructing a 1-story brick substation, 62 by 105 feet, for a power plant at Electric Park. Estimated cost \$9,000. C. N. Black, general manager.

Personal Mention

Mr. Charles Johns has resigned as manager of the St. Thomas Street Railway, which is owned and operated by the municipality of St. Thomas, Ont.

Mr. Fred H. Heckler, master mechanic of the Lake Shore Electric Railway at Fremont, O., has been appointed chief engineer in place of Mr. F. B. Matthews, resigned.

Mr. J. T. Mooney, chief of the construction department of the Pottsville Union Traction Company, Pottsville, Pa., has been appointed assistant manager of transportation, and Mr. H. O. Ellis has been appointed chief of construction.

Mr. E. L. Greene, formerly foreman of the general repair and equipment shops of the New York City Railway Company, has accepted a position with the engineering department of the Westinghouse Electric & Manufacturing Company.

Mr. A. E. Weist, Jr., formerly general manager of the Indianapolis Huntington Columbia City & Northwestern Railway, which is building a line from Syracuse to Goshen, Ind., has resigned his position and will leave shortly for Texas where he is interested in a proposed interurban line.

Mr. Oral A. Stevens has resigned as division superintendent of the Boston & Northern Street Railway. He is succeeded by Mr. W. E. Maloney, who for the past five years has held the office of the superintendent of the Manchester Street Railway, Manchester, N. H. Mr. Maloney began his railway career at the age of 18, in the offices of the Worcester Consolidated Company, and remained with that company for 12 years, until he was appointed superintendent of the Manchester company.

Mr. Charles H. Armatage, who, as announced in the Electric Railway Review of March 23, has been appointed traffic manager of the United Traction Company and the Hudson Valley Railway Company, controlled by the Delaware & Hudson

Company, with office at Albany, N. Y., has been connected with the street railways of that city for the past six months as superintendent of the express department of the United Traction Company. Mr. Armatage was born in Albany on January 30, 1857, and has lived there all his life, having occupied several important public offices. He received his education at the Albany Boys' Academy and after leaving school entered the railway service. He was for several years assistant superintendent of the Buffalo division of the West Shore Railroad under D. B. McCoy, now assistant general manager of the New York Central & Hudson River Railroad.

He left that position to enter the mercantile business in Albany, and during 1894 and 1895 was president of the common council. His present appointment became effective on March 14, 1907. The duties of traffic manager, heretofore, have been combined with those of the operating department of the companies, but on account of the expansion of the passenger and freight business it was deemed advisable to separate the two departments.

Mr. J. T. Harmer of Boston has been elected to the newly created position of comptroller of the Worcester Railways & Investment Company of Worcester, Mass., the holding company of the Worcester Consolidated Street Railway Company. A new treasurer of the company also has been elected in the person of Mr. Leverett Candee of Boston, who succeeds Mr. E. E. Foye. Mr. A. George Bullock of Worcester was elected president and Mr. Francis H. Dewey of Worcester, president of the Worcester Consolidated Street Railway Company, vice-president. Mr. B. W. Warren of Boston was elected secretary.

Mr. E. E. Lillie, whose appointment as superintendent of the Spokane & Inland division of the Spokane & Inland Empire Railroad was noted in the Electric Railway Review of March 16, has been associated in various capacities with the railway systems of the United States and Canada for a number of years. He was born in Galt, Ontario, in 1869, and began his railroad career as telegraph operator on the Canadian Pacific Railway at Winnipeg, Manitoba, in 1884, where he remained four years. In 1888 he accepted a position at Superior, Wis., with the Eastern Minnesota Railway (now a part of the Great Northern system) as timekeeper and shop clerk, later becoming chief clerk to the master mechanic. In 1892 he again entered the telegraph service as operator in the general office of the Great Northern at St. Paul, later serving as train dispatcher, chief train dispatcher and assistant superintendent on the various divisions of the road. In 1902 he resigned to accept a position with the Choctaw Oklahoma & Gulf Railway at Little Rock, Ark. In 1903 Mr. Lillie again

Charles H. Armatage.

Financial News

entered the service of the Great Northern as assistant to the general superintendent of transportation at St. Paul and later became chief dispatcher at the company's Spokane office, where he remained until his recent appointment as superintendent of the Spokane & Inland Empire Railroad of that city.

Mr. E. P. Wetmore has been appointed general manager of the Augusta (Ga.) Railway & Electric Company, with headquarters at Augusta; effective at once. The duties of this office formerly were combined with those of Mr. James U. Jackson, vice-president, but on account of extensions and improvements planned by the company it was decided to create a separate head for the operating department in order that Mr. Jackson's time might be given to larger matters. The office of general superintendent, which has been vacant since the resignation of Mr. Charles Furbay, has been abolished and its duties incorporated with those of the general manager. Mr. Wetmore formerly was connected with the electric street railway systems of Liverpool, England, and other European cities, and more recently with some of the larger systems of this country.

Mr. R. E. Danforth, vice-president and general manager of the Rochester (N. Y.) Railway Company, has resigned to become general manager of the Public Service Corporation of New Jersey, succeeding Mr. Albert H. Stanley, who resigned recently to become general manager of the London Underground Electric Railways. For the past four years Mr. Danforth has been connected with the Rochester Railway Company, first as assistant manager and later, on the resignation of Mr. T. J. Nichol, as general manager of the company. He was formerly in charge of the International Railway Company's lines in Buffalo, resigning his position there to become connected with the Lake Shore Electric Railway when that system was being organized. In April, 1902, he severed his connection with this company to become identified with the Rochester Railway, where he has remained until his present appointment.

Mr. W. C. Smith, whose portrait we present herewith, was recently appointed general superintendent of the Mahoning & Shenango Valley Railway & Light Company, with headquarters at Youngstown, O., as reported in the Electric Railway Review of March 2, 1907, succeeding Mr. T. C. Armstrong, resigned. Mr. Smith was born near Saxon Station, Butler county, Pa. He was associated with the street railway companies of Pittsburg for 20 years, having been assistant superintendent of the Citizens' Traction Company when it was a cable line, and later having served as general superintendent of the Central Traction Company. When that line was absorbed by the Consolidated Traction Company in 1896 he was appointed superintendent of transportation of that company. In February, 1902, Mr. Smith was appointed assistant general manager of the Pennsylvania & Mahoning Valley Railway at Youngstown, O., and in November of that year he was promoted to the position of general manager. In May, 1904, he was made manager of the Youngstown division of that company and in October resigned to go to Pittsburg. He now returns to Youngstown with the Mahoning & Shenango Railway & Light Company, which controls the Pennsylvania & Mahoning Valley Company.

W. C. Smith.

Mr. C. A. Alderman, for the past two years chief engineer of the Cincinnati Northern Traction Company, has resigned to become associated with J. G. White & Co., of New York, effective on April 1. Mr. Alderman's experience in railway construction has been obtained by years of service with prominent construction and railway companies of the middle west, both steam and electric. Before entering the electric railway business he was connected with the engineering departments of the Southern Pacific and the Duluth South Shore & Atlantic railroads and at one time was city engineer of Eau Claire, Wis. During 1905 he was general superintendent of the Appleyard lines between Dayton and Columbus and for eight years previous was manager and chief engineer of the Great Northern Construction Company, which built the Appleyard lines in Wisconsin and Ohio, as well as a portion of the Tucker-Anthony lines in the latter state. Two years ago he entered the service of the Cincinnati Northern Traction Company, with full charge of its extensive plans for reconstructing, straightening and the placing on private right of way of its line between Cincinnati and Dayton. It was under his supervision that the 26-mile line of the Lima & Toledo Traction Company from Lima to Lelapsic, O., was built last year.

Obituary.

A. F. Ramsey of Crawfordsville, Ind., president of the Indianapolis Crawfordsville & Western Traction Company, died on March 13.

Amherst (Mass.) & Sunderland Street Railway.—It is reported that the control of this company has been sold to William S. Loomis, president of the Holyoke (Mass.) Street Railway Company, and others.

Coney Island & Brooklyn Railroad.—Stockholders have voted to increase the stock from \$2,000,000 to \$3,500,000.

Easton (Pa.) Transit Company.—This company has called for payment on April 1, at 103 and interest, its \$300,000 first mortgage 5 per cent bonds.

Georgia Railway & Electric Company, Atlanta, Ga.—At a meeting of stockholders on March 26 the authorized common stock was increased from \$6,000,000 to \$8,500,000. Of the increase \$2,000,000 will be issued as a stock dividend to common shareholders and the remaining \$500,000 will be held in the treasury to be sold from time to time for extensions and improvements. When the \$2,000,000 stock is issued the dividend rate will be reduced from 8 to 6 per cent.

Havana (Cuba) Electric Railway.—The earnings for the year ended December 31, 1906, compare as follows:

	1906	1905	Increase
Total receipts	\$1,662,073	\$1,542,870	\$119,203
Operating expenses and taxes....	1,031,374	776,052	255,322
Net earnings	\$ 630,699	\$ 766,818	*\$136,119

Surplus	\$ 132,385	\$ 370,921	*\$238,536
Dividends	200,000	200,000
Deficit	\$ 67,615	†\$370,921	\$438,536

*Decrease. †Surplus.

Indianapolis & Northwestern Traction Company.—This company has filed amended articles of incorporation with the secretary of state whereby the capital stock is increased \$3,550,000. The money procured from the sale of this stock is to be used in building extensions from Crawfordsville to Williamsport, the taking over of the Lebanon-Thorntown Traction Company and building an extension from Clarksville to Lafayette.

Interborough Rapid Transit Company, New York City.—The company has made public its income account for the year 1906. Gross earnings increased 14.8 per cent over 1905 and operating expenses increased 6.65 per cent. The gain in net earnings was 21.55 per cent. The final surplus increased 41.57 per cent. The earnings, with comparisons, are as follows:

	1906	1905	Increase
Gross earnings	\$20,916,147	\$18,218,266	\$2,697,881
Operating expenses	8,793,486	8,245,004	548,482

Net income	7,493,192	6,368,142	1,125,050
7 per cent on Manhattan Railway Company stock	3,948,000	3,864,000	84,000
Surplus	\$3,545,192	\$ 2,504,142	\$1,041,050
Operating expenses—per cent of gross earnings	42.04	45.26	*3.22
Passengers carried	420,302,389	366,174,479	54,127,910

*Decrease.

Lewiston (N. Y.) & Youngstown Frontier Railway.—It is reported that this road will be acquired by the Niagara Gorge Railroad Company, Niagara Falls, N. Y.

North Alabama Traction Company, New Decatur, Ala.—The capital stock of this company will be increased from \$150,000 to \$300,000.

United Railways Company, St. Louis.—The statement for February shows an increase in gross earnings as compared with the previous year, but a final deficit after the payment of fixed charges. The St. Louis & Suburban system was taken over as of January 1. The figures for February, with a comparison, are as follows:

	1907	1906	Increase
Gross earnings and other income....	\$764,680	\$713,664	\$51,016
Expenses, taxes and depreciation....	548,479	463,041	85,438
February net earnings	\$216,201	\$250,623	*\$34,422
Charges	231,324	231,991	*667
February deficit	\$15,123	†\$18,632	\$33,755

*Decrease. †Surplus.

West Chester (Pa.) Street Railway Company.—This company will acquire the property of the Coatesville Traction Company, which is now controlled by the West Chester Company. The Coatesville Company owns a road extending from Coatesville to Downingtown, Pa.

Manufactures and Supplies

ROLLING STOCK.

Lexington Railway, Lexington, Ky., is reported to have ordered six new cars.

Alabama City Gadsden & Attalla Railway, Gadsden, Ala., is figuring on one double-truck car.

Buffalo Lockport & Rochester Railway, Buffalo, N. Y., is asking prices on equipment for 17 cars.

New Berlin & Winfield Railroad, New Berlin, Pa., is in the market for one passenger and baggage car.

Elgin & Belvidere Electric Company, Chicago, is reported to have placed an order for 10 new interurban cars.

Philadelphia Rapid Transit Company has ordered 60 passenger cars for elevated service from the Pressed Steel Car Company for November delivery.

Dayton Covington & Piqua Traction Company, Dayton, O., has ordered two 15-bench open cars for summer service from the Wason Manufacturing Company.

Oakland Transit Company, Oakland, Cal., is building in its shops 20 large city cars, each with a seating capacity of 56 passengers. The estimated weight of these cars is 36,000 pounds each.

Winnipeg Electric Railway, Winnipeg, Can., has placed an order with the Ottawa Car Company for 20 double-truck cars, 40 feet in length over all, and has ordered 20 similar cars from its own shops.

Coos Bay Gas & Electric Company, which is building an electric line from Empire City to Marshfield, Ore., is in the market for a number of combination passenger and mail cars, to be equipped with a controller on each end of the car. Seymour H. Bell, general manager, Marshfield, Ore.

SHOPS AND BUILDINGS.

Denver Interurban Railway.—Contracts have been awarded for the construction of a car barn, 100 by 140 feet, of brick and steel construction, at Ft. Collins, Colo., in connection with the street railway to be built in that city. The building will contain a machine shop, blacksmith shop and tool rooms and will have a capacity of 12 cars. The construction is in charge of C. H. Harpman, mechanical engineer of the Colorado & Southern Railroad, of which the Denver Interurban is a subsidiary company, organized to build its electric lines.

Evansville & Southern Indiana Traction Company.—This company has ordered plans and will soon ask for bids for the erection of a 2-story brick passenger and freight station, also a large car barn, at Princeton, Ind.

Indiana Union Traction Company.—Bids are being asked by George H. Penrose, quartermaster U. S. A., at Ft. Benjamin Harrison, near Indianapolis, for the construction and equipment of a terminal station on the government grounds for the use of the traction company. It is understood that it is the plan of the government to own all the buildings and the railroad track laid upon the government grounds.

Syracuse Rapid Transit Company.—This company will erect a car barn and machine shop, to cost about \$150,000, on Wolf street, Syracuse, N. Y. C. Loomis Allen, general manager.

TRADE NOTES.

H. B. Smith Machine Company, Smithville, N. J., will soon remove its Chicago office from 110 and 12 North Canal street to 105-109 Clinton street.

J. H. Burwell, with offices in the Fisher building, Chicago, has been appointed sales agent in the middle west for the Automatic Ventilator Company of New York.

Arthur D. Newton, manager electrical department of the Boston branch of the H. W. Johns-Manville Company, New York, died on Wednesday, March 13, from an attack of la grippe.

Kilby Frog & Switch Company, Birmingham, Ala., has increased its capital stock to \$130,000 for the purpose of enlarging the capacity of the plant and for which new machinery is now being installed.

E. L. Greene, formerly foreman of the general repair and new equipment shops of the New York Central Railway, has accepted a position with the engineering department of the Westinghouse Electric & Manufacturing Company.

Standard Railway Equipment Company, St. Louis, Mo., dealer in Monarch pneumatic tools, Murphy inside and outside metal roofs, draft rigging, etc., has opened an office in suite 359-361 Frick building annex, Pittsburg, Pa.

Electric Storage Battery Company, Philadelphia, at its annual meeting elected H. H. Vreeland a director of the company to succeed Thomas F. Ryan. Mr. Vreeland has for a number of years been president of the Metropolitan Street Railway of New York. All of the retiring board of directors were re-elected. The annual report of the year ending December 31, 1906, showed gross

sales of \$1,331,800, an increase of \$135,687. The surplus for the year, after deducting dividends, amounted to \$246,923. The total surplus is now \$3,754,452 and the total assets of the company are placed at \$22,225,209, an increase of \$351,866. Of the total assets \$13,661,625 represent patents, etc.

Dossert & Co., 244 West Forty-first street, New York, manufacturers of solderless connectors, have received an order for 1,000 Dossert clamp joints from the Union Gas & Electric Company, Cincinnati, O. These joints are to be used for connecting No. 6 wire or ½-inch pipe in the grounding of transformers.

American Hoist & Derrick Company, St. Paul, Minn., is erecting a foundry building, 460 by 180 feet, with stone foundation, brick walls and steel roof. The foundation is well under way and it is expected the building will be completed in August. The cost of the building will be about \$100,000.

Westinghouse Lamp Company, New York, is the new name by which the Sawyer-Man Electric Company will be known on and after April 1. It has been generally understood for a number of years that the Sawyer-Man Electric Company was a Westinghouse interest, and the change of name is but a logical result of changed conditions.

Wason Manufacturing Company, Springfield, Mass., as reported in the Electric Railway Review of March 16, has announced purchase of its car building plant by The J. G. Brill Company, Philadelphia, effective on April 1. This is one of the oldest plants of its kind in the United States and has an annual capacity of about 150 steam railway passenger cars and 125 electric cars.

J. H. Wagenhorst & Co., Youngstown, O., report a partial list of their automatic electric blue printing machines as follows: Westmoreland Coal Company, Irwin, Pa.; Casey & Hedges Company, Chattanooga, Tenn.; Norton Company, Worcester, Mass.; Eugene Dietzgen Company, San Francisco, Cal.; U. G. Charles, Wichita, Kan.; Yawman & Erbe, Rochester, N. Y.; H. E. Ahrens & Brother, Lewiston, Pa.

Invincible Rail Joint Company, Youngstown, Wash., has been incorporated in the state of Washington with an authorized capital of \$2,000,000 for the purpose of manufacturing a patent nut and bolt lock and a rail joint. For this purpose the company proposes to erect a plant at a cost of \$25,000. The officers of the company are: President, A. McPhaden; vice-president, C. R. Arnold, and secretary and treasurer, A. C. Shaw.

Philip Carey Manufacturing Company, Lockland, O., is just starting excavation work in preparation for the construction of two very large brick and concrete factory buildings, 80 feet wide by 400 feet long, which it expects to have ready for operation by September 1. We are informed all orders for building and equipment have been placed. These two immense additions to its plant are occasioned by the phenomenal increase in its business.

Northern Engineering Works, Detroit, Mich., manufacturer of electric traveling cranes of all kinds, is completing extensions and improvements to its plant that will materially increase its output capacity and enable the company to make more prompt delivery of its products. The additions include an electric building for electric crane trolleys, 50 by 110 feet, one story high and equipped by a 10-ton electric traveling Northern crane; a 2-story tool room of brick and steel construction, with saw-tooth roofs, to be 30 by 50 feet.

George W. Jackson, Incorporated, has taken over the business of Jackson & Corbett Bridge & Steel Works, Interlocking Steel Sheeting Company and George W. Jackson, consulting engineer. The new organization will continue the business of the former companies as contractor for bridges, structural steel, subways, tunnels and heavy foundations. The present location of the offices is on the tenth floor of Borland building, Chicago. About May 1 permanent offices and warehouse will be open at 169-179 West Jackson boulevard and 179-190 Quincy street.

Cincinnati Iron Store Company, Cincinnati, O., is about to erect a new addition, 113 by 116 feet, to its present warehouse. The company represents the following companies in and surrounding Cincinnati: Quincy, Manchester, Sargent Company, Case Manufacturing Company, Long & Allstatter and the Hamilton Machine Tool Company. The machinery and equipment department of this company is enjoying a prosperous growth and preparations are being made to enlarge its facilities. Among the recent contracts recently received for power punching and shearing machinery is the equipping of the new plant of the Cincinnati Frog & Switch Company.

C. H. Whall, Boston, Mass., who was the pioneer in the use of fiber for the insulation of rail joints for track circuits, has had his fiber adopted as the standard for rail-joint insulation on a number of the large railway systems. The first application of fiber as insulation in a patented rail joint was made by Mr. Whall about 1885. Since that time C. H. Whall & Co. have made a special study of this method of insulation and the Whall fiber is now in extensive use. It is claimed that about 90 per cent of the fiber used for insulation of track circuits is sold by C. H. Whall & Co., of which C. H. Whall is president and F. R. Whall general manager. The company also manufactures fuses.

Western Wire Sales Company, Chicago, has been incorporated under the laws of Illinois to take over the business, good-will, assets, agencies, etc., of J. Allen Haines, Incorporated, 324 Dearborn street, Chicago. The new company has taken over all the agencies recently handled by Mr. Haines, and in addition has added several new agencies and will represent in the western territory a large eastern manufacturer of German silver, nickel wire, resistance wire, etc., and the Tipless Lamp Company of New

York. The company is publishing weekly a market letter which it will be glad to send to parties interested. The offices of the new company will remain at their present location.

Keystone Equipment Company, recently organized and incorporated under New York state laws, has taken offices on the sixth floor in the new West Street building, 90 West street, New York. Mr. Leonard R. Winters is president and Mr. John J. McDonald is secretary and treasurer. The company will represent the Keystone Powder Manufacturing Company of Emporium, Pa., manufacturers of high explosives, and will act as agents for railroad and contractors' equipment, new and second hand. A bureau of information will be at the disposal of contractors and buyers visiting New York desiring to purchase supplies of all description, where mail can be sent and letters written and every facility provided for their use and convenience.

ADVERTISING LITERATURE.

Railway Steel-Spring Company, 71 Broadway, New York.—This company has issued a catalogue in the interests of its steel tired wheel department showing the various styles of wheels manufactured by it.

Association of American Portland Cement Manufacturers, Land Title Building, Philadelphia, Pa.—Bulletin No. 13 is entitled "Forms for Concrete Construction." The paper of which it is a reprint was presented by Sanford E. Thompson, M. Am. Soc. C. E., before the third annual convention of the National Association of Cement Users.

Lane & Bodley Company, Cincinnati, O.—Bulletin No. 101 describes the four-valve shaft governor engine which is manufactured by this company. This engine was designed to fill the demand for an engine with high rotative speeds, and economy in the use of steam comparable with releasing gear engines of slow rotative speed.

Century Cement Machine Company, Rochester, N. Y.—A splendidly printed and well bound catalogue has been issued by this company in the interests of those concerned with the manufacture of concrete stone. It describes the Hercules cement stone machine and the method of its operation. The publication is illustrated with a large number of engravings from photographs.

Expanded Metal & Corrugated Bar Company, St. Louis, Mo.—"Tests of Bond Between Concrete and Steel" is the subject of a reinforced concrete bulletin No. 1 issued by this company. It includes a report of tests made at Lewis Institute, Chicago, by Professor DePuy. The paper was originally read before the Western Society of Engineers, at Chicago, December 5, 1906, by T. L. Condron.

Niles-Bement-Pond Company, 111 Broadway, New York.—List No. 13 of second-hand metal-working machinery has been issued. It includes railroad machinery, screw cutting lathes, speed lathes, brass finishers' lathes, chucking lathes, screw machines, planers, shapers, drills, multiple spindle drills, bolt and nut machinery, milling machines, punch presses and shears, etc., and a number of other classes of machinery.

Samson Cordage Works, 88 Broad St., Boston, Mass.—A convenient pocket catalogue designated as No. 12 lists the products of this company, which include solid braided cord, sash cord, clothes lines, signal cords, trolley cords, arc lamp cords, rope couplings and other cord appliances. The company has had about thirty-five years' experience in the manufacture of solid braided cord and its output is favorably known.

Arthur Koppel Company, 66-68 Broad Street, New York.—This company's new works at Koppel, Beaver county, Pennsylvania, are now turning out their first orders. The opening of the plant is announced in a small folder illustrating the new plant and incidentally calling attention to the stock on hand of industrial, narrow and standard gauge railway materials. The plant affords facilities for the manufacture of cars of any description and gauge up to 30 tons capacity. This company issues a useful notebook for 1907, having a detachable cover and containing leaves partly subdivided for each day of the year and partly blank for miscellaneous. There are also a few pages devoted to useful information and a few others describing some items of shop and contractors' cars which the company manufactures at its new plant at Koppel. The book will be sent on application.

Dayton Manufacturing Company, Dayton, O.—Catalogue No. 139 is devoted to the Silvey storage batteries which are made in various types suited to all sorts of requirements. Those having to do with railway train lighting will be interested in the car lighting storage battery with armored type plates. This company also manufactures portable storage batteries for railway block signal service which are designed so that the elements retain their capacity for a long period of time without loss of power due to the local action in the cells.

B. F. Sturtevant Company, Boston, Mass.—The revised edition of bulletin No. 125 describes the line of vertical forced-lubrication enclosed engines which this company manufactures in eighteen different sizes, ranging from 5 by 5 to 12 by 10 inches. A sectional view shows the method designed to effect positive lubrication. Generating sets with compound engines are subjects of Bulletin No. 142. The generating sets manufactured by this company consist of vertical compound engines directly connected to generators of eight and ten-pole types and are specially designed

to fill the rigid specifications of the United States navy department.

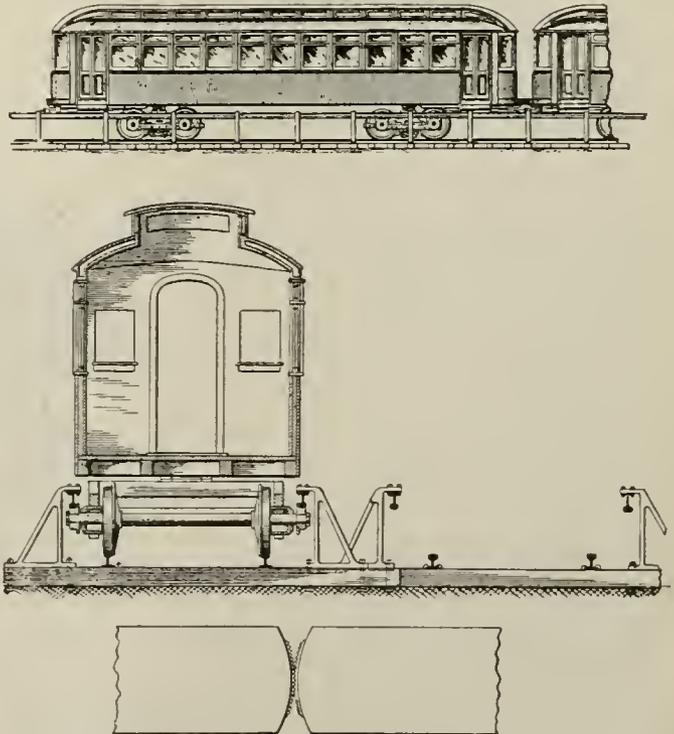

American Locomotive Company, 11 Broadway, New York.—A pamphlet recently issued by this company illustrates and describes locomotives, both steam and compressed air, adapted for the use of contractors, mines, logging roads, plantations and industrial plants and for a wide range of service on light rails and poor road bed. The pamphlet is a complete record of the production by this company of locomotives of light power.

Ferro-Concrete Construction Company, Cincinnati, O.—This company, which is engineer and contractor for ferro-concrete construction has issued index No. 2, designed to put before the architect, engineer, or owner, a list which will show what has been done in the modern form of ferro-concrete fireproof construction. The index bulletin furnishes an alphabetical list of owners with the names of the architects for whom the Ferro-Concrete Construction Company has done work. The nature of the work is briefly outlined, the number is given of the bulletin describing the work in detail and the subjects of the photographs which can be obtained of the same work.

General Electric Company, Schenectady, N. Y.—Bulletin No. 4487 describes small plant continuous current switchboard panels. It is an eight page publication. Bulletin No. 4488 is devoted to the Thomson recording wattmeter, and supersedes Bulletin No. 4415. Portable gasoline engine and generator outfits are the subjects of Bulletin No. 4485. Crane wiring supplies are described in Bulletin No. 4489 and a brief description of a portable air compressor set is presented in Bulletin No. 4490. Controllers for power and mining service are described and illustrated in Bulletin No. 4491. Bulletin No. 4492 describes small plant alternating current switchboards for 1,150 and 2,300 volts. An index to the bulletins, published by the General Electric Company, has been published for the convenience of those who make it a practice to file the various publications of the company.

A Method for Preventing the Derailment of Railway Trains.

The number of serious accidents which have taken place of late have generally been attributed to the derailment of one or more cars on curves. And especially several derailments which have taken place in the subways throughout the country have

Device to Prevent Derailment of Trains—Side Elevation and Transverse Sectional View of Guard Rails.

called attention to the disastrous effects which would probably result should one of the trains in the New York subway be derailed on a curve at high speed.

The thought of what the result of such a derailment would be has led to the designing and invention of the number of devices which would prevent the trains from being completely demolished and from tearing down the columns of the subway which support the roof above.

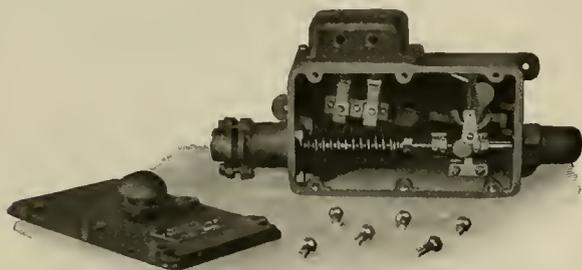

There is presented herewith a transverse cross section of the Van Dorn patent guard rail, manufactured by the W. T. Van Dorn Company, 1074 Paulina street, Chicago, which, it is stated by the inventor, will absolutely prevent the derailment of trains and permit the rounding of curves at the highest speed with perfect safety. As it will be seen by the illustration, the invention consists

of T-rails which are inverted and supported by a heavy iron bracket securely bolted to the end of the ties, which are made unusually long expressly for this purpose. On the end of the axle are mounted small wheels, which engage with the guard rails when there is the least tendency for the wheels to jump or climb the rail or the inner wheel to leave the track. The inventor claims, and no doubt rightfully so, that the axle is the only proper place at which to apply a force which is to keep the wheels from jumping or climbing the rails. These rails, of course, could easily be so insulated that they would at the same time serve in place of the usual contact rail, and therefore, the additional expense of providing this safeguard would, for electric lines at least, be far less than the safety assured would warrant.

On steam roads or roads where the contact rail is already installed—and it would entail considerable expense to make an installation of the guard rails the entire length of the lines—the guard rail need only be placed on curves where the danger of derailment is unusually great. The attention of managers and companies operating incline and scenic railways is particularly desired for, as is well known, the danger of derailment and the frequency of serious accidents on these light tracks makes the installation of some device of the nature of that herein described absolutely necessary.

PORTABLE MOTOR-DRIVEN AIR COMPRESSORS.

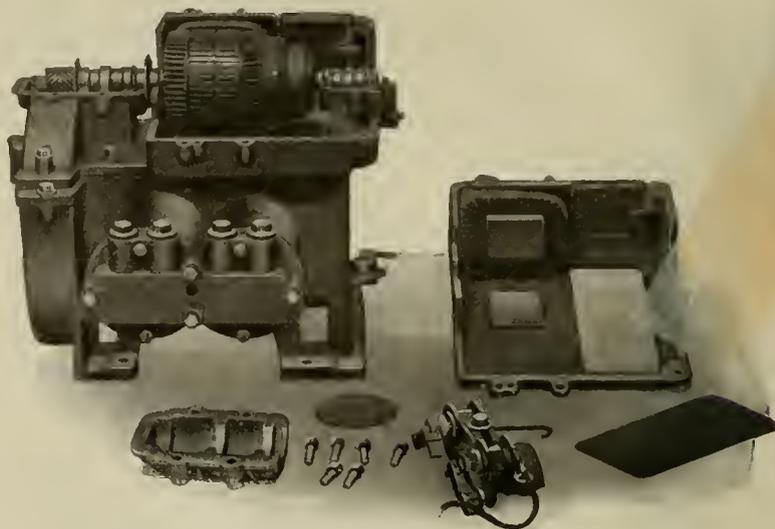

There is probably no field of industry which is extending so rapidly as the application of compressed air for commercial and industrial purposes. This is especially true of the application of compressed air in small quantities in the electric railway field,

Portable Air Compressor—Figure 3—Governor Open for Inspection.

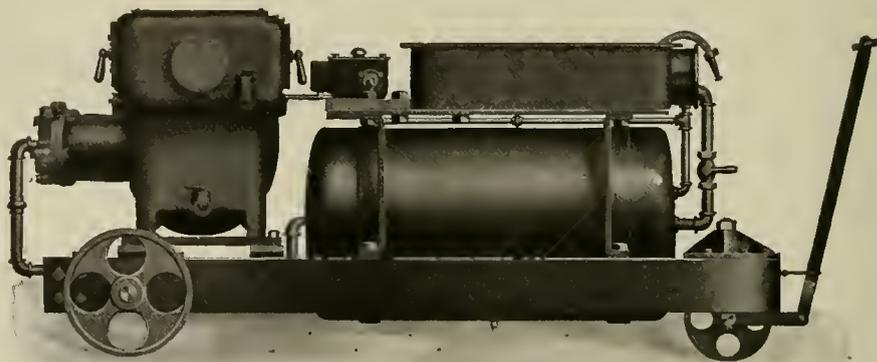

where the sphere of usefulness of a small compressor, especially of the portable or semi-portable type, is almost unlimited. In the power house a small motor-driven portable air compressor is of great value for blowing out armatures and fields for running small compressed air tools, such as drills, riveters, chippers and pneumatic hammers, pneumatic lifts, etc., the usefulness of which in emergency repair jobs would, as a rule, make the cost of such an outfit insignificant. In the car house the portable air compressor is indispensable for blowing out the motors, operating pneumatic tools and especially for the cleaning of cars by the use of compressed air, which is now acknowledged to be the only efficient, sanitary and economical method of performing this service. Another use to which stationary air compressors with water-cooled cylinders can be efficiently applied, is to raise water from deep artesian wells, as they furnish an abundant supply of water with the expenditure of comparatively little energy and are far more reliable than deep well plunger pumps. An interesting demand for small motor-driven portable air compressors has developed as the result of the widely known reliability and compactness of the small air compressors used in the air brake service of electric cars. The result of this great demand for these remarkable little compressors led the National Brake & Electric Company of Milwaukee, Wis., to build a complete line of portable and stationary air compressors in which are embodied all the improvements and superior quality of material and workmanship which are so prominent in the air brake compressors and have established their well-known reputation for high efficiency, compactness and ability to withstand hard, continuous service and the unusual amount of hard treatment which is the lot of all railway machinery. In Figure 1 is presented an assembled view of one of these portable air compressors, mounted on a strong cast-iron base, which also carries the storage tank governor, pressure gauge, relief valve and tank in which 100 feet or more of air hose can be neatly coiled so that it is always ready for use and protected, which insures the longest life possible. A particular point to which attention is called in these outfits is the overall width, which has been kept down to but 29½ inches, which permits it to be taken through doors and openings in shops and factories which are far smaller in size than the average. The air compressor is of the 2-cylinder, single-acting, trunk-piston variety, having the cylinders horizontal and an enclosed crank pit which readily permits of splash lubrication and also protects the cylinder, piston and crank pins from dust and grit. The connecting rods, in place of being of the ordinary marine end type, are constructed with a hinged cap, thus permitting adjustment with one bolt, which makes the adjustment

by inexperienced workmen a simple matter when it becomes necessary. The connecting rod bolts are fitted with lock nuts and split pins and there is absolutely no danger of their working loose in operation. The clearances can therefore be reduced to a minimum, which assures a high efficiency of the compressor,

Portable Air Compressor—Figure 2—Open for Inspection.

and to prevent leakage the pistons are fitted with Dunbar piston rings, which this company has employed for over eight years and found to its entire satisfaction. The crank shaft, which is of forged steel, is slotted out to form the crank pins, which are set 150 degrees apart. A feature in the design which is worthy of special attention is the center bearing which is provided between the crank pins, thus supporting the shaft at its weakest point and preventing the danger of fracture. The bearings are all oiled by the splash of the connecting rod, which keeps them constantly flooded with an abundant supply of clean oil, as the bearings throughout the machine are entirely protected from dust and moisture. Another feature which is of great importance is the design of the gearing, which is of the Herringbone type, with fine pitch and constructed of a medium steel, which insures long life and quiet operation. The gear case is cast integral with

Portable Air Compressor—Figure 1—Assembled View.

the cylinders and crank pit, thus making both a light and substantial construction, which is oil tight and permits opening the crank case without having to remove all the oil. The motor, which is mounted directly above the air compressor, is of the standard 4-pole type adapted for air brake air compressors.

There are two field magnet coils, which are form wound and heavily insulated. A unique feature in the construction of the field magnet is the manner in which it is divided to afford access to the armature and bearings. This is clearly seen in Figure 2, which shows the upper portion of the field magnet and the brush holder removed from the motor. The heavy insulating and large insulating surfaces on the brush holder can be easily seen and assure safe operation and little difficulty from broken down insulating bushings. The armature, which is of the drum type, has form-wound coils and a commutator of ample size to insure sparkless operation. The compressor is controlled by a governor shown in Figure 3, which shows its substantial and simple construction. A particular feature, which is worthy of attention, is the large diameter of the spring and the short travel of the actuating piston, which insures reliability and certainty of action.

Rehabilitation of the Chicago traction properties, as planned in the ordinances approved by voters on April 2, will involve an estimated expenditure of \$40,000,000.

Traction Improvements in Chicago. The work of rehabilitation will be conducted under the direction of the board of supervising engineers, of which the companies will appoint one member and

the city another. Bion J. Arnold is appointed in the ordinances as the third member. The detailed specifications to which the improvements must conform are published in this issue of the Electric Railway Review. The effect of the ordinances will be to give Chicago a system of electric railways designed to meet the increasing needs of the community for several years. Whether the growth of the city will render the lines inadequate to accommodate the traffic and the final result will be the construction of a subway to relieve the congestion in the central district, only the future will determine.

In designing the new light-weight motor cars of the Denver City Tramway Company, as described elsewhere in this issue,

Light Cars as a Good Investment. It was desired to obtain a substantial type of rolling stock equipment which could carry 48 passengers and have the lowest weight consistent with strength and rigidity.

The ever-present question of maintenance was well kept in mind and the saving in weight made by trimming only those parts which experience had shown to be heavier than absolute necessity demanded. The new cars, as described, are of the California type, seat 48 passengers, have two 50-horsepower motors, straight air brakes, and weigh, ready to run, 28,000 pounds. This is a total weight of 583 pounds per unit of seating capacity. The desirability of having cars of consistently low weight is obvious. It has been shown by extensive series of wattmeter readings that the new cars consume less power by 1.5 kilowatts per car mile, measured at the switchboard, than the four-motor type of the same system, weighing 38,000 pounds. With current costing 0.66 cents per unit at the power house, this difference represents the desirable saving of approximately one cent per car mile. There are other

economies, due to light-weight cars, such as decreased wear on track work and reduced expense for wheel and brakeshoe renewals, which, when combined with the remarkable saving in power consumption, open an avenue leading to a possible reduction in total operating costs that is worthy of attention from street railway organizations maintaining and operating heavy city equipments.

While there is apparently no end to the number of auxiliary appliances which can be installed in a power house, experience in actual operation shows that there is

Motor-Driven Steam Valves. a limit beyond which it is undesirable to go in the failure to make use of well-tryed devices designed to promote economy of

fuel consumption or to forestall the effects of accidents. The motor-driven steam valve stands in the latter class of apparatus; it has made a good record in the few plants where it has been installed, and on the score of convenience and flexibility its results in service are far beyond the possibilities of hand operation. Yet on account of the cost of installing electrically-driven valves, or perhaps from an inert appreciation of their advantages, their use has not extended very rapidly in railway service, but now and then operating experience shows the importance of such control of at least the high pressure steam lines. A case in point occurred recently in a power plant supplying the car service of a city of considerably over 100,000 inhabitants. In the early evening a tube burst in one of the boiler batteries, a large quantity of water was at once let loose on the fires and the boiler room filled with dense steam. It was impossible to enter the room to cut off the injured boiler from the rest and start the fires beneath the others; there was a complete shut down of the generating units, and for about an hour every car on the system was at a standstill. The loss of earnings during this hour based on the average hourly income of the system from passenger traffic was something in excess of \$200, leaving out any consideration of wages and fixed charges, and the direct cost of the damage to the boiler room equipment. Matters were remedied by smashing in the skylights in the roof of the station,

which allowed the steam to escape and made the boiler room habitable again so that the damaged boiler could be shut off and fires started on cold water in the others. If a small, rugged induction motor had been attached to the valve between each boiler and the main header with remote control in both boiler and engine rooms, the trouble would probably have lasted but a few moments.

NEW YORK AND ITS PUBLIC UTILITIES.

To those who examine critically the provisions of the so-called "Public Utilities" bill now pending before the legislature of the state of New York, it must seem that in the form of a law it would go far toward the establishment of the principle of government ownership, even though such is claimed to be foreign to the intention of its chief promoter. The intention of Governor Hughes is doubtless laudable, and under the control of an always level-headed executive it is probable that most of the corporations directly affected would welcome the degree of supervision contemplated in the bill. Those, however, who are responsible for the affairs of a corporation for a longer period than that embraced by the ordinary tenure of office of a state executive are apt to look with some trepidation upon the power which the passage of a law in such terms would place in the hands of a single individual. In fact, the objections which have been made by those who have already put in an appearance in opposition to the passage of the present bill make this point perfectly clear. It is not especially to the terms of the bill in respect to the abuses which it is designed to correct that objection is taken. It is to the general principle of the establishment of a commission, responsible to the one man who may happen at any time to hold the position of chief executive of the state and whose acts in this particular respect are sought to be withheld from the ordinary supervision of the courts, that objection lies. It must be acknowledged, in view of the ordinary possibilities of political vicissitudes in the state of New York, that the objectors have some grounds for opposing hasty action of so far-reaching a character.

Most of the objections thus far urged against the bill in question relate each to a single feature which seems of vital importance to the interest concerned. As undercurrents to the general tide which developed at Albany at the first public hearing on the bill on March 27, the direction and force of which could be discerned by the various amendments proposed, lines of opposition were developed relating to the following features:

The absence of any provision for a judicial review of the acts of the proposed commissions;

Proposed salaries of members of the commission inadequate to secure men whose motives and intelligence could be relied upon as unimpeachable;

The absolute power of the chief executive of the state as to appointment and dismissal;

The minuteness of the bill in its provisions as to operating methods, schedules and rates;

The requirements as to the purchase of new equipment and the improvement of existing service coupled with a withdrawal of power to raise additional capital or acquire the stocks and bonds of existing corporations;

And, on the part of the city of New York, the proposition to remove from the financial department of the city the control of the expenditure of the city's money and vest it in the hands of a commission responsible to the governor alone and not to the authorities of the city.

Such, in brief, are some of the objections which have been opposed to the passage of the bill. Another objection that is very important to the city of New York is that the passage of the bill would at once remove from its position the present rapid transit commission, which has

fairly earned the respect of its constituency by its efforts to solve the urban transportation problem, and that at a moment when the pressure of an immediate solution was never more fully appreciated and its possibilities never more promising. Presumably, the magnitude of the interests concerned in securing the retention of this one item of supervision in the hands of a tried body rather than again reducing its control to the realms of experiment, is paramount to that of any other single item of control involved. It may be safer, therefore, at the present time, to seek the middle of the road.

It is unfortunate that the ardent supporters of the bill, including the governor himself, whose intentions, as before intimated, are beyond reproach, should contend as strenuously as they do against the insertion in the bill of a provision for court review.

PUBLIC OWNERSHIP REPUDIATED AT CHICAGO.

The result of the city election in Chicago on April 2 was the severest setback which the socialistic propaganda for public ownership and operation of public utilities has ever sustained in the United States. Both the candidates for municipal offices who supported the ordinances to empower the present traction companies to go ahead and run and reconstruct the street car system, and the ordinances themselves, received substantial majorities. That the issue of the election was an even more emphatic repudiation of the principle of public ownership than of the Dunne city administration is indicated by the fact that while E. F. Dunne, the democratic candidate for mayor, who opposed the ordinances, was defeated by F. A. Busse, the republican candidate, who favored their adoption, by a plurality of only about 13,000, the ordinances were endorsed by a majority of more than 33,000.

The result of the city election in Chicago in 1905 was hailed by persons of socialistic propensities as a triumph for their cause. The people of the city have since had a good opportunity to study the question of public ownership and they have taken advantage of it. Mr. Dalrymple, the traction expert whom Mayor Dunne imported from Glasgow immediately after his election, taught the voters one of their most effective lessons. Mr. Dalrymple, being the manager of a municipally operated tramway system, was invited to this country with the expectation that out of the fullness of his experience he would give many useful suggestions regarding the best means for securing the adoption and successful carrying out of the policy of municipal ownership. This canny Scotchman decided, however, after studying the conditions of government in American cities, that it would be extremely unwise for Chicago to attempt to own and operate its traction system. His statements of his conclusions did not change the views of those who were committed to the advocacy of public ownership, regardless of municipal conditions or of the results that it probably would produce. It did, however, cause thousands of voters to decide that they had placed entirely too much dependence on the rosy predictions which had been made concerning the great improvements which would be brought to pass by the socialization of public utilities—predictions which had been made chiefly by persons who never had had any practical experience of the actual workings of municipal socialism.

Revelations regarding the bad conditions which have been brought to pass in London under a policy of municipal socialism, and the complete overthrow at the recent election in the British metropolis of those responsible for those conditions, also exerted some influence upon the result of the election in Chicago. These and other developments, combined with a study of the results of public ownership, both where it has been tried in Chicago and in other cities, combined to convince the people that the dangers of the adop-

tion of this policy were greater than any possible benefits which it reasonably could be expected to confer.

While the terms of the ordinances are not so favorable to the companies as they were justified in demanding, their adoption gives the companies an opportunity to redeem the bad name which the traction service of Chicago long has borne; and upon the service which shall be given in the reconstruction and operation of the lines probably will depend largely the decision of the people as to whether they shall adopt ultimately a policy of private or of public ownership. Of course, nobody believes that the radical advocates of public ownership will be convinced that they are wrong, no matter what kind of service may be given; but the majority of the people are more open to conviction. What the great majority of the people want is good service. The rehabilitation of the traction system has been brought much nearer by the vote in favor of the ordinances. The opponents of the ordinances asked the people, in effect, to vote for a lawsuit; and if it had been decided to attempt to oust the private companies from the streets by proceedings in the courts, the reconstruction of the lines would have been postponed for years. Meantime, the people would have had to tolerate even worse service than that which has caused such loud complaints for several years.

The issue of the election in Chicago should exert influence upon public opinion in other American cities. This is one of the few occasions on which the voters of any populous community in the United States have expressed themselves intelligently regarding the question of public ownership. The fact that the people of Chicago, after mature consideration, have rejected the policy of municipal socialism should cause those of other cities, large and small, to hesitate long and study carefully before committing themselves to that policy.

CAR DISPATCHING IN LARGE CITIES.

The control of car movements on large city systems is one of the most important problems bearing directly upon the efficiency and profits of the service. Transportation expenses are such a large percentage of the total cost of operation that it is particularly desirable to study the organization of the employes' work and hours from every point of view in order to reduce delays, idle time and lost motion of all kinds to the minimum. The maintenance of proper discipline in the car service, the adjustment of timetables to meet the ever-shifting demands of the traffic, the insuring of prompt departure and arrival of cars at time points and terminals, the checking of register readings and oversight of platform earnings all require constant attention.

On all systems, large and small, the movement of cars must be controlled by some central authority if the best results are to be secured. The exact form which this control should take is a matter of special interest as the conditions of the service vary, but in every case, from the four-car country road to the urban system operating from 1,000 to 2,000 cars at a given moment, positive and authoritative superintendence is essential. Starting with the small road, some form of telephone dispatching seems to meet the executive requirements better than an extensive subdivision of authority, but as systems grow in size toward the complication of perhaps several hundred miles of track, thousands of employes and hundreds of cars it is a question how far telephone dispatching can be profitably carried. In the Electric Railway Review of March 2 Mr. S. W. Cantril showed how a telephone dispatching system is applied successfully to the lines of the Denver City Tramway Company, serving a population of not far from 150,000. The central location of the dispatcher's office, the facility with which cars are started from the ends of routes, extras thrown into service at times of heavy riding and withdrawn when the traffic is light, the

close touch with weather conditions, fires and other emergencies all contribute to a flexibility of car movement which could scarcely be improved under the conditions prevailing in Denver.

In cities where great congestion of traffic, or more properly speaking, slow movement, is enforced by the narrowness of the streets and the high density of population, existence of crowded waterways, drawbridges, severe grades and sharp curves, and particularly where the transportation systems require an extensive divisional organization with scores of motormen and conductors to be directed at each main car house, it is doubtful if anything less than the usual organization of division superintendents and starters will meet the conditions. There are several reasons for this. Under the close headway which prevails on many routes in such systems, even the time required for the conductor to telephone his arrival at the end of the line to the dispatcher becomes a matter of considerable expense to the company; and as it must virtually be added to the setback allowance ordinarily made for the car to complete its schedule, the multiplied time for perhaps hundreds of car crews to communicate with headquarters, with due allowance for busy reports on the telephone lines, may easily amount to a considerable sum annually, and also require more cars for maintaining a given schedule.

It is also a difficult matter to enforce proper discipline over a mere telephone wire when a large body of assembled trainmen are to be held together for punctual starting on trips. On systems where starters are employed, if the organization is what it should be, the starter's time is likely to be pretty well filled from morning until night, picking out regular and spare men for different runs, taking register records, checking mileage, filling gaps in the intervals between cars, and in general adjusting the rolling stock movement to the traffic conditions. Some of this work can be done by the dispatchers, but the larger the number of men employed at any single car house, the more essential personal direction becomes by an official on the spot. Where telephone reports are relied upon it is not always easy to obtain a check upon the leaving time of cars and the registers, although inspection of schedule maintenance along the different routes tends to correct any abuses.

The cost of installing a telephone system which will bring all parts of a large urban street railway into common touch is seldom to be weighed against the increased convenience of operation thus afforded. Certainly there should always be some means of turning emergency calls at any hour of the day or night to the proper official of the road. Wherever the operating headquarters of the road are located, whether at a dispatching office, at the general manager's office or at the company's private branch telephone exchange, the operating rules should provide for the prompt reception and transmission of all information and orders relating to the service.

Device for Protection of Passengers in Denver.

Mr. John Crosby, shop foreman of the Denver City Tramway, has developed and patented an ingenious device for the protection of passengers, which is now being given a trial on the company's cars. The device consists of the application of contact points to the safety tread on the lower step of the cars, so that when a passenger stands on this step a circuit is closed and a buzzer is caused to ring either in the motorman's cab or at the middle of the car, where the conductor can hear it. Favorable results as regards accidents and the saving of the conductor's time are expected. The Denver City Tramway Company also expects to equip all its motor cars with mirrors attached so that the motorman can conveniently watch the car door and steps.

CHICAGO TRACTION ORDINANCES ASSURE IMPROVEMENTS ON A VAST SCALE.

The approval by the voters of Chicago on April 2 of the Chicago City Railway Company and the Chicago Railways Company (Union Traction) ordinances paves the way for complete rehabilitation of the properties. The ordinances provide that the companies must proceed at once to reconstruct portions of their track and roadbed and put their entire system, plant and equipment in first-class condition. The aggregate of expenditures which the companies must make within three years is estimated at \$40,000,000.

The ordinances give the following general specifications covering the materials and equipment which the companies must furnish:

Rails.

All new track construction hereafter laid in streets or public ways shall be laid with modern improved rails of the grooved type, weighing not less than 129 pounds per yard, which shall in all respects conform to the specifications for grooved rails as contained in section 1944 of the revised municipal code of Chicago, as amended by ordinance of the city council passed October 8, 1906; provided, that all rail used in the tunnels and on their approaches, and in the subways and on their approaches may be T-rail weighing not less than 80 pounds per yard.

Joints.

All rail joints shall be either cast welded, electrically welded or of a type which will give an equally smooth and even joint, except that the joint used must be one which will provide a carrying capacity for the electric current equivalent to the carrying capacity of the rail.

Track Substructure.

The rails shall be laid upon concrete beams, wooden ties, steel ties or cast-iron chairs or in some other form of first-class modern approved street railway track construction. The foundation shall be either of concrete, crushed stone or other ballast material which in the judgment of the board of supervising engineers shall best suit the conditions of soil and drainage. Said foundation to be brought to the proper height to serve as a suitable foundation for the pavement.

Bonding.

In case the rails are joined by any other form of joint than a cast welded or electrically welded joint, there shall be some form of bond used which will connect the ends of the rails in such manner that the conductivity of the joints shall be equivalent to the carrying capacity of the rail. The rails of each single track and the inside rails of the double track of all tracks shall be connected by cross bonds of No. 2-0 (B. & S. gauge) copper wire spaced not more than 1,000 feet apart, and properly secured to the rails in such manner that the full conducting effect of the wire may be utilized. The rails shall be so bonded or joined and such return circuits and other necessary devices installed as to prevent damage from electrolysis as effectually as possible.

Special Work.

At all points of intersection of the tracks of the companies with their own tracks or with the tracks of other companies, there shall be provided suitable steel special work of ample strength and weight to correspond with the structure to which it connects. The frogs, switches and mates shall be provided with wearing plates of hardened steel. All special work and curves shall be laid in the same general manner required for straight-line track.

Poles and Wires.

All new overhead construction shall consist of one trolley wire suspended over each track by span wires attached to poles set at the curb line or suspended from brackets attached to poles. The design of poles hereafter erected shall be subject to approval of the board of engineers, and shall be of iron or steel, weighing approximately 900 pounds each, set in concrete and kept thoroughly painted. They shall be spaced on an average of from 100 to 115 feet apart for straight track, except at street intersections, and so as not to obstruct cross streets, alleys or private driveways. The location of poles shall be subject to the approval of the commissioner of public works. All material used in the overhead construction shall be of the most modern type and shall be capable of sustaining all the weights and strains that come upon it under normal conditions of operation and from wind, sleet and ordinary accidents. The trolley wire shall be not less than No. 2-0 (B. & S. gauge) hard-drawn copper, unless the board

of supervising engineers shall approve other sizes for specific cases. Phosphor bronze, silicon bronze or other material equal in strength may also be used. Trolley wires shall be suspended not less than 18½ feet above the rails, except when such wires are suspended under viaducts, bridges and other structures. There shall be at least two insulations between the trolley wire and the supporting pole. Span wires shall be galvanized iron or steel or silicon bronze.

Feeders and Transmission Wires.

All feeder and transmission wires in certain portions of the city shall be laid underground. To this end authority is conferred upon the companies to enter upon, excavate for, and construct a system of conduits in the streets, alleys and other public ways of the city of sufficient capacity to carry the said wires. All feeder wires in any other territory shall be similarly placed underground whenever the city shall require all other overhead public service wires (except trolley wires) in such territory to be placed underground. All transmission wires used by the companies within the city limits, carrying a pressure of 1,000 volts or more, shall be placed underground. Feeder and transmission wires, not required to be placed underground, shall be suspended by insulators upon said poles supporting said trolley wires or upon poles placed at the side of streets, alleys or other public ways in locations to be approved by the commissioner of public works. These wires and poles shall be so situated that the companies may conveniently make all the connections authorized by said ordinances and the exhibits thereto. The said trolley wires, feeder wires and all other wires authorized by said ordinances to be installed by the companies, where located in streets, alleys or other public or private ways in, along or across which are located railroads elevated above the surface of the streets, may be strung upon or from the structures of such railroads, with the consent of the company owning or operating the same. Said wires shall be attached to said structures and maintained under the supervision of the city electrician.

Conduits.

Underground conduits to carry any of the wires authorized by said ordinances, to be installed by the companies, shall not exceed 4 feet in width and 3 feet in depth, and shall be of tile, cement, iron or other material impervious to moisture and not subject to decay. All transmission and feeder wires and cables laid underground shall be covered with lead or other impervious material. Before any cable containing such wires shall be put in use it shall be tested by an alternating current of twice the working voltage of the cable. All forms of cable used by the companies containing more than one conductor shall be tested in like manner.

City Conduits.

If at any time the city shall desire to place conduits and manholes in streets or public ways wherein the companies are then about to place conduits and manholes, a single trench may be used for both conduits, but the manholes of the companies shall be kept separate and distinct from those of the city. The expense in such case shall be divided between the companies and the city according to the space used by each.

Conductors.

All wires and conductors for the transmission of electricity in and along any street, alley or public way (whether under or above ground) shall be installed in a substantial and workmanlike manner, so as to interfere as little as possible with the other uses of said public places; and all electric work of every kind and character shall comply strictly with the ordinances of the city applicable thereto.

Maintenance of Streets.

The companies, as respects filling, grading, paving, keeping in repair, sweeping, sprinkling, keeping clean, or otherwise improving the streets or parts of streets occupied by their railways, shall fill, grade, pave, keep in repair, sweep, sprinkle and keep clean and free from snow 8 feet in width of all streets and public ways, or portions thereof, occupied by them with a single-track railway, and 16 feet in width of all streets and public ways, or portions thereof, occupied by them with a double-track railway.

Pavement.

The companies, upon the order of the commissioner of public works, and approval of the board of supervising engineers, shall pave, repave or repair the portions of the streets and public ways which by this grant they are required to keep paved and in repair, whenever and as often as the same shall reasonably require paving, repaving or repairing, and shall at all times keep the surface of all of the paving at least up to the top of the rail. The pavement which the companies shall be required to lay down and keep in repair

in the portion of any street or way which they are required to pave and keep in repair shall be of the following kinds, to wit: 1. In all streets or ways in which the companies have in place, at the date of the passage of this ordinance, a good serviceable pavement, they shall repair and maintain the same while serviceable under the direction of the commissioner of public works. 2. Whenever any existing pavement of the companies, in any paved street or way, can no longer be made serviceable by repair; and whenever the portions of any street or public way outside of the strip herein required to be paved by the companies are newly paved or repaved, with asphalt, granite, brick, creosoted block or other similar material, and the pavement of the companies therein does not comply with the following specifications; and whenever the companies relay their rails in any such paved street or public way in which the pavement does not comply with the following specifications, then, and in any of such events, the companies shall pave or repave the portion of any such street or public way, which they are required to keep paved, with granite paving blocks having a uniform grain and texture, without lamination or stratification, and free from an excess of mica or feldspar. Said blocks shall measure from $3\frac{1}{2}$ to $5\frac{1}{2}$ inches in width, from 7 to 11 inches in length (except that shorter stones may be used to break joints), and not less than 5 inches in depth. They shall be so dressed as to have substantially rectangular plane surfaces, so that when in place the joints at the ends and sides shall average $\frac{1}{4}$ inch in width. Soft or weather-worn stones, obtained from the surface of the quarry, and stones which wear to a polish under traffic shall not be used. All blocks shall be laid in uniform courses across the roadway; and the space between the blocks, when in place, shall in no case be less than $\frac{1}{8}$ of an inch nor more than $\frac{3}{8}$ of an inch in width. Each course shall consist of blocks of the same width. They shall be so laid that all longitudinal joints shall be broken by a lap of approximately 3 inches. The spaces shall be immediately filled to within 2 inches of the top of the blocks with dry gravel free from loam or dirt, and the blocks rammed to a true surface and firm bed with a 75-pound rammer of approved shape. No cracked or chipped blocks shall remain in the pavement. After ramming the spaces between the blocks shall be completely filled with a paving pitch made by the distillation of "straight run" coal tar and of such quality and consistency as shall be approved by the commissioner of public works. The pitch shall be used at a temperature of not less than 280 degrees F. and be spread in such quantity as to apply 2 gallons to each square yard of pavement. The spreading shall be done in sections if the commissioner of public works so directs. Provided, that, in any ordinance providing for the paving of such streets the companies may be required to pave in like manner and with like material as specified for other contiguous portions of said streets, except that when asphalt is used a layer of granite blocks shall be put in next to and on both sides of each rail. 3. Whenever any existing pavement of the companies, in any unpaved street, or public way, can no longer be made serviceable by repairs; and whenever the companies lay down any track or tracks in any unpaved street or public way, then, and in either of such events, the companies shall pave or repave the portions of any such street or public way, which they are required to keep paved or repaved, with good serviceable granite blocks. 4. In each case whereby the companies are authorized and required to change a single track to a double track in any street or part of a street, if the roadway therein be not at least 38 feet in width, the companies shall, at their own cost (such cost to be charged to capital account), widen said roadway to said width, and shall rebuild the catchbasins and their connections and curb and pave said street, as may be required by the city council; provided, that the companies shall not be required to pave, in addition to the part of the street occupied by their double-track street railway more than 8 feet in width of such roadway, nor to acquire private property in order to secure the necessary width for such roadway.

Power Houses, Buildings.

The companies shall build such power houses and auxiliary buildings, together with the necessary machinery and appurtenances, as may be determined upon by said companies with the approval of the board of supervising engineers to supply whatever electric power may be required (in addition to such power as the companies may acquire by lease or contract with such approval from sources other than its own plants) to enable the companies to operate at all times their street railway systems efficiently and continuously. In the construction of power plants, substations and other buildings, the companies shall comply with all general ordinances of the city in regard to buildings and to the installation of machinery, boilers and smoke-consuming appliances. The buildings of said power plants shall be substantially fireproof and supplied with smokestacks sufficient to carry off all

gases emitted, and the foundations for the machinery therein shall be constructed in a solid and substantial manner. The machinery and apparatus employed shall be selected and installed with a view of affording uninterrupted operation of the cars upon said railways, and to attain this end the machinery shall be so arranged that a stoppage of one machine shall not prevent the operation of the remaining machines, and reserve machinery shall always be ready to be thrown into service. All boilers, piping, valves, fittings, steam engines, turbines, generators, switchboard apparatus and other appliances used shall be of the latest and most approved design and constructed and installed in accordance with the best engineering practice. In all dynamos and connections where a high voltage current is produced or used approved methods for the protection of human life shall be employed. The high tension switches shall be entirely inclosed in fire-proof material, and shall be operated by levers compressed air, auxiliary currents or by such other means as will, as far as practicable, prevent personal contact with high tension current. All feeders leading out of power plants and substations shall be provided with some form of safety switches or automatic circuit breakers designed to instantaneously open the circuit in case of a short circuit occurring on the feeder or on the trolley which it feeds. All the foregoing specifications regarding modern and approved apparatus, protection from fire, and provisions for the protection of human life, shall apply with equal force to the substations in case a system of transmission involving the use of substations is adopted. In case it is found desirable to secure power from any other source than the companies' own power plants no contract for supplying such power shall be entered into by the companies without the consent of the board of supervising engineers.

Car Shops and Machinery.

It is contemplated that the present car shops and machinery contained therein will remain as at present installed, with such additions thereto as may be necessary, and located as follows: Complete plant east of West Fortieth avenue, extending from Washington boulevard to the Chicago & Northwestern Railway for the Chicago Railways Company. Complete plant fronting on Vincennes road at the corner of Seventy-eighth street, extending from Vincennes road to Wentworth avenue, for the Chicago City Railway Company.

Cars.

Within one year from the passage of the ordinances the Chicago City Railway Company must acquire and place in operation 150 new cars, subject to delay by strikes or other causes; and the Chicago Railways Company at least 225 cars. These cars shall be of the best and most approved finish; they shall have center aisles; they shall be without running footboards along the sides, and shall be equipped with sufficient motor capacity. Cross seats facing forward shall be used, but longitudinal seats, each seating not more than four passengers, may be used at the ends of the cars. All closed cars shall be vestibuled. All new cars hereafter put in service shall be of the type known as double-truck cars, seating from 40 to 50 passengers. The cars shall be equipped with electric bells, connections and push buttons; fenders, headlights and sand boxes; two sets of brakes, "one of which shall be a hand brake and the other an efficient power brake of modern approved type;" the cars shall be kept heated at 50 degrees F., as nearly as practicable, and shall contain standard thermometers; the cars shall be kept well lighted by electric light or other illuminants approved by the board of supervising engineers; signs to indicate by day, and, through illumination, by night the destination of each car shall be provided; the companies may operate funeral cars, and special cars for mail; every electric car, after one year, must be operated singly. The Chicago City Railway Company may retain in operation until the board of supervising engineers directs otherwise, 251 of the present single-truck cars now in service. The Chicago Railways Company may retain in operation until the board of supervising engineers otherwise directs, 486 closed and 564 open cars of the present single-truck cars now in service. All the above cars shall be equipped with sufficient motor capacity to properly operate the cars at the schedule speed required by the service over the particular lines that they may be operated upon. Electric or hot water heaters or heaters of other types approved by the board of supervising engineers, of sufficient capacity to heat the above cars as stipulated in the accompanying ordinance, shall be used. Every passenger car used by the companies which is not now equipped with a power brake shall, on or before nine months after the passage of the ordinance, be equipped with a power brake of a type approved by the board of supervising engineers. Every passenger car used by said companies which is not now vestibuled shall, on or before nine months after the passage of the

ordinance, be vested in such manner as may be approved by the board of supervising engineers.

Rolling Stock.

The companies shall provide all necessary snowplows, sweepers, repair cars, work cars, etc., to properly take care of their systems and maintain them in first-class working condition.

Unnecessary Property.

The companies, subject to the approval of the board of supervising engineers, may sell unnecessary property. They must remove all tracks which are not expressly authorized.

Vote on the Ordinances.

The vote in favor of the ordinances was greater than that cast for the republican candidate for mayor, Fred A. Busse, whose platform had for its principal plank the final settlement, through approval of the ordinances, of the 10-year traction problem. The vote on the traction ordinances stood as follows:

Total voting	292,272
For the ordinances	165,846
Against the ordinances	132,720

Majority

Mr. Busse secured 12,725 more votes than his opponent, E. F. Dunne, the present mayor.

Statement from Mr. Arnold.

Bion J. Arnold, who, by the terms of the ordinances is appointed a member of the board of supervising engineers, made the following statement:

The work to be done within the first three years from the date of the passage of the ordinances is as follows:

To remove from the streets all the present cable tracks, slots and conduits and substitute therefor electric tracks of the type described in the ordinances. This will involve the reconstruction of 34 miles of cable track and 60 miles of electric track of the Chicago City Railway system, and 48 miles of cable track and 90 miles of electric track of the north and west side systems.

Also to construct the necessary system of distribution, involving the construction of all necessary conduits, pole lines, etc., with their transmission wires, for carrying the electrical energy from the power stations to the various substations located in different parts of the city for the proper distribution of energy to the trams.

Also the furnishing of 800 new cars for the south side and 1,200 new cars for the north and west side systems of the new type now in use upon the Chicago City Railway Company's lines.

In addition to the above work a decision soon will be made as to whether it will be necessary to build new power houses, and, in case the companies are unable to purchase power at advantageous figures, the decision will be made to build these power houses. The cost of these power houses will be approximately \$10,000,000.

In this period of rehabilitation the public should understand that there will be more or less inconvenience, owing to the tracks being torn up in places. But the construction work will be done with as little of this as practicable in order to keep the cost of construction within suitable limits.

Union Traction Reorganization.

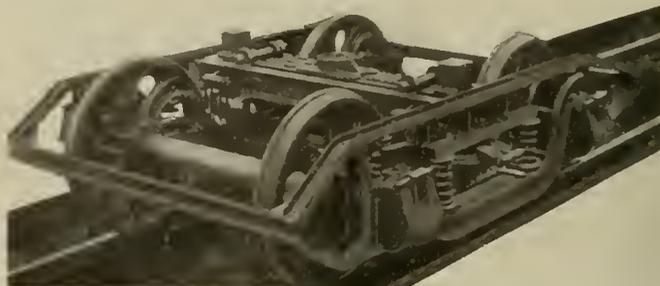

Every effort will be made to reorganize the Chicago Union Traction Company so that the new corporation, the Chicago Railways Company, which has been formed to acquire the Union Traction lines, may accept the ordinance before July 1. The plan of reorganization is under consideration and will be completed soon. While the reorganization is being effected the reconstruction of the lines of the Chicago City Railway Company will be begun.

It is possible that by agreement between the companies some of the through routes provided in the ordinances may be established within a short time.

T. E. Mitten, president of the Chicago City Railway Company, has called a meeting of the board of directors for April 8, when plans will be considered for the purchase of new equipment, reconstruction of the old cable car tracks, etc. The advisability of building power houses or of purchasing power from outside companies will be decided upon.

NEW 14-TON MOTOR CARS, DENVER CITY TRAMWAY.

There are now being put into service on the lines of the Denver City Tramway Company 30 new 2-motor cars which have an especially low weight per unit of seating capacity. In general the design and appearance of these cars is similar to the standard 4-motor cars which this company has operated for some years, but a remarkable difference exists between

New Light Motor Cars, Denver—Truck with Channel Section Members.

the total weights of the two types. The new cars, each equipped with two 50-horsepower motors and seating 48 passengers, weigh less than 28,000 pounds, while the standard 4-motor cars, as operated with four 37.5-horsepower motors, weigh 38,000 pounds. The actual weight of the first one of the new cars to be operated, which was put into service on March 6, 1907, was 27,850 pounds.

It is not thought that the design of this car, even though it may be much lighter, is less substantial than that of many cars of like capacity which weigh much more. With such substantiality and the low weight, the advantages are obvious.

New Light Motor Cars, Denver—Interior View Showing Types of Seats.

The extreme lightness of the car has not been obtained by sacrificing a good factor of safety for any important structural members, but rather by judiciously trimming all useless material so that there remains a mechanical structure, of accepted design necessary for carrying the desired number of passengers, with the lowest possible weight of equipment per passenger.

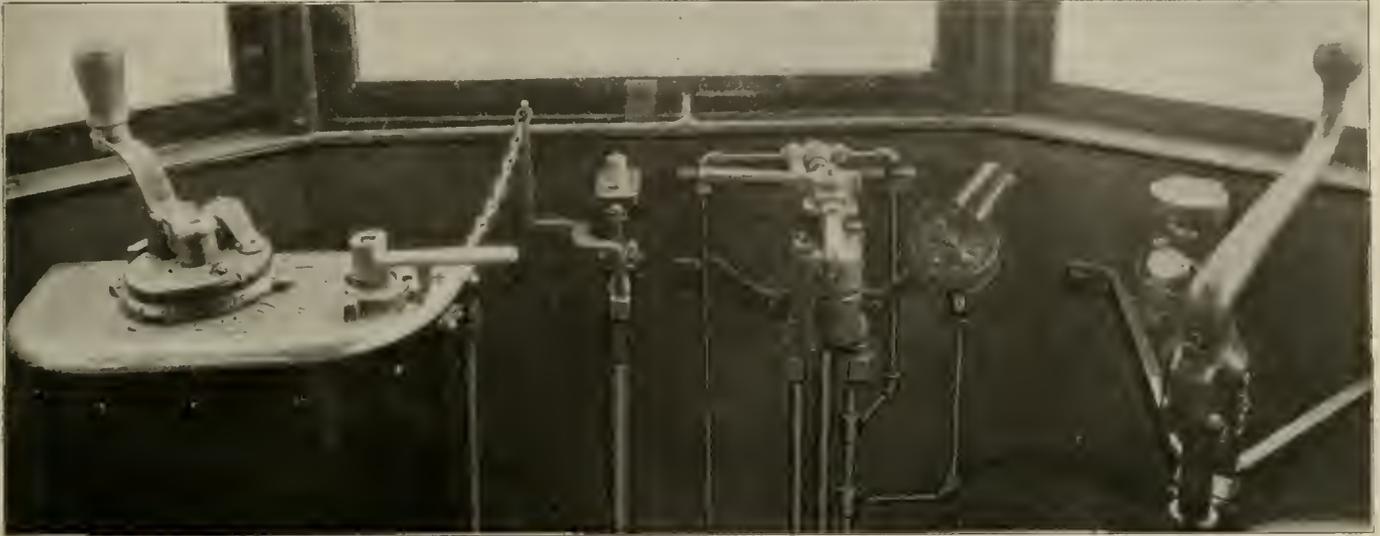

Car Body.

The accompanying engravings reproduced from line drawings and photographs illustrate clearly the general appearance

and type of construction of the new motor cars. It will be noted that the company's California-type standards have been observed.

The car body is 40 feet 3½ inches long, over all, and 8 feet 4 inches wide at the belt. A bulkhead divides the body into halves, one of which, the smoking compartment, has ash seats and the other, the main compartment, rattan covered seats. In all, there are seats provided for 48 passengers. The

car the conductor is never more than one-half the car's length from the entering and leaving passengers. He is at this extreme distance only momentarily. With the center entrance, the load divides, part taking seats in each half of the car. In unloading, the movement of passengers is the opposite, and thus it is seen that the passengers at the extreme ends of the cars are but one-half a car length from the door. The conductor's position is near the door, and with the center en-

New Light Motor Cars, Denver—Interior of Cab Showing Control and Automatic Attachments.

arrangement of the seats is shown in the accompanying plan. An aisle 23 inches wide extends the full length of the car, the cross seats being 32 inches long. The height of the car body from the bottom of the sills to the top of trolley board is 9 feet 10 inches.

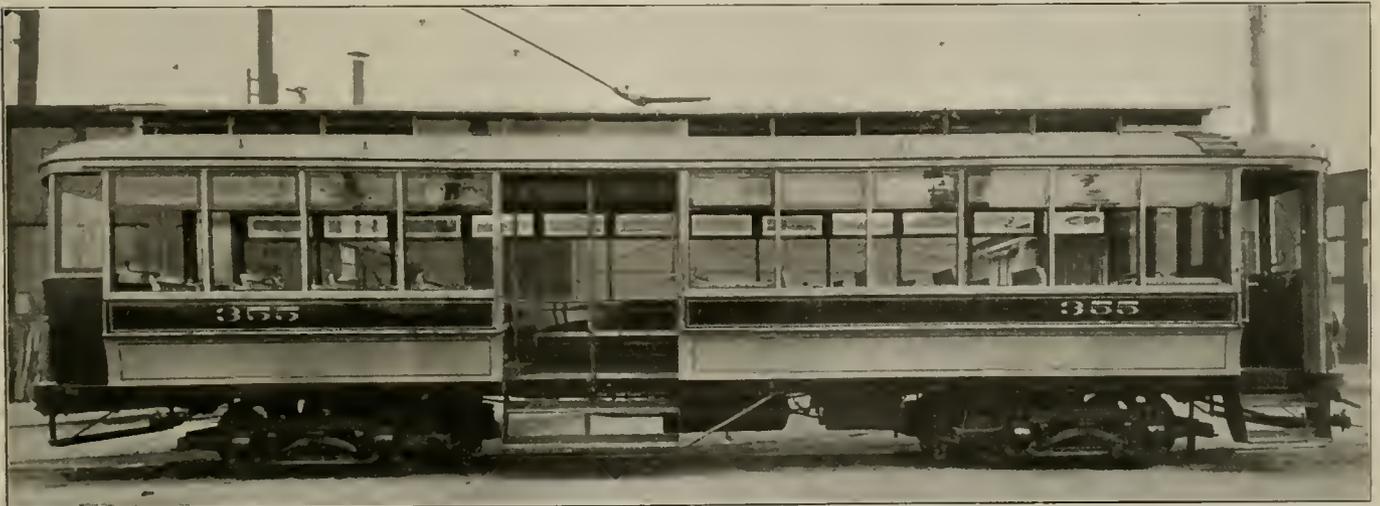

The climate of Denver warrants the use of a car that is practically open most of the time. For this reason the windows of the new cars were made as large as possible. The sashes are built to drop in pockets having covers. The distance from the top of these covers to the car floor is less than usual.

trance he can maintain this position and yet be the shortest possible average distance from all his passengers.

This car body, complete with electric heaters, drawbars and carriers, hand-brake rigging, seats for 48 passengers and the other necessary fittings, ready to be run, weighs 10,150 pounds. This is a net weight per unit seating capacity of 211.5 pounds. The Woeber Carriage Company of Denver is building these car bodies.

Trucks and Equipment.

The trucks on which the new cars are mounted are of an

New Light Motor Cars, Denver—Exterior of New Type of Car.

It is 27 inches, at which height it affords a convenient arm rest.

The front vestibule is provided with a door on one side. Normally this door is closed. It is used very infrequently and then only by the crew. The one other door, which affords entrance and exit for all passengers, is 5 feet 2 inches wide, located at the center of the car.

The value of a center side entrance for city cars is quite generally recognized. With the steps at the center of the

entirely new design, evolved in the engineering department of the Tramway company. It will be noted from the accompanying engraving that the principal members are built of channel sections. All the parts of the trucks are being constructed from the raw materials in the shops of the Denver City Tramway Company. The design has been carefully considered with a view to an extreme lightness consistent with the necessary strength to support the car body and the motors. The wheel base of the trucks is 4 feet 10 inches and

the cast-iron wheels are 33 inches in diameter, weighing 475 pounds. The driver axles are 4½ inches and the idler axles 4 inches in diameter. Without motors the two trucks complete with wheels and fittings, ready to run, weigh 9,400 pounds or 4,700 pounds each.

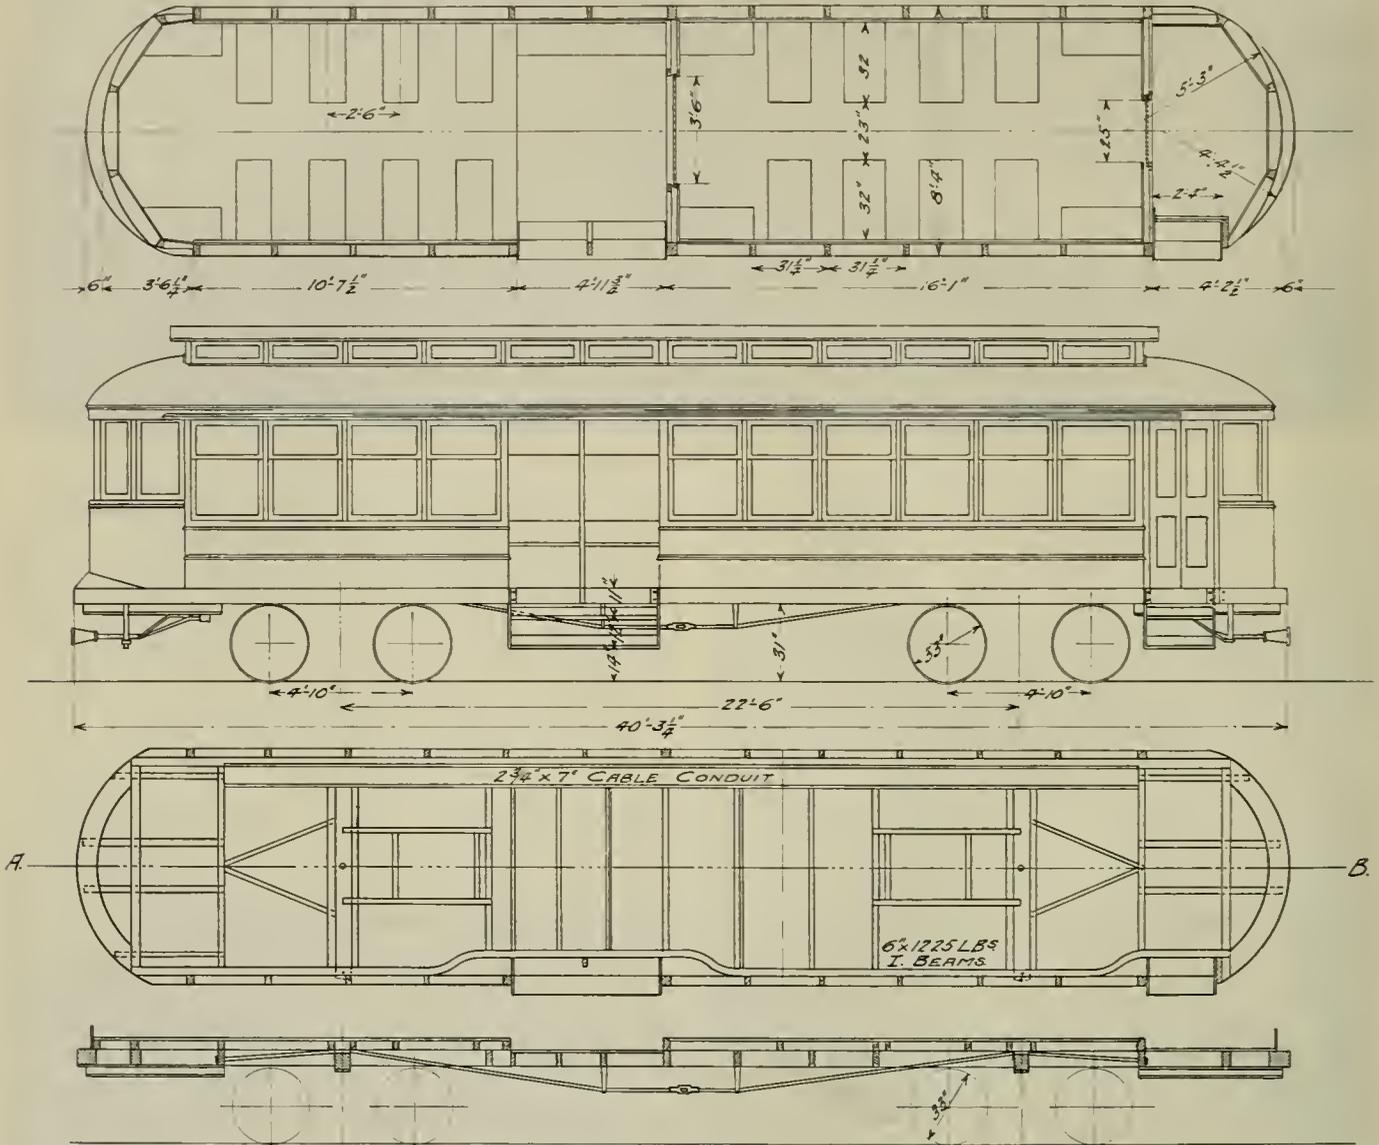

Each truck carries one General Electric No. 53 motor, rated at 50 horsepower. The motors are outside hung, mounted on the No. 2 and No. 3 axles. This 2-motor equipment, including two controllers, resistance and wiring for double-end operation, weighs 7,300 pounds.

The air brake equipment is of the Christensen AAI type, with inside-hung brakeshoes. This is a straight air equip-

made for possible discrepancy in the weight of other equipments from the particular one which was weighed, this type of car complete, seating 48 passengers, weighs 14 tons. This is a weight of equipment of 583 pounds per unit of seating capacity.

Operating Features.

By reference to the view of the interior of motorman's cab the arrangement of the control apparatus will be seen. On the right is the hand-brake handle, and near it a fixed watch pocket, also the air pressure gauge. Small incandescent lamps with reflectors are provided for illuminating the watch pocket and air gauge. As a part of the handle of the

SECTION THRO' A-B.
New Light Motor Cars, Denver—Floor Plan, Elevation and Section Through Floor Framing.

ment installed for single-end operation. These particular equipments are being transferred from an older type of 4-motor car which is used for train operation and on which the Westinghouse SME type brake equipments are now being installed. The straight-air brake equipments as installed on the new 2-motor cars weigh complete 1,000 pounds.

To reconsider the weights of the parts of this light-weight car, there appears the following:

	Pounds.
Car body	10,150
Double trucks	9,400
Two motors and control.....	7,300
Air brakes	1,000

Total 27,850
It is thus seen that when an allowance of 150 pounds is

engineer's valve for the air brakes will be noted a rib cast on the surface opposite the handle proper. The valve of the air-sanding apparatus is so designed and located that when the brake valve is thrown to emergency position, this rib or boss comes in contact with the sanding valve and thus automatically sands the track.

The drop fender is used on all of the cars of this system and to lessen the movements necessary on the part of the motorman a chain connects the tipping trigger of the fender with the reverse handle on the controller top. The length of the chain is such that it can be hooked to the reverse handle only when the handle is in the "ahead" position. Thus, at the time of an accident, when the motorman reverses his motors, he also automatically drops the fender.

TESTIMONY AT INVESTIGATION OF WISCONSIN COMMISSION INTO MILWAUKEE SERVICE.

The testimony of John I. Beggs, president of the Milwaukee Electric Railway & Light Company, and other officials of that company, and of electric railway officials from other cities during the investigation of the Milwaukee service by the Wisconsin railroad commission, has brought out many features of the operation and management of large properties. The summary of the testimony which follows supplements the previous articles in the issues of the Electric Railway Review of March 2, 23 and 30.

In his testimony on March 18 Mr. Beggs explained the methods that are employed to meet the estimated increased travel by companies which make a conscientious effort to anticipate the need for transportation facilities. Two years ago, looking forward to increased business, the company ordered 100 of its standard city cars, of which 50 were to be delivered during the latter part of 1905, and 50 during the latter part of last year. In order further to provide cars, and if possible to allay adverse criticism, Mr. Beggs, in January, 1906, increased the allotment of new cars for the year 1906 from 50 to 75. The earliest of these cars to be received were put in service on September 17, 1906, and the last on January 23, 1907.

Before the investigation was started Mr. Beggs reduced the headway on the Wells street line from 5 to 4 minutes. In stating this fact to the commission Mr. Beggs said that while the reduction in headway on that line was 20 per cent, it required an increase in equipment of 25 per cent. Even with the greatest care, he added, it is not always possible to anticipate needs and to have new equipment before the actual necessity for it arises.

Work of Transportation Department.

Mr. Beggs outlined the duty of the transportation department, which is held strictly accountable for the handling of traffic. In this department, of which W. B. Tarkington is general superintendent, and George Kuemmerlein, Jr., assistant superintendent, there are six division foremen, who have charge of the six divisions of the city and of the car houses. It is their duty primarily to see that the men in their divisions are carefully trained and properly disciplined under broad general orders, and that the public is cared for properly. These foremen patrol their divisions, and are assisted by six supervisors, who spend their time on street corners and at the points of congestion. The supervisors are assisted by three men who patrol the lines and see that the cars are properly operated, and help to relieve congestion.

After describing how the company tries to keep informed of the wants of the traveling public, Mr. Beggs stated that public needs change radically from day to day. It is not possible at all times, he said, to get equipment to the spot where it is needed at just the moment when it is required. If a shower comes at 5:30 p. m. it diverts immediately to the cars crowds of people who would otherwise walk a mile or a mile and a quarter to their homes. It was because of the service in just such an emergency as this that the company was notified to defend itself before the state railroad commission.

An Ideal System.

In describing what new lines should be undertaken to make an ideal system for the developing city, Mr. Beggs said that the conflicting interests which must be considered make the problem of extensions difficult to solve. If an attempt is made to build a line in one street, protests result and mass-meetings are held to denounce the company; while if an attempt is made to withdraw a line after it has been in service, there is a riot.

Mr. Beggs would include in the ideal street railway system four large car houses at outlying points, and the large central car house, which is a part of the company's present public service building. He believes these car houses would make the handling of cars much more effective. The construction of shops where the company will build its own equipment will be a step toward the ideal system. It is Mr. Beggs' idea to build at least one car a week in these shops.

In reply to questions of the city attorney, John T. Kelly, Mr. Beggs stated that the service is not better than when the complaint was filed with the state railroad commission, but conditions have changed in that the sun sets later and rises earlier. The greatest difficulty in meeting the congestion is experienced during the short days of the latter part of November and during December. Mr. Beggs added:

Growth of Traffic and Population.

"We have to spend large amounts of money, but the expenditure of this money was one of my methods of trying

to save this bankrupt property when it was thought the property could not be saved. Our business has grown on an average from 9 to 10 per cent per annum—far in excess of the growth of population, which has been at the rate of only 4 per cent. The reason of that is the greatly improved service year by year. It demonstrates what I said 20 years ago in discussing the advisability of investing the large amounts of money that have to be invested to establish electric railways over this country, that I believed you could provoke the public to ride. For 10 years we have had a regular increase in passengers of 10 per cent per annum, compounded each year, and yet our earnings here have been the lowest per capita of any large city in the United States. The growth in traffic has been partially taken care of by slight increases in the speed of cars, in order that the cars may make more trips, and by increases in the size of the cars from time to time. We have to make a great many miles to cover a very short distance. Instead of cutting across the two points of the horseshoe, as an engineer would do, we have got to go around the horseshoe."

Proceeds of Bond Sale Smaller.

In referring to the financial conditions prevailing at present Mr. Beggs continued: "Twelve months ago we sold \$3,000,000 of a new issue of 30-year 4½ per cent bonds at 97 and accrued interest. To reimburse us for the expenditures made last year, we sold within 30 days \$1,000,000 of these bonds at 90. You ask me what we will do in the future. The important point is the raising of the capital; and if there is to be this constant stirring up of the public with false statements and misrepresentations, it will be impossible to raise the capital."

In two years the company will have reached its capacity in power, and plans are now being made for a power house probably of 100,000 kilowatts capacity.

The Transfer Question.

Mr. Beggs declared that the company cannot reopen the question of giving transfers on transfers. He said that thousands of fares are lost every day now through the dishonesty of people who take transfers and hand them to others to use. To give transfers on transfers, Mr. Beggs insisted, would train the public in dishonesty, because people cannot realize that it is petty larceny to take advantage of the company. It is a rule that passengers who want transfers must ask for them when the fares are paid. This rule, inaugurated by Mr. Beggs, has been adopted in cities throughout the country. Mr. Beggs regards it as one of the duties of passengers to see that their transfers are accurately punched. He concluded his testimony on the subject of transfers by saying: "There is nothing that is the subject of so much abuse on a street railway line as the transfer slip. Therefore we protect the transfers with every condition that can reasonably be enforced, simply to try to reduce to some extent the fraudulent use of them."

Complaints.

In the 10 years that Mr. Beggs has been at the head of the Milwaukee company no complaint of the service has failed to reach him personally. He has made it a rule that when a person takes the time and trouble to write a letter, the company must take the time and trouble to investigate and to find whether the complaint is well founded.

In response to a question as to the rules of the company with regard to the cleaning of cars it was stated that conductors are instructed to sweep out their cars at the end of the run. Mr. Beggs said he would admit that since the inquiry began some of the conductors had been disciplined because they would spend their time idly at the end of the line and would not begin sweeping until their cars started on the return trip. The cars are thoroughly swept every night, and scrubbed thoroughly as often as is necessary. If there has not been sufficient fire in the cars sometimes, as testified by witnesses for the city, it is due, Mr. Beggs said, to the carelessness of conductors. The question of heating was brought up and he maintained that the use of electricity for heating was, from a financial standpoint, absolutely impracticable. He also spoke of the great difficulty of ventilating cars to the satisfaction of every one.

Air Brakes Versus Hand Brakes.

Testifying on the subject of brakes, Mr. Beggs said that the hand brake used on the Milwaukee cars, if all circumstances are considered, is infinitely superior to any air brake that can be applied on a city car. He considers an air brake absolutely unnecessary in Milwaukee, on account of the low grades and the light weight of the cars. The cars weigh from about 37,000 pounds to 40,000 pounds. The present standard car weighs about 40,000 pounds. If air brakes should be placed on the Milwaukee cars Mr. Beggs believes that inside of 24 hours 20 per cent of the cars would have to be placed

in the shops because the air brakes would be out of order. The company purchases its wheels under a guarantee of 40,000 running miles, barring flat wheels. On the wheels removed in December because they were flat only 20,081 miles, average, had been secured; and in January the mileage made by removed wheels was 17,591, average.

Air brakes are used on the cars of the United Railways of St. Louis. Mr. Beggs continued, because the company there was forced to use them. He said, however, that the St. Louis cars are much heavier than Milwaukee cars and are longer, and that climatic conditions in the two cities are very different. The most severe grade on the Milwaukee lines is 7.3 feet, and it is only for a distance of 371 feet.

To equip the Milwaukee cars with air brakes would cost, Mr. Beggs estimated, between \$300 and \$400 a car, while there would be an additional expense, he testified, of at least \$150 per annum a car. The greatest disadvantage, Mr. Beggs thought, would result from the inability to use the cars on account of the repairs which the air brakes would necessitate. The city cars are not expected to run at a maximum speed exceeding from 12 to 15 miles an hour at any point. The average is slightly less than nine miles an hour. Under these cars is the slowest speed gear that can be operated under them and still clear the cobblestones. If air brakes were used, Mr. Beggs believes, there would be five accidents by collision where there is one now. He said that the management which permitted the installation of air brakes in St. Louis ran the company into bankruptcy. The storage system is used in St. Louis, which, in Mr. Beggs' judgment, is less liable to derangement than the other air brake systems. In St. Louis two minutes is lost in taking air on each trip.

Difficulty of Getting Men.

In speaking of the difficulty of getting men who are competent to handle air brakes, Mr. Beggs said that wages have been advanced in the last two years in order to enable the company to command the services of men of a higher degree of intelligence. When he was asked whether anything had been done to lessen the damage to wheels caused by sliding, Mr. Beggs replied that steel wheels have been tried, and while they may not be injured as much as the present wheels, a flat place, or, to a certain extent, a curve in the rail might be caused. The company is putting on some of the higher speed cars steel wheels costing between \$20 and \$30 apiece. These have not to the present time, Mr. Beggs stated, proved entirely satisfactory nor durable. The company is experimenting constantly with wheels, and buys, he testified, the highest grade of chilled car wheels made. These weigh slightly in excess of 500 pounds and the price now is about \$1.85 a hundred pounds.

When Mr. Beggs was asked if the rattle of the trucks on old cars could be reduced he said that as time goes on the bolts and bolt holes will wear a little, the bolts will give out and increasing rattle is inevitable. In order to reduce the rattle the company reams out the hole and puts in larger bolts and keeps those renewed.

Traffic Arrangements.

The company sends special cars to every manufactory in the city when the factory employes are through work for the day; and it is a general rule, if knowledge of a special entertainment is secured, to send cars to accommodate the people. Several years ago Mr. Beggs prevailed upon the managers of the theaters to let the electric railway company place switches on their switchboards back of the stage and run a special line to posts where signal lights could be installed. Five minutes before the final curtain drops the theater management is requested to turn the switch which lights the red lamp. When the lamp is lighted trainmen are instructed to hold their cars until the crowd arrives. Mr. Beggs said that the theatrical managers do not realize that they are rendering more comfortable their own patrons if they give the signal which holds the cars, but take the stand that they do not see why they should help the business of the electric railway company.

Accident Record.

The accident record of the Milwaukee company, Mr. Beggs stated, is the best in the United States. The cost of accidents has not reached quite 3 per cent of gross earnings, on an average, for 10 years. This percentage includes all expense incident to injuries and damage. This cost, Mr. Beggs said, is the lowest of any metropolitan property in the United States.

Chicago and Milwaukee Compared.

C. N. Duffy, comptroller of the company, brought up in his evidence the question of depreciation of the plant and the amortization of the investment. The franchise of the company will expire on December 31, 1934. Mr. Duffy said

he was impressed by the fact that the representatives of the city of Milwaukee, in seeking expert information on the traction problem, sent to Chicago "as the fountain of knowledge in the street railway business." He made the point that the Chicago City Railway Company, of which he was secretary and auditor from 1899 till 1906, had three through streets downtown on which its cars could be operated, although the feeling of the management was that the company was very much cramped for room; but the Milwaukee company is obliged to operate all the cars of its system over tracks in streets that are practically crowded within a quarter of a mile. All of the east and west cars have to run on Wisconsin street and Grand avenue; all of the north and south cars on East Water street, West Water street and Third street. The Chicago City Railway had 220 miles of single track and the Milwaukee company 120 miles.

Mr. Duffy said that the greatest congestion of which he has knowledge is at Broadway and Thirty-fourth street, New York city. Oren Root, Jr., vice-president and general manager of the New York City Railway, had told Mr. Duffy that he would not undertake to operate more than three cars a minute each way, over a double crossing. Allowing for north and south bound cars on Broadway and east and west bound on Thirty-fourth street, this would make 12 cars a minute over that crossing, whereas the Milwaukee company operates nearly one-half that number of cars now over the crossing at Third and Grand avenues, with the turning in and out of cars three ways in addition.

Regular Meetings are Held.

Mr. Duffy explained that the Milwaukee company holds every Sunday morning a meeting at which the heads of departments, and in many instances the assistants and subordinates also, are present. No one is obliged to attend the meeting. Any one who wants the day for himself or for religious duties is not required to attend the meeting. At these meetings complaints, letters, newspaper articles, happenings in other cities, trouble with the cars, power or light, etc., are considered. Mr. Duffy said that Mr. Beggs takes the position that the company is serving the public, and that no matter how unreasonable people may be, the departments are held accountable to the highest degree; and that Mr. Beggs emphasizes to all those who attend the meetings that they are just as responsible as he is, and he is responsible not only to the owners of the property, but to the public.

In 1906, Mr. Duffy said, 86.3 per cent of the total passengers carried rode on tickets and the balance paid five cents cash. The company sells 25 tickets for \$1.00, or 6 tickets for 25 cents.

W. D. Tarkington, general superintendent of transportation, said that when extra men earn less than \$50 a month they leave the service. In the last 15 days, he testified, 30 men quit for that reason. Large numbers of men leave, Mr. Tarkington testified, because they will not submit to discipline. In 1906 of 546 men who were employed 356 resigned and 67 were discharged.

Evidence of Charles N. Black.

Charles N. Black, general manager of the Metropolitan Street Railroad Company of Kansas City, Mo., said that draw-bridges and grade crossings of steam railway tracks would naturally tend to derange the schedule of street railways. The Kansas City system has a total of 225 miles of single track, of which, approximately, 215 miles are within the city limits of Kansas City, Mo., Kansas City, Kan., Rosedale and Argentina, two towns contiguous to Kansas City, Kan. From 515 to 525 cars are operated at the maximum. The minimum is 315 cars at noon.

William O. Wood's Testimony.

William O. Wood, assistant general superintendent of the Brooklyn Rapid Transit Company, was cross-examined by Mr. Kelly, who endeavored to make him admit that a riotous condition of affairs prevailed on the line of his company for several days. Mr. Wood denied Mr. Kelly's insinuation that the company had to call out the police department to assist in operating the line. He said that the paid employes of the New York Journal and the New York World caused the trouble. Not 1 per cent of the regular people riding on the cars caused trouble and the ejections were very largely of the paid employes of the newspapers, who sometimes appeared in carloads.

Mr. Wood said that until 3½ years ago the hand brake was used on the Brooklyn Rapid Transit lines exclusively. The company placed the air brake on 451 cars that were purchased. After giving it a trial and noting what happened in the way of accidents the company discarded it as a standard. Mr. Wood said that the company has some cars equipped with air brakes and hand brakes and some cars

with hand brakes alone. The air brake is used on the large heavy cars weighing about 48,000 pounds convertible for summer and winter purposes.

John T. Funk on Brakes.

John T. Funk, general superintendent of the Louisville (Ky.) Railway Company, said that in Louisville the hand brake is used on twelve of the lines and the air brake on five. He added:

"The agents for these air brakes are the slickest men that you ever came in contact with; they came to Louisville and we believed the air brake was a panacea for all ailments and that we would just stop hurting people, running over wagons, horses, cattle, etc., and that we would simply be kept out of the courthouse. But the experience has been just the reverse. The amount of money, saying nothing of the suffering, that we paid out in the month of December, which is only one of our average winter months, and in January was more than double that of any other month or months in the history of the road."

Mr. Funk said he had asked 50 to 100 people what kind of a railway system they had in Milwaukee; that he was a stranger and would like to know. In every case the person said the system was excellent. One man said that the newspapers and politicians had caused all the trouble.

The arguments in the case are to be heard by the commission at Madison, Wis., on April 23.

THE LEBLANC CONDENSER.

An account is given in l'Eclairage Electrique for December 1 of a new jet condenser invented by M. Maurice Leblanc, and constructed by the French Westinghouse Company. As shown in the figures, the main feature is the use of a re-

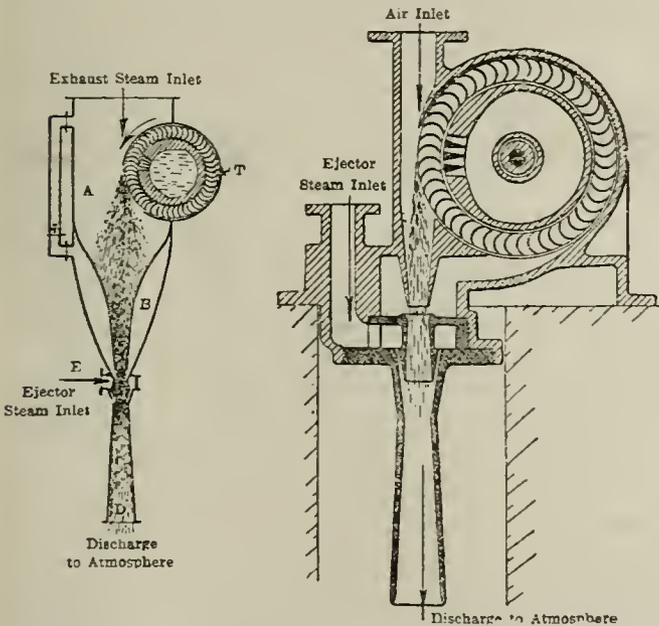

Figure 1.

The Leblanc Condenser.

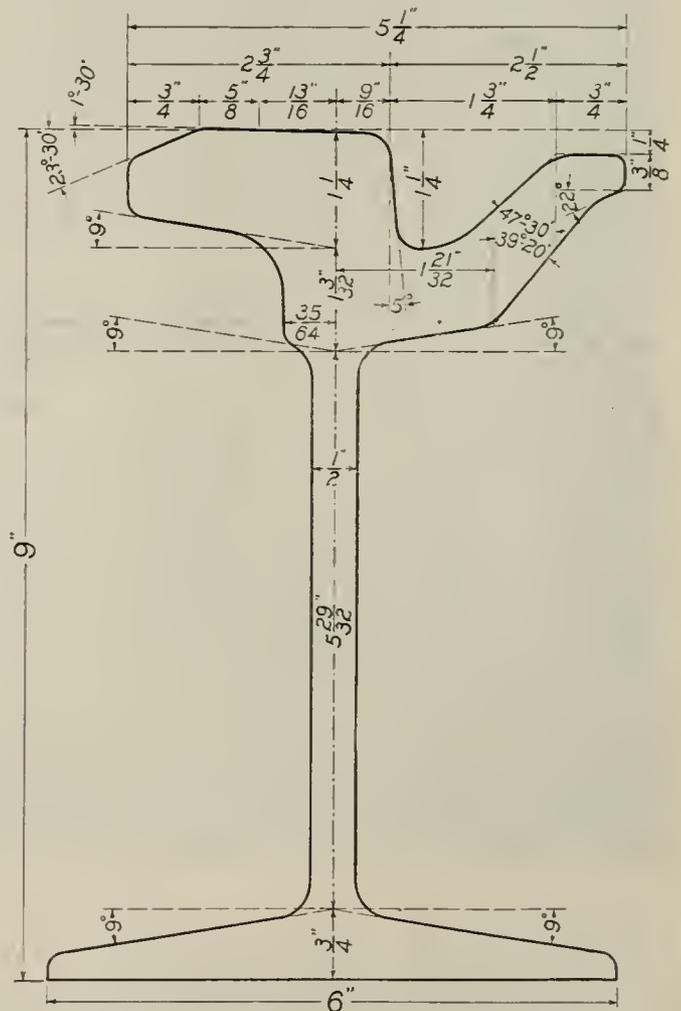

Figure 2.

versed turbine to drive a spreading jet of water into a cone, sweeping out the air and water vapor, compressing them into the convergent cone and allowing them to expand in the divergent cone, where the velocity is checked and the pressure increased so that the whole is discharged against the pressure of the atmosphere. In Figure 1 a simple jet condenser is shown; A is the condensing chamber, B the convergent cone, C the divergent cone, T the turbine pump, and E the inlet for steam, which is used to start the action of the apparatus. If the water is supplied under a slight head, the condenser starts without the use of a steam jet. With this condenser, a vacuum of 98 per cent of the absolute value can be obtained, using 25 pounds of water per pound of steam and with an expenditure of power to drive the turbine amounting to from 2½ to 3 per cent of the power of the steam engine. There are no valves at all, and the cost of upkeep is trifling. Figure 2 shows a dry-air pump on this system,

which takes less power than reciprocating pumps; it is proposed to use this in conjunction with a centrifugal pump for extracting the water of condensation. This device used with existing surface condensers has allowed of an increased vacuum with less mechanical loss. It has also been employed with a centrifugal pump keyed on the turbine shaft, and enclosed in the same cover; the pump extracts the water, while the Leblanc pump deals with the gaseous products. The exhaust steam enters a conical chamber into which the injection water is squirted through a number of holes round the periphery. With this apparatus, under good conditions, it is said to be possible to reduce the back pressure even below that of water vapor at the temperature of the exhaust steam.—The Electrical Review, London.

STANDARD RAIL FOR CHICAGO.

The accompanying illustration shows the rail section which has been specified in the traction ordinances as the standard for new street railway construction in Chicago. This

Standard Rail for Chicago—129 Pounds per Yard.

section weighs 129 pounds per yard and was adopted on the recommendation of the companies' engineers after the city had determined that 120 pounds should be the minimum weight of rail for the rehabilitated Chicago lines.

The losses due to faulty drainage or leaky drain-cocks are often a great deal larger than is imagined. Experiments on a 200-horsepower triple-expansion engine at Charlottenburg showed that faulty closing of drain-cocks resulted in losses amounting to 5.8 per cent of the total steam consumption.

THE ENGINEERING SOCIETIES BUILDING.

The Engineering Societies building in New York, which has been built as a home for several of the national technical associations and which will contain the general offices of the American Street and Interurban Railway Association, is now completed and, as previously announced, will be dedicated on April 16 and 17, 1907. The building was made possible by the gift on February 14, 1903, by Andrew Carnegie of one million dollars, to which he subsequently added \$500,000, for the purpose of erecting a building which should be a home for the American Institute of Electrical Engineers, the American Society of Mechanical Engineers, the American Institute of Mining Engineers and the Engineers' Club. The only limitation connected with the gift was that it should be devoted to

\$1,050,000 to the Engineering Societies building and \$450,000 to the club building.

The site for the Engineering Societies building is on West Thirty-ninth street, between Fifth and Sixth avenues. The frontage covers five city lots, the total front being 125 feet. The area occupied by the building itself is 115 feet by 90 feet. In order that there should be no obstruction in the matter of light and air the committee purchased for its protection a large four-story private house of restricted height adjacent to the site on the east. In the preparation of the plans six architects of high reputation were invited to participate. The unanimous choice of the committee awarded the work of preparing the plans to Herbert D. Hale of Boston and Henry G. Morse of New York. The contract for the construction of the building was awarded to Wells Brothers Company on

Engineering Societies Building—Entrance Hall.

the erecting of a building, the associations interested purchasing the land.

At first it was proposed to erect one building on Fortieth street, where the Engineers' Club had already purchased the site, which should serve the purposes of all the organizations interested. Owing to difficulties involved in the purchase of such land as would be necessary and in combining under one roof the social and technical functions exercised by these organizations, it was decided to erect two separate buildings, one for the club on Fortieth street and one for the three professional societies on Thirty-ninth street, with means of connection between the two. A joint committee of the several associations was given in charge the acceptance of the gift and the erection of the buildings, and that committee with some changes has remained in active existence up to the present time. The gift was divided by the allotment of

July 17, 1905, and the cornerstone was laid by Mrs. Carnegie on May 8, 1906. The offices were ready for occupancy on December 15, 1906.

In the construction of the building advantage has been taken of the limitation prescribed by the building laws of the city of New York, that only 85 per cent of the lot area shall be occupied by the structure, to give the building a monumental appearance. All four sides are finished. The exterior is of limestone up to the auditorium floor and of gray mottled brick and terra cotta above. The building rises to a height of 218 feet 6½ inches, comprising 13½ stories above the sidewalk.

In excavating for the foundations rock was found at from 27 to 67 feet below the curb line and the building rests upon 46 concrete piers which descend to the solid rock. All steel work in the building is covered with from 2 to 4 inches of

semi-porous terra cotta. The floors are built of terra cotta, covered with five inches of cinder concrete. The woodwork in the building has been reduced to a minimum. The large window frames are built of cast iron and other window frames of wood, covered with kalamined iron, with only a small molding in place of the usual wide trim and casing. The doors are similarly protected and all the woodwork has been fireproofed. The windows up to a height of 100 feet are glazed with wire glass except on the Thirty-ninth street front. All the walls and ceilings are painted in neutral tint and the decoration is simple though carefully studied, with an idea to later development in the way of mural paintings.

The basement is occupied by the boiler room, 22 feet below the curb, and an engine room 16 feet below. There is also ample coal storage. The entire basement and boiler room

designed with reference to the uses of the various societies which will occupy the building.

One of the most interesting features of the building is the system of lighting, which, however, can be only briefly described. The central space in the entrance hall is lighted by means of individual lamps placed in recesses and concealed by panes of ground glass in the ceiling. The result of this arrangement here and elsewhere is to afford ample illumination without glare. In the halls above the fourth floor glass globes have been provided for screening the lamps. The lighting of the main auditorium is most effective. The architects provided a space of about 15 inches between the ceiling of the auditorium and the beams of the floor above. A glass septum was substituted for plaster panels in the ceiling. The lamps occupy this space and the general effect is very satis-

Engineering Societies Building—Auditorium.

up to the level of the curb have been made thoroughly waterproof. Steam is used for heating and ventilating purposes, and is generated at low pressure by three boilers of Babcock & Wilcox manufacture, with an aggregate of 5,226 square feet of heating surface. The heating is by low-pressure steam circulating through radiators beneath the windows. All radiators are controlled automatically by the Johnson system of heat regulation. An extensive blower system has been installed for ventilation purposes. This comprises four Sturtevant blowers located in the basement and driven by C. & C. electric motors.

The electric current supply for the building is derived from the New York Edison Company and the United Electric Light & Power Company. Space has, however, been provided so that an electric generating plant may be installed at any time. The electric system is unusually complete and well-

factory. The general illumination of the library is obtained by similar means, although light for reading is obtained by means of standard fixtures placed upon the tables.

The building is provided with two Otis passenger elevators and one freight elevator. The latter is of sufficient capacity for use in hoisting safes and the like.

The floor plans have been so arranged as to provide suitably for the seating of gatherings of different sizes in rooms suited to the number of persons expected. Ample accommodation is made for meetings of from 100 to 1,000 persons. The main auditorium has a seating capacity for 1,000 and is surrounded on all sides by corridors, giving easy access to every point and assisting to maintain quiet within the hall. There are in addition seven lecture rooms occupying the next two floors immediately above the main auditorium. All of these rooms have facilities for water, electrical connections, etc., for dem-

onstrations and experiments. Each of the three founder societies occupies a floor laid out in accordance with its own plans. These are devoted entirely to administrative and

Engineering Societies Building—Entrance.

executive work, and the libraries of the three societies are concentrated in the two upper floors of the building.

Report on Fire-Killed Timber and Effect of Soaking on Drying.

Tests recently completed at the timber-testing laboratory at the University of Washington, show the comparative values of green and fire-killed timber. In the states of Colorado, Montana, Nevada, Utah, and Wyoming it is estimated that nearly one billion feet of dead timber is to be found in the national forests, and this has led to the study of the problem of saving this vast quantity of wood for some practical use, instead of allowing it to go to waste or furnish fuel for conflagrations.

The results of the tests indicate that the killing of timber by fire is not in itself injurious, and that if it is cut in time may simply be regarded as seasoned timber, entirely fit for lumber. If allowed to stand too long, however,— a year is a safe limit—the wood is marred by the opening up of cracks, called “checks” by the lumbermen, which lessen its value for lumber. For such purposes as railroad ties, for which checks are not so important, timber may prove satisfactory after having been dead 50 years.

The timber used in the tests was white fir from the Pecos River National Forest in New Mexico, and the work was done under the direction of the Forest Service, which has one of its testing laboratories at the University.

A moot question highly important in the matter of seasoning wood has just been settled after a long period of uncertainty and many careful experiments. It is found that the process of seasoning wood can not be materially hastened by first soaking it. Up to this time opinion has been divided, and there were many supporters of the contrary view, that if suffered to lie in water for a certain period green timber underwent some change from the action of the water which facilitated its drying when afterward removed and placed in the yard or in the kiln.

In reaching the conclusion that soaking has no appreciable effect in preparing wood for seasoning, the Forest Service worked up a large amount of data secured from the seasoning experiments which it has been conducting upon loblolly pine crossarms, chestnut telephone poles, and hemlock and tamarack railroad ties. Incidentally it was brought out that it doubtless pays to keep wood in water to prevent damage from checking and insects until it can be manufactured.

THE NEW YORK PUBLIC UTILITIES BILL.

The Page-Merritt bill, which has been introduced into both branches of the New York state legislature, and known as the “Public Service Commissions,” or popularly as the “Public Utilities” bill, has been the subject of much discussion by its supporters and opponents. This bill is the outcome of the recommendation made by Governor Hughes in his inaugural address, extracts from which were published in the *Electric Railway Review* on January 5, 1907. The principal provisions of the bill contemplate the abolition of the present railroad commission and of the rapid transit commission of the city of New York, as well as of a similar board having control of gas and electric service in Greater New York and the substitution therefor of two commissions, one representing the city alone and the other representing the state outside of the city, and to have supervision and control over all of the various utilities named. There have been several hearings at Albany, at which various amendments were proposed to the original bill.

Provisions of the Bill.

In substance the bill is to provide for two public service districts, to be known as the first district, embracing the counties of New York, Kings, Queens and Richmond, and the second district, including all other counties in the state. The commission in each case is to consist of five members, to be appointed by the governor by and with the advice and consent of the senate, but subject to removal at the will of the governor. The term of office is to be five years. The jurisdiction of the commission for the first district is to be (1) over railroads and street railroads lying exclusively within that district; (2) over street railroads, a portion of whose lines lie within that district, except that the commission for the second district shall have jurisdiction over such portion of the lines of said street railroads as lie within the second district so far as concerns the construction, maintenance, equipment, terminal facilities and local transportation facilities of said street railroads within the second district; (3) over such portion of the lines of any railroad as lie within that district, so far as concerns the construction, maintenance of equipment, terminal facilities and local transportation facilities within the district; (5) over any common carrier operating or doing business within the district; and (6) over the manufacture, sale and distribution of gas and electricity for light, heat and power in the district. Also the commission in the first district is to have and exercise (7) all powers heretofore conferred upon the board of rapid transit commissioners.

All jurisdiction under the act that is not specifically granted to the commission for the first district is to be exercised by the commission for the second district; the jurisdiction of the commission for the second district also includes the regulation and control of “interdistrict commerce” on any railroad other than a street railroad, subject to grant (4) to the other commission.

The bill provides for an annual salary of \$10,000 for each commissioner, and for counsel to the commission, and for a salary of \$6,000 to the secretary of the commission. It is provided that in all investigations or hearings the commission or a commissioner or the secretary shall not be bound by the technical rules of evidence and that no person shall be excused from testifying or producing books or papers on the ground that such testifying may tend to incriminate or subject him to penalty or forfeiture.

Article II of the proposed bill relates especially to railroads, street railroads and common carriers, and in defining the scope of the article it is specified that the provisions of the article apply (1) to the transportation of oil or other commodity, except water or natural or artificial gas, by means of pipe lines or other means of transportation from one point to another within the state under a franchise obtained from the state or any subdivision thereof, and (2) to the transportation of passengers, freight or property from one point to another within the state and to any common carrier performing such service. The bill gives to the commission authority over the class of service and facilities for the transportation of passengers, freight and property, all charges made or demanded by such corporation, switch and sidetrack connections and the determination of what switch and sidetrack connections may be considered necessary, the publication of schedules showing rates and charges, following in this respect largely the terms of the act of congress approved on June 29, 1906. The bill requires that no changes in rates or charges be made except upon 30 days' notice to the commission and publication for 30 days, the establishment of joint or through rates for the transportation of passengers,

freight or property and that every carrier shall file with the commission sworn statements of every contract with any other common carrier relating in any way to such transportation. Provisions similar to those of the interstate commerce act relating to discrimination are also included in the bill. The provisions in relation to the issuance of passes prescribe that no pass shall be issued for free transportation except that passes may be issued to any officer of the state or any division thereof to whom a provision of statute directs such issuance, to a necessary care-taker of live stock, poultry, etc., during its transportation, to a person actually an officer, attorney, agent or employe of the company issuing the transportation and to various other classes of people, such as employes of express, sleeping car, news companies or those engaged in the United States mail, customs or immigration service and to the military forces of the state or of the United States.

Under the head of distribution of cars the bill provides that every common carrier shall furnish to all persons and corporations that may apply therefor, suitable cars for the transportation of freight and shall have sufficient cars and motive power to meet all requirements. The commission also is given power to make reasonable regulations for furnishing and distributing freight cars to shippers, for switching, loading, unloading, etc. In the case of any franchise to be exercised in both districts the approval of both commissions shall be required. No franchise nor any right under any franchise in reference to a railroad or street railroad shall be assigned or leased, nor is any agreement with reference to such franchise valid unless approved by the proper commission. The bill says further:

"No railroad corporation or street railroad corporation, domestic or foreign, shall hereafter purchase or acquire, take or hold, any part of the capital stock of any railroad corporation or street railroad corporation organized or existing under or by virtue of the laws of this state, unless authorized to do so by the commission empowered by this act to give such consent; and save where stock shall be transferred or held for the purpose of collateral security only with the consent of the commission empowered by this act to give such consent, no stock corporation of any description, domestic or foreign, shall purchase or acquire, take or hold, more than 10 per centum of the total capital stock issued by any railroad corporation or street railroad corporation organized or existing under or by virtue of the laws of this state. Nothing herein contained shall be construed to prevent the holding of stock heretofore lawfully acquired. Every contract, assignment, transfer or agreement for transfer of any stock by or through any person or corporation to any corporation, in violation of any provision of this act, shall be void and of no effect, and no such transfer or assignment shall be made upon the books of any such railroad corporation or street railroad corporation, or shall be recognized as effective for any purpose. The power conferred by this section to approve or disapprove a transaction relating to franchises, rights or stock of any railroad corporation or street railroad corporation, shall be exercised by the commission which is authorized by this act to approve the issue of stock by such railroad corporation or street railroad corporation."

Article III further defines the power of the commissions in respect to common carriers relative to the power of the commission to examine into the capitalization, franchises, the manner in which the lines controlled or operated are managed, not only with respect to the adequacy, security and accommodation afforded by their service, but also with respect to their compliance with all provisions of the law. Each commission is required to prescribe the form of annual reports of the common carriers and may require such corporations to file monthly reports of earnings and expenses. Failure to provide any such report within 30 days from the time required will subject the corporation to forfeit to the state the sum of \$100 for each day it is in default. Any corporation operating a line of railroad partly within the second district and partly within the first district shall report to the commission for the second district, but the commission for the first district may upon reasonable notice require a special report. Similarly a street railroad corporation operating a line partly within the first district and partly within the second shall report to the commission for the first district, but the commission for the second district may require a special report.

Power is given to the commission to investigate the cause of accidents on any railroad or street railroad and every such corporation is required to give immediate notice by telephone or telegram and letter to the commission of every accident happening upon its lines. Complaint may be made to the proper commission by any person or corporation in regard to any act done or omitted to be done and upon investigation the commission shall take such action as it deems proper. The commissions are empowered to order repairs or changes to any tracks, switches, terminal facilities, motive power or

any other property or device used. Changes may be made in time schedules or the running of additional cars or trains required. Each commission is empowered to make rules and regulations concerning the number and efficiency of employes and may prescribe tests to establish the competency of such employes. They may require the establishment of a uniform system of accounts to be used by railroad and street railroad corporations or other common carriers and when such forms have been prescribed it shall be unlawful for them to keep any other accounts, records or memoranda. The penalty for failure to comply with any order made by the commission is a forfeit of \$5,000 for every offense and every day's continuance of such violation is considered a separate and distinct offense. Every officer, agent or employe of any common carrier who violates the orders of the commission shall be guilty of misdemeanor. Similar regulations and penalties apply to corporations other than common carriers.

Article IV of the bill relates to the powers of the commissions in respect to the manufacture and furnishing of gas for light, heat or power, including natural gas, and the generation, furnishing and transmission of electricity for light, heat or power. Under this head they are given authority to investigate and ascertain the quality of gas, the standard of illuminating power, the purity of gas and the efficiency of electric lights, to appoint inspectors of gas and electric meters, etc.

Article V provides for the abolition of the existing boards as above referred to, the abolition of the offices of inspectors of gas meters, for the repeal of certain acts and parts of acts in conflict with the present proposed act and for the appropriation of \$150,000 for the use of the commission of the second district under the terms of the act.

Suggested Amendments.

At a hearing upon the bill held in Albany on March 27 a large number of railroad and other corporations were represented. Among these were the Pennsylvania, New York Central, Erie and Baltimore & Ohio railroads, Adams Express Company, Brooklyn Rapid Transit Company, Brooklyn Union Gas Company and Richmond Light & Power Company. In favor of the bill appeared representatives of various political clubs and citizens' unions from various cities in the state. Various objections have been urged to the bill—in general, that the act would be more stringent than the federal interstate commerce act—and attention was particularly directed to the following points upon which amendments were desired:

A judicial review of all actions of the proposed public service commissions, both as to facts which may be in dispute and as to the law involved.

The appointment of high-class men at a larger salary than that proposed in the measure.

The independence of the commissions of the political powers to be insured by taking from the governor the power of absolute dismissal.

Omission of the clause in the present bill that would prohibit traction companies from acquiring the stock of other traction corporations to the extent that would render a merger possible.

Omission of that portion which would give the proposed commissions absolute control in the matter of capitalization and stock issues by public service corporations.

A general toning down of those portions of the proposed law dealing with the financial supervision of the traction companies, as well as with the supervision of their operating methods, schedules, and rates.

One of the principal arguments made in favor of amending the bill was that by Paul D. Cravath, representing the Interborough Rapid Transit Company. Mr. Cravath said that any amendments which his principal had to suggest were not intended to defeat any purposes which the framers of the bill have in view. On the contrary, they welcomed legislative action, conferring upon proper public authorities power to deal with the difficult problem of providing adequate traffic facilities for the city of New York. He said that the corporations had quite as much to gain as the public from intelligent supervision. It was useless, he said, to ignore the fact that traffic conditions in Greater New York are unsatisfactory to all concerned and that for some time they have been growing worse instead of better. He said that the new commission would not accomplish its purpose if its power was given only to restrict the public service corporations, and that the most serious difficulties in providing for the traffic

requirements of New York were in the limitations which laws of recent years had imposed upon the public authorities and the dangers which attend the investment of capital in public enterprises under these conditions. The last thing which the commission should do was to hamper corporations so that they would be unable to do their share toward bringing the needed relief. He said it was impossible for these corporations to increase their facilities, buy new equipment and improve the service upon existing lines, much less build new lines, without additional capital. They could not raise additional capital without issuing new securities and offering the investors a fair chance of return. Under this bill he said the principal company engaged in transportation in the city of New York would be tied hand and foot. It could not acquire the balance of the stock of the corporations, a majority of which it already controls. It could not buy or guarantee further issues of the stocks and bonds of these corporations. It could not acquire the stocks and bonds of other corporations which it might be necessary to organize to operate connecting lines or extensions.

Mayor McClellan of New York endorsed the general policy involved, but condemned the provision for the metropolitan commission on the ground that the power was entirely in the hands of the governor of the state to appoint the commission, while the city would be compelled to bear the entire expenses. He thought the power of appointment should be with the mayor. Although the city of New York would be forced to pay all the expenses of the commission for the first district out of its own funds, it would also be compelled to contribute heavily toward the expenses of the commission of the second district. He could hardly imagine a more vicious example of double taxation. The passage of the bill would negative the work done by the rapid transit commission, under which a successful system of rapid transit has been inaugurated and is now in operation and the commissioners would be supplanted by officers over whom the city has no control.

In defense of the bill in an address made at Utica on April 1, Governor Hughes explained that federal regulation is not a substitute for state regulation and that where congress has complete authority over interstate commerce the state cannot interfere with the exercise of its powers and that on the other hand over local and domestic commerce congress has no power to exert control. It is proper that the state in the exercise of its authority should take account of the wise legislation of congress, but that any state which should set a high standard in its legislative supervision would contribute powerfully toward similar action in other jurisdictions and to the establishment throughout the country of proper administrative standards. He then answered the question why there should be a public service commission by the explanation that every power that a corporation has is derived from the legislature which creates it. The corporation is constantly subject to legislative control and questions calling for investigations must be examined and a suitable flexibility of action be provided. The legislatures are in session but a portion of the year and must have some agent in whose hands such powers may be placed. The function of such a commission is administrative.

In answer to some of the objections previously referred to, relating to the broad powers granted to the commissions and referring to their relation to the courts, Governor Hughes said:

It has been urged that the granting of such broad powers is incompatible with the maintenance of the freedom of management said to be incident to the property rights of the corporations. Such an objection has a certain plausibility, but will not stand critical examination. The legislature, in safeguarding the public interest, has the power to require such equipment and facilities, and such manner of operations, as will secure good service. It will hardly be claimed that the existence of this power is inconsistent with property rights. The property of a public service corporation has been acquired subject to this power. And the power conferred upon the commission is conferred for the purpose of securing the perform-

ance of obligations to which the right of property is subordinate.

Another question is, What is the relation of the courts to such a commission? As has been said, the commission is an administrative body. It would not be proper for the legislature to confer these powers upon the appellate division of the supreme court. It is not in accordance with the theory of our government that an attempt should be made to convert the court into an administrative board. It is not the proper function of the courts to fix rates or to make orders as to the facilities which should be supplied or the safety appliances which should be used. This is the function of the legislature, or of the administrative board which it may create to aid in securing the performance of the duties it has imposed. It would be most unfortunate if, with the necessary extension of state supervision of public service, our courts should have cast upon them such burdens of administration.

The power of the legislature and of the commission it creates is not, however, without limits. And where the legislature goes beyond its constitutional powers, or where the administrative board exceeds its authority or passes its constitutional limits, the matter falls within the jurisdiction of the courts, who will declare such action null and void and prevent any attempt to enforce the provisions of the obnoxious statute or order.

Both the state and federal constitutions prohibit the depriving of any person of property without due process of law, and the taking of private property for public use without just compensation. Nor can a state deny to any person within its jurisdiction the equal protection of the laws. Neither the legislature nor the commission can escape these salutary checks upon their authority. So that if it be claimed that the action of the legislature or of a commission in fixing a rate operates as such a deprivation of property, a judicial question is presented and the courts will take jurisdiction and determine that question.

It thus appears that there is of necessity a court review where such questions are presented. This court review the legislature cannot curtail.

To provide a right of appeal to the courts from every order of the commission not only invites delay and an unnecessary multiplicity of proceedings, but has for its object the substitution of the judgment of the court for the action of the commission.

What is needed is a commission of dignity, of force, of ability, representing the best intelligence of the state available for the purpose and proceeding in a responsible manner. It should have such an equipment and such technical assistance as will enable it to deal with the matters before it thoroughly and expertly. With the highest respect for the courts, I believe that such a commission can best deal with the matters which properly fall within its province, and we may be sure, as has already been stated, that in cases where any doubt can exist as to whether there is an invasion of property rights or whether the matter does not lie within the province of the commission, the courts will be called upon to exercise their admitted jurisdiction.

The power to issue stock and bonds and to invest in the securities of other corporations is a power derived from the legislature and subject to such conditions as it may impose. No consolidation or merger of interests can take place except pursuant to legislative authority. Evils that have resulted from an abuse of the freedom which has been enjoyed under our corporate laws are patent to all. It is not simply or primarily the question of protection to the investor. The paramount demand is that through the improper issue of securities there shall not be provided a motive for crippling the public service or a basis for demanding extortionate returns. The power of the state should be exercised to compel respect for the public interest.

A further hearing upon the bill was had on April 3, in which special attention was given to lighting interests.

Protective Device for New York Subway.

According to a London newspaper dispatch from Vienna, plans have for some time past been under consideration for the future introduction of electric traction for the Alpine railways. For the section of line on the Aalberg Railway between Innsbruck and Bregenz, two large hydraulic powers have been acquired on the Ache in the Oetzthal and on the River Inn, at Landeck, of which the first will probably be selected for operation. In addition to this, supplementary power may possibly be obtained in the Vorarlberg district. In the northern districts of the Alps many sources of water power are being surveyed for the above purposes.

THE MARION BLUFFTON & EASTERN RAILWAY.

The railway recently completed by the Marion Bluffton & Eastern Traction Company is an important line among the many important interurban roads that are operating in the north central part of Indiana. This line is 31.57 miles in length and reaches, besides the terminal cities of Marion and Bluffton, the towns of Liberty Center, Warren, Van Buren and

Marion Bluffton & Eastern Traction Company—Map of Route.

Landessville. The population served for each mile of track is 1,820.

At Marion, the western terminus, connection is made with the north and south lines of the Indiana Union Traction Company and with the line of the Kokomo Marion & Western Traction Company, which extends west from Marion to Kokomo, Ind. At Bluffton, the eastern terminus, connection is made with the Bluffton branch of the Ft. Wayne & Wabash

Marion Bluffton & Eastern Traction Company—Six-Mile Tangent Near Warren, Ind.

Valley Traction Company and with the old Muncie Hartford & Ft. Wayne Railway, which is now leased by the Indiana Union Traction Company. Between the terminals the line parallels the Toledo St. Louis & Western, a steam railway.

The electric line is operated on a 2-cent mileage basis and charges for the ride between Marion and Bluffton 60 cents for a ticket one way or \$1.05 for a round-trip ticket.

It is expected to derive a large business during the summer months from the traffic between Marion and Goldthwait Park, located on the line of the Marion Bluffton & Eastern

Marion Bluffton & Eastern Traction Company—Culvert in Fill Near Marion, Ind.

about 1 mile from Marion and near the Mississenawa river. This is a large new park to be opened for the first time this year, containing 34 acres of ground especially suited for park purposes. The park will contain an especially complete "White City," provided with all the usual amusement resort features. The railway company has signed a contract with the park management agreeing to furnish a 15-minute service between Marion and the park from June 15 to September 15. Round-trip tickets, including admission to the park, will be sold for 10 cents.

The officials of the Marion Bluffton & Eastern Traction

Marion Bluffton & Eastern Traction Company—Culvert Between Warren and Van Buren, Ind., with Square Top.

Company gave particular attention to the substantial construction of track and roadway in order that they might operate cars at a high rate of speed. The cars are now operated on an hourly schedule and the running time between terminals is 1 hour and 20 minutes. As soon as the tracks have settled and the final work is done on the roadbed, the running time will be reduced 10 or 15 minutes.

Track and Roadway.

The track is built on private right of way 40 feet in width, with a maximum grade outside of the towns of 1.5 per

cent. There is one short-radius curve in the track at Warren where the road enters the bridge across the Salimonia river; but, with this exception, long-radius curves prevail. In the 31 miles of track there are two 6-mile and two 5-mile tangents.

In order to retain the low grades and long radius curves it was necessary, during construction, to make extensive cuts

Marion Bluffton & Eastern Traction Company—Underground Passage Near Marion, Ind.

and fills at several points on the line. Just east of Marion the largest fill and the largest cut, 20 feet each, were made.

The railway has three steel bridges of the deck-plate girder type. They span the Mississenewa and the Salimonia rivers and Rock creek. The bridge abutments are of concrete construction. There are several concrete waterways and cattle-passes, which are substantially built. The bridges were erected by the Indiana Bridge Company. The track and roadway were built under contract by the Moore-Mansfield Construction Company of Indianapolis. The engineers were the

Marion Bluffton & Eastern Traction Company—Bridge Over Mississenawa River.

Riggs & Sherman Company of Toledo, O., who were represented by J. S. Worley.

The track is laid with standard white oak ties, 70-pound steel rails in 33-foot lengths, 4 and 6 bolt splice bars, and is bonded with the Ohio Brass Company's solder bonds. Two thousand cubic yards of gravel per mile was used in ballasting the track.

Power.

The power for operating the line is rented from the Marion Heat & Light Company. Sixty-cycle, 3-phase current is carried on No. 4 copper cables at a line pressure of 22,000 volts from the power house at Marion to the substations at Van Buren and Liberty Center. In providing 60-cycle current instead of 25-cycle current the company has departed from

Marion Bluffton & Eastern Traction Company—Liberty Center Substation.

the prevailing custom in railway operation. This was done because the company expects to secure a large lighting business in the towns through which the lines pass.

The transmission lines are supported on Western Electric triple-peticoat porcelain insulators spaced 2½ feet apart on a single 9-foot cross arm located at the top of the poles. The pole line is composed of 40-foot Idaho cedar poles. A copper feeder 250,000 circular mils in cross section, which is tapped into the trolley every 1,300 feet, runs the length of the road. The trolley wire is No. 000 round copper and is

supported on 9-foot tubular brackets at a height of 20 feet above the rails. The overhead work was built by C. O. Scott of Kokomo, Ind.

Substations.

The Van Buren substation is located 10 miles east of Marion. The building is a 2-story brick structure 22 by 100 feet. A space 55 feet long at the rear of the building is used

for the substation equipment and the balance of the ground floor is fitted up for an office and waiting room. The second story is used as a living room by the station attendant. The electrical equipment of this station consists of two 300-kilowatt, 60-cycle, 3-phase Westinghouse rotary converters, six 100-kilowatt, 22,000-400-volt, oil-cooled transformers, and a 6-panel switchboard with recording and other necessary in-

are provided under each of the four tracks entering the building. The superstructure of the building is of brick and the roof is of frame construction.

Equipment.

The car equipment consists of five passenger cars, one work car and one express car. Four of the passenger cars are of the combination single-end type and the other is of the two-compartment interurban type. They are 45 feet in length, weigh about 30 tons each, are mounted on Taylor trucks and are equipped with four Westinghouse 93-A motors, K-14 controllers, straight air brakes and have steel-tired wheels. The cars are geared to run 50 miles an hour.

Personnel.

The Marion Bluffton & Eastern Traction Company was organized in 1905. Four-fifths of the stock issued is owned by residents of Bluffton. The officers of the company are: L. C. Davenport, president; R. F. Cummins, secretary and general manager; W. A. Kunkel, treasurer. The board of directors is composed of the president, the secretary and treasurer and H. C. Arnold, C. Max Hofman, James W. Sale and W. W. Edwards. C. W. Clark is operating superintendent and electrical engineer. The operating office is located at Bluffton.

High-Speed Electric Line in Italy.

Consul James E. Dunning, in a report from Milan, says: "The Mediterranean Line, one of the two trunk systems of steam railway in Italy, is seriously at work on the plans for the continuation of the electric road now running from Milan north to Varese and Porto Ceresio, about 50 miles, to Laveno, on Lake Maggiore, via Ponte Tresa, on the Lake of Lugano. At Laveno this extension, which will be operated with the same high-speed express electric service now in use between Milan and Varese and Porto Ceresio, will connect with the existing steam branch to points north, including Luino and Bellinzona on the St. Gothard main line; while at Ponte Tresa another line, now projected, will start direct

Marion Bluffton & Eastern Traction Company—Combination Car.

struments. In addition to these railway units there will be installed for lighting purposes in Van Buren two 37½-kilowatt, 60-cycle, 22,000-2,200-volt transformers, and a 25-light constant-current arc regulator, with two additional panels to the switchboard, one for the arc light line and the other for commercial lighting.

The substation at Liberty Center is built of concrete blocks. The equipment is identical with that provided for the Van Buren station. The high-tension wires are carried

Marion Bluffton & Eastern Traction Company—Car House, Near Bluffton, Ind.

direct from the pole line through 12-inch wall insulators to the apparatus in the rotary room.

Car House.

The car barns are located just west of the city limits of Bluffton. The main building, 70 by 125 feet in floor area, is divided into a repair shop, 24 feet wide, and a car storage house. The machine shop, in which the lathes, drills and other tools needed for car repairing are installed, is located at the rear of the bay set aside for repair work. Concrete pits

for Lugano, to connect there with the main line over the St. Gothard pass. If the plan goes according to present indications, the new line—Milan, Varese, Ponte Tresa-Lugano—will be in operation by the end of 1908, thus affording another direct route to Lugano and tapping the richest industrial section of Lombardy."

The Knoxville Railway & Light Company is now equipping its cars with fenders as fast as the work can be done.

CLEVELAND TRACTION SITUATION.

The prospects of a settlement of the Cleveland street railway controversy under the holding company plan, by which it is proposed to lease the Cleveland Electric Railway to the Municipal Traction Company on the basis of an agreed valuation of the property, have not brightened materially during the past week. Since President Andrews of the Cleveland Electric Railway and President Du Pont of the Municipal Traction Company submitted their estimates of the valuation of the property to the city council on March 25, naming \$105 and \$45.10 respectively as the value of the company's shares, neither side has been willing to make any change in the method of computing the valuation, and both have charged each other with bad faith in conducting the negotiations. The city council on Tuesday of this week voted to fix a price of \$60 per share for the stock and the matter will remain undecided until the Cleveland Electric directors have voted on that proposition.

At the public meeting of the city council on March 30 it became evident that Mr. Andrews and Mr. Du Pont were very far apart in their ideas as to the valuation of the Cleveland electric property, and that they could not agree as to the methods to be followed in determining that valuation. Mr. Andrews submitted a reply to Mr. Du Pont's communication to the council on March 27, in which he explained the principles on which he had calculated the value of the physical property and franchises, saying that he had followed the plan laid down by Mr. Du Pont at the beginning of the negotiations. He charged Mr. Du Pont with bad faith in not having followed the principles agreed upon. He said that in determining the value of the physical property he had followed the "Chicago plan" of adding to the cost of labor and material 20 per cent for the legal and engineering expenses incidental to construction, whereas Mr. Du Pont's figures omitted all such items. He said that in computing the franchise values he had estimated the value of the outlying franchises on the basis of average earnings per mile for the entire system. Mr. Du Pont had estimated franchise values according to the earnings of each line and had allowed no value for the outlying franchises after the franchises on the more central connecting lines had expired.

Mr. Andrews also submitted in writing answers to a list of 16 questions propounded by City Solicitor Baker at the meeting on March 27, in which he explained in detail many of the principles on which the valuation was based. The remainder of the meeting was principally taken up by a debate between Mayor Johnson, City Solicitor Baker and Presidents Andrews and Du Pont in regard to the methods used in fixing the valuation. The mayor asked Mr. Andrews to set a price on the property, but Mr. Andrews declined, saying that he had supposed that they were going to determine the real valuation of the property, instead of attempting to name an arbitrary price. The mayor then wished to inform the council as to the data used in calculating the valuation in order that it might set a price, but Mr. Andrews objected to having the data made public as they had been given to Mr. Du Pont in confidence.

At the mayor's suggestion it was then decided that the special committee of five appointed on March 27 to formulate a plan of arbitration meet on Monday afternoon to agree upon a price which could be recommended for the Cleveland Electric stock on the holding plan basis.

The committee met in secret sessions on Monday and Tuesday, April 1 and 2, and at a public meeting of the council on Tuesday morning submitted a report. The committee recommended a price of \$60 a share for the stock, to be redeemable at a 10 per cent increase, interest to be paid at the rate of 3 per cent for the first year, 4 per cent for the second year, 5 per cent for the third year and 6 per cent thereafter; that the company must accept the offer by May 1 or lose two points monthly on the valuation thereafter until the date of acceptance; that a security franchise be given to the Cleve-

land Electric Company, based on seven tickets for a quarter. The council adopted the report by a vote of 30 to 1.

Mr. Andrews then said that he wished to submit the proposition to his directors at once and asked if the holding company would guarantee a 3-cent fare within the city limits and a 5-cent fare outside, with a provision for the reversion of the franchise to the Cleveland Electric Company in case of failure. Mayor Johnson said he would make no such guarantees to the old company, but that any contract as to rate of fare would be between the city and the holding company. He said that he was willing to submit both the committee's proposition and the Cleveland Electric Company's original proposition to a vote of the people.

Mr. Andrews then agreed to submit the new proposition to the directors as soon as possible and promised to inform the mayor as soon as he was ready to give an answer.

TRAMWAYS IN FRANCE.

Consul-General R. P. Skinner forwards the following report on the electrical transit system of Marseille:

When the city of Marseille contracted with the Compagnie Générale Française de Tramways, for the construction of a complete electrical transit system, the terms of the concession attracted wide attention, as they provided for: First, 2-cent fares (10 centimes); second, an annual minimum payment to the city of \$19,300 plus 1 per cent of the annual receipts when such receipts should exceed \$1,930,000, this percentage to increase with each \$1,000,000 of additional receipts until the total receipts would amount to \$2,316,000, at which time the city's share should remain stationary at 3 per cent; third, reversion to the state of all rights and full proprietorship as to tracks, wires, and other material occupying the public thoroughfares, at the expiration of the concessionary period of 50 years.

The company possesses similar concessions at Marseille, Nancy, Havre, Orleans and Tunis, but the Marseille system is by far the most important. The company, which was capitalized at \$4,825,000 in 1891, has now increased its capital to \$8,106,000, divided into 84,000 shares of \$96.50 each, and has also issued \$6,967,300 in 4 per cent bonds and \$205,641 in 3 per cent bonds. The 4 per cent bonds are now worth in the open market \$95.44 and the 3 per cent bonds \$81.44. The shares have paid interest regularly for the past seven years as follows: 1900, \$3.86; 1901, \$4.34; 1902, \$4.34; 1903, \$4.82; 1904, \$5.31; 1905, \$5.31, and 1906, \$5.31. There is now some talk of a \$5.79 dividend for 1907, but this is hardly likely. The shares are now quoted in the open market at \$123.52, which shows that the enterprise has been entirely satisfactory from the investors' point of view.

The results to the public have been these: The city enjoys the use of a street railway system which is probably as complete as any in Europe. The rolling stock is by no means as elegant as in many American cities, but the cars are substantially constructed and answer all practical purposes. The tracks reach out in every direction and converge into the heart of the business district. While no transfers are allowed, the fares are uniformly two cents, with the exception of one circular excursion route along the sea front, upon which three cents is collected. Very general use is made of the service, and, owing to the low fares, cars are taken for distances so short that otherwise they would be covered on foot. Electricity replaced horse cars and omnibuses in 1900, but the new system was not completed until 1902. I supply below a table of statistics showing the exact situation since 1900, when the 2-cent service was partially inaugurated:

Year.	Length of lines in exploitation.	Number of employees.	Mileage traveled.	Number of passengers.	Gross receipts.
1900*44.98	2,196	5,845,152	42,243,060	\$ 876,055
1901*50.39	2,125	6,730,243	48,581,585	1,019,539
1902*62.91	2,047	7,875,289	61,180,191	1,240,995
1903*64.70	1,763	8,387,623	64,605,692	1,317,869
1904*65.56	2,170	9,309,421	70,782,479	1,430,959
1905*73.00	2,400	10,664,306	77,176,908	1,550,183
1906*76.56	2,400	12,016,661	88,943,150	1,781,994

*Miles.

PIPING AND POWER STATION SYSTEMS.—XXXVI.

BY W. L. MORRIS, M. E.

Though this saving is conspicuous in the larger sizes, it is doubtful whether there are any advantages attending the use of dry vacuum pumps on condensers smaller than 16 inch diameter of exhaust. The service to which this class of machinery is subjected is rather severe because of the high temperature of the air resulting from compression and the large quantity of oil entering the cylinder. The oil burns on the valves due to the high temperature and therefore requires considerable care and attention on the part of the attendant to keep the pump in a working condition. The smaller sizes of condensers, such as would be operated with out air pumps, may require more steam for the circulating pump, but as the air pump also requires steam to operate it

and an expenditure for oil, repairs, attendance, interest on investment, etc., the saving is too slight to justify the use of additional apparatus.

There is a special design of elevated jet condenser which employs two tail pipes, one being restricted in size and designed for a high water velocity to eject the air and discharge it into the hot well. The other tail pipe, which is of sufficient size to carry away all the water which the ejection pipe will not discharge, has its opening from the condenser bowl at a higher elevation than the ejection pipe opening. A condenser designed on this principle is shown in Fig. 269 (J 1-1) and it has been claimed that a vacuum of 26 and 27 inches has been maintained with a high temperature of the water in the hot well, and no other means provided for removing the air other than the air ejection tail pipe. This being the case, but very little additional machinery and apparatus is required with this condensing arrangement, the circulating pump being any one of the standard low pressure designs, the one which is most flexible and efficient being a direct connected engine type

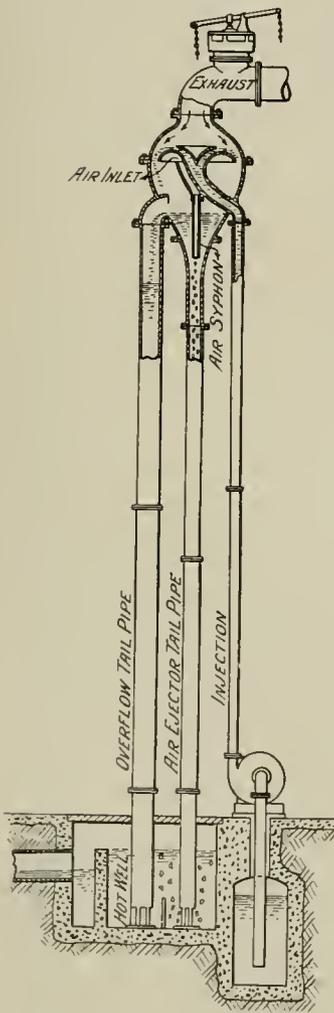

Figure 269—(J1-1).

centrifugal pump, the exhaust of which is piped to the feed water heater.

A motor driven pump is quite attractive to operating engineers on account of its simplicity and reliability, but it is much less efficient than an engine driven pump, the exhaust of which is used for feed heating. A difficulty which is experienced with motor-driven centrifugal pumps is that of starting the condenser without a dry vacuum pump, as the water must then be raised to about twice its normal elevation, as the water in the tail pipe is not there to balance a column of equivalent height in the injection pipe. The speed of the motor being fixed, and the centrifugal pump not being capable of raising water much above the head for which it was designed, it is necessary to have the motor constantly driving a high lift pump for low lift service. In the case of engine

driven pumps, however, it is possible to temporarily increase the speed of the engine sufficiently to start the condenser operating and establish the vacuum, after which the speed may be reduced to the operating conditions determined by the amount of water required.

An engine for this service should be economical in steam consumption, a vertical compound engine being employed if the condenser is of large size. By using auxiliaries which are economical in the use of steam, it is possible to run all the auxiliaries non-condensing and use the auxiliary exhaust steam for heating the feed water. If a dry-air pump is employed, it should also be steam-driven either directly or combined with the circulating pump.

A geared motor driven pump is quite unsatisfactory as a power station auxiliary for any service, unless possibly the small air compressor used for blowing out armatures, etc. This machine is, however, not essential for continuous operation and a motor drive with an automatic controlling switch has been found entirely satisfactory, the outfit being generally such as is used for the air brake system on electric cars. Feed pumps, and circulating and air pumps should be driven from a source of power the speed of which can easily be varied. The motor drive is objectionable because it is not easily adapted to variations in speed and the continuous rumbling noise of the gearing is very annoying. To insure the best results from the station operator it is quite necessary that the plant be as quiet as possible so that he can easily hear any unusual sound and locate the difficulty.

The dry vacuum pump is not wholly necessary with surface condensers, but unlike the elevated jet condenser some provision must be made for removing the air with a pump, either of the wet or dry vacuum type. Air that accumulates in a surface condenser is in the compartment together with the condensation and in no way comes in contact with the circulating water. The movements of the condensations are comparatively slow and not sufficient to remove the air. The air may be taken together with the water, or separately, as shown in Figures 28 and 29, Chapter 4. The wet vacuum pump is that most generally used and is so termed because it handles the air together with the condensation. This class of pump is also used for the suction type jet condensers to remove the air and condensation, and when so used is generally styled an "air pump." The class of service is practically the same for both condensers, the jet condenser having approximately thirty times as much water to handle and a correspondingly greater amount of air. The action of this combined air and

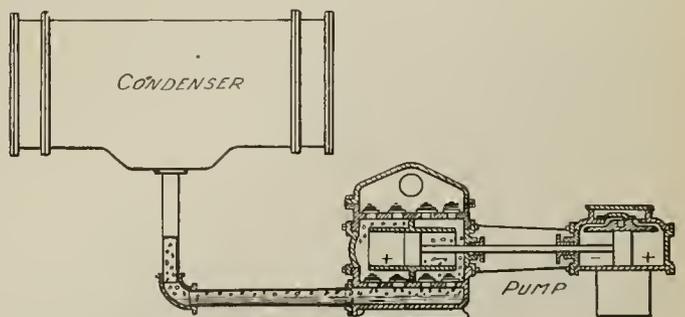

Figure 270—(J1-2).

water vacuum pump is somewhat peculiar, its jerky motion not being generally understood. Figure 270 (J 1-2) shows the wet vacuum pump attached to a condenser. When the pump is in regular operation, but little condensation is being handled, and that is well down in the suction pipe. When the pump is discharging the contents of the water end, one side is under pressure marked + and the other side is at the same pressure as the condenser and is marked -. The pressure behind the steam cylinder is also under pressure marked +, this pressure being maintained sufficiently high to overcome

the pressure on the water end marked +. The work performed in compressing the contents in the water cylinder marked + is similar to compressing a spring. The air contained in the water cylinder being the elastic body, as soon as the steam valve has crossed over the port and allowed the exhaust port to communicate with the end of the cylinder that has been under compression, the support in the steam cylinder is taken from the end of the piston rod, and the compressed air in the water end marked + is free to expand, thus causing the quick recoil so conspicuous in this class of machinery. The recoil movement will reach almost the full stroke when the pump is running above speed, and when there is no recoil the pump is taking only water, the air in this case accumulating in the condenser and by keeping the steam from the condensing surfaces, reduces its capacity and as the capacity becomes less than that required to condense the steam delivered to the condenser, the vacuum drops.

The amount of air that is being handled can easily be judged by the amount of recoil. The amount of recoil necessary for successful operation can only be determined by observing the vacuum, as the volume of air is largely dependent upon the tightness of the piping, stuffing boxes, etc. When the amount of recoil of the pump piston reaches nearly the full stroke, it is an indication that there are air leaks which should be located at once and made air tight. This is in many cases a very difficult operation, both the locating of the leak as well as to close them after they have been found. One of the most positive methods of showing up the leaks is to fill the vacuum system with water and put a slight pressure on it, about 10 pounds to the square inch, and while the pipes are filled with water make a careful inspection of the entire system, marking or drawing up all joints and stuffing boxes where leaks are found. In case the exhaust pipes are large, it may be necessary to place posts under the pipe to support the additional weight, as 10 feet of 24-inch pipe will contain about 3,000 pounds of water. Another method of locating leaks in the system is to create a low vacuum on the system, say five pounds, and with a small pointed brush, shellac the joints, observing carefully where the shellac is drawn in. Many of the small leaks can be closed in this manner, but where large leaks are found it may be necessary to make a new joint. Another method, but quite crude, is to give all the joints a heavy coat of pitch, while the vacuum is maintained on the system, trusting that the pitch will fill up the cracks and stop the leaks.

If gas is obtainable at the plant the entire piping system can be filled with gas and leaks located by a candle passed around the joints. The quantity of gas necessary would not be expensive, a thousand cubic feet being sufficient to fill a large system, say 140 feet of pipe 3 feet in diameter. To fill a line with gas, it is of course necessary to fill it with steam and then close up the system, and as the steam condenses allow gas to fill the pipe.

(To be Continued.)

Electric Railway Statistics of Canada.

According to the annual report of the Department of Railways and Canals of Canada, there were in operation at the close of the fiscal year ended on June 30, 1906, 814 miles of electric railway, 195 miles being double-tracked. The paid-up capital amounted to \$63,857,970. The gross earnings aggregated \$10,966,872, an increase of \$1,609,747, and the working expenses \$6,675,038, an increase of \$756,844, leaving the net earnings \$4,291,834, an increase of \$852,903. The number of passengers carried was 237,655,074, an increase of 34,187,757, and the freight carried amounted to 506,024 tons, a decrease of 4,326 tons. The car mileage was 50,618,836, an increase of 4,659,735 miles. The accident returns show a total of 47 persons killed during the year and 1,653 persons injured. Power was supplied in 15 cases by water, and in 41 cases by steam. Ontario has 441 miles, Quebec 198, New Brunswick 16, Nova Scotia 54, Manitoba 32, and British Columbia 72 miles. Returns were received from 47 companies.

RECENT ELECTRIC RAILWAY LEGAL DECISIONS.

BY J. ROSENBERGER, LL. B.

Rails and Fastenings Not Fixtures.

The landowners from whom a right of way was obtained for a suburban electric railway, the supreme court of Georgia holds, *Georgia Railroad & Banking Company vs. Haas*, 56 Southeastern Reporter, 313, could not successfully claim the rails and fastenings laid solely for the purpose of operating the road as being fixtures forming part of the land itself, and not movable therefrom.

Passenger Carried Beyond Destination Leaping from Car.

It is certainly true as a general proposition, the supreme court of appeals of Virginia says, *Newport News & Old Point Railway & Electric Company vs. McCormick*, 56 Southeastern Reporter, 281, that the misconduct of the conductor in carrying a passenger beyond his destination can afford no sufficient justification for his hazarding life or limb in jumping from a moving car. If, however, he should negligently persist in doing so and suffers injury, he is to be regarded as the author of his own misfortune, and his right to recover is barred, upon the principle that the negligence of the company in failing to stop the car was the remote, while the negligence of the plaintiff in leaping from the car while in motion was the proximate, cause of the injury.

When One Car Meets Another Stopped on Adjacent Track.

When a car has been stopped at the usual place for discharging passengers, the court of appeals of Kentucky holds, *Louisville City Railway Company v. Hudgins*, 98 Southwestern Reporter, 275, it is the duty of those in charge of an approaching car on the other track to have it under such control that it may be stopped at a moment's notice, so that persons who have alighted may cross the track safely. It is manifestly dangerous, while passengers are alighting from a car, to permit another car, not under perfect control, to run by it on the adjacent track, as the motorman cannot discover the peril of the person attempting to cross the track in time to prevent injury, and it must be anticipated that persons who have alighted from a standing car at a street crossing may cross the street immediately behind it. It is said that it is the duty of the passenger after alighting from a street car to stand in the street until the car has gone a sufficient distance to enable him to see an approaching car, and to allow persons in charge of the approaching car to discover them; in other words, that it is the duty of passengers to exercise ordinary care for their own safety. That is true, but the passenger is not to be charged with negligence because he fails to anticipate that the company from whose car he has just alighted will place him in imminent peril from another car before he has had opportunity to reach a place of safety. The duty that persons operating street cars owe to passengers does not end immediately when the passenger has stepped safely to the ground. They are required to, and should, exercise ordinary care to prevent injury by their cars to persons who have left the car while they are attempting to reach the street or a place of safety.

Highest Court on Paving Requirement.

The supreme court of the United States says that the case of the *Fair Haven & Westville Railroad Company v. City of New Haven*, 27 Supreme Court Reporter, 74, involved the validity of an assessment of \$36,879, against the company, for the cost of paving between its tracks and for 1 foot on each side thereof, and it affirms a judgment approving of the assessment with a deduction of \$3,590.85 for the cost of repair. It says that by its original charter, granted in 1862, the company was required to keep the street between its tracks, with a space of 2 feet on each side of the tracks, in good and sufficient repair. It was also provided that the act might be altered, amended, or repealed at the pleasure of

the general assembly. In the amendment of the charter in 1864 this obligation was retained, and also in the public acts of 1893. In the act of 1895 the duty of paving and repaving was imposed on all railway companies. The court assumes, for the purpose of its discussion, that the duty to repair did not include the duty to pave and repave, although much can be said and cases can be cited against the assumption. Did the change and increase of burden upon the company come within the limitations upon the reserved power of the state? Had it no proper relation to the objects of the grant to the company or any of the public rights of the state? Could it be said to be exercised in mere oppression and wrong? All of these questions must be answered in the negative. The company was given the right to occupy the streets. It exercised this right first with a single track, and afterwards with a double track. Before granting this right the state certainly could have, and reasonably could have, put upon the company the duty of paving as well as of repairing. Such requirement would have been consistent with the object of the grant. It is yet consistent with the object of the grant. It is not imposed in sheer oppression and wrong, and the good faith of the state cannot be questioned. It is imposed in the exercise of one of the public rights of the state,—the establishment, maintenance, and care of its highways. The extent of this right is illustrated by *West Chicago Street Railroad Company v. Illinois*, 201 United States Reports, 506, and cases cited.

Need Not Transfer to Leased Elevated or Steam Lines.

Section 78 of article 3 of the New York railroad law provides that "any railroad corporation or any corporation owning or operating any railroad or railroad route within this state, may contract with any other such corporation for the use of their respective roads or routes, or any part thereof, and thereafter use the same in such manner and for such time as may be prescribed in such contract." The court of appeals of New York says, *People v. Brooklyn Heights Railroad Company*, 79 Northeastern Reporter, 838, that, as it understands the phrase "any railroad corporation," etc., it refers to every railroad incorporated under the provisions of the act. Such corporation "may contract with any other such corporation." No limitation is apparent. A steam railroad corporation can lease another steam surface railroad, a street surface railroad or an elevated railroad. So with a street surface railroad. It may lease another street surface railroad or steam surface railroad or an elevated road; but when one railroad corporation undertakes to lease and operate another road, it assumes all the duties, obligations, and requirements imposed by the statute and the character of such railroad. Such duties and obligations in the operation of steam surface railroads are in many respects different from those imposed in the operation of street surface roads, and in the operation of elevated roads there are still other obligations assumed which are materially different.

The court thinks it apparent, therefore, that when the legislature authorized the defendant to lease and operate the elevated and steam surface roads here in question, it not only became empowered and authorized, but it was also its duty, to operate such roads in accordance with the requirements of their respective characters. Having had cast upon it the duty and obligation to operate such roads in accordance with the requirements of their charters and the statute applicable thereto, as such lessee, it became entitled to all of the privileges and benefits authorized by their charter and the statute, unless such roads were brought within the meaning of the sections in article 4 in which the defendant is limited to the charge of but one fare. The court thinks that they are not. As the court construes those sections, they have reference to street surface railroads and no others.

Nor does the court think that the defendant, in dispensing with steam as a motive power and substituting electricity,

affected the situation or changed its right so far as the question of fares was concerned. Such change has been authorized under general laws, and, by complying with the requirements of the statute with reference thereto, it may be lawfully made.

Duty of Motorman Seeing Person on Trestle.

Where a woman was walking on the trestle or unfloored bridge of an interurban electric railway, near the city limits, the court of civil appeals of Texas holds, *Northern Texas Traction Company vs. Mullins*, 99 Southwestern Reporter, 433, that, after the discovery of her perilous position, it was the duty of the motorman to use "the greatest precaution to avoid injuring" her. In other words, as supported by numerous authorities, in such cases, the law, as well as the dictates of humanity, imposed upon him the duty of using every means then reasonably within his power, consistent with safety to himself and others on the car, to avoid running the woman down. Such duty certainly demanded of the motorman prompt rejection of any merely speculative chance that the woman would "get off" the track in time.

Name Does Not Make Extension—After Grant Ends.

The use of the tracks of a line for a short distance by an alleged branch, the supreme court of the United States holds, in *Cleveland Electric Railway Company vs. City of Cleveland and Forest City Railway Company*, 27 Supreme Court Reporter, 202, does not make the latter a mere extension of the former. And because on some occasions it has been called a branch does not alter the weight to be given the facts, or turn the branch into a mere extension where it has been otherwise uniformly treated. The branch road certainly did not become a part of the main road simply because it ran in connection with it, or because it ran over a small portion of the tracks of that road. It remained what it started out as, a road with a separate route and a different term of life. Upon the termination of the grant to such branch the title to the rails, poles and other appliances for operating that road, and then remaining on the various streets, remained in the railway company which had been operating the road. Another company could not avail itself of an ordinance, so far as taking possession of such property was concerned.

Right Speed Cannot be Shown by Experts or Ordinances.

In a case where an electric car struck a pedestrian walking near the outer edge of the track, the court of appeals of Kentucky holds, *Ford's Administrator vs. Paducah City Railway*, 99 Southwestern Reporter, 355, that there was no error in refusing to permit a witness to testify as to what would be a reasonable rate of speed, for the reason that what might be negligence in the speed of a car in one portion of a city might not be negligence in another portion thereof; in fact, what would be negligence in the speed of a car in one square of a street might not be negligence in the next square. So it is impossible to fix an arbitrary rate of speed at which it would be safe to operate a car within the city limits. It has been held that to move a car at all is per se (by itself) dangerous. The danger is not confined alone to the speed with which the car is moved, but to the manner in which it is operated as well, and, when the jury is told how fast the particular car in question was moving, the condition of the track over which it was moving, and the use to which the street was put over which it was moving, they must judge for themselves as to whether or not the rate of speed, under the circumstances and conditions shown to exist, was excessive. Nor does the court think that there was error in a refusal to permit to be introduced in evidence an ordinance of the city requiring street cars to move in the business sections of the city at a rate of speed not exceeding eight miles an hour, and elsewhere at a rate not exceeding 10 miles an hour. The court says that the violation of a city ordinance is no more evidence of negligence than obedience to its provisions would be evidence of due care.

News of the Week

Central Electric Railway Association.

President H. A. Nicholl of the Central Electric Railway Association has appointed a supply men's committee, composed of the following members: John F. Ohmer, chairman, Dayton, O.; L. J. Drake, treasurer, Indianapolis, Ind.; S. D. Hutchins, Columbus, O.; William Bloss, Indianapolis, Ind.; R. W. Palmer, Cincinnati, O.

North Jersey Street Railway Company Indicted.

The grand jury of Essex county, New Jersey, on March 30 returned indictments against the North Jersey Street Railway Company, a subsidiary of the Public Service Corporation of New Jersey, charging overcrowding, poor equipment, with inadequate fenders, and unsanitary condition of cars.

Chief Justice William Gummere of the supreme court on March 27 had addressed the grand jury, which had been investigating street railway conditions in the county, and cautioned them against yielding to "public clamor." Justice Gummere said:

"It makes no difference whether fenders on the cars are of the latest, up-to-date model, so long as they are fenders that will save any obstacle from going beneath the wheels and are fenders approved in general by companies throughout the country.

"In the matter of sanitation, the company is only expected to have the cars cleaned at regular intervals. The company cannot be expected, owing to the extent of its service, to have the cars immaculate. The amount of dust brought in by the public on rainy and stormy days makes it a very hard task for the company to keep the vehicles cleaned.

"Those are matters that are left to the common sense of the jurors as to whether they are severe enough to menace the public health and warrant an indictment. But it is not fair for the jury or the bench to swerve one iota from the performance of a sworn duty because of the clamor of the public or the influences of the moment.

"No man can serve the public no matter how honestly and fail to escape criticism by those who do not appreciate the importance of doing the right thing for the public without regard to appearances. The grand jury is just as much derelict in the performance of its duty when it yields to the public clamor and indicts an innocent man as it is when it fails to indict a man who is guilty."

Memphis Court Sustains Low-Fare Ordinance.

Judge Pittman of Memphis, Tenn., has decided in favor of the plaintiff in the case of William G. Byrne against the Memphis Street Railway Company in which the plaintiff seeks damages because the company refused to sell him six tickets for 25 cents, as provided in a city ordinance. The company based its refusal on its franchise ordinance, which provides for a 5-cent fare. The court holds that this ordinance is invalid and does not constitute a contract for the reason that the legislature of the state of Tennessee had expressly and unequivocally declared that no taxing district should make any contract of any description, except in writing, to be signed by a majority of the fire and police commissioners and a majority of the board of public works.

Isidore Newman & Sons of New Orleans, who control the Memphis Street Railway, have given out the following statement:

"Before we became interested in the company our attorneys reported favorably on the franchise. The franchise provides for a 5-cent fare for a continuous ride but reserves the right to the city to request the company to sell 11 tickets for 50 cents. The ordinance stipulating 6 tickets for 25 cents was passed some months ago during the political turmoil which existed between the two factions in the management of the city. When the ordinance was first introduced we were advised by counsel that the city could not enforce the sale of tickets except as provided in the franchise. Though the city council passed the ticket ordinance, no attempt was made to enforce it by the city.

"After the passage of the ordinance, a citizen was ejected from the car for refusal to pay his fare because the conductor would not sell him tickets. This citizen brought suit against the company for damages. The case was tried in a lower court and a preliminary decision was rendered today. The company will appeal this decision. We are most confident that the higher courts will sustain the rate of fare provided in the franchise, for the franchise constitutes a contract between the company and the city.

"We are advised that no other question as to the franchise is involved in this decision."

Legislation Affecting Electric Railways.

Iowa.—The Meredith bill to encourage the establishment of automobile railroads in Iowa has been passed by the house. The bill declares that any railroad operated over any track other than steel or iron shall be known as an "automobile railway," and confers on such a road all the rights and privileges now enjoyed by other lines of transportation in Iowa.—The house has also passed by a unanimous vote a bill requiring street railways to permit interurbans to use their tracks and terminal facilities and requiring them to furnish power for the interurbans.

Nebraska.—The senate has passed a bill which requires city railway companies to permit interurban railways to use their tracks, terminals and power facilities.—The bill to permit city railway companies to own interurbans has been indefinitely postponed by the house, at the instance of the sponsors of the bill, because of the large number of restrictions added by amendments.

Pennsylvania.—Senator Brown of Harrisburg has introduced a

bill permitting street railway companies to enter into contracts for the sale of electric power to motor truck, express or parcel carrying companies under such terms as may be agreed upon. The object of the bill is to enable the Philadelphia Rapid Transit Company to enter into a contract with a company which is being organized to run automobile express wagons on its tracks.—The McNicol-Fahey bill to permit the city of Philadelphia to enter into a contract with the Philadelphia Rapid Transit Company has passed both houses and has been sent to the governor. The bill provides: "That it shall and may be lawful for any city, borough or township of the one part and any street passenger railway company, surface, elevated or underground or motor power company leasing and operating the franchises and property of such company within the limits of such cities, boroughs or townships of the other part, to enter into contracts with each other affecting, fixing and regulating the franchises, powers, duties and liabilities of such companies and the regulations and respective rights of the contracting parties. Such contracts may inter alia provide for payments by the companies to the local authorities in lieu of the performance of certain duties or the payment of license fees or charges imposed in favor of such city, borough or township by the charters of the respective companies or by any general law or ordinance for the appointment by the local authorities of a certain number of persons to act as directors of such company, and further may provide for the ultimate acquisition by the local authorities upon terms mutually satisfactory of the leaseholds, property and franchises of the contracting parties."

Wisconsin.—The legislature has ordered engrossed the Elver bill limiting the hours of service for street railway employes to 10 hours a day within a period of 12 consecutive hours.—A bill now before the house places the building of new electric lines or extensions of present lines under the control of the state railway commission. The bill also provides that no steam or electric line shall be built parallel to an existing line within a distance of 30 miles, unless the commission decides that the proposed line is necessary and would prove a profitable investment. The bill also requires all corporations operating in the state to report to the commission on request full lists of their stockholders and the amount of stock held by each.

Rapid Transit Affairs in New York.

The rapid transit commission on April 2 began advertising for bids for the construction and operation of the Lexington avenue, the Seventh avenue, the Eighth avenue and the Jerome avenue subway routes. Bids will be opened on Thursday, April 25, and the board will award the contract within 15 days thereafter. The subways are to be built by sections; in the case of Lexington avenue route there will be 11 sections to bid for. The operating company will have a contract for 20 years, with the privilege of renewal for 20 years more.

The board of estimate on March 28 approved of the form of contract for the Seventh and Eighth avenue routes.

President Shonts and other officials of the Interborough-Metropolitan company held a conference on March 26 with Corporation Counsel Ellison and representatives of various West Side organizations, at which it was agreed that the company would remove its unused tracks on Amsterdam avenue, from Seventy-second to One Hundred and Twenty-ninth streets, and on other streets. A bill is to be introduced in the legislature providing for the removal of the tracks without invalidating the company's franchises.

"The result of the agreement reached at the conference," said Mr. Shonts, "will be the clearing of Amsterdam avenue and other thoroughfares of surplus and discontinued car tracks. All that I asked for was that our franchises should not be taken from us because of the tearing up of the rails. There will be nothing in the bill validating any franchises which may be defective. It will merely provide that if in the future the needs of traffic should require the operation of the roads now out of service the company shall be allowed to relay the tracks under conditions which will be acceptable to the board of estimate or the rapid transit commission, or, if the public utilities bill passes, to the commission which will be appointed under that act.

"It is apparent that we could not consent to take up the tracks without some protection to our interests. For instance, securities have been issued on the strength of the franchises held in the case of these lines, and while we will go on paying the interest on the securities, it would be unfair to the stockholders to agree to any canceling of the franchises. Again, in the case of some other properties, we have merely leased them, and it is not in our power to consent to an extermination of those roads."

There are about 25 miles of disused car tracks in the city, most of them being old horse car lines in the lower part of the city, over which one car a day is run in order to keep the franchises alive.

E. W. Winter, president of the Brooklyn Rapid Transit Company, has refused to grant the petition of patrons of the Brighton Beach division of the Kings County Elevated for transfers to the Montague street cable road, running from Court street to Wall street ferry. Mr. Winter said: "The company has so increased its transfer system that in 1907 it will issue 84 per cent more transfers than it did in 1906. To grant this request for transfers would complicate matters too seriously."

The New York State Board of Tax Commissioners on March 29 reported the special franchise tax assessments for 1907. The assessments on New York city corporations have been increased from \$361,479,300 to \$466,855,000, an increase of \$105,375,700 over 1906. The assessment on the Brooklyn Rapid Transit Company is \$54,645,000, an increase of \$16,166,000; on the Manhattan Elevated Railway the assessment is \$74,900,000, an increase of \$12,200,000; on the Metropolitan Street Railway, \$24,600,000, an increase of \$5,797,000, and on the Interborough Rapid Transit Company, \$24,000,000, an increase of \$6,000,000.

St. Louis Municipal Assembly Defeats 3-Cent Fare Bill.—A bill providing for 3-cent street car fares in St. Louis was defeated in the last hours of the session of the municipal assembly on March 28, after it had been reported unfavorably by the railroad committee, by being referred back to the committee.

Threatens to Forfeit Franchise.—The city council of Kalamazoo, Mich., on March 26 passed a resolution demanding that the Michigan United Railways Company pay within 10 days the sum of \$15,921, said to be due the city for paving between the company's tracks. The resolution states that unless the money is paid within the time stated the company's franchise privileges will be declared forfeited and the city will take possession of the streets and of the company's property as security. The company has offered to pay \$10,000 at once and the rest this summer.

Strike on Michigan United Railways.—The motormen and conductors employed by the Michigan United Railways Company, which operates the city systems of Lansing, Kalamazoo and Battle Creek, Mich., as well as an interurban system connecting those and other cities, struck on the morning of April 3. About 200 men are affected. Several conferences between the men and the officials were held on April 2. The company offered an increase of one cent an hour but the men refused to accept it, demanding 23 cents an hour on the city lines and 25 cents on the interurban lines. They now receive 18, 19 and 20 cents an hour.

Strike at Montgomery, Ala.—The street car service in Montgomery, Ala., has been tied up for several days. On March 27, 125 employes of the Montgomery Traction Company went on a strike because of the refusal of the company to accede to the following demands: Recognition of the union; 9-hour day; straight day work with dinner and night relief; time for meals so that they will not be forced to eat on the cars; 20 cents an hour for men for the first six months' service, and after that 22 cents; 25 cents an hour for overtime for all over 12 hours' work. Some cars have been running during the day, but at night service has been entirely discontinued. The company is importing strike-breakers.

Will Prosecute Dishonest Conductors.—The Cleveland Electric Railway has had considerable trouble of late from embezzlement of fares by conductors, who have failed to register the proper number of fares. The practice in the past has been simply to discharge such offenders when caught, but the company last week had several conductors arrested, who had been caught "knocking down" fares, and will prosecute them. "The company proposes to stamp out dishonesty on the part of conductors if it is possible to do so," said G. L. Radcliffe, general superintendent, last night. "We have come to the conclusion that arrests backed by vigorous prosecution will remedy an evil that discharges do not seem to reach. Dishonest employes are to be prosecuted from now on. The practice of arresting conductors who hold out fares seems to be very successful in raising the standard of honesty on systems in a number of eastern cities. We will now see how it works in Cleveland."

Committee Advises Against Corporation Profit-Sharing Plan.—A commission named by the governor of New Jersey to investigate the feasibility of requiring public utility corporations to share their profits with municipalities in which they operate made its report on March 28. The commission advises against the adoption of such a plan and recommends the continuance of the present plan of requiring those companies to pay a franchise tax based on the gross receipts. Several reasons are given for advising against the profit-sharing plan, among which are the following: 1. That differences in capitalization of these companies would make a profit-sharing tax unequal. 2. That the revenue that would be received would be very small in most instances unless the dividends allowed to stockholders should be placed lower than the dividends received on most investments. 3. That except in populous centers it would discourage the acceptance of franchises under the present law limiting those franchises to 20 years.

President Tuttle on Electric Railways.—Replying to a request that the Boston & Maine Railroad equip its Stoneham branch for electric trains, President Lucius Tuttle has written to Charles H. Hoyt of Winchester as follows: "Your suggestion is an easy one to make, but in the present state of the art the substitution of electricity for steam power on general railroad service has not passed beyond the experimental stage, and is not yet sufficiently in use anywhere to demonstrate its practicability or feasibility. It is true that the New York Central and the New York New Haven & Hartford roads are completing plans for handling their passenger traffic to and from the Grand Central station in New York by electrically equipped trains, but as there is no freight traffic handled by either of these roads to and from the Grand Central station, the problem is not with them as difficult as it would be if they were undertaking to provide electric power for handling all the road's traffic, both passenger and freight. In so far as the matter has yet been worked out the details of operating expenses are necessarily incomplete, but there is good reason for the belief that because of electric operation—as compared with that of steam locomotives—it is very much greater, but how much no one can tell. Again, in the past 15 years the introduction of rapid transit by electric railways, which give greater convenience to suburban travel than can possibly be furnished by steam railroads, has so diminished the volume of steam railroad suburban traffic that it is upon the whole now becoming a question whether there is any profit at all derivable by the steam railroads from the carrying of short distance suburban travel at the existing low rates charged therefor, and not only the Boston & Maine, but railroads carrying similar traffic everywhere, are fast coming to the belief that the surrender of this kind of travel to the street railways and interurban trolley lines will be from every point of view the best solution of the problem."

Construction News

FRANCHISES.

Atlanta, Ga.—The Georgia Railway & Electric Company has secured the consent of the council to lay a double track from the corner of Berne street and South boulevard, along South boulevard to Confederate avenue and on Confederate avenue to Little Switzerland, where a new park now is being built.

Brazil, Ind.—The Indianapolis & Western Traction Company has made application for permission to enter Brazil with its interurban line.

Brunswick, Ga.—F. D. M. Strachan, Brunswick, Ga., and associates have been granted a 40-year franchise for an electric railway system and lighting plant. It is stated that in return for the franchise the grantees have agreed by contract to purchase and turn over to the city the present waterworks plant at an arbitrated value, the city to pay for the plant at the rate of \$10,000 a year.

Fairfield, Ia.—A franchise has been granted by the city council to the Iowa-Missouri Traction & Power Company to operate its line in this city, the exact route to be determined later.

Jamestown, N. Y.—The Jamestown Street Railway Company has applied for permission to run its Lakewood line under the Erie Railroad's tracks near the Crystal ice houses. The crossing will be 17 feet high and 30 feet wide. The application will be acted upon by the railroad commissioners at Albany, N. Y., on April 10.

Kansas City, Mo.—An application for the extension of its Prospect avenue line from Thirty-first street to the Swope Park line, a distance of two miles, has been made by the Metropolitan Street Railway Company. Action has been referred to the committee on streets, alleys and grades.

Kewanee, Ill.—The franchise of the Galesburg & Kewanee Electric Railway, which was declared invalid some time ago by the Wethersfield village board, because the company had not completed its line according to the terms of the original franchise, has been reinstated by action of the board on March 26.

Lincoln, Ill.—The Springfield & Northeastern Traction Company, a line associated with the Illinois Traction System, which will connect Springfield, Bloomington and Mackinaw, has been granted a 50-year franchise for the right to build its line through Lincoln on Chicago street.

Marengo, Ia.—The Marengo & Midland Interurban Railway has been granted a franchise for the use of several streets and alleys in this city.

Milwaukee, Wis.—At a meeting of the council committees on railroads and judiciary favorable action was taken on the application of the Chicago & Milwaukee Electric Railroad to operate its cars on Wells street from Fifth to Second streets, provided that other urban and interurban lines be allowed the use of the tracks upon payment of a reasonable rate for such privileges.

Norwalk, O.—A franchise has been granted by the city council to the Cleveland & Indianapolis Interurban Railway, which will build a line from this city to Bluffton, Ind.

Reading, O.—The Cincinnati Reading & Middletown Street Railway, which is building a line from Cincinnati by way of Saaron to Middletown, O., has applied for a franchise to enter Reading with its interurban line. Guy M. Mallon of Cincinnati is interested.

Roanoke, Va.—The ordinance recently introduced for the extension of the Roanoke Railway & Electric Company's line on Genesee street from Thirty-ninth to Forty-third streets, has been approved.

St. Louis, Mo.—The bill authorizing the St. Louis Electric Terminal Railway Company, owned by the Illinois Traction Company, to lay its tracks on streets in North St. Louis, has been passed by the house of delegates. A charter already has been granted by congress for a bridge across the Mississippi river at Salisbury street and it is stated that with the signing of the franchise bill, work will be started on the line in St. Louis and on the bridge. A large passenger station will be erected at Eleventh street and Lucas avenue. Freight terminals will be erected on the 24 acres of ground purchased by the company in North St. Louis. The St. Louis line is intended to be the terminus of the extensive system of the McKinley interurban lines in Illinois.

Silver Creek, N. Y.—The Buffalo & Lake Erie Traction Company, which is building an interurban line between Buffalo and Erie, has applied for a franchise to lay its tracks through Silver Creek. J. C. Calisch, Buffalo, general manager.

Vincennes, Ind.—The Vincennes Washington & Eastern Traction Company, which is building a line from Vincennes to Loggootee, Ind., has been granted a franchise for its line in this city. It is stated that work will be commenced at once and that the company guarantees to have trains running inside of one year. W. H. Schott of Chicago, president.

Waterloo, Ind.—The Toledo & Chicago Interurban Railway has been granted a franchise to operate its interurban line in this city.

Wheeling (W. Va.) Traction Company.—An ordinance now

before the city council provides that this company may construct a second track and make other improvements. B. W. Peterson, vice-president.

York, Pa.—The application of the York Street Railway for a franchise to operate its line in several streets of the city was denied by the mayor upon the company's refusal to pay 3 per cent of one-seventh of the gross receipts of its interurban business to the city.

Youngstown, O.—A franchise has been granted to the New Castle & New Wilmington Electric Railway to operate its line in this city. This company, which is building an interurban line between New Wilmington, O., and New Castle, Pa., already has secured the site for a terminal at New Castle.

RECENT INCORPORATIONS.

East St. Louis Southeastern Railroad.—Incorporated to build an electric railway between East St. Louis, Freeburg and Mascoutah, Ill. Capital stock, \$2,500. Incorporators: L. C. Haynes, T. W. Gregory, G. C. Pierce, J. A. Farmer and Fred H. Kruger, all connected with the East St. Louis & Suburban Railway.

Ellwood City & Hazel-Dell Railway.—Incorporated in Pennsylvania to build four miles of electric line from Ellwood City, Lawrence township, to other points in the county. Capital stock, \$25,000. C. J. D. Strohecker, Zellenople, Pa., is president.

Greensburg & Western Railway.—Incorporated in Pennsylvania to build and operate an electric railway from Greensburg to Irwin, Pa., about 10 miles. Capital stock, \$60,000. William S. Kuhn, Pittsburg, is president.

Kansas Traction Company.—Incorporated in Kansas to build and operate a standard gauge road, either steam or electric, from Coffeyville to Kansas City, Mo., by way of Topeka, about 260 miles. Capital stock, \$25,000. Incorporators: F. B. Shirley, E. C. Kiddoo, S. D. Frazier and W. C. Hall, all of Coffeyville, Kan.

Lake Erie & Youngstown Railroad.—Incorporated in Ohio to build a gasoline motor line from Conneaut south through Pierpont and Andover, O. Gasoline motor cars only will be used and it is stated that work on laying out the route and securing private right of way will be started at once. Much of the property already has been secured. Capital stock, \$10,000. Incorporators: G. M. Brown, Wilbur F. Stanley, George J. Chapman, Conneaut; Frank J. Cheney, Toledo; John H. Ruhlman, Youngstown; William Ruhlman, North Lima; A. W. Jones, Burg Hill.

Lawrence Electric Transportation Company.—Incorporated in Kansas to build and operate a trackless trolley line in Lawrence. Large automobiles will be used, taking power from an overhead trolley wire. The company has a franchise to operate in Lawrence, and the work of constructing the line will be begun at once. The main line of the system will extend from the Santa Fe depot to the Haskell Institute. A branch line will also be run to the Kansas University. Lawrence has no street cars at present. Capital stock, \$200,000. Incorporators: O. W. Murphy, J. A. Hamlin, W. W. Cleland, F. W. Blackmar, R. M. Ridgeway, W. E. Pitts and Harry Dick, all of Lawrence.

Lincoln (Ill.) Railway & Light Company.—Incorporated in Illinois to operate street railways and light, heat and power plants. Capital stock, \$2,500. Incorporators: Charles R. Scott, M. O. Payne and Thomas Marshall.

Milwaukee & North Shore Railway.—Incorporated in Wisconsin to build and operate an electric interurban line from Milwaukee to Manitowoc, Sheboygan and Fond du Lac, Wis., with headquarters in Milwaukee. William C. Stone of Manitowoc is one of the incorporators.

Missoula-Bitter Root Traction Company.—Incorporated in Montana to build a proposed line from Missoula to Hamilton, Mont. Capital stock, \$40,000, about half of which has been subscribed. Incorporators: J. L. Humble, Corvallis; E. O. Lewis, Stevensville; C. M. Allen, Lo Lo; J. P. Shannon, Hamilton; and P. M. Reilly, Missoula, Mont.

Southern Wisconsin Light & Traction Company.—Incorporated in Wisconsin to operate an electric line in Dane and Rock counties which will be part of an interurban line from Madison to Janesville, Wis. The articles provide for a \$2,000,000 bond issue. F. W. Montgomery, 128 Broadway, New York, is one of the incorporators.

Toledo Wabash & St. Louis Railroad.—Incorporated in Maine to build an electric railway for freight and passenger service from Toledo, O., to St. Louis, Mo., through Defiance, O., and Ft. Wayne, Muncie and Terre Haute, Ind. Present plans include only the construction of the first section from Toledo to Defiance, which will be built under the name of the Toledo & Defiance Railway. Capital stock, \$6,000,000. There are to be no bonds or preferred stock. Officers: Clarence D. Whitney, president and general manager; George C. Metzger, vice-president; J. P. McAfee, treasurer; S. L. McAfee, secretary; all of Toledo. The Riggs & Sherman Company of Toledo has been engaged as engineers and has made the preliminary survey for the first section. President Whitney is quoted as saying that arrangements have been made with Burr Brothers of New York to finance the first section and that construction will begin at an early date. The road will be built on a 1½ per cent grade and 70-pound rails will be used.

Virden & Taylorville Traction Company.—Incorporated in Illinois to construct an electric line from Virden, Macoupin county, to Taylorville, Christian county. This will be the first section of a projected line which will ultimately extend from Quincy, Ill., to Terre Haute, Ind., via Hannibal, Winchester, Roodhouse, Virden,

Taylorville, Findlay, Windsor, Toledo, Casey, Martinsville and Marshall, nearly 300 miles. The line will be built for passenger and freight traffic and will open up some of the best coal and oil districts in Illinois, which at present are without such service. Branch lines will run to Carrollton, Springfield, Sullivan and Shelbyville. Capital stock, \$2,500. Incorporators: H. C. Simon, John Colderm, W. E. Allenson, T. B. Teney, Virden; and E. E. Barclay, Springfield, Ill.

TRACK AND ROADWAY.

Abilene, Tex.—It is stated that local capitalists have arranged to finance the proposed street railway line for this city and that contracts will be let in a short time for the first 3½ miles.

Accomac Traction & Power Company.—This company has been organized to build an electric railway from Onancock to Accomac Court House via Tasley, Va., with a possible extension to Battle Point on Matomkin Bay.

Anderson Traction Company.—Cars are now being operated over the first five miles of the line from Anderson to Belton, S. C., and as soon as the trestle at Broadway creek is completed, as it is expected to be some time this month, cars will run over the entire line.

Asheville, N. C.—Surveys are now being made for an electric line from Asheville to Montreat, N. C., and it is stated that construction will begin this spring.

Buffalo Lockport & Rochester Electric Railway.—It is stated that tracklaying will begin within a week in the town of Gates, N. Y. The line when completed will connect Buffalo, Lockport and Rochester, N. Y. J. G. White & Co. of New York are the contractors.

Calgary, Alta.—The public works committee has reported in favor of building a municipal street railway at a cost of \$250,000.

Cheyenne, Wyo.—Negotiations are in progress for an electric street railway for Cheyenne and Fort Russell to be installed this summer. Work is to be commenced on the power plant and tracks not later than May 1. The line will run from South Cheyenne, through the city to Lake Minnehaha, to Fort Russell, and later to Frontier Park, Sloan's Lake and other resorts.

Chicago & Western Indiana Traction Company.—This company has filed notice with the secretary of state of Indiana that it will increase its capital stock to \$600,000. This company proposes to build a line connecting four of the principal college towns of Indiana—Lafayette, Crawfordsville, Greencastle and Bloomington—and is called the "Educational Route." Edward F. Barrows, secretary and general manager, 610 Traction and Terminal building, Indianapolis, announces that work will begin on the line in a short time.

Columbus (O.) Urbana & Western Railway.—Control of this property has been sold to capitalists, who will organize the Columbus & Northern Traction Company with \$1,400,000 capital stock, of which \$1,000,000 will be common stock and \$400,000 preferred stock. The new owners will extend the line in a northwesterly direction, either to Lima, by way of Dublin, or to Bellefontaine, by way of Hilliards. The new owners of the property are connected with the Columbus Magnetic Springs & Northern Railway, which was incorporated last October to take over the electric line extending from Delaware to Magnetic Springs, and to extend its lines.

Consolidated Railway (New Haven, Conn.)—President C. S. Mellen has announced that this company is ready to build the electric line from Hartford to Middletown, Conn., which has been petitioned for by several towns along the proposed line. Plans have also been announced for building lines from Great Barrington, Conn., to South Egremont and Canaan, Mass.

Findlay-Marion Railway & Light Company.—This company, which proposes to build an electric railway from Findlay to Marion, O., 47 miles, has organized by electing the following officers: President, R. P. Hankey of Detroit; secretary and treasurer, G. W. Meeker of Columbus; general counsel, E. W. Tompkins of Columbus. The right of way has been secured and construction is to begin this summer.

Ft. Dodge Des Moines & Southern Electric Railway.—Manager J. L. Blake, Des Moines, Ia., has let a contract to George M. Kepner of Des Moines for a part of the grading and tracklaying. Mr. Kepner agrees to complete the grading between Ames and Kelly by June 1. Tracklaying is to begin at once.

Ft. Wayne & Wabash Valley Traction Company.—This company has put a large force of men to work straightening the lines between Ft. Wayne and Logansport, where numerous curves now exist. They are also replacing decayed ties and rebalancing the road in many places where the recent floods washed the ballast away.

Illinois Traction Company.—Two parties of surveyors have started from a point about 10 miles south of Mackinaw and will work in both directions toward Mackinaw and toward Lincoln, to locate the line which is to connect the line between Lincoln and East St. Louis with the line from Bloomington to Peoria, and form a part of the proposed through line to Chicago. Much of the right of way has been promised and it is the intention to build the line this summer. The contract for grading the line from Springfield to Jacksonville, 40 miles, and the Springfield belt line has been awarded to Tuttle Brothers of Decatur, the firm that graded the Bloomington-Peoria line and that now has the contract for the Champaign-Decatur line.—It is now announced

that the Bloomington-Peoria line will be opened for traffic on April 15. This line has been in operation between Bloomington and Danvers, since January 1.—Plans have been prepared for the expenditure of about \$5,000,000 in and near St. Louis if the franchise bill recently passed by the St. Louis city council is signed by the mayor. Plans have been prepared by Ralph Modjeska, consulting engineer, for a bridge across the Mississippi river from near Salisbury street, St. Louis, to Venice. The bridge will be 2,365 feet long, of five spans, and will cost about \$2,500,000. The other work planned includes the lines into St. Louis and the erection of passenger and freight terminals, for which land has already been purchased.

Indiana Columbus & Eastern Traction Company.—Contracts have been awarded for the construction of 13 concrete bridges to replace wooden structures along the line of the Columbus & Lake Michigan steam road, in operation between Defiance and Lima, recently purchased by the Schoepf syndicate. Many improvements are about to be made on the line preparatory to its electrification. Contracts have been let for the extension from Lima to Bellefontaine, and work will commence on April 1. This will give a direct line from Defiance to Columbus via Lima and Bellefontaine.

Iowa-Missouri Traction & Power Company.—This company has filed a trust deed to the Knickerbocker Trust Company of New York to secure an issue of \$1,000,000 20-year 5 per cent bonds, to be used in building the line from Fairfield, Ia., to Memphis, Mo. J. W. Andrews of Keosauqua, Ia., is the promoter and chief engineer.

Jackson (Miss.) Electric Railway Light & Power Company.—This company expects to expend about \$200,000 in extensions and improvements this year and is only awaiting the arrival of rails to begin work. A short time since the company announced its intention to build a line on North Jefferson street, and plans are now being considered for another extension in the western suburbs. Instead of extending another line to Duttoville, the plan is now to build south on Gallatin street to Lynch and west on Lynch to the several new subdivisions being opened in the vicinity of Jackson College and Campbell College. Manager F. G. Proutt is confident that he will have the construction work resumed during the early summer, and at least four months will be required for the completion of the extensions, including the double-tracking on North State and West Capitol.

Maynard, Mass.—The Lowell Acton & Maynard Street Railway is reported to have announced that 11 miles of track will be constructed this season.

Metropolitan Street Railway.—This company is relaying its tracks on Grand avenue, Kansas City, with 143-pound rails.

Milwaukee & North Shore Railway.—This company has been organized by W. C. Stone of Watertown, Wis., and others to construct and operate an electric railway from Milwaukee to Fond du Lac by way of Manitowoc and Sheboygan.

Monticello, Ky.—It is reported that an interurban line is to be built from Tateville to Monticello, Ky.

New Jersey & Pennsylvania Traction Company.—Surveys for the line from Princeton to Somerville, N. J., 18 miles, have been completed. Charles Serfass of Yardley, Pa., is chief engineer.

New Roads, La.—It is reported that a movement is now on foot to build an electric railway 32 miles long from New Roads to Glynn, La., along False river, for both freight and passenger service.

Northern Ohio Traction & Light Company.—The Wadsworth extension of the Akron-Barberton line has been completed and work trains have been run over it. Regular passenger service will probably be started on April 6 or 8. Manager Charles Currie, Akron, O., is quoted as saying that surveyors would soon resume the work of locating the line of the proposed extension from Wadsworth to Seville. Three alternate routes are to be surveyed, but the line is not to be built this year.

Northern Texas Traction Company.—This company has let a contract for the poles to be used on the line from Ft. Worth to Cleburne, Tex.

Omaha & Council Bluffs Street Railway.—A large shipment of rails and ties has been received and work is to be rushed on a large amount of tracklaying in Omaha. Work has already started on the Twenty-fourth street line from Vinton street to Leavenworth. The double-tracking on the Bellevue line will be extended north and south, and the Lake street line will be double-tracked from Twenty-fourth to Thirtieth streets. The Ames avenue line will also be extended, and when the above work is completed other extensions will be made as fast as materials can be secured.

Red Lion & Airville Traction Company.—The survey for this proposed line from Red Lion to Airville, Pa., has been completed. The route includes Springvale, entering on South Main street. A. K. Frey and others of York county, Pennsylvania, are interested.

Sandusky Fremont & Southern Railway.—This company, which is building a line from Sandusky to Fremont, O., for the Lake Shore Electric Railway, has let a contract for the construction between Vickery and Fremont to George Kinney of Fremont. According to the terms of the contract the line is to be completed by June 1. Tracklaying between Vickery and Sandusky is now progressing rapidly.

Southwestern Wisconsin Railway.—F. W. Hild of Chicago, who has been promoting a line from Platteville, Wis., to Dubuque, Ia., has given up his offices in Dubuque, and it is stated has abandoned

the project on account of inability to secure necessary franchises.

Tacoma, Wash.—It is reported that the Dupont Powder Company, together with eastern capitalists, has agreed to finance the line from Tacoma to Seattle, which is being promoted by Merle J. Wightman of Tacoma.

Tri-City Railway Company, Davenport, Iowa.—It is announced that this company is rapidly extending its double track on Brady street from Central park to the city limits. The work is being done in two sections. As soon as the Brady street section is completed the track from Locust street to Central park will be laid. The work on the new substation is progressing rapidly and the rotary converters will be installed within the next 10 days.

Utah Light & Railway Company.—A contract for \$50,000 worth of frogs and switches has been let to the William Wharton, Jr., Company of Philadelphia, including the special work for the crossing at Main and South streets, where two double-track lines intersect. As soon as possible this spring work will be started on an extension to be built from the intersection of Fifth North and Second West streets to Fourth West street, thence north on that street to the county road leading to Bountiful, and thence through North Salt Lake to the Oregon Short Line gravel pits. The line will be built primarily for carrying gravel for the reconstruction of the company's downtown lines.

Washington Frederick & Gettysburg Electric Railway.—This company has awarded to Charles Klipp the contract for grading its line on Fourth street, Frederick, Md., along the entire length of which the Frederick end of its line to Thurmont will run. The roadbed has been graded a distance of about three miles out of Frederick, and tracklaying will begin as soon as the grading on Fourth street is completed, so that construction materials for the balance of the line may be hauled out on the company's own cars. A shipment of \$20,000 worth of rails is expected to arrive on April 20.

White Salmon, Wash.—It is reported that a movement is on foot to build an electric railway from White Salmon to Binger, Wash.

Wichita Railroad & Light Company.—The bridge across the Arkansas river near First street in Wichita, Kan., is under construction and is expected to be completed so that cars may run over it some time in May, when Wonderland Park, with which the bridge will connect, is opened.

POWER HOUSES AND SUBSTATIONS.

Alabama City Gadsden & Attalla Railway Company.—It is announced that the new power house of this company is now practically completed and was put in operation on March 25, 1907. The plant, as announced in a previous issue, was tested some time ago, but was not put into regular operation. The power house is of brick, steel and reinforced concrete work, equipped with the latest machinery, at a total cost of about \$125,000. The contract and material for a \$10,000 pumping station and 3,600 feet of 14-inch pipe line have been let, but the work is not yet completed.

Chester Traction Company, Chester, Pa.—Two 300-horsepower Babcock & Wilcox boilers have just been installed in the Penn street power house, at right angles with the original installation of Berry boilers, which have been in use in the plant for some time and will still be continued in service. The installation also includes a smokestack 117 feet high. The boilers are supported on foundations resting on concrete piles driven 28 feet on solid rock. It is rumored that a line will be constructed from Chester to Rockdale, in which case it has been found that it will be necessary to install a 1,000-horsepower engine and generator to furnish the extra power required by this line.

Ft. Wayne & Wabash Valley Traction Company.—During a severe electrical storm on the evening of March 26 the generators in the Ft. Wayne and Huntington power houses were burned out, and the power for operating the lights and electric railway is now transmitted from Lima, O., Bluffton, Ind., and from the Logansport power house of the Indiana Union Traction Company.

Indianapolis & Northwestern Traction Company.—This company is making an improvement to the water cooling tower at its Lebanon power house. The tower has been completely inclosed at the sides and ends and in the sides have been placed four 8-foot draft fans, two on each side. These fans will be operated by a 50-horsepower engine.

Northern Colorado Power Company.—This company is building a new substation about half a mile southwest of the Agricultural college, which will be used to furnish power and light for the electric cars in Ft. Collins. The workmen are progressing rapidly with the line from Longmont to Ft. Collins, and it is expected that with favorable weather the line will be completed within a few days. The cost of the new substation will be about \$15,000.

Northern Ohio Traction & Light Company.—The work on the new Barberton power house is progressing rapidly and the mechanical stokers which are being installed are now practically completed and will soon be put in operation. It is stated that the operation of those which are completed has materially reduced the smoke made by the plant. The boilers in the old Barberton power house have been removed and will be installed at the Cuyahoga power house. These boilers will be put in operation as soon as the new stack which is being built is completed. The old plant at Barberton will simply be used as a rotary converter substation, the old generating machinery having been removed.

Personal Mention

Mr. Frank J. Doyle has been appointed master mechanic of the Schenectady (N. Y.) Railway, succeeding Mr. L. L. Smith, resigned.

Mr. S. L. Vaughan, auditor of the Grand Rapids Grand Haven & Muskegon Railway, Grand Rapids, Mich., has been appointed traffic manager.

Mr. L. R. Gaw has resigned as master mechanic of the Toledo & Indiana Railway to accept a similar position with the Ohio Central Traction Company at Gallon, O.

Mr. R. R. Ray, claim agent of the Northern Indiana Railway at South Bend, Ind., has been appointed superintendent of transportation of the Southern Michigan Railway, South Bend.

Mr. J. A. Killingsworth has been appointed manager of the St. Thomas Street Railway, which is owned and operated by the municipality of St. Thomas, Ont., succeeding Mr. Charles Johns, resigned.

Mr. Alexander K. Cuthbert has been appointed agent of the express department of the United Traction Company, Albany, N. Y., succeeding Mr. Charles H. Armatage, who has been appointed traffic manager.

Mr. W. J. Krotz, superintendent of the local lines of the Illinois Traction Company at Jacksonville, Ill., has been transferred to a similar position at Granite City. He is succeeded at Jacksonville by Mr. A. Hopkins.

Mr. James Bowlsh has been appointed superintendent of the Coeur d'Alene & Spokane division of the Spokane & Inland Empire Railroad, with headquarters at Coeur d'Alene, Idaho. Mr. Bowdish was formerly a trainmaster on the Northern Pacific Railway.

Mr. L. L. Smith, master mechanic of the Schenectady (N. Y.) Railway, has resigned, effective April 10, to accept a similar position with the Chicago & Milwaukee Electric Railroad with headquarters at Highwood, Ill. Mr. Smith has been with the Schenectady Railway since December, 1905.

Mr. Clarence Buckingham has resigned as president of the Northwestern Elevated Railroad of Chicago, and has been elected vice-president, succeeding Mr. Walter B. Smith, resigned. Mr. Smith and Mr. Ledyard Blair have resigned as directors and are succeeded by Mr. Mason B. Starring and Mr. Samuel McRoberts.

Mr. E. J. Davis, heretofore assistant treasurer of the Terre Haute Traction & Light Company, Terre Haute, Ind., has been appointed auditor of that company, which is now known as the Terre Haute division of the Terre Haute Indianapolis & Eastern Traction Company. Mr. C. T. Mordock will be retained as manager.

Mr. Mason B. Starring, vice-president and general manager of the Chicago City Railway Company, has been elected president of the Northwestern Elevated Railroad of Chicago, succeeding Mr. Clarence Buckingham. Mr. Starring was born in Chicago on May 8, 1859, and received his education in the public schools of Chicago. From 1878 to 1885 he was connected with the operating departments of the Burlington and the Pennsylvania lines, subsequently engaging in a general merchandise and banking business in Iowa. In 1888 he became connected with the Chicago City Railway Company as clerk in the office of Mr. C. B. Holmes, president and superintendent, where he remained for three years. Upon the appointment of Judge J. S. Grinnell as general counsel for the company Mr. Starring was placed in charge of the claim department. At this time he resumed the study of law, was admitted to

Mason B. Starring.

practice in the courts of Illinois in February, 1894, and soon after was appointed assistant general counsel of the company, which position he held in connection with his duties as manager of the claim department until his appointment as general solicitor in 1904. On May 12 of that year he succeeded Capt. Robert McCulloch as general manager of the company and in March, 1906, was elected vice-president in addition to his duties as general manager. Mr. Starring's two years of continuous service in the management of an important street railway organization, and his close connection with its operating managers through several successive administrations, should qualify him to manage successfully the affairs of the property of which he has just been elected president.

Mr. C. M. Bange, master mechanic of the Detroit Jackson & Chicago Railway, formerly the Detroit Ypsilanti Ann Arbor & Jackson Railway, has been appointed master mechanic and super-

intendent of motive power of the Northern Ohio Traction & Light Company at Canton, O., succeeding Mr. William E. Ralston, resigned.

Mr. John G. Carrol has been appointed general foreman of the Paterson, South Orange, Dunnellen and Milltown shops of the Public Service Corporation of New Jersey, to succeed Mr. I. R. Nelson, who has resigned to engage in the electrical contracting business. The shop foremen in districts 2 and 3 gave Mr. Nelson a farewell banquet at Newark on March 26.

Mr. Henry C. Page, general manager of the Springfield (Mass.) Street Railway Company, whose election as president of the New England Street Railway Club at its annual meeting on March 28 was announced in last week's issue of the Electric Railway Review, is about 43 years of age. He began his street railway career in August, 1883, as conductor on the old horse-car line of the Lynn & Boston Street Railway, running between Chelsea and Boston, Mass., and after seven years of service with this company, during which time successive promotions had placed him in charge of the schedule arrangement and car dispatching system of the line, he accepted a position with the Newburyport Street Railway Company as superintendent. During his two years' successful management of this road electricity was substituted for horsepower and the line otherwise improved. In October, 1892, he again entered the service of the Lynn & Boston Company. This company previously had taken over the Naumkeag Street Railway and Mr. Page remained as superintendent of its Salem division for nearly two years. In July, 1900, he was appointed general superintendent of the entire Boston & Northern system, comprising 450 miles of track. In 1903 he severed his connection with this company to become general manager of the Berkshire Street Railway Company at Pittsfield, Mass., and later, when this road and the Springfield Street Railway Company's lines were taken over by the Consolidated Railway Company in 1905, Mr. Page, on June 13 of that year, was transferred to Springfield as general manager of the latter company, which position he now holds.

Henry C. Page.

Mr. Francis H. Dewey, president of the Worcester Consolidated Street Railway, has been elected president of the Worcester & Southbridge and Worcester & Blackstone Valley Street Railway companies, controlled by the New York New Haven & Hartford Railroad, succeeding Mr. Charles S. Mellen, resigned. The Worcester & Webster and Webster & Dudley Street Railways have been leased to the Worcester & Southbridge company and will hereafter be operated from Worcester in connection with the Worcester Consolidated Company. Mr. E. G. Connette, general manager of the Worcester Consolidated, will be general manager of the entire property. Mr. A. B. Potter, now superintendent of the Worcester & Webster, Worcester & Southbridge and Webster & Dudley, has been transferred to the Stamford (Conn.) lines of the New Haven's electric system, and Mr. J. W. Anderson, superintendent of the Worcester & Blackstone Valley, has been appointed superintendent of the enlarged Worcester & Southbridge system.

Obituary.

Edward C. Nichols, vice-president of the South Side Elevated Railroad, died at his home in Maywood, Ill., on March 28 of pneumonia, after an illness of two weeks. Mr. Nichols was born at Maywood, Ill., in 1870, and attended the public schools of that village until he entered the University of Michigan, where he graduated in 1892. He later entered the law department of the University of Chicago and after finishing his course there in 1894 he entered the service of the South Side Elevated Railroad as attorney. He held this position for 12 years and at the annual meeting of the company on January 31 of this year was made vice-president, succeeding Mr. T. J. Lefens, resigned.

Henry W. Goode, president of the Portland (Ore.) Railway Light & Power Company and its several subsidiary companies, died at Atlantic City, N. J., on March 31, aged 46 years. For many years he had been prominently identified with the electric traction, light and water-power interests of the country. At one time he was district director of the Westinghouse Electric & Manufacturing Company of Pittsburg, subsequently becoming president and general manager of the Northwest General Electric Company. In 1892 he was elected president of the Portland General Electric Company and later, when the Portland Railway Light & Power Company was formed as a holding company for the Portland Railway, the Portland General Electric and the Oregon Water Power & Railway companies, Mr. Goode was chosen its president. He also was president and director-general of the Lewis and Clark exposition at Portland in 1905, and has the rather unusual distinction of having carried this extensive undertaking through to a successful finish with actual financial profit to stockholders.

Financial News

Amherst (Mass.) & Sunderland Railway Company.—A large majority of the stock of this company has been bought at \$45 a share, par value \$100, by the leading stockholders of the Holyoke (Mass.) Street Railway Company.

Atlantic City (N. J.) & Suburban Traction Company.—At a meeting of stockholders on March 30 the issue of \$300,000 preferred stock was authorized.

Cleveland Southwestern & Columbus, Cleveland.—The following have been elected officers of this company: President, F. T. Pomeroy; first vice-president, A. E. Akins; second vice-president, F. E. Myers; secretary, E. F. Schneider; treasurer, J. O. Wilson; assistant treasurer, H. B. Kavanaugh.

Grand Rapids (Mich.) Railway.—An additional \$465,000 first mortgage 5 per cent bonds has been listed on the New York stock exchange, making a total listed of \$3,157,000. The exchange has also authorized the listing of \$285,000 additional bonds prior to October 1, 1907. The total issue now outstanding has been applied as follows:

Retiring \$1,203,500 Consolidated Street Railway 5 per cent bonds, \$600,000 Street Railway Company of Grand Rapids 6 per cent bonds, \$50,000 North Park Street Railway Company 5 per cent bonds, a floating debt of \$177,283.35, and to provide \$150,000 in cash expended for a new power house, and remaining proceeds for various corporate purposes	\$2,500,000
For 85 per cent of the actual cost of extensions and permanent improvements, consisting of additional track and equipment, real estate, additional power house, machinery, etc.	715,000
Less retired and canceled under sinking fund provision	58,000

The income account of the Grand Rapids Railway for the year 1906, with comparisons, follows:

	1906.	1905.	1904.
Gross	\$910,027	\$820,469	\$760,776
Expenses	447,891	392,579	434,442
Net	\$462,136	\$427,890	\$326,334
Charges, taxes and sinking fund	205,460	196,260	189,345
Surplus	\$256,676	\$231,630	\$136,989
Preferred dividend	75,000	75,000	75,000
Balance	\$181,676	\$156,630	\$ 61,989
Common dividend	40,000
Surplus	\$141,676

Metropolitan West Side Elevated Railway, Chicago.—The annual report for the year ended on February 28, with a comparison, follows:

Earnings.			
	1907.	1906.	
Passenger	\$2,604,366	\$2,360,257	
Advertising	58,365	60,956	
Rent	15,909	14,419	
Miscellaneous	18,598	16,695	
Gross	\$2,697,238	\$2,452,327	
Operating Expenses.			
Structure	\$ 111,430	\$ 114,962	
Equipment	211,216	202,220

Surplus	404,455	322,632	

Mt. Mansfield Electric Railroad, Stowe, Vt.—On application of the American Trust Company of Boston, trustee under the mortgage securing the 5 per cent bonds due in 1928, Charles E. Burt of Stowe has been appointed receiver of this company. The road extends from Waterbury to Stowe, a distance of 10 miles.

Philadelphia Rapid Transit Company.—The syndicate formed two years ago to underwrite the issue of \$10,000,000 first mortgage 50-year 4 per cent bonds of the Market Street Elevated Railroad Company, a subsidiary of the Philadelphia Rapid Transit, has been dissolved. It is stated that of the entire issue of bonds about two-thirds was sold.

Portland (Ore.) Railway Company.—An additional \$245,000 first refunding mortgage 5 per cent bonds, due in 1930, has been listed on the New York stock exchange, making a total listed of \$6,227,000. The new bonds were issued on account of the following expenditures aggregating \$307,044. Extension and recon-

struction of tracks, including special work, \$134,078; extension of overhead lines, \$12,242; new paving, \$42,091; new electric cars, trucks and motors, \$63,748; additional power house equipment, \$415; additional car shops, \$51,325; additional right of way, \$2,145. In the year ended December 31, 1906, the company's gross earnings were \$1,684,157. After deducting operating expenses the net earnings were \$709,457. Fixed charges and taxes were \$436,832, leaving a balance of \$272,624. After the payment of dividends of 5 per cent on the preferred stock and 2 per cent on the common stock, the surplus was \$65,625.

Milwaukee (Wis.) Electric Railway & Light Company.—The report for the year 1906 compares as follows:

	1906.	1905.	1904.
Gross railway	\$2,973,442	\$2,669,847	\$2,698,641
Lighting, etc.	549,995	556,688	520,054
Gross earnings	\$3,523,438	\$3,226,535	\$3,218,695
Operating expenses	1,734,587	1,551,463	1,592,413
Balance	\$1,788,851	\$1,675,072	\$1,626,282
Other income	155,791	122,161	66,653
Total	\$1,944,642	\$1,797,233	\$1,692,965

From the net earnings in 1906 of \$1,944,642 the sum of \$509,765 was paid for interest, \$211,406 for taxes, \$270,000 for preferred dividends (6 per cent), \$540,000 for common dividends (5 per cent) and \$352,344 was charged up for depreciation, leaving a surplus balance of \$161,127.

The Milwaukee Light, Heat & Traction Company, which is controlled by the Milwaukee Electric Railway & Light Company, reports the following earnings for 1906:

Gross railway	\$605,584
Gross electric light	96,638
Total gross	\$702,222
Expenses, railway and electric light	277,416

Net earnings \$424,806
Other income 30,826

Total	\$455,632
Taxes	\$ 42,133
Depreciation	56,178
Interest	226,194
Balance	\$130,917

Toledo & Western Railway Company, Toledo, O.—Control of this company has been sold to the Toledo Railways & Light Company. The Toledo & Western was acquired last year by a syndicate headed by J. R. Nutt. The road extends from Toledo to Pioneer, O., on the west and to Adrian, Mich., on the north. C. F. Franklin will continue as president and general manager. J. R. Nutt and Edward Kelley have retired as directors and are succeeded by Joseph S. Young and W. R. Hodge.

United Railways Investment Company.—This company, which owns all but directors' qualifying shares of the stock of the United Railroads of San Francisco, and 72.9 per cent of the outstanding stock of the Philadelphia Company of Pittsburg, has made its report for the year 1906. The combined income account of the two companies, as compared with that for the previous year, follows:

	1906.	1905.	Increase.
Gross earnings	\$24,533,603	\$24,229,062	\$304,541
Operating expenses and taxes	12,746,041	12,535,503	210,538
Net earnings	\$11,787,562	\$11,693,559	\$ 94,003
Fixed charges	6,202,315	5,884,100	318,215
Balance	\$ 5,585,247	\$ 5,809,459	*\$224,212
Sinking funds dividend on Philadelphia company preferred and other stocks	647,235	730,189	*\$82,954
Surplus	\$ 4,938,012	\$ 5,079,270	*\$141,258

*Decrease.
This statement includes the business done with the public by every company connected with the Philadelphia Company, but does not include intercompany business, except small transactions, which, if eliminated, would not affect the surplus, as shown. In his report to the stockholders of the United Railways Investment Company, Ernst Thalmann, the president, says: "The policy of reinvesting the large surplus earnings of the two subsidiary companies has given rise to considerable comment by some of the stockholders in the holding corporation, but in relation to this complaint it must be borne in mind that with the rapidly increasing business in Pittsburg and the reconstruction work in San Francisco the cash expenditures necessarily are large, and in view of the present condition of the investment market it becomes necessary for the stockholders to forego cash dividends and to continue to use the cash to pay for betterments out of earnings until the markets permit the sale of securities to refund the treasuries of the respective companies for the amounts expended for betterments, improvements and extensions which they are making. The financial condition of the Investment company is sound, as, after payment on April 4 next for the \$2,400,000 bonds purchased by the syndicate, the floating debt of the Investment company will be less than \$100,000, and it should receive its regular dividends on the Philadelphia Company stock on May 1 and August 1 next, which will amount to, approximately, \$727,200, and the total of its obligations, including interest on its bonds and the balance of its floating debt, is less than this amount. The company then will have invested out of its earnings in the acquisition of new securities during the years 1906 and 1907, approximately, \$1,300,000, and no doubt these expenditures will later on be funded by an increased issue of securities, and the scrip dividends which have been issued will be redeemed."

Manufactures and Supplies

ROLLING STOCK.

Aurora Elgin & Chicago Railway, Chicago, is asking prices on two Interurban cars.

Williamsport Passenger Railway, Williamsport Pa., has recently ordered new equipment.

Camden Interstate Railway, Huntington, W. Va., has ordered five 33-foot closed cars from the Cincinnati Car Company.

Consolidated Railway, Bridgeport, Conn., has placed an order with the Cincinnati Car Company for five 30-foot closed cars.

Pittsburg Railways, Pittsburg, at a meeting of its directors recently authorized the purchase of additional rolling stock and equipment.

City Railway, Dayton, O., is reported to have ordered 11 large double-truck cars from the Barney & Smith Car Company for fall delivery.

Eastern Pennsylvania Railway, Pottsville, Pa., has placed an order with the Cincinnati Car Company for five double-truck semi-convertible cars.

Scioto Valley Traction Company, Columbus, O., at a recent meeting of its board of directors authorized the purchase of three new freight cars.

Union Street Railway, New Bedford, Mass., expects to contract during the present month for six 30-foot double-truck box cars and one box freight car.

Sheboygan Light & Power Company, Sheboygan, Wis., has placed an order with the Cincinnati Car Company for six 18-foot single-truck cars and three 45-foot interurban cars.

Chicago Union Traction Company, Chicago, pending the reorganization of its company, will probably not place orders for new cars for several weeks.

Conneaut & Erie Traction Company, Erie, Pa., has just ordered two combination passenger and express cars from the Wilmington (Del.) plant of the American Car & Foundry Company. These will be 47 feet in length over all.

Trans-St. Mary's Traction Company, Sault Ste. Marie, Mich., has recently purchased from The J. G. Brill Company two 30-foot semi-convertible cars to be equipped with GE-67 motors, Peacock brakes, Consolidated heaters and International registers.

Chicago City Railway, Chicago, we have been officially advised, will hold a meeting of its board of directors the early part of next week, at which time the matter of new cars will be decided upon.

Elgin & Belvidere Electric Company, Chicago, has placed an order with the Niles Car & Manufacturing Company for three interurban cars instead of 10 as previously reported. These will be equipped with Baldwin trucks and GE-74 motors with type M control.

Morris County Traction Company, Morristown, N. J., has ordered six cars from the Wilmington (Del.) plant of the American Car & Foundry Company, to be equipped with Westinghouse motors and air brakes. The company expects to purchase six additional double-truck cars from the same company in the near future.

Interborough Rapid Transit Company, New York, has ordered from the Wason Manufacturing Company 84 cars for elevated service, from the St. Louis Car Company 116 cars for elevated service, and from the American Car Company 50 all steel cars for subway service.

SHOPS AND BUILDINGS.

Galt Preston & Hespeler Street Railway, Galt, Ont.—This company is making preparations for the erection of new car barns at Galt to replace those destroyed by fire last summer. Martin N. Todd of Galt, president and general manager.

Washington Baltimore & Annapolis Railway.—This company is engaged in condemnation proceedings to secure property on North Liberty street, Baltimore, for a large terminal station.

Washington Frederick & Gettysburg Electric Railway.—This company expects to begin shortly the construction of its car barn at Frederick, Md.

TRADE NOTES.

W. A. Hughes, purchasing agent for the Pullman Company, died on March 8.

Charles B. Pear has resigned as secretary and advertising manager of the Albert & J. M. Anderson Manufacturing Company of Boston, Mass.

S. F. Bowser & Co., Ft. Wayne, Ind., have opened an office in Chicago at 210 Fisher building, in charge of James W. Runyan, assistant general manager.

Ball Engine Company, Erie, Pa., has opened a branch office at 1213 Chemical building, St. Louis, Mo., in charge of O. L. Collins. The company has also opened an office in New York at 39 Cortlandt

street under the management of Lancelot Copleston. The company is a builder of automatic and Corliss engines.

Emil Calman & Co., New York, have removed their New York offices from 299 Pearl street to 100 William street, instead of 100 Washington street, as previously reported.

Quincy Manchester Sargent Company on April 1 removed its machinery sales department from Plainfield, N. J., to the new West street building, 90 West street, New York.

Elmer P. Morris Company has recently moved its New York offices and store from 51 Dey street to 72 to 78 Trinity place, where the company has secured about 6,000 feet of floor space.

New Departure Manufacturing Company, Bristol, Conn., has secured the rights to manufacture the Liberty cushion trolley harp formerly owned by the Liberty Bell Company, Bristol, Conn.

Wheeler Condenser & Engineering Company on April 1 removed its New York offices from 42 Broadway to the 10th floor of the West street building, corner West and Cedar streets.

W. D. McMahon, formerly assistant manager of the Michigan Malleable Iron Company, Detroit, Mich., has been appointed to the position of manager of the Belle City Malleable Iron Company of Racine, Wis.

J. H. Wagenhorst & Co., Youngstown, O.—The salient features of the Wagenhorst electric blue print machine are set forth in a pamphlet, which also presents a number of references from users of the machine as to its qualities and serviceability.

Joseph T. Ryerson & Son, Chicago, have been awarded the contract for all the heavy machinery for the new plant of the American Car & Foundry Company at Milton, Pa., including a complete hydraulic equipment, riveting machinery, splitting shears, bevel shears, guillotine shears, punching machinery and other tools.

Brown & Sharpe Manufacturing Company, Providence, R. I., is having plans prepared by Treat & Alschuler, Fisher building, Chicago, for a mercantile building to be erected at the northeast corner of Washington and Desplaines streets, Chicago. It will be 75 by 160 feet, of fireproof reinforced concrete construction and from two to eight stories in height.

Kansas City Railway Foundry Company, Kansas City, Mo., is erecting a plant at that point for the purpose of manufacturing lubricating cups and journal boxes for use on street cars. This device is the patent of John Rogers of Kansas City. The officers of the company are: President, A. F. Reitz; vice-president, O. M. Hunt, and secretary and treasurer, R. H. Webber.

Berger Manufacturing Company, Canton, O., has increased its capital stock from \$1,000,000 to \$1,500,000. The increase, of which \$250,000 of 7 per cent cumulative preferred stock and \$150,000 of common stock has been issued, was authorized at a meeting of the stockholders held in February. The present officers are: President, Edward A. Langenhach; secretary, Charles A. Irwin; treasurer, F. A. Schwertner.

Invincible Rail Joint Company, Youngstown, Wash., whose incorporation was noted in the Electric Railway Review of March 30, has just purchased two acres of land at Edmonds, Wash. It is the intention of the company to commence at once the erection of a manufacturing plant for the purpose of putting upon the market a patented nut and bolt. It is expected the plant will be in operation by the first of May.

Warren Electrical Manufacturing Company, Sandusky, O., has purchased the plant and good-will of the Warren Electric Manufacturing Company of that city, and in addition to manufacturing the well-known Warren alternator, will manufacture a full line of revolving field type generators, also alternating-current and direct-current motors, transformers, etc. The officers of the new company will be Millard H. Nason, president, who is also vice-president of the Brilliant Electric Company, Cleveland, O.; Frank Warren, secretary, who has been secretary of the Warren Electric Manufacturing Company for a number of years; and Norman L. Hayden, general manager, who was president of the Hayden & Derby Manufacturing Company, New York City, for several years, and for the past five years general manager of the N. L. Hayden Manufacturing Company, Columbus, O.

The J. G. Brill Company, Philadelphia, Pa., as previously intimated by reports in these columns, has acquired the car building plant of the Wason Manufacturing Company, at Springfield, Mass. The class of equipment manufactured by the Wason Manufacturing Company will be the same as heretofore and no change in the name of the company is contemplated. The new board of directors of the Wason Manufacturing Company includes James Rawle, Edward Brill, Samuel L. Curwen, H. S. Hyde and Henry Pearson. Mr. Pearson has been elected president to succeed George C. Fisk resigned. The J. G. Brill Company recently increased its capital stock from \$6,000,000 to \$10,000,000, divided into \$5,000,000 of 7 per cent cumulative preferred and \$5,000,000 of common stock; par value of shares \$100. Part of the increase was to provide funds for the purchase of the Wason Manufacturing Company's plant and aside from \$420,000 of preferred stock and about \$100,000 of common stock, which has been held in reserve for the retirement of an existing mortgage on the plant of the John Stephenson Company, the balance of the increase will be used to add to the working capital required in the constantly expanding business of the company. The Commercial and Financial Chronicle states that it is understood that the stock was sold at par, the entire proceeds going into the treasury. The present owners have not only received no money, but have actually increased their interest in the company, while the only commission paid to the bankers was in common stock. It is understood that

the present earnings are sufficient to cover the dividends on the preferred stock and leave a surplus largely in excess of 10 per cent on the common stock. Purchase of the plant of the Wason Manufacturing Company was effective on April 1. The plant has a capacity of about 150 steam railway passenger cars and 125 electric railway cars annually.

B. F. Sturtevant Company of Boston, Mass., has just received from the Interborough Rapid Transit Company an additional order for standard economizers. The previous order was for the equipment of a 26,000-horsepower boiler. The total number of tubes to complete both orders will be 11,200, making up approximately 100 carloads. The Williamsburg plant of the Brooklyn Rapid Transit Company and the Waterside plant of the New York Edison Company are also to be equipped with economizers manufactured by this company.

Knox Engineering Company, Fisher building, Chicago, is the engineer and superintendent for an electric railway which is building a large power house at Guthrie, Okla. Engines, generators and boilers have already been purchased, but considerable additional equipment is yet needed, including building pumps, condensers, piping, etc. The Knox Engineering Company has also been appointed operative engineer of the Peoples Traction Company, Galesburg, Ill., and in this connection it has appointed Howard Alton as superintendent in charge. Mr. Alton was formerly in charge of equipments of divisions three and four, Seventy-seventh street, of the Chicago City Railway. In addition to these the Knox Engineering Company has charge of the Green Bay Gas & Electric Company, Green Bay Traction Company and the Choctaw Railway & Lighting Company of McAlester, Okla.

Alberger Pump Company has been organized to manufacture and sell centrifugal and turbine pumping machinery designed especially to meet the demand for a higher class of work and more economical performance than has heretofore been attained. The management and works of this company are identical with those of the Alberger Condenser Company, whose principal offices are at 95 Liberty street, New York, and branch office at 205 La Salle street, Chicago. In order to provide for the business of the Alberger Pump Company a large addition to the shops of the Alberger Condenser Company is now being made. The equipment will consist of special tools for this particular class of work and elaborate testing apparatus is being installed to insure the highest efficiency of the product before shipping to the purchaser. The company announces that it is prepared to build centrifugal and turbine pumps of all capacities, either steam or electrically driven and for operation against any head. The steam turbine has shown that the principle of dealing directly with rotary motion is applicable for pumping purposes and accordingly it is proposed to build pumps employing this principle for the specific uses to which they will be applied and from new designs of which every point has had mature consideration. Announcement is made that the line of volute centrifugal pumps will undoubtedly be particularly adapted to the requirements of paper mills, sugar houses, steel mills, irrigation and drainage projects, dry docks, filtration plants and to all situations where a low pumping head exists. The feature of construction which will permit of continuous service with minimum attention will be given particular consideration. For higher heads such as mine pumping, boiler feeding, waterworks supply, fire service, etc., improved multi-stage turbine pumps of superior design both in details of construction and general efficiency will be produced. The company is prepared to make surveys of plants and to furnish plans, drawings, specifications and estimates and to contract for centrifugal and turbine pumping machinery for all services. The officers of the Alberger Pump Company, which are identical with those of the Alberger Condenser Company, are as follows: Louis R. Alberger, president; George Q. Palmer, vice-president; B. W. Pierson, secretary and treasurer; Frederick Ray, chief engineer.

ADVERTISING LITERATURE.

Baldwin & Rowland Switch & Signal Company, New Haven, Conn.—A multiple interlocking recording block signal which is handled by this company is the subject of a brief illustrated pamphlet showing the type of the semaphore and indicating the method of operation of the signals.

Allis-Chalmers Company, Milwaukee, Wis.—Miniature bulletins Nos. 4002, 4003 and 4004, on the subjects of "Allis-Chalmers Direct Current Motors and Generators," "Electric Hoists" and "Polyphase Induction Motors," present in condensed form information about some of the features of these machines in a manner designed to attract the reader to more elaborate bulletins published on the same subject.

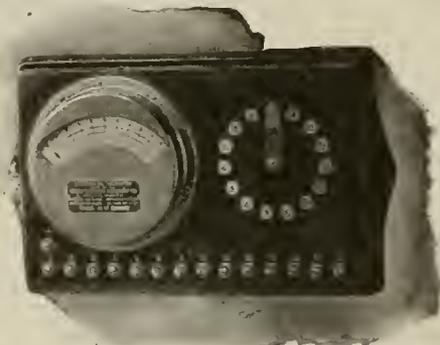

Charles Warner Company, Wilmington, Del.—In the interests of its waterproof concrete and Portland cement lime mortars, this company has issued a pamphlet containing a report of a series of tests made by the Henry S. Spackman Engineering Company of Philadelphia using varying mixtures of hydrated lime and Portland cement. These tests covered the tensile strength and permeability of a number of mixtures, the object being to demonstrate the most economical mixture to be used to meet any particular requirement in building construction.

Wallace-Coates Engineering Company, 355 Dearborn Street, Chicago.—Catalogue No. 2, containing 80 pages, with full descriptions, drawings and photographs of Strauss bridges, has just been issued. Since October 14, 1905, when the Wheeling & Lake Erie bascule bridge at Cleveland was placed in operation, a bridge which is the subject of a number of illustrations in the catalogue, work on eight other Strauss bascule bridges has been commenced. Of these, one for the New Jersey Short Line Railroad near Rahway, N. J., has just been finished and is also the subject of dis-

ussion. Other work which is under way and which is considered is the Baltimore & Ohio bridge at Bodine creek on the New York division and the Missouri Pacific bridge over the Black river, which will be completed this year, and the monumental bridges at Copenhagen and Camden, which are well under way. A contract has recently been received from the Chicago & Northwestern for a double-track, single-leaf Strauss trunnion bascule bridge for the crossing of the Chicago river at Kinzie street, Chicago. The award covers an additional double-track bridge of the same kind to be built adjacent to this structure within five years. Strauss ribbed-concrete bridges are also illustrated and described in the catalogue. The Elgin-Belvidere bridge, successfully completed, near Belvidere, Ill., is given considerable attention. Another structure of the same type is a 1,500-foot concrete viaduct for the city of Spokane, Wash.

WESTON ELECTROPLATERS' VOLTMETER

For many years electroplaters have depended almost entirely upon the experience and judgment of the operators in managing the voltage regulation on the tanks with different quantities of work in the solutions. The result of this has been a great waste of time in the past through imperfect plating, caused either by the burning of the work by too high a current density or too thin a deposit, which would come off under the buffing wheel, and thus necessitate the replating of the work. With various quantities of work in a tank even the most expert plater will misjudge the rate of deposit, thus necessarily resulting in loss of time, if not of the reputation of the plater. The expense of installing separate voltmeters for each tank has been so great that platers have depended upon the old methods in preference to investing such a large sum of money in these instruments. To meet the demand for an instrument having a high degree of accuracy at a low cost,

Weston Electroplaters' Voltmeter.

and for one which can easily be changed from one tank to another to determine the exact voltage, the Weston Electrical Instrument Company, of Waverly Park, Newark, N. J., has placed on the market a highly accurate standard Weston voltmeter, mounted on a small switchboard having 15 binding posts, to one of which the positive terminal of the line is connected. To each of the other 14 posts may be connected leads to any number of tanks, up to the number of binding posts. By means of a multiple point switch, mounted on the instrument board, any one of the tanks may be connected to the voltmeter and its voltage thus easily and accurately determined, assuring uniform and economical results and avoiding the loss of time through imperfect plating. The instrument, which, as has been stated, is of Weston-D'Arsonval standard, is enclosed in a neat airtight waterproof case, which adequately protects the internal mechanism from the action of fumes usually present in the plating room. This instrument will no doubt fulfill the longfelt want in providing electroplaters with a cheap, accurate and convenient instrument.

THE PREVENTION OF SULPHATING IN STORAGE BATTERIES.

One of the most serious complaints which have been brought against storage batteries is the reduction of capacity as the life of the battery is increased. The most universal cause for this falling off in capacity and efficiency is the closing up of the pores in the negative element. This is generally caused by the deposit of sulphate in the pores, which prevents the liquid from reaching the inside surfaces of the plate and thus, by reducing the effective area of the plate, the capacity is materially diminished. A further result of sulphating is the buckling of plates and the shedding of active material, due to the swelling of the active material by the sulphate which has formed in it. This naturally shortens the life of the battery, not only because of reduced effective area, but also because of short circuits which are caused by the buckling and shedding of material.

To overcome these difficulties, Mr. Joseph Bijur of New York invented and patented a process for making the active material of the active plate, no matter how formed, porous, thus increasing the life and capacity of the battery many times. The invention, which is covered by patents, No. 845331—J. Bijur, "Negative Pole Plate," issued on February 26, 1907. The invention which is applicable to Plante and paste plates as well, consists of introducing into the material of the plate a carbonaceous material, preferably in the form of a dilute sugar solution, which will thoroughly

permeate the material of the plate and fill the most minute pores with the liquid, which, upon heating to a temperature of about 240 to 300 degrees C., will completely carbonize the sugar and leave the pores of the material filled with a soft, porous filling of pure carbon, which thus permits the electrolyte to enter the innermost portions of the active material and prevents the formation of sulphate, or, should a slight amount of sulphate form, it counteracts the difficulties which would arise with the small particles of carbon not present in the active material.

The General Storage Battery Company, 42 Broadway, New York City, controls the patents for this process exclusively and has been applying the invention to all the plates which it has manufactured during the past year. No doubt this invention is of the greatest importance and should rank in the electric storage battery history as one of the greatest improvements in storage batteries made since the day of Plante. It may be well to add that the invention also covers a heating device, which protects the grid when the latter contains antimony, which would cause it to melt at a temperature below 300 degrees C.

PATTEN TICKET DESTROYER.

It has been found that frequently when destroying old or used tickets or transfers by the burning process there has been an opportunity for dishonesty of employes which results in loss to the company. Either tickets which can be readily passed again are separated from the others by the employes having the burning in charge and sold or tickets which are incompletely burned are obtained by other persons and used. In order to do away with this possibility a machine was placed on the market by Paul B. Patten, 79 Lafayette street, Salem, Mass., which destroys by cutting. The machine can be set up in the auditing department so as to be operated under the immediate supervision of the auditor and will

The Patten Ticket Destroyer.

completely destroy tickets or transfers. Two rolls do the cutting. The frame of the machine is cast iron; the bearings are babbitted and the cylinders are made of crucible steel. The machine weighs 395 pounds when crated and is strongly built and durable. It occupies only a small space and may be operated by hand power if necessary. The manufacturer recommends, however, that it be operated by a one-horsepower motor or driven by a two-inch belt from some convenient shaft. An accompanying engraving from a photograph shows the design of the machine, which has been placed in service by the auditing departments of the following companies: Boston & Northern Street Railway Company, Old Colony Street Railway Company, Cincinnati Traction Company, Fitchburg & Leominster Street Railway Company, Youngstown & Sharon Street Railway Company.

THE PLANT OF THE DANVILLE CAR COMPANY.

The plant of the Danville Car Company, which has been rapidly nearing completion, was formally dedicated on March 16, there being a large number of electric railway men and others interested in attendance for the ceremonies. The ground was broken for the plant on November 17, 1906, and in the few months between that date and the present time the buildings which provide for 10 distinct departments and cover 160,000 square feet, have been erected. The machinery is now being installed. The buildings include an erecting shop, 150 by 320 feet; freight car shop, 90 by 320 feet; wood working department, 60 by 180 feet; cabinet shop, 60 by 120 feet; varnish and trimming room, 60 by 120 feet; power house, 60 by 120 feet; blacksmith shop, which is entirely of steel construction, 82 by 120 feet; dry kilns, 18 by 160 feet; office building, 130 by 120 feet; truck and machine shops, 120 by 120 feet.

The plant, which is located on the outskirts of Danville, is connected with the tracks of the Wabash, Cleveland Cincinnati Chicago & St. Louis, and of the interurban lines of the Illinois Traction System. Particular attention will be paid to the construction of cars for interurban electric lines. The equipment installed makes it also possible to build cars for steam lines, and attention will be paid to this feature of the car building business,

Plant of the Danville Car Company on March 16, 1907.

as well as to the construction of trucks and freight cars, and particularly to the repair of steel cars.

The president and general manager of the Danville Car Company is H. F. Vogel, who about a year ago severed his connection with the St. Louis Car Company as vice-president and general manager, and in October, 1906, organized the Danville Car Company under the laws of the state of Illinois, with a capital of \$250,000. Mr. Vogel has associated with him E. H. Gorse, formerly secretary of the Missouri Lincoln Trust Company of St. Louis, who holds the office of secretary and treasurer. Mr. W. L. Primm, formerly general manager of the Merchants' Association of St. Louis, will assume the position of purchasing agent and auditor; Mr. E. J. Lawless, formerly with the American Car Company and the John Stephenson Car Company, has been appointed general sales agent; Mr. G. A. Moffat, who has been connected with the Philadelphia Traction Company and the Metropolitan Street Railway Company of New York, has been appointed general superintendent; Mr. John Visser, formerly with the St. Louis Car Company, has been appointed chief draftsman and will have the assistance of Mr. Fred Hussman and Mr. Charles Littell, who were also connected with the St. Louis Car Company. Mr. William Russell, formerly with the Cleveland Electric Railway Company, will have charge of the mechanical and engineering department, with the title of mechanical engineer. The other members of the operating staff are equally well known as successful men in their respective departments.

In an accompanying engraving the plant is shown as it appeared at the time of the dedication on March 16. The buildings were erected by the H. F. Vogel Contracting & Engineering Company, whose offices are in the Rialto building, St. Louis, under the immediate supervision of James O. Gordon, formerly with the Goldie Construction Company of Chicago.

To Give Up Ash-Handling Business.

It is stated that President E. W. Winter of the Brooklyn Rapid Transit Company has informed Comptroller Metz that the American Railway Traffic Company, a subsidiary company, does not intend to bid again for the contract for removing ashes in the borough of Brooklyn. The present contract expires on October 28 and it is stated that the company does not want to renew it because the hauling of ashes over its lines interferes with the passenger traffic. The company's system of handling ashes and street sweepings was described in the Electric Railway Review of February 23, 1907, page 261.

There are certain conditions under which the cost of condensing apparatus would not be warranted by the gain in economy which might reasonably be expected. It is, therefore, fortunate that electric railway and lighting companies can in many cases develop a very profitable exhaust steam heating business if their power houses are not too far from the business district of a city.

Steam Heating Versus Condensing. There was a time when it was thought that steam could only be sent a few hundred feet without being totally condensed. Such, however, is not the case, as has been proved by a large number of successful heating installations having miles of pipes under the streets, in which it has been found the condensation is not more than 10 per cent in extreme cases. The experience of one company, which found it economical to operate a heating system in conjunction with a railway and lighting plant, was reported recently. The plant is of about 1,000 kilowatts capacity and supplies a small railway and lighting system in a city having a population of about 28,000. Exhaust steam from the engines is distributed to the business district and a small portion of the residential district through about three miles of pipe under a pressure of from one to seven pounds. In small quantities, the exhaust sells for 50 cents per thousand pounds, and on the flat rate contracts based on the radiating surface the return is about 35 cents per thousand pounds. The total income from the heating system was sufficient to pay the entire coal bill of the plant and the cost of repairs and maintenance of the heating system, and to show a balance of about \$1,200. Besides furnishing the heat, power for the electric railway and street lighting was supplied by the steam before it was sold at the rates referred to. It would be difficult to imagine such returns from a condensing plant. As a further evidence of the profit to be derived from steam heating systems, it may be stated that there are small electric plants within the Niagara distribution district which are selling electric light and power at a lower rate than the Niagara companies and are deriving large profits from the investment in the plant and heating systems. Surely no more severe test could be given an enter-

prise of this nature than to operate it in competition with the cheap power from Niagara Falls.

The developments of the last week have disappointed hopes of an early settlement of the Cleveland street railway problem, and it is evident that the controversy between the Cleveland Electric Railway Company and the city of Cleveland, or that part of it which is represented by Mayor Johnson and the Municipal Traction Company, is to be resumed with renewed vigor. In the early stages of the recent negotiations between the presidents of the two companies looking to a lease of the Cleveland Electric property to the Municipal Traction Company through the formation of a holding company it appeared probable that an agreement would be reached which would result in a practical test of 3-cent fares. The 3-cent fare interests, however, fixed a valuation of the Cleveland Electric property, which was so low that the company could not accept it. This valuation was subsequently increased by a committee of the city council, which offered \$60 a share as the basis of a lease to the proposed holding company. In a communication, of which an abstract is presented on another page of this issue of the Electric Railway Review, the company, in reply to the committee, not only refuses to accept any offer which does not provide an adequate valuation of its property, but declines to continue negotiations with either a city administration which has persecuted it for six years or "an irresponsible paper company." Two alternatives have been forced on the company—virtual confiscation of its property as the price of peace or continued warfare with the low-fare companies backed by Mayor Johnson and the city organization. The company has decided to fight. The people of Cleveland also have two alternatives before them—the offer of the Cleveland Electric company of seven tickets for 25 cents, good for a ride over a first-class system covering nearly 200 miles, or the proposition of the Municipal Traction Company to give 3-cent fares on a system which is not yet built. The citizens of

Cleveland Negotiations a Failure.

Cleveland cannot decide until the election next November. In the meantime there will probably be a repetition of last year's warfare, with injunctibns and midnight tracklaying, while the mayor makes a spectacular campaign to attract the savings of the people to investment in his low-fare enterprise.

The average car has so many separate devices in the motorman's cab that it is little wonder he becomes confused and makes mistakes at critical times. As a rule,

Tripping when a quick stop is necessary he must shut off current with one hand, operate the air brake valve with the other, and at the same time by some means he must ring his gong,

Fenders and Sanding Track. open the sand valve, and in many instances drop the fender to the rails. In the shops of the Denver City Tramway Company every effort is encouraged toward devising attachments that will lessen the number of independent movements necessary on the part of the motorman when a quick stop is demanded. As a result, this company has adopted two interesting and valuable attachments, one for tripping the fender and the other for opening the air sander. The fender trip, as used on the Denver cars, has a trigger at the end of the raising shaft in the vestibule. The top of the trigger is about level with the controller top. A 3-16-inch twist chain is attached to the trigger and in turn hooked to the bottom side of the reverse handle of the controller. This chain is of such length that it can only be hooked with the fender raised and the handle in the "ahead" position. This places the chain near by for quick tripping and adds the desirable feature that the very act of reversing the car to make an emergency stop trips the fender. The second "automatic" attachment to relieve the motorman of some of his many duties in times of emergency, comprises the casting of the air brake handle with a projection on its cylindrical part. This projection is of sufficient length and at the proper point on the handle so that when the brake valve is thrown to the emergency position the protrudence on the handle engages the sanding valve placed close by. Thus by these simple devices the motorman is relieved of two separate movements that must be made in times of emergency. While there may be a possibility of getting too many so-called "automatic" parts, the use of such simple expedients as these can in no wise be questioned on that score, and their simplicity and established reliability warrant due consideration.

NEW YORK'S TRANSIT PROBLEM.

The electric traction companies in New York city are now principally concerned with the necessity of providing for the steady increase in traffic flowing toward the Bronx region. The subway is now hauling twice as many passengers as it was intended for, and it is running at as full capacity as its present style of car equipment will permit. The traffic on the Third avenue elevated line is increasing at the rate of one million passengers per month. The surface lines running north and south are overcrowded and uncomfortable. All these lines are operated with a large proportion of the passengers standing in the aisles, which tends to restrict the movement of egress and ingress and to increase the length of stops at stations. At present the capacity of the New York traction lines, carrying passengers to their homes and back, is one and one-half millions in 12 hours.

To provide rapid transit for the abnormal increase in this population, and, if possible, to furnish more comfortable transportation, is the problem which Theodore P. Shonts, the new president of the Interborough-Metropolitan Company, is now trying to solve. As the result of his studies thus far, Mr. Shonts has made a number of suggestions which are published in Harper's Weekly of April 6, 1907. In order to relieve the congestion on surface lines, a reasonable but not

exclusive use of the tracks is desired; and to accomplish this the co-operation of the city authorities is requested so that vexatious delays during the rush hours may be avoided by the proper regulation of the freight traffic hauled by horses. The methods of handling freight and passenger traffic on the streets of large cities is barbaric, but something more than police regulation is necessary to produce any important reform. Real improvement can be accomplished by the work of the engineer in a better design for the construction of the street surface. The extra cost of moving freight by wagon over the rough and irregular surface of Belgian block pavement would soon pay for the cost of a smooth and substantial pavement having much less resistance. The objection to all forms of mineral surfaces for wagon tracks is that it is soon disintegrated by heavy pressure and becomes worn in holes. The drivers of heavy drays always seek the smooth surface of the street car rails because the wheels move easily and require less effort of the horses. Their reluctance to leave such favorable conditions continually delays the street cars and the obvious method of avoiding such delays is to provide a pavement outside of the street car lines which has a smooth surface and low resistance. A number of streets in the downtown district of New York have been paved with creosoted wooden blocks set on a solid foundation of concrete and grouted in cement. On this pavement, wagons and drays heavily loaded can be moved as easily and rapidly as on the street car lines, and if such pavement was built alongside the car lines there would be much less obstruction to the car traffic.

Other improvements suggested for the surface cars relate to the use of wider platforms and doors for the exclusive use of those getting on and others for passengers getting off. Early in the investigation, Mr. Shonts noticed the slow movement of passengers at the subway stations due to the fact that ingress and egress must be through the same doors, and although the engineers are slow to admit that the cars are not properly designed in their door arrangement, it is now believed that side doors at the center will offer a partial solution of the difficulty. In an editorial on the door arrangement of passenger cars in *The Railway Age* of September 1, 1905, it was pointed out that that full benefit of an expensive electric installation, giving high acceleration and speed between stations, will not be realized if the seconds thus gained are wasted in standing at stations, as the result of slow loading and unloading. The benefit of the side doors was there demonstrated by figures relating to the steel suburban cars on the Illinois Central, which have numerous doors along the side, to those on the Boston Elevated, which have a wide door at the center of car, and to the Interborough cars, which at present have only end doors. The times required to handle passengers in and out of these cars in busy hours were relatively as follows: Illinois Central, 1; Boston Elevated, 2½; New York subway, 4. The average time for a number of stops on the Illinois Central is 7 seconds; on the Boston Elevated it is 17 seconds; and in the New York subway 30 seconds. In the latter stops are frequently noticed in rush hours of over a minute at important stations, while the minimum is 10 to 12 seconds. As Mr. Shonts is convinced that the use of side doors on the subway cars would do much to relieve congestion and minimize delays, it is probable that the experiment will be made, and it will be interesting to see how this can be accomplished in the cars having continuous steel side girders as high as the window sills, also the degree of relief obtained from a more rapid movement of passengers.

It is further proposed to add two more tracks to the Second avenue elevated lines and have express trains connect with these lines, thus diverting a great deal of traffic from the subway and Third avenue elevated and relieve the pressure of the Bronx traffic. These additional tracks could be built and the lines operated in two years, while the proposed new subways on the east and west side will require four years for

their construction. The plans for the new subways will be found on another page of this issue.

DEPRECIATION AND RESERVES.

On another page of this issue of the Electric Railway Review will be found some extended extracts from a lecture by Mr. George Wilkinson, C. P. A., on the subject of "Depreciation and Reserves."

The exposition of general principles as applied to machinery and equipment—the inanimate things that move or are moved—is admirable, as are also the brief comments on the need of provision for "Displacement" and the objections to showing accrued depreciation as a reduction of the plant account.

Emphasis should be laid on the fact that the views of Mr. Wilkinson with regard to there being no depreciation of railway tracks refer to steam railways and have but little bearing upon electric railways within municipalities. The lecturer's recommendation seems to be based upon the practice of steam railways rather than upon theory, since by following the same course of reasoning as is followed by Mr. Wilkinson when discussing machinery and equipment, the existence of a depreciation of track not compensated for by current repairs may be shown.

Mr. Wilkinson says that it is neither customary, practicable nor necessary to make any charge specifically for depreciation against earnings arising from the use of piers, docks or wharves, railway tracks, telegraph lines, reservoirs, dams, canals, locks and many other properties of a similar description. This statement, when taken in connection with the premises on which it is based, is doubtless true. The premises are that properties of this nature are permanent and irremovable, and that those portions of such properties as are not really permanent are renewed again and again in the life of the property, and all the replacements paid for out of earnings. As an illustration of a permanent property upon which it is not customary or practicable to compute depreciation, a railway track is taken, and in the discussion it is assumed that all renewals and replacements are paid for out of the current year's earnings and charged to "Maintenance of Permanent Way."

The trouble is that, in the practice followed by electric railways, neither of these premises is generally true. In the majority of states street railway companies can secure only short-term franchises, and in a great many places inter-urban electric lines have been built in public highways under short-term franchise, and these companies, as well as the urban railway companies, are thus in a position where they can never be sure of securing that renewal of franchise grants which is necessary to give their properties even a semblance of permanency in the sense used by Mr. Wilkinson.

In the first part of Mr. Wilkinson's lecture he defines maintenance as meaning repairs, and a depreciation reserve as the fund needed to provide for renewals, and applies these terms to what in railway service would be comprised in equipment. When discussing permanent way he assumes that there is no depreciation because renewals, as well as repairs, are included in maintenance. While a careful reading of Mr. Wilkinson's statement of the problem makes his views clear, we believe that there is needless confusion bound to result from using the term maintenance with different meanings when applying that term to different parts of the same property.

Mr. Wilkinson's statement that a charge for depreciation on track is neither customary nor practicable probably had in view a limited application. The policy of providing a depreciation reserve for railway track is considered both practicable and necessary by the management of the Glasgow Corporation Tramways, which has followed it for years. For the fiscal year ending May 31, 1906, the Glasgow Tramways, besides expending £391 (\$1,905) per mile for ordinary repairs

and upkeep of track, appropriated £500 (\$2,435) per mile of track to the permanent way renewals fund.

The subject of depreciation was discussed editorially by "The Engineer" of London in its issue of March 15 last, and the general attitude of that journal is shown in the following extracts:

Referring to the "great railway companies" it is said: "They never dream of providing a depreciation fund. Repairs and renewals come out of revenue if the company is doing well; if not, they are paid for by the issue of fresh stock."

Criticizing the comments of a contemporary concerning the policy of County of London Electric Supply Company, "The Engineer" says: "Had this [the appropriation of 40,000 pounds sterling for depreciation] been done for the past year the immediate result of no dividend would have been an enormous drop in the value of the company's shares, which would represent a loss that would far outstrip the value of the depreciation fund; and, still worse, it would very effectually ward off all those who might be induced to supply money for the fresh developments of the company's business which appear imminent."

"The Engineer" concludes: "When a company is prosperous, there is always money enough for repairs and renewals available out of revenue. If it be not, the possession or not of a depreciation fund will make little difference in its downward career."

The second of these quotations states the view of the promoter, who is seeking to create an artificial value in order that he may sell and secure his profit, and it is not an argument that the permanent management can use. To the others it is a sufficient answer to say that if a business is not prosperous the owners of it should certainly endeavor to determine the true state of the case.

In a purely private undertaking, such as a manufacturing business, it may be said that aside from the limited number of stockholders who suffer loss, it is a matter of indifference as to how the accounts may be kept, because improper methods do not influence the public. The manufacturer cannot be compelled by statute to sell his products at a price which means a loss to him; moreover the manager of a purely private undertaking is always at liberty to fix the prices of his finished product in accordance with the fluctuations in the cost of raw material, in the price of labor, etc., though limited by the competition which he may have to meet.

It is entirely different in the case of railway companies for transporting passengers. The statutes provide the maximum passenger fares and there is a constant pressure brought to bear to reduce these maxima. Everyone knows of the present agitation in this country to secure lower freight rates and a maximum of two cents a mile for passenger fares on steam railways, and for 4-cent fares, or 3-cent fares, on urban street railways. The rates at present in force on many steam and on nearly all interurban electric lines are below the maxima which may be charged, so that there is opportunity for these companies to increase their rates when it may become necessary; but with street railways this is not possible.

In many cases street railway companies in American cities are now giving more service than they can afford for the fare they are authorized to charge. Doubtless all of them will in time reach the point where, through increase in the density of traffic, the fare received and the cost of the service may be brought into equality, but this point will never be reached if the companies must yield to the constant demands for increased service, reduced fares, contributions for street paving, for street lighting, etc. It is therefore of the utmost importance that the managers and owners of street railway properties should demonstrate to the public that the demands made upon the transportation companies are unreasonable. This they can never hope to do until they cease trying to deceive themselves, and the neglect of accounting for depre-

ciation is one of the most important and far-reaching self deceptions that is practiced.

It is comparatively a small matter that the stockholders in any one enterprise should lose their investment; it merely means that they were unfortunate in undertaking a losing business. But there should be a strong protest against a policy which, if continued, will make it a certainty that every purchaser of stock in street railways will lose his investment because the companies engaged in this business have undertaken to furnish transportation at too low a rate.

ANNUAL REPORTS OF RAILWAYS.

New Orleans Railway & Light Company.

The annual report of the New Orleans Railway & Light Company for 1906 gives the following details of maintenance expenditures on the property which E. C. Foster, the president, believes to have been "sufficient to maintain the property in its present serviceable condition":

Maintenance of track, roadway and paving, \$957.95 per mile for the year.
 Maintenance of electric line, \$261.10 per mile for the year.
 Maintenance of electric cars, \$207.36 per car for the year.
 Maintenance of electric equipment of cars, \$164.14 per car for the year.

Gross earnings averaged \$19,346 per mile of single track. They increased 13.3 per cent over the previous year, while operating expenses increased 15 per cent, due largely, Mr. Foster says, "to an increase of 5 per cent to employes and to the increased volume of business, necessitating more cars and labor to conduct operations; and also to the well-known fact that the cost of material used in making the ordinary repairs to our property and the various equipment has considerably increased over that of the preceding year."

During the year the company expended for construction, betterments and improvements \$2,497,822. Most of this amount was expended on power houses, substations, transformers, motors, cars, equipment and real estate for power purposes. The income account for the year compares as follows:

	Income.		
	1906.	1905.	1904.
Railroad earnings	\$3,724,271.80	\$3,291,960.90	\$3,071,929.10
Electric and gas earnings....	1,875,400.13	1,705,807.36	1,541,575.19
Miscellaneous earnings	173,518.20	95,941.53	60,839.79
Total earnings	\$5,773,190.13	\$5,093,709.79	\$4,674,344.08
	Expenses.		
Railroad operating	\$2,225,580.14	\$1,901,084.56	\$1,753,720.71
Electric and gas operating...	848,434.95	770,375.79	744,802.22
Total operating expenses.	\$3,074,015.09	\$2,671,460.35	\$2,498,522.93
Net earnings from operation.	\$2,699,175.04	\$2,422,249.44	\$2,175,821.15
Interest on funded debt, taxes and miscellaneous....	1,900,900.77	\$1,784,226.24	\$2,149,840.46
Net income	\$ 798,274.27	\$ 638,023.20	\$ 25,980.69
Dividends on preferred stock.	*500,000.00	*125,000.00
Surplus	\$ 298,274.27	\$ 513,023.20	\$ 25,980.69
Operating expenses—percent- age of gross earnings.....	53.2	52.2	53.4

*The dividend, in 1905 was for three months, at the rate of \$1.25 per share of preferred stock, and the dividend in 1906 was for the year, at \$5.00 per share of preferred stock.

The following traffic statistics are given:

	1906.	1905.	1904.
Revenue passengers carried....	73,606,068	65,021,214	60,696,927
Transfers redeemed	7,220,152	6,641,193	5,832,572
Revenue mileage	17,718,107	16,753,874	16,354,145
Eighteen-hour cars	108,637	102,156	99,897

Chicago & Milwaukee Electric Railroad Company.

The annual report of the Chicago & Milwaukee Electric Railroad Company for 1906 shows that the company expended for maintenance \$56,885, but no details of the application of this amount are given. This expenditure is equivalent to 6.4 per cent of gross earnings. Operating expenses were 41 per cent of gross earnings. The report shows earnings and expenses for 1906 as follows:

Earnings.	
Passenger	\$550,351.26
Freight	305,450.77
Express	13,750.82
Miscellaneous	14,653.95
Total	\$884,206.80

Expenses.	
Trainmen	\$ 68,332.86
Power house and substation employes.....	33,368.18
Maintenance	56,885.08
Fuel	64,549.99
General operating expenses*.....	132,046.96
General expenses	11,213.89
Total	366,396.96
Net earnings	\$517,809.84
Other income	31,791.63
Total net income for the year 1906.....	\$549,601.47
Interest on bonds	\$330,000.00
Taxes and insurance	17,996.27
Total	\$347,996.27
Net surplus for 1906.....	\$201,605.20
Surplus from 1905.....	301,333.45
Total	\$502,938.65

Net surplus, December 31, 1906..... \$502,938.65
 In his address the president, A. C. Frost, gives the following information regarding the property, which supplements the information contained in the Electric Railway Review of March 9, 1907, page 339:

Last year the company built a cut-off between Highland Park and Lake Forest, a distance of about two miles, all on private right of way, for 4-track construction, thereby eliminating two bad curves and greatly reducing the time between the two cities. A number of new stations and shelters were built, the capacity of the power plant increased, and 10 large interurban cars added to our equipment. The company also made other improvements along its entire line. A total of \$200,000 was expended out of surplus for permanent improvements.

The Wisconsin division, as far as Racine, was placed in operation on September 2, 1906, and the earnings from this extension have been very gratifying. Nearly all the right of way from Racine to Milwaukee has been acquired and the road constructed to within 15 miles of Milwaukee. It is expected to have the road completed and in operation to Milwaukee about October 1.

Active construction work has been begun on the United States Naval Training Station and 1,000 men will be employed there this year. Already \$2,000,000 has been appropriated and it is expected that a total of \$5,000,000 will be expended on the property. Extensive public and private improvements are being made in all the cities and towns along our line.

The Chicago & Milwaukee Electric Railroad operates in a territory which is unequaled anywhere in this country, connecting Chicago with Milwaukee and 23 other cities and towns along the line, serving a population of 3,000,000, which is rapidly increasing.

Earnings of the property from 1900 to 1906 are as follows:

	Gross earnings.	Operating expenses.	Net earnings.
1900.....	\$140,684.55	\$ 59,515.44	\$ 81,169.11
1901.....	171,171.99	74,015.09	97,156.90
1902.....	190,110.31	79,364.12	110,746.19
1903.....	292,246.76	98,627.07	193,619.69
1904.....	464,655.22	179,037.58	285,617.64
1905.....	594,874.64	244,551.84	350,322.80
1906.....	884,206.80	366,396.96	517,809.84

Weight of New Motor Cars, Denver City Tramway.

The total weight of the first of the new 2-motor cars completed by the Denver City Tramway Company is 29,000 pounds, distributed as follows:

	Pounds.
Car body	11,200
Double trucks	9,500
Two motors and control.....	7,300
Air brakes	1,000
Total	29,000

These cars were described in detail in the Electric Railway Review of April 6, 1907, page 452, and the estimated weight, as given there, was 27,850 pounds.

It is a good plan to have car washers keep some raw linseed oil at hand to touch up all damaged places before washing and so protect the wood till the cars are revarnished. A little touch of putty here and there where it is needed will keep the moisture from penetrating to the inside of panels and other places where it will work mischief. A very small quantity of pulverized pumice stone used with the soap will cut the dirt, but too much will, of course, dull the varnish. Plenty of clean water should be used to rinse off every trace of soap, as any soap that remains on the varnish will surely leave its mark.—Brill's Magazine.

THE AMERICAN STREET AND INTERURBAN RAILWAY ASSOCIATION TO MEET AT ATLANTIC CITY.

The annual conventions of the American Street and Interurban Railway Association, and the organizations affiliated with it, will be held in Atlantic City, N. J., from October 14 to October 18, 1907, inclusive. The days on which the several associations will hold their meetings have not yet been definitely determined.

At a meeting of the executive committee of the American association, held in New York on January 28 last, it was decided that this year the conventions should be held in the east and preferably on the Atlantic seaboard, and a joint

ness sessions of the several associations. Atlantic City is especially able to meet these requirements: In a circular letter issued by Secretary Swenson on April 9 the following information concerning hotels, exhibit space and convention halls is given.

Hotels.

Practically the only criticism made in connection with the Columbus convention was the inadequacy of the hotel facilities. If any criticism of Atlantic City were made in this particular it would be that there are too many large, first-class and thoroughly modern hotels. Atlantic City can provide without difficulty at least 3,000 rooms in the large beach front hotels, with from 1,200 to 1,500 private baths. In addition, there is an almost unlimited number of rooms in the best grade of

Atlantic City Convention—Steel Pier as Arranged for Exhibits.

committee representing the American association and the Manufacturers' association was appointed to consider the matter further. The selection of Atlantic City as the place for the 1907 convention was made after a careful investigation by this committee, which reported that in view of its instructions only two points could be considered, Norfolk (Jamestown Exposition) and Atlantic City. While each of these places had its particular advantages the opinion of the committee was that Atlantic City would be the more desirable location, and its recommendations have been approved by the executive committee.

In choosing the convention city three points are very important: there must be adequate hotel accommodations of the first class, a sufficient space for the manufacturers' exhibits and suitable assembly rooms in which to hold the busi-

side street hotels, many of which are provided with private baths. The rates which have been obtained from 35 of the largest hotels, of which 13 are on the ocean front, are the same as the rates guaranteed for the conventions of the Master Mechanics' and Master Car Builders' associations, which will be held in June of this year. The rates for one person on the American plan vary from \$2.00 to \$4.00 per day without bath, and from \$3.00 to \$6.00 with bath. For two persons occupying the same room on the American plan, the rates are from \$4.00 to \$8.00 per day without bath, and from \$6.00 to \$10 (in some instances slightly higher) with bath.

Exhibit of the Manufacturers' Association.

The exhibit of the Manufacturers' association has become a very important feature of the annual conventions. The 1907 exhibit will be located on the Steel Pier, which is within a few minutes' walk from the various beach hotels. It is expected that the Manufacturers' association will have a

larger and more attractive exhibit than that at the Columbus convention last year.

Convention Halls.

A large convention hall, with a seating capacity of 800 people, will be provided on the Steel Pier for the opening of the American association convention and smaller meeting rooms will be available for the various sectional meetings of the American, the Accountants', the Engineering and the Claim Agents' associations.

Additional information in regard to the hotel and railroad facilities, the convention halls and the arrangements made for the manufacturers' exhibits will be issued from time to time from Mr. Swenson's office.

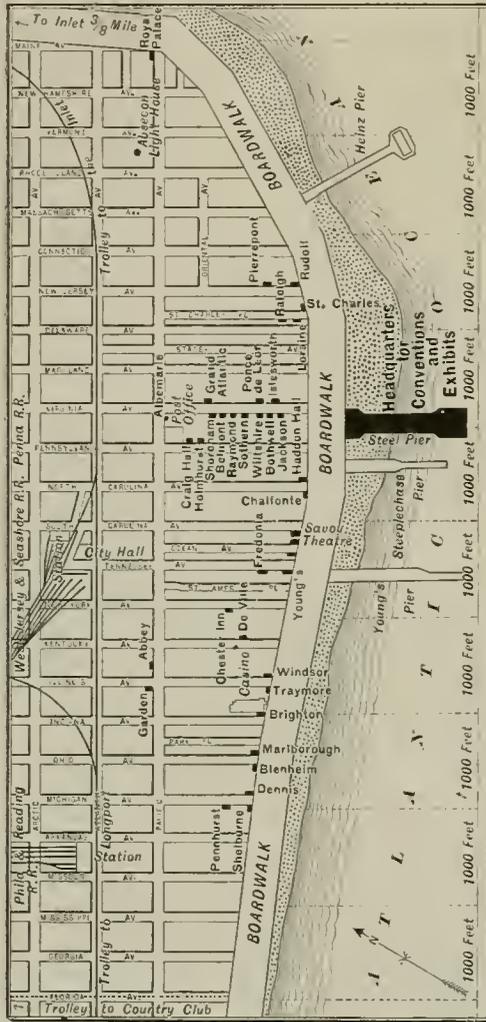

Reference to the map herewith shows the relative location of the railroad stations, the principal hotels and the Steel

PROBLEMS WHICH CONFRONT THE PUBLIC SERVICE CORPORATION.

Thomas N. McCarter of Newark, N. J., president of the Public Service Corporation of New Jersey, delivered an address before the board of trade of Plainfield, N. J., on February 12 on "Public Utilities in New Jersey." In explaining the situation which led to the formation of the Public Service Corporation, Mr. McCarter discussed the subject of overcapitalization, the prevailing sentiment against public service corporations, and the problems which now confront the company of which he is the president. He said in part:

For the past two years, during the peak—as we say in the electrical business—of the public feeling against corporations in general, and quasi-public corporations in particular, I have conceived it to be wiser, in the performance of my duty as president of the Public Service Corporation, to refrain from speechmaking, and devote my entire energy to the routine and arduous duties of my position. The public, rightly or wrongly, has not been in a receptive frame of mind, and anything that I, or one similarly situated might have said, would have had little, if any, effect. The pendulum has swung so far, however, that the thinking men of the country are beginning to appreciate the gravity of the situation, and therefore it seemed to me, when I received the courteous invitation of my friend, your mayor, to come here and speak on this subject, that perhaps the time was ripe for me to frankly discuss the problems which confront me as the head of the large corporation over which I preside, and affect us all as citizens of New Jersey.

I was educated as a lawyer, and I pursued my profession until the formation of the Public Service Corporation and my election to its presidency in 1903. The few years prior to 1903 had been formative or constructive years of the underlying companies now in the Public Service Corporation, and in my professional work I had been considerably employed in doing the legal work involved. In several instances I invested money in the enterprises which I was conducting legally, out of one or two of which I made money, out of others not. My point is, that I was not one of the gentlemen concerned in the original exploitation of these various enterprises. Not that I am casting any reflection upon those who were; that work was done by some of the strongest men this state has produced. It was a strenuous undertaking, and undoubtedly shortened the lives of Vice-President Hobart and the late B. M. Shanley of Newark. There is much to admire in the work of these gentlemen and their associates. They quickened the growth and development of our state, they gave employment to thousands of people, and they made living more comfortable. But from the present standpoint it is clear that they made mistakes, too, in that they overdiscounted the future, and overcapitalized some of the great properties they constructed. This was all done, however, in the open, under due forms of law, and without public hostility at the time; in fact, those who were given an opportunity to "come in" were regarded as highly fortunate. In the course of a short period these securities became widely scattered for value, in the hands of the investing public. It is not too much to say that they passed into the possession of the rich and the poor, the corporation and the individual, the husband and the widow. While we all, I think, disapprove now of the extent to which this overcapitalization was carried on, we must remember that the theory on which it was based was justified at the time, both by law and public sentiment, and that without the expectation on the part of the promoters of some profit above the ordinary interest return, these properties with their resultant benefits would not have been constructed.

Atlantic City Convention—Map of Atlantic City, Showing Location of Principal Points.

pier which is to be the headquarters for the convention and the exhibits. The accompanying halftone engraving shows the Steel pier as arranged for the convention exhibits and gives an excellent idea of the pleasing and artistic manner in which it is possible to arrange and decorate the booths.

The Utica & Mohawk Valley Railway Company has for some time been making experiments to determine the adaptability of the hot water system of heating to the small single-truck cars in use on some of its lines. Such a system has been in operation on the interurban cars and has worked very satisfactorily. In the interurbans the heater is located in the motorman's vestibule. In the small cars there is no space for it in the vestibule and the experiments were to determine the feasibility of locating it in the corner of the passengers' section. A heater was recently installed in a car that has been running in Utica much of the time and it has worked satisfactorily.

Obligations Could Not be Met.

But time was passing on, and it gradually became apparent that, while in the main, gas and electric properties were profitable, and justified expectations, the street railroads did not. By the winter of 1902-1903 it was evident to those at all in touch with the situation, that without new capital for necessary improvements, and for the restoration of impaired credit, the railroads could not go on. Just at this time a horrible catastrophe occurred. A carload full of school children collided at a dangerous crossing in Newark, with a Lackawanna train, resulting in much loss of life, great personal injury, and filling the whole country with consternation. This was the last straw, which, it was quickly seen, would break the camel's back. Something had to be done, and that quickly, or a great financial panic stared New Jersey in the face. The railroads could not meet their accruing obligations. This was becoming generally known, and I knew it professionally, as well as a matter of general information. While the securities were held broadcast, the policy of the constituent companies was shaped by a comparatively small

number of men. To these gentlemen I suggested, as the solution of the problem, the formation of a new company, with a large cash capital, which should acquire, upon fair terms, all the constituent properties, good and bad, represented by them, the theory being that during the critical period the strong and prosperous should carry the financially and physically weak properties.

Thus the Public Service Corporation was formed, with a cash capital of \$10,000,000, fully paid up, without one dollar of water. It shortly acquired all of its gas, and many of its electric, properties by lease. The stocks of the financially embarrassed railroads, and of the United Electric Company of New Jersey, which served Essex, Hudson and a part of Union counties electrically, and which was also in a struggling condition, were exchanged for the obligations—not the cash—of the new company, but in the doing of it approximately \$60,000,000 of stock obligation was transformed into approximately \$20,000,000 of new obligations. This transaction was certainly free from the injection of water.

At this juncture the gentlemen put up to me, as the suggestor of the enterprise, its successful consummation as a going concern, and I withdrew from my profession to accept its presidency. This fact is only of importance as showing the untrammelled point of view with which I approached my duties. At the commencement of my administration I had, and I still have, three and only three objects in view.

1. The making good of every dollar of all these underlying bonds and securities by whomsoever held, and the prevention of the financial panic that would have ensued, and, gentlemen, unless socialism and confiscation are to prevail in this country, which they are not, that object has been attained beyond peradventure.

2. The giving of efficient and economical service to the people of this state in the three great public utilities of gas, electricity and street railway transportation.

3. The assurance of an ultimate fair return to the stockholders who have invested their money in the stock of this company at par, first to the extent of \$10,000,000, subsequently increased by \$2,500,000, now making \$12,500,000 in all, thus far without a cent of return thereon.

These, then, have been the three objects before me. The first, that of safeguarding the underlying securities, has, happily, as I say, been accomplished. What of the second—the giving of efficient and economical service to the people? Let us bear in mind that the company operates all the important gas, electric and street railway properties in the state, as far south as Camden, with the exception of the gas property in and about Elizabeth and the street railway system in Trenton. This is a vast undertaking, and that it is not done with entire satisfaction to the public or to ourselves, no one knows so well as I. Remember, if you please, that the Public Service Corporation came into possession over night, as it were, of a vast number of properties of different kinds, in all stages of efficiency and decomposition, and this was only four years ago.

Rebuilding the Railways.

In the railway department alone we are in process of amalgamating into one homogeneous whole nine different systems of railroads that previously had no interdependence. Many of them were in a state of physical as well as financial collapse, and have had to be rebuilt. This work is progressing, but it will take several years to complete. We have in these four years already spent upwards of \$26,000,000 in the improvement, extension and rehabilitation of the properties, and have appropriated over \$6,000,000 additional for similar expenditure this year. This money, over and above the \$12,500,000 of capital stock, has been raised by the sale of securities. We have built and rebuilt over 110 miles of track. We have purchased 568 new cars; we have built new power stations. The community is growing so rapidly that it is difficult to keep pace with it, let alone to improve conditions. Nevertheless, they are being improved; each year there is a substantial improvement, and this will continue if present administrative policies prevail, until the time will surely come when this company will give as satisfactory service as the nature of the business will permit. It will never be perfect; it is not perfect anywhere.

The troubles of street railway operation are legion, and in winter time are always with us. They are caused by difficulties too numerous to mention, over many of which the company has no control, such as snow, vehicular traffic, blocking of cars, etc. Of course we are not free from blame. No concern handling over 10,000 employes in work of this character is free from error, from the president down to the humblest employe. All we can do is to do the best we can, and that is the honest purpose of my administration.

As to the second branch of the subject of which I am treating, viz., the economy of service, I am proud of what we have accomplished and are doing for the people of the state. To summarize briefly, a complete transfer system has been

put into effect between the nine railroad systems at all connecting points, where none formerly existed, and the 5-cent fare zone has been extended to the limits of reason, it being now possible to ride over 15 miles for a nickel in certain localities.

While all this reduction has been going on, the price of nearly everything else has been going up, taxes, labor, coal, oil, manufactured products of every character all advancing, while the cost of the finished product—gas, electricity or transportation, as the case may be—has been coming down. This state of affairs, with its attendant results, if carried to extremes, was commented on with great force by Samuel Spencer, the late president of the Southern Railway, in a public address shortly before his death. The public should realize that there is a point beyond which these opposing forces must not go, if conflict is to be avoided.

Extensions Demand Capital.

All this is of the very greatest importance. It has a direct bearing on the ability of corporations to raise the necessary capital to properly extend. If rates are to be put below the point where fair earnings on obligations can be secured, fresh capital cannot be secured, and stagnation of enterprise will result. It takes, and will continue to take, for some years, if not indefinitely, about \$4,000,000 annually of new money to finance the new business and extensions of the Public Service Corporation. This does not include a mile of extended railroad track. In these troublous times, even this comparatively small sum of money is not easily acquired. This situation, so far as new extensions are concerned, is accentuated by the passage, in response to a well-defined but, in my opinion, mistaken public sentiment of the so-called limited franchise law, restricting the period for which franchises may be granted to 20 years, except where by vote of the people the period is lengthened to 40 years. This does not affect the Public Service Corporation to any extent, for I am entirely satisfied that we have enough to do to develop the properties we now have, without further substantial extension. In a sense, it is a direct benefit to the Public Service Corporation, for it prevents others from obtaining what the Public Service Corporation already has. But it will, in my judgment, retard the development of the rural sections of the state. In these times it is utterly futile to consider the financing of rural country lines upon any such limited basis, and we are not attempting it. This is not the manifestation of any dog in the manger policy, but simply a recognition of conditions.

Stock-Watering and Overcapitalization.

The third aim of the Public Service Corporation is to earn a fair return to stockholders upon their investment. We have been going four years. In 1906, for the first time, we earned a little over 5 per cent on our stock, and that on a gross business of \$21,000,000 and a stock capital of \$12,500,000. I think that all will agree that this is as close a margin as any legitimate business should be conducted upon. But with the enormous increase in the company's business each year, unless all conditions change, within a reasonable time the earnings will substantially increase. At least this is our hope and belief. How then shall these earnings be distributed? The day of stock-watering and overcapitalization of properties of this character is over, and properly so. Governor Stokes in his annual message of 1906 strongly inveighed against this evil, and recommended legislation to prevent it. In compliance therewith the legislature of last year passed a very drastic act, with which I do not think the public are very familiar, but which positively forbids public utility companies from issuing their obligations for less than par, except a reasonable banker's commission, and forbids the issuance of all stock, except for par. Heavy penalties are attached, including the rendering of the securities invalid. The governor will bear me out, I think, that because of my familiarity with the subject, I, at his request, prepared this bill, and I am in hearty sympathy with his provisions.

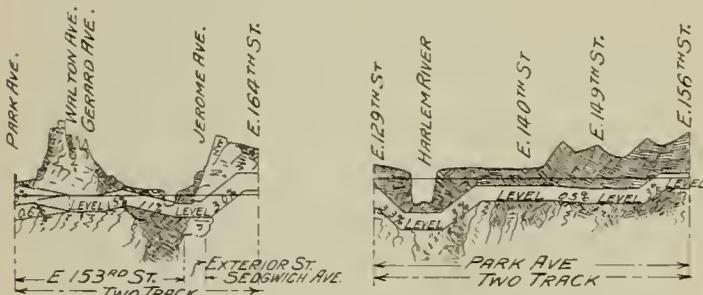

I believe that we should recognize conditions as they are, without any attempt to undermine values or confiscate securities heretofore issued under forms of law; that we should, as above, prevent all further watering; that stockholders of existing companies should be allowed to receive 10 per cent annually—a fair business profit—upon their investment before there is any further restriction placed upon these companies by taxation or otherwise. Until such time comes, the companies are taxed sufficient in all conscience.

The Indianapolis & Cincinnati Traction Company, which recently opened its Shelbyville and Greensburg division, has instituted freight service on this division a month sooner than anticipated to meet the general demand upon the part of the citizens for an interurban freight service.

THE LEXINGTON AVENUE SUBWAY, NEW YORK.

Bids for the construction of the new Lexington avenue subway in New York were advertised for on April 2, by the Board of Rapid Transit Railroad Commissioners. The plans which are shown herewith, and for which we are indebted to Mr. George S. Rice, chief engineer of the commission, show that the new line is intended to extend from the Battery to One Hundred and Sixty-fourth street, the Bronx. The line from the Battery to the vicinity of Forty-second street follows somewhat closely the line of the existing subway, but at a short distance to the west.

Beginning from Battery Park the line follows Church street to Vesey, where it turns to the right to Broadway, under which it proceeds to Twenty-fifth street, whence it deflects and passes under Fifth avenue to Thirty-fifth and Thirty-sixth streets, under which streets are to be two lines which turn three blocks east to Lexington avenue. From Thirty-sixth street the line proceeds directly under Lexington avenue as

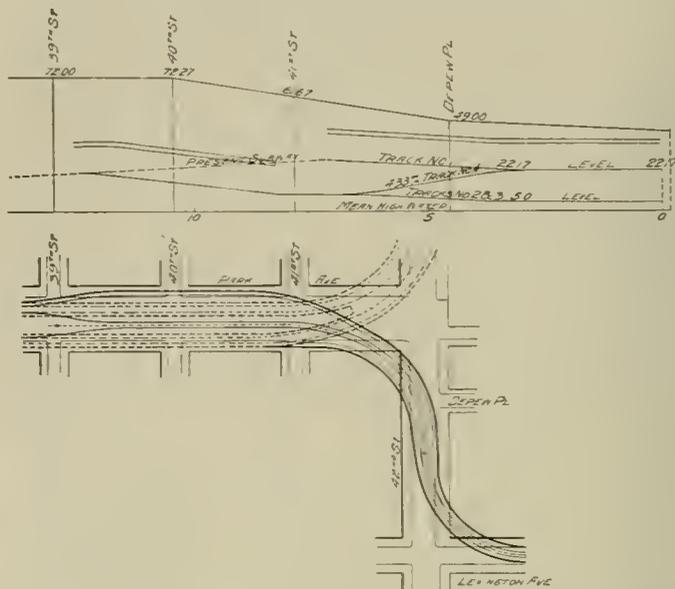

Lexington Avenue Subway, New York—Longitudinal Cross-sections.

far as the Harlem river. Passing under the river the line continues under Park avenue, crossing underneath the present subway at East One Hundred and Forty-ninth street, whence it turns to the west along the line of One Hundred and Fifty-third street to One Hundred and Sixty-fourth street.

From a point between Thirty-eighth and Forty-first streets, where a junction can conveniently be made with the existing subway north to One Hundred and Twenty-ninth street, the road will consist of four tracks. From One Hundred and Twenty-ninth street north there will be two tracks and the

maximum width of 15 feet for each track, except at stations, where the width is increased. The roof and sides of the tunnels will be of iron or steel and masonry, and the roof will be as near the surface of the street as street conditions and grades will permit, but the track will be depressed wherever necessary to avoid grade crossings and at the approach to the Harlem river.

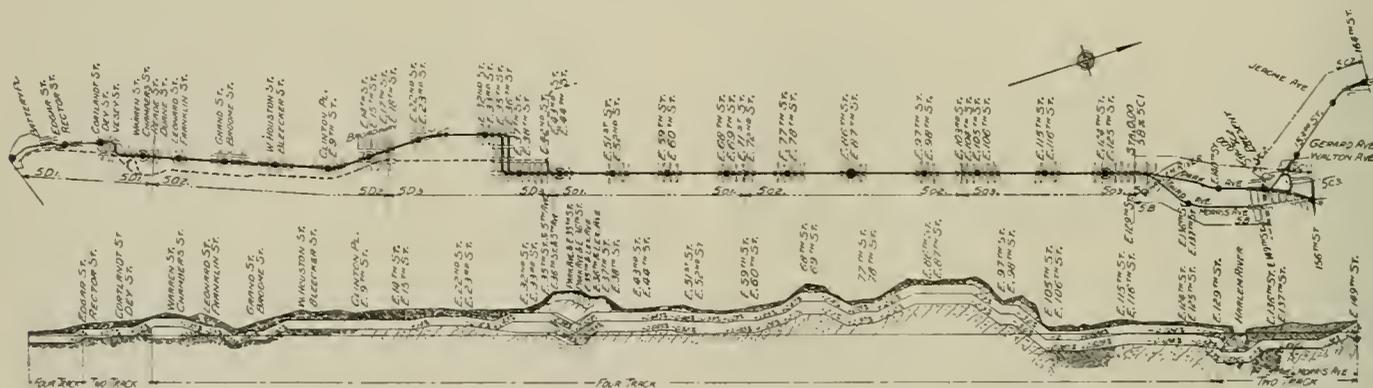

In some features the plans provide for a different construction than that which prevails in the case of the existing

Lexington Avenue Subway, New York—Skeleton Elevation of Rapid Transit, Metropolitan and Lexington Avenue Subways.

subway. Entrances to stations will in general be placed within private property, and stations are in general located midway between the lines of two streets. Construction generally will be carried on by means of tunneling or excavation under cover, except in cases in which express permission for an open cut may be obtained from the board. Contracts for the work will be let in seven different sections, which cover the entire line from Battery Park to One Hundred and Sixty-fourth street.

At Chambers street, which is assumed to be the southerly

Lexington Avenue Subway, New York—Route and Longitudinal Cross-section.

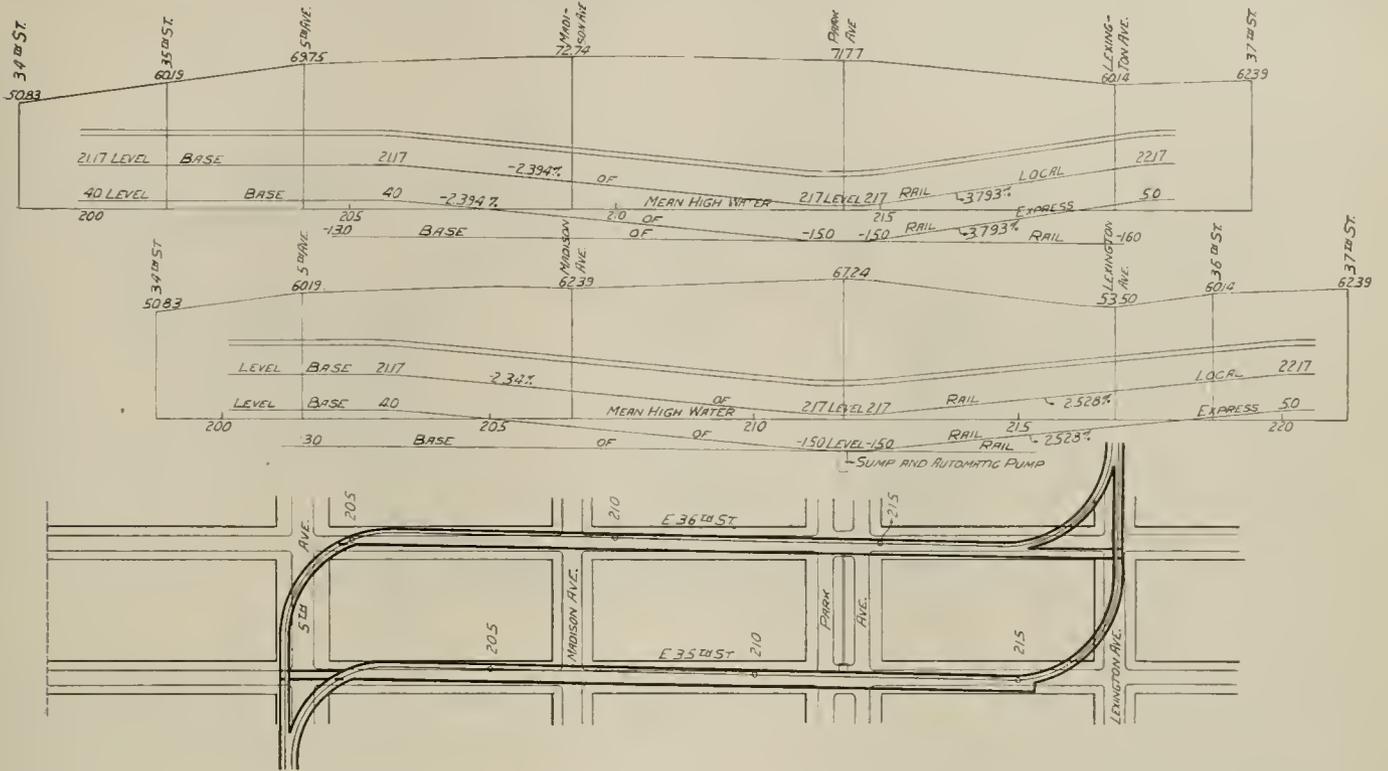

loop at Park avenue between One Hundred and Fifty-first and One Hundred and Fifty-second streets will be one track. Including the two lines at Thirty-fifth and Thirty-sixth streets there will be four tracks at this point, and the four tracks will be continued as far south as Chambers street. From this point south to Battery Park there will be two tracks exclusive of the additional tracks required for terminal purposes under Battery Place and Battery Park.

It is provided in the specifications that the tunnels are to have a height of not less than 13 feet in the clear and a

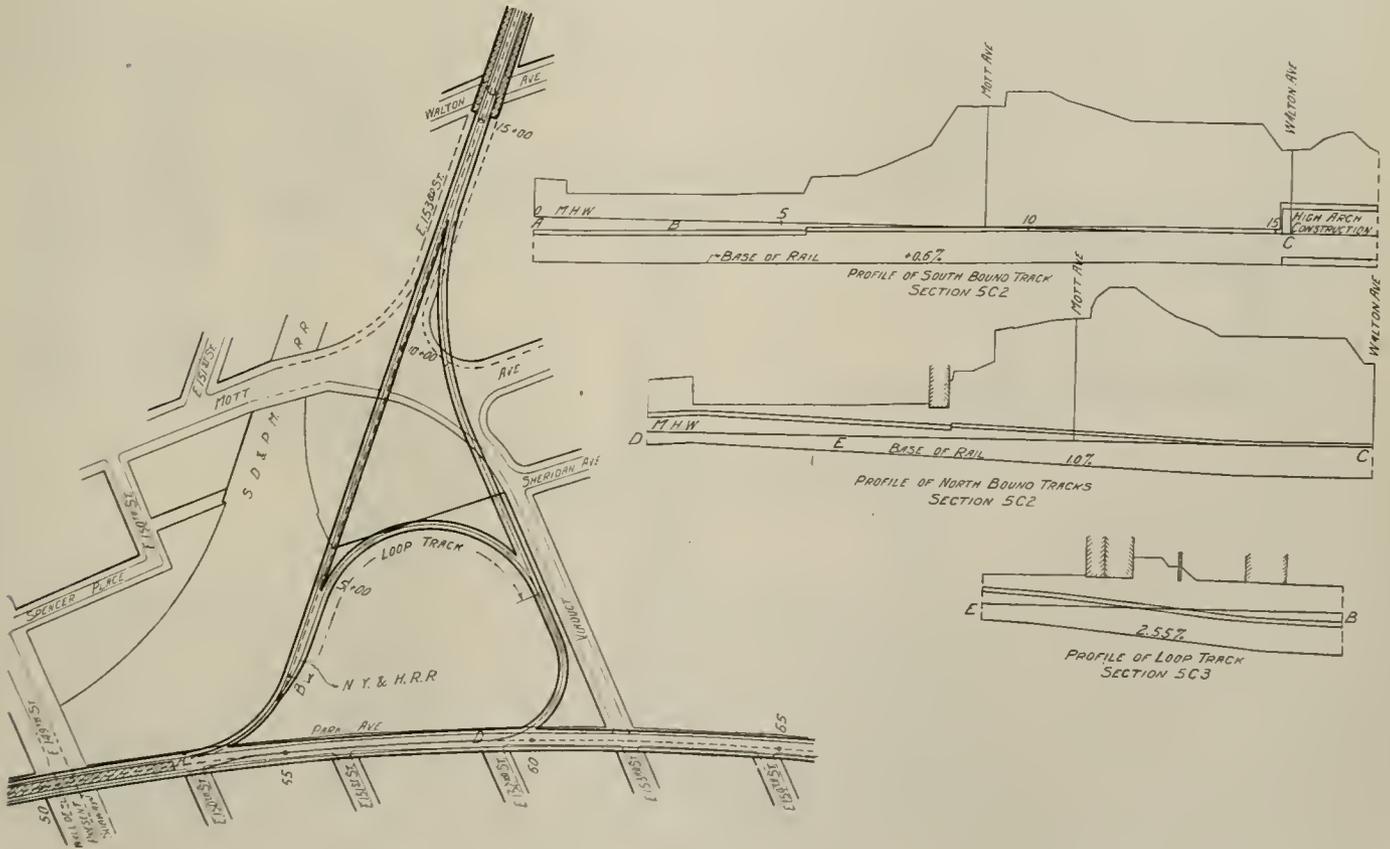

limit of express service, there will be located a station accommodating four tracks, in the form of a double-deck structure. The two upper tracks will be for express service north of Chambers street and will be the continuation of the tracks which come north from Battery Park. The two lower tracks in the station will be for the accommodation of local trains coming from and going to the north of Chambers street. These two tracks will be extended south under Broadway to provide sidings for the housing and care of local trains. From Chambers street north the four tracks continue under Broad-

way, coming to substantially the same level at a point 700 or 800 feet north of the station. They will then continue along Broadway as near the surface as practicable to and

Thirty-first street. The local tracks will then converge and come together over the express tracks at the south end of the station, between Thirty-second and Thirty-third streets,

tinue north on substantially the same level to about One Hundred and Twenty-ninth street, and the two lower tracks will branch in order to provide connections which will be described hereafter. These two tracks will pass under the Harlem river and Morris avenue to One Hundred and Forty-eighth

Walton avenues, where it is joined by the southbound track, which has been carried farther to the north before diverging from the lines leading to the terminal. A loop at this point connects the south and north bound tracks. This loop will be entirely under private property and under the tracks of

the New York Central. The location and arrangement of these tracks, as well as the connections described at Thirty-fifth and Thirty-sixth streets, will be clearly understood by reference to the accompanying engravings, showing the gen-

eration of these devices shall be built two between every two stations, one on each side of the track. Free air will be secured through gratings in the sidewalks in the roof of the ventilating

Lexington Avenue Subway, New York—Plan and Section of Station.

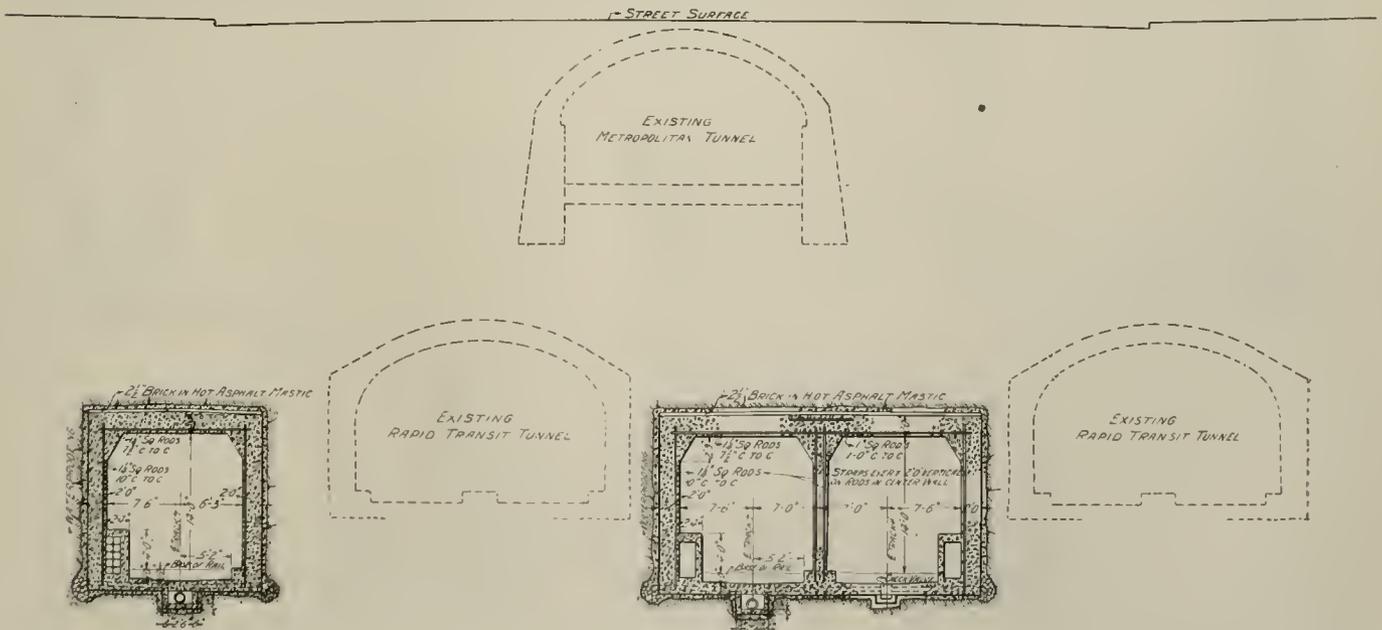

eral plan of the entire line, and these two portions in considerable detail.

As indicated in the foregoing description, on parts of the road which have four tracks on substantially the same level, the inside tracks will be used for express purposes. When the form of construction provides a double-deck structure, the two lower tracks will be used for express service.

In view of the difficulty which has been experienced in

chambers. Also, in the construction of the walls suitable provision is required to be made for the piping of the various services which may occupy the ground below the street level.

The fact that Lexington avenue is largely a residential street, and is comparatively narrow, has been the occasion for determining to make the structure of double-deck character. This condition is also taken into account in the provision that the contractor must be required to maintain free

Lexington Avenue Subway, New York—Section Through Subways Under Park Avenue and Forty-second Street.

connection with the ventilation of the present subway, provision is made in the present plans for the installation of necessary apparatus for ventilation at the sides of the roadway to be constructed in connection with the construction of

access to entrances of all buildings during the progress of the work.

In the construction of the stations, the feature which has been found so desirable in the present subway, that is, making

DEPRECIATION AND RESERVES.*

BY GEORGE WILKINSON,† C. P. A.

The accountant, in his investigation of the accounts, must be careful to determine what amount has been expended on maintenance and current repairs of building and machinery, and what, if anything, has been charged against the earnings with respect to "Depreciation." If the amount so charged is, in his opinion, insufficient to properly provide for the replacement of the machinery, by the time it is estimated such machinery will be useless, it is his duty to make a specific allowance for depreciation in addition to what the books may show, before stating the net profits. In such an investigation the accountant should not content himself by stating the profits "before charging depreciation."

The investigating accountant should also carefully examine the accounts to determine what amount has been expended on renewals and to what accounts charged. If he finds that any considerable sum has been charged against the earnings for machinery, to replace that which has become worn out or obsolete, he must surely take such amount into consideration as a deduction from the amount he would otherwise charge as "Depreciation."

The science of bookkeeping has been gradually evolved for the purpose of recording permanently, by the combined use of words and figures, the history of a business undertaking.

Fundamentally, the receipt and payment of money form the basis of commercial transactions, money being the means of interchange between different members of the same community, between the producer and the consumer. But there are certain facts to be recorded, in the history of a manufacturing enterprise, which do not affect anyone but the proprietor of the business, and among these comes the matter of depreciation. Ultimately even this matter resolves itself into a cash transaction, because some day the property, upon which the depreciation is today computed, will become worn out and have to be renewed, and then money must be spent to renew it.

The question of "Depreciation," if taken as a whole, is so vast, that a lecture of one hour's duration must either deal with the subject superficially (which is never convincing) or else its scope must be narrowed down to dealing with a few subjects, so that these can be carefully considered and the application of certain rules determined. The latter is the object sought for this evening's lecture.

No one, to my knowledge, was ever bold enough to lay down fixed rates at which depreciation ought to be charged under all conditions. On the contrary, all agree that considerable diversity of opinion exists, even among those best informed on the subject. Further, that, as no two cases are exactly alike, fixed rules cannot be made to apply. It is also fully agreed that the question of depreciation comes within the realm of opinion and that the special conditions under which each property is operated must be carefully taken into consideration.

"Depreciation" may be defined as the loss in value of some destructible property over and above current repairs. The loss which arises with respect to breakage and which can be replaced by repairs has nothing to do with depreciation.

If any part of a machine breaks or becomes worn out, there is a loss. The loss to the machine may be readily replaced by a new part and the machine is said to be "as good as new." This results in an expense to the owner of the machine, which is commonly called "Repairs," or, more technically, "Maintenance." The loss that arises through "Depreciation" is of a different nature. It is not accidental, but slow, gradual, inevitable. If the owner of a machine repairs it ever so well there inevitably comes a day when it can no longer be kept in serviceable condition. Its usefulness is gone. It cumbereth the shop. It is thrown on the scrap heap or sold to the junkman. Its owner is then face to face with the loss of its value. This results in a loss of "Capital," or a loss of "Revenue," according to the manner in which it is dealt with. If the necessity to make proper provision for depreciation out of earnings is neglected (as it often is) it will ultimately assert itself, to the most serious embarrassment of the owner, as a loss of capital.

If the business is a temporary one, or if the process the machine was bought for is at an end, then the loss is part of the capital of the owner, and he may be quite content to see it thrown on the scrap pile. But this is very seldom the case. In a vast majority of instances the owner wishes to

continue in business and finds himself compelled to replace the defunct machine, generally with a better one. Modern development lies in the direction of constantly increasing the efficiency of the machinery employed in all classes of manufacture, and it is seldom that a worn-out machine is replaced by another its exact equal.

Now, if he has been wise, the manufacturer will have provided for the replacement of the worn-out machine out of the profits it has earned for him during its life of usefulness.

Just as a portion of the proceeds of his finished product is paid to the mechanic for his labor, so a portion of those proceeds should be set aside to replace the machine that aids the mechanic when it shall be worn out.

It may be that the machine may never be replaced with another of its own kind, but if the same process is continued another machine—possibly ten times more costly—will eventually be purchased to replace or displace the old. It matters little whether we spell the word replacement or displacement—nothing lasts—either a machine is replaced with another of its kind, or it is displaced by a different machine of much greater capacity. This principle applies to any inanimate thing that moves or is moved, be it a windmill, or a traction engine that pulls the machine it drives and drives the machine it pulls.

Now, if we have successfully argued that the proprietor of a manufacturing business must provide, out of its earnings, for the replacement of the machine he uses, if he wishes to continue in business, let us see how this may be accomplished. It is impossible for him to know for a certainty how long a machine will last, or how much finished product it will turn out during its lifetime. The best he can do is to estimate how long a machine will continue in active service. If, having estimated how long the machine will last, he finds that it will have to be thrown out of use in a given number of years and sold for scrap, he will know that he must spread the cost of that machine over its estimated life, on a per cent basis, setting aside a certain amount of his profits each year, to provide for the replacement of the machine.

A common, and I believe mistaken, view of depreciation is that it is simply a loss that the business of a manufacturer suffers from, which should be written off, just as a bad debt is written off. Under this method the amount which the proprietor or the directors determine to charge against the earnings is credited to the asset account and its value thereby reduced. This method makes an annual charge for depreciation a detestable subject, a particularly bitter pill for the management to swallow; whereas, in reality, a reservation of a portion of the profit is merely a wise and conservative provision for the future.

There are other objections to the method of writing down the asset account. In the event of the destruction of the plant by fire, when it comes to making an adjustment of the loss, the diminished amount shown in "Plant Account" will certainly be considered by the adjusters in arriving at the basis of valuation. Or again, if the proprietor of the business wishes to sell his property, the diminished value of the plant and machinery, as shown by the books, will surely be urged by the purchaser. In vain shall it then be said that the machinery had really been kept up as good as new, and that no such depreciation as has been recorded on the books had really been suffered. On the method preferred, which we will call the "Reserve Method," it is easy to explain that the amount to the credit of the "Depreciation Reserve" represents the accumulation of sums which the directors had thought fit to set aside, out of the profits, to provide for replacement of the plant at some future time, and did not necessarily represent the measure of the deterioration of the property.

When the proprietor of the business determines to set aside a certain portion of the profits for the purpose of replacing the plant, the official historian (whom we call the bookkeeper) is called upon to record the fact on the official record of the business, namely, the books of account—and an entry is made charging "Profit and Loss Account" and crediting an account entitled "Reserve to Provide for Replacement of Plant."

Now it may be urged that this is merely a piece of bookkeeping, sometimes disrespectfully called "red tape." Not so. Something more than bookkeeping has been accomplished. The official historian of the business has recorded the fact that the proprietor, or, if it be a company, the directors of the company (those men who have been chosen to govern the affairs of the company), have officially decided to set aside a certain portion of the earnings, ear-marked, so to speak, to provide for the replacement of the plant. Bear in mind that it is not the making of an entry on the books, but the action of the board of directors, that gives validity to this transaction. Thus we know that, although no sum of money has been taken out of the business, a portion of the earnings has surely been set aside for the specific purpose required.

We have seen (1) that wherever profits are earned by

*Abstract of a lecture delivered at the Evening School of Accounts and Finance held in connection with the Wharton School of Finance and Commerce.

†Of the firm of Wilkinson, Reckitt, Williams & Co., Certified Public Accountants.

a manufacturing business the use of machinery is involved; (2) that machinery will last only a limited time; (3) that a sufficient portion of the profits, earned by the use of such machinery, should be conserved for the specific purpose of replacing the same; (4) how to give effect to these principles.

In a paper on the subject of "Depreciation of Water Works Plants," Mr. John W. Alvord, consulting engineer, of Chicago, gives an interesting table showing the history of 32 horizontal tubular boilers used in water pumping stations in Illinois, Iowa and Michigan. The active life of these 32 boilers was found to have varied from 6 years for two boilers at Sterling, Ill., where artesian water was used, to 23 years for two boilers at Oskaloosa, Ia., where river water was used, the latter boilers being still in service. The average life of this group of 32 boilers was 15 years.

These data would seem to indicate that the rate of depreciation charged on the diminishing value of the boilers should be 20 per cent where artesian water is used, 10 per cent where lake water is used and 5 per cent where soft river water is used, other factors being equal. These rates may be subject to revision in view of the success with which boiler compounds are used; also, in respect of the duties the boilers are called upon to perform and whether they are running easy, with ample time for repairs and cleaning, or whether they are crowded beyond their proper capacity.

When an accountant comes upon the scene and persuades the proprietor to begin making a provision for the replacement of the machinery, after the plant has been several years in use, and the value has been reduced by service, on what basis will the accountant compute the rate of depreciation?

This is and will remain a somewhat perplexing problem. It would manifestly be unfair to divide the entire cost of the half-worn-out boiler over the few remaining years it has to live. The effort of the accountant, if acting as auditor, should be exerted in the direction of having a liberal amount charged off each remaining year, so that when the plant has actually to be replaced, the amount then to be written off as the cost of replacement shall be reduced as much as possible.

If the accountant is acting in the capacity of special examiner, with the object of stating the profits of a manufacturer for a given number of years, he may content himself making a charge for depreciation, computed at what it would have been had proper principles been followed through the life of the plant. That is to say, he should calculate what the charge should have been in each of the preceding years, and base his charge for the period examined on the diminished value.

It is not always necessary or desirable to continue charging depreciation after a sufficient amount has been accumulated to the credit of "Reserve for Replacement of Plant," to substantially replace the plant and machinery. In actual practice this point is seldom reached, but it has come plainly in sight to some of us, with the result that we have recommended a gradual reduction of the rates charged, and ultimately we shall recommend that a further charge will be unnecessary.

Of course, such a state of affairs indicates that the charge made in the early years was excessive; but if the earnings arising from the use of the property, during the early years, have warranted the charge, the owner is just that much to the good, and can enjoy the profits of the later years, without deduction in respect of depreciation, albeit the property may still be declining in value.

This brings me, logically enough, to another and not less interesting phase of this many-sided subject of depreciation—its negative aspect—when and where not to charge depreciation.

It is seldom nowadays that we come across a manufacturing business where a specific charge for depreciation on machinery ought not to be made.

In the old days, say 15 years ago, when the great wave of company promotion first swept over this country, and public accountants were employed to examine the accounts of manufacturing companies, with the view of establishing the average net profit earned during a period of years, it was no uncommon thing to find that the value of new machinery, bought during the period and improperly charged against the earnings, was sufficient to cover a reasonable depreciation charge. In these cases the accountant's certificate stated that the plant had been adequately maintained, but no specific charge was made for depreciation.

This was particularly the case in manufactories where skilled mechanics were extensively employed. It was customary, under the primitive bookkeeping methods in use 10 or 15 years ago, to charge all materials, including lumber, iron, steel, castings, hardware, tool steel, and similar, to "Material Account," without keeping any record of the use same was put to. It was also quite customary to charge all wages, including machinists, carpenters, painters and all, to "Labor Account," irrespective of the nature of their employment.

In those days it was extremely difficult, and in some cases absolutely impossible, to determine, from the books of account, how much had been spent for "Maintenance and Repairs" and how much for "New Machinery and Betterments to Plant." In such cases we had to "make a stab at it." We would go carefully all over the plant with the superintendent, who pointed out new machines and improvements made during the period, the cost of which had been charged against the earnings. We were perforce obliged to be content with that.

The refinement of modern bookkeeping methods of today has changed all that. If a pound of nails is used to repair a break in the fence, "Maintenance Account" is surely charged. If a new machine, however small, is bought or made in the machine shop, the actual cost, including the freight and labor and incidental expenses of installation, is all charged most religiously to "Improvement Account." All this makes it more than ever necessary to be sure to make a proper charge for depreciation.

During the first year of the life of a new plant it is inadvisable to make any charge for depreciation, except as hereinafter noted. The reasons for this view are: (1) While the business is new and struggling to get on its feet, it cannot afford to put aside any portion of its profits for the purpose of rebuilding the plant; (2) there are always a large number of expensive things occurring in the infancy of a business—the machinery doesn't run right and requires adjusting, causing a loss of time; a great deal of the time of the proprietor or the superintendent must be given to supervising the installation of machinery, no charge for which is made; correspondence, telegrams, and other expenses incidental to the installation of the plant, run high during the infancy of a manufacturing business. When these disappear and the plant gets down to a regular working basis, say during its second year, it will be time enough to begin charging depreciation. New machinery added to the plant should only enter into the calculation of depreciation for half of the first year.

The exception is when an operating company steps into a ready-made business and into the possession of a ready-to-operate plant, with average earnings from the very first. Then the charge for depreciation should begin at once at the full rate.

As has been said before, theoretically there is depreciation on everything that comes under the head of property, except cash investments and land. But there are many classes of property upon which there is no practical way in which the depreciation can be handled, their nature making it necessary to maintain them in a state of perfect preservation. Let us look at some of these and see how this principle applies.

It is neither customary, practicable, nor necessary to make any charge specifically for depreciation against the earnings arising from the use of piers, docks, wharves, railway tracks, telegraph lines, reservoirs, dams, canals, locks and many other properties of a similar description.

These properties are permanent and irremovable. Their maintenance is a constant source of expense and must be paid for out of the earnings they yield. The nature of the properties demands that they be kept practically in a state of perfect preservation. What portions of these properties are not really permanent are renewed again and again in the life of the property, and all these replacements must be paid for out of the earnings.

In examining the accounts of companies owning any of the above-mentioned properties, the accountant must see to it that no amounts expended for materials or labor usable for repairs are charged to capital accounts, unless they represent absolutely new work, involving an extension of the earning power of the property. It will be possible, in this lecture, to refer to only three of these properties, which may fairly be considered indicative of the principles governing the others, though the detailed considerations herein suggested will not apply in each case.

Another illustration of a permanent property, upon which it is not customary or practicable to compute depreciation, is a railway property.

[In a letter to the editors, Mr. Wilkinson says that this statement refers particularly to steam railway tracks and has little bearing upon electric railways within municipalities.—Eds.]

A railway track, in all its parts, is irremovable. It is a permanent structure and as such must be maintained in the highest state of efficiency in order to be effective. This is such a paramount necessity that any railway company which does not spend generous sums upon maintenance of the permanent roadway, and upon improvements thereof, will soon find the operation of the road unduly expensive and dangerous.

First, let us look at the roadway itself. From the very first day that operation begins there must be spent large sums for strengthening the roadbed. Heavy rains, melting

snow and sliding banks necessitate large expenditures for additional culverts, for larger drains, for ditching and for stone retaining walls, while the expense of heavy rock ballasting appears to be almost without end. There is always something to be done in straightening out curves, reducing grades, filling in soft places, draining the right of way and oftentimes part of the surrounding country, all of which must be paid for out of the earnings.

Then the bridges and trestles, hastily built in construction days, require strengthening with additional timbers as well as new sills, caps, posts and stringers for replacement of rotten or defective materials. Even if a wooden bridge is entirely rebuilt, the cost must be paid out of the earnings.

In five years or less, the ties, especially those that lie low in the sand, are found to be rotten or cut with the chafing of the rails, and have to be replaced a few at a time. It is not long before the rails on the curves and gradients show wear and have to be renewed, the old rails being retired to service on sidetracks. Switches, frogs, track fastenings, anglebars and all the rest don't last long and must be gradually replaced.

The cost of all these renewals and replacements must be paid for out of the current year's earnings and charged up to "maintenance of permanent way." This charge is likely to include much that is really in the nature of a betterment of the property, and it is right that it should. If this is done—and it is done on all properly managed railroads—the question of depreciation on permanent way does not arise. On the contrary, the railway is in better physical condition each year as a result of use and of experience paid for out of the earnings. Nothing should be added to property account, as an improvement to the permanent way, unless it represents actually more trackage. Under this method there is absolutely no depreciation whatever, the real value of the property being enhanced every year.

In time it will be found economical, in order to reduce operating expenses, to replace wooden bridges with steel spans, or when possible with permanent stone structures. Retaining walls and fills will take the place of many a trestle. Conservative management would permit the cost of these steel spans or stone bridges, which displace wooden structures, to be carried in a separate account, or preferably in an individual account for each structure, and would permit the cost to be spread over a period of years in equal instalments; so that in 10 years, or even 20 years for very heavy improvements, the cost of these betterments would have been paid out of the earnings of the road, the book value of the property as a whole being left intact at the original cost.

On the other hand, it would be wrong to add the entire cost of these improvements to property account as additional cost of the permanent way, although this is frequently done. There is, however, much to be said in favor of charging at least a portion of the cost of such permanent improvements as steel bridges and stone walls to property, on the ground that the value of the road has been increased and the cost of maintenance and of operation reduced.

Actually the value of the road has been enhanced to the extent of the difference in cost between the new structure and the old, and it would be no more than fair to add this difference to the property account, if same could be ascertained. The trouble is that in a majority of cases it is impossible to determine just what the original structure cost, especially where the railway company purchased the entire road as a going concern, or had the railway built for it by a construction company at a flat price per mile.

The "Depreciation Reserve" is sometimes called "Reserve for Replacement of Plant," or "Reserve for Replacement of Machinery." The more definite the title the better. A credit balance to this account represents a portion of the earned profits set aside to provide for the replacement of the plant. At the time of setting aside these profits the charge was made against the earnings as "Depreciation." This feature of the subject has been fully discussed in the early part of this lecture. It remains only to repeat that profits set aside for this purpose and carried to "Depreciation Reserve" are not available for any other use.

It has been urged, as an objection to this method, that directors have been known to use profits, which had been reserved for replacement of plant, for other purposes within their business. Such a course is certainly bad business, but it is no argument that the so-called "Reserve Method" is not the best. What the directors have done they can undo. I have in mind a case where the board of directors, by a series of resolutions, reconsidered all the previously made charges for depreciation, and set up substantially the same aggregate amount on an entirely different basis.

Conditions may arise in the history of a business under which the profits of prior years, reserved at the time for the replacement of plant and machinery, can be used to far greater advantage for some more necessary purpose.

The balance of "Depreciation Reserve" should not be shown on the balance sheet as a liability, but should be deducted from the assets affected, so that "Plant Account," while it remains at the total gross cost on the books, will appear on the balance sheet at its depreciated value.

The cost of machinery, specifically purchased to replace that which has become worn out or obsolete, may legitimately be charged to "Depreciation Reserve Account," but in actual practice it is found very difficult to do this intelligently, and it is regarded as a better plan to keep both the cost of machinery and the amount reserved out of the profits for the replacement thereof intact. The effect on the balance sheet is the same.

CENTRAL ELECTRIC ACCOUNTING CONFERENCE.

The next meeting of the Central Electric Accounting Conference will be held in Indianapolis on June 1. This conference was organized at Dayton, O., on March 2, 1907, for the purpose of enabling the accounting officers of electric railways in the central states to meet from time to time and discuss matters of interest. It may result in the adoption of a uniform method of accounting.

The following officers were elected:

Chairman—M. W. Glover, auditor Indiana Columbus & Eastern Traction Company, Cincinnati, O.

Secretary—C. S. Baker, auditor Western Ohio Railway Company, Lima, O.

Executive Committee—Walter Sbroyer, acting auditor Indiana Union Traction Company, Anderson, Ind.; A. F. Elkins, auditor Columbus Delaware & Marion Railway, Marion, O.; A. C. Henry, auditor Lake Shore Electric Railway, Norwalk, O.

COMMUNICATION.

The Future of the Steam Boiler.

To the Editors:

When I returned to St. Louis, Mo., I found on my desk a copy of your paper of the date of March 23, containing an editorial on and an abstract from Professor Breckenridge's paper before the Western Society of Engineers, read on March 20, 1907, entitled: "A Review of the United States Geological Survey's Fuel Tests Under Steam Boilers." The editorial gives the impression that the efficiency of a boiler as a heat absorber is constant when reckoned on all of the heat actually generated. This is nearly true, but the exact statement is that the efficiency is constant, or very nearly constant, when reckoned on the heat available to the boiler, counting as available that heat which remains from the heat generated after deducting out the heat required to raise all of the gases passing through the boiler from atmospheric temperature to steam temperature. As an illustration, it is easy to see that if a boiler were infinitely long, thus having a true boiler efficiency of 100 per cent, even then it could never cool the gases below its own steam temperature. The boiler should not be blamed for not absorbing this remnant of heat which is required to heat the gases of combustion from atmospheric temperature to steam temperature.

We wish the public distinctly to understand that this idea of constant boiler efficiency is as yet only tentative, and I believe Mr. John Perry so considered it. The fact remains that as yet we have found nothing to contradict it and dozens of facts and experiments to substantiate it.

Also please state in the description under Fig. 1, on page 397, the fourth line should read "No. 2, CO₂ in flue gases" instead of CO; the subscript 2 has evidently dropped out.

WALTER T. RAY,

Assistant Engineer, Boiler Division, St. Louis, Mo.
St. Louis, Mo., April 8, 1907.

Statistics show that between the years of 1895 and 1905 the steam railroads of Massachusetts decreased their mileage on main and branch lines 9 miles, while electric railways increased their mileage by 1,550 miles. The electric railways, it might be mentioned, are still reaching out their lines to better accommodate the great traveling public.

TRAINMEN AID IN INSPECTION AT DUBUQUE, IA.

The Union Electric Company of Dubuque, Ia., has adopted a very unique method of inspection which, in the absence of regularly employed inspectors on the system, materially aids in the operation and maintenance of the railway property.

Each conductor on the various divisions is required to fill out daily a report blank. These reports contain the following instructions:

Delays: Report all delays during the day, stating place and length of time of each delay, including time held on turn-outs (names of conductors and motormen causing delay), failure of power, derailment or disability of cars, delays at railroad crossings, fires and any other causes of unusual interest.

Accidents: State briefly all accidents occurring on or about your car; also state fully any trouble you may have had with passengers, and all disturbances, of whatever nature, that may have happened on your car during the day.

Track: Report all defects in track.

Cars: Report anything that is out of order about your car. Motormen will also report in a book provided at the barn. Urgent matters must be reported at the end of your trip to the office, in person or by telephone.

Running Past Meeting Points: This is positively forbidden under any circumstances other than those stated in the rules and regulations; report under this heading all such circumstances.

Overhead Line: Report all defects in overhead line.

Found Articles: Should be reported; also state when and where found.

Miscellaneous: Report all information, not classified elsewhere, that you think the company should have.

When these blanks, properly filled out and signed, are turned in to the superintendent's office, written orders are issued by the superintendent for the repair of all defects in equipment, tracks or lines, as reported. As soon as the required repairs have been made the man in charge of the work places his O. K. on the order and returns it to the superintendent. From these reports and order slips the superintendent's daily report, which is kept as an office record, is prepared.

The superintendent's report, which is known as the railway daily operating report, is printed in blank on the obverse side, on a good grade of paper, 4½ by 12 inches in size. On the reverse side of the paper the following instructions are printed:

Report fully by route the cause of all delays.

Report briefly by route all accidents. Report fully all disturbances.

Report defects in track, overhead lines and other property of the company. State if the same have or have not been reported to the person in charge, and, if reported, the date and time of the report.

Report defects in cars and car equipments. State whether same have or have not been reported to person in charge, and, if reported, date and time of such report.

Report fully cases of running past turn-out switches, stating route, time, place and cause of same, and names of men in charge of the car so doing.

Report the names of all employes discharged or laid off and the reason for the same.

Report by route the length of time power is off, giving the time of day of the same.

Report troubles with overhead lines; also time same were reported to the repairmen and time repairs were completed.

Report the purpose and length of time extra cars are operated during the day.

Report all articles found and turned into the office, stating the time, route and name of conductor who found the article.

Report the names of men employed and place of last employment; and state what work they are to do.

Report all extra teams and help employed and extra work ordered done.

Report all miscellaneous matters of interest to the company.

This system of reporting all defects observed in the company's property has developed a very thorough system of inspection without extra expense to the company. The trainmen have willingly obtained and reported unusual occurrences and unusual conditions; and incidentally they furnish to the company much valuable information. To increase the effectiveness of the daily reports the operating superintendent,

Mr. G. E. Miller, holds informal conferences with the employes once a month, and encourages them to discuss the operating features of the railway and to present their ideas as to the best methods of meeting unusual conditions that may arise.

CHICAGO CITY RAILWAY ACCEPTS NEW ORDINANCE.

Directors of the Chicago City Railway Company and of a new controlled company, the Chicago City Railroad Company, voted on April 12 to accept the ordinance which was approved on April 2 by the voters of Chicago. The formal acceptance, it was announced officially, will be filed with the city clerk on April 15. Under the terms of the ordinance the company is allowed 90 days from April 2 in which to file its acceptance and a bond for \$100,000 to indemnify the city against damages which may be suffered by reason of the privileges granted in the ordinance. This early acceptance will facilitate the improvements contemplated.

The subsidiary company, the Chicago City Railroad Company, was formed in January of this year in anticipation of the approval of the ordinances at the April election. The company was formed in accordance with a clause which provides that the obligations of the Chicago City Railway Company to construct, reconstruct, equip, re-equip and operate street railways, tunnels and subways may be discharged either by the company itself, or at its election, either in whole or in part, through the agency of the Chicago City Railroad Company. The Railroad company assumes all the obligations, assumed or imposed, as to street railways, tunnels and subways within the north and west divisions of the city; and under this clause will be responsible for the operation of the through routes of the Chicago City Railway Company cars in those two sections of the city.

Plan to Consolidate Companies.

The Chicago traction ordinances will lead to a financial readjustment of the Chicago City Railway Company. Those who are now in control of this company propose to authorize an issue of \$50,000,000 first mortgage 5 per cent bonds.

When the syndicate offered to pay \$200 cash for the \$18,000,000 outstanding stock of the Chicago City Railway Company, it acquired about 90 per cent of the stock. In the intervening period, while the outcome of the negotiations with the city has been in doubt, the stock has sold considerably below this figure, and it is stated on good authority that the syndicate now owns nearly all of the stock. While the plan of readjustment has not been officially announced, it is said by members of the syndicate to be substantially as follows: For each share of stock, par value \$100, the stockholders of the Chicago City Railway Company will receive \$100 in the new bonds and \$100 in stock of the Chicago Railways Company. The Chicago Railways Company will later acquire the properties of the Chicago Union Traction Company and under this plan will then control the systems in the three divisions of the city. The new bonds will mature in 20 years.

The City Railway ordinance stipulates that the property of the company shall be taken as worth \$21,000,000, as of June 30, 1906. The company has outstanding \$3,000,000 in notes, which will be redeemed, but as these represent additions to the property, the company would be entitled to pay 5 per cent on \$24,000,000 before there is any division of net profits with the city. The view of the syndicate is that these bonds, representing the agreed purchase price, should the city buy the property, will in effect be guaranteed by the city of Chicago.

Assuming that \$18,000,000 will be required by the Chicago City Railway Company for rehabilitation additional bonds to that amount will be sold, leaving \$8,000,000 which can be used for additional construction. The city, under the ordinance, agrees, if it purchases, to pay the cost of new improvements, which are charged to capital account. The City Railway Company also will be entitled to profits of 10 per cent

on construction and of 5 per cent for brokerage on the sales of securities. On the estimated expenditure of \$18,000,000 this will be \$2,700,000 which, the syndicate figures, the company will be able to capitalize and issue to shareholders as a bonus.

New York holders of a majority of the outstanding stock of the Union Traction Company have united in a declaration of trust, appointing five custodians of the franchises, which are to be deposited with the Central Trust Company of Illinois. The custodians are: Chauncey Keep, Charles G. Dawes, A. C. Bartlett, Charles H. Hulburt and A. A. Sprague, Sr. Henry A. Blair, one of the receivers for the Union Traction Company, believes that the affairs of the company will be in such shape within a month that contracts for improvements can be entered into.

Board of Engineers.

Bion J. Arnold is taking preliminary steps which will facilitate the work of the board of supervising engineers when the other two members are appointed. It is understood that the engineer who is to be nominated by the railway companies will be named very shortly after the Chicago City Railway Company formally accepts its ordinance. The first step will be the organization of the working force. The first matter to be decided upon by the engineers will be the form of track construction which is essential in order that the necessary materials may be ordered.

In their work the engineers will have in mind the probability that subways will be constructed eventually to lessen the congestion in the central district. These subways will be so planned that they will permit important extensions in the north, the south and the west divisions of the city.

New Substation.

The Chicago City Railway Company has let contracts for a new substation, which will be built at Wabash avenue and Forty-second streets. The substation will have a capacity of 6,000 kilowatts.

Contracts for Cars and Rails.

The Chicago City Railway Company has let contracts to the Lorain Steel Company for 5,000 tons of rails of the section illustrated in the Electric Railway Review of April 6, 1907, page 457, and to The J. G. Brill Company for 300 cars. These cars are substantially of the company's standard type, but the seats will have steel pedestals instead of cast-iron pedestals, and the gear cases will be of sheet steel instead of malleable iron, as in the old cars. Ventilators will be installed in the transoms at the ends of the cars.

The Chicago Union Traction Company has ordered 10,000 tons of rails from the Lorain Steel Company. This company received on March 30 the first two cars of 103 cars which are under construction by the St. Louis Car Company.

The Non-Partisan Association.

The success of the traction ordinances was due in large part to the campaign which was conducted by the Citizens' Non-Partisan Traction Settlement Association. This association represented 88 non-partisan organizations of the city with an aggregate membership of more than 100,000 persons who were pledged to vote for the ordinances.

The association conducted its campaign largely through circulars which were mailed under a 1-cent permit. The last circular contained on its face a picture of an electric car running out of a ballot-box. A large hand was shown dropping a slip marked "yes" into the ballot-box. The association sent with this circular a map showing the 21 through routes provided in the ordinances. This circular said: "One of the through routes will give us for five cents the longest car ride in the world without changing cars, viz., from Jackson park on the south side to the city limits (Howard avenue) on the extreme north side. For one fare and by transferring once you can ride 21½ miles in one direction."

In a statement to voters which was made public on March 30 the association emphasized that the ordinances are not

"snap" ordinances in any sense of the word, but are the product of the best legal and professional advice the city of Chicago has been able to secure. The association said that the ordinances conceded to each interest all that is due such interest in law, and at one stroke they clarified a situation which, if the courts were resorted to, would require years of litigation to settle.

Frederick A. Bode, president of the association, in a statement said: "We are gratified because we feel that we have lifted the traction problem to a plane above that of party politics. The victory shows that the power of the non-partisan organization far exceeds that of one political party, provided the movement is in the right direction."

IMPROVEMENTS ON THE METROPOLITAN ELEVATED, CHICAGO.

In the annual report for the year ended on February 28, 1907, the figures for which were given in the Electric Railway Review of April 6, 1907, H. G. Hetzler, the president, speaks of the following improvements:

Rotary converters were installed and ready for use at the Robey street and Forty-sixth avenue substations during October. Since that time power has been purchased from the Commonwealth Electric Company, making it possible to handle the heavy loads of the morning and evening rush hours in an efficient manner, and at the same time relieving the power house during the night hours and allowing necessary repairs to be made without interfering with the service.

Arc lights have been installed at the intersection of our structure with public streets, in accordance with the city requirements.

A sidetrack connection has been built between the tracks of the Aurora Elgin & Chicago Railroad and the Chicago Terminal Transfer Railroad, a short distance west of Fifty-second avenue, enabling your company to effect quite a saving and convenience in the handling of material in carload lots.

A loop has been installed at Desplains avenue, and the handling of trains at that point greatly facilitated. Fifth avenue trains on the Garfield park branch are now running through to Desplains avenue during the morning and evening rush hours, and an all-night schedule is maintained on this part of the system.

On account of the elevation of the Chicago Burlington & Quincy, the Chicago & Northwestern and the Chicago Terminal Transfer railways at Sixteenth street, on the Douglas park branch, the tracks of your company have been raised approximately 14 feet without interruption to the service.

The extension of the Douglas park branch to the Western Electric Company, at Forty-sixth avenue, has been practically completed and will be ready for operation about May 1, 1907.

The elevated storage yard at Forty-sixth avenue, Garfield park branch, has been abandoned and a new yard of greater capacity has been built on the surface at Fifty-second avenue.

The increased earnings and satisfactory physical condition, together with a healthy growth in the volume of business, warranted your directors at their January meeting in placing your preferred capital stock on a 3 per cent dividend basis.

The equipment, structure, track and buildings have been maintained in good condition and all requirements for safety have received careful attention.

Shop Practice for Motormen at Cedar Rapids, Ia.

The Cedar Rapids & Iowa City Railway & Light Company requires its motormen to spend four weeks out of each year in the company's shops at Cedar Rapids. This service is divided into periods of two weeks each and the motormen are allowed the wages usually earned while engaged in their regular work at the front end of the car. This method of keeping the motormen familiar with the car equipments was introduced several years ago and has proved very gratifying in the operation of cars. After having once been employed in the shops the men become familiar with the work required of them and render valuable assistance in the work of repairing cars.

The Detroit Jackson & Chicago Railway is installing nine new switches between Ann Arbor and Detroit, Mich., and will operate a half-hour schedule beginning on May 1.

CAR HOUSE AND SHOPS AT KNOXVILLE, TENN.

Finding it necessary to provide new quarters in which to repair and house its rolling stock the Knoxville Railway & Light Company has recently constructed new buildings at the corner of Magnolia avenues and Jasmine street, Knoxville,

Car House and Shops at Knoxville—Locker Room.

ville, Tenn., that are in keeping with the very interesting railway system in operation in that city. The new repair shops and car houses were occupied early in the summer of 1906 but were not entirely completed until fall.

In designing the new buildings an effort was made to use construction materials of such composition that the buildings were made as nearly fireproof as was possible. The foundation of the buildings is of concrete, the superstructure is of brick, and the roof design, which in the shop is of the saw-tooth type, is of lattice-truss and purlin construction. Kinnear steel rolling doors are used throughout.

The structure is not elaborate in design, though ample

Each one of these is separated from the others by corrugated iron partitions and all open directly into the pit room.

Brass Furnace.

The blacksmith shop is one of the interesting sections of the building. In the space provided for this department is located a motor-driven air-furnace, a brass and babbling fur-

Car House and Shops at Knoxville—Brass Furnace.

nace and a cabinet for the storage of the castings made at the shops.

The brass furnace, shown in one of the illustrations, is of 100 pounds capacity. It is used in melting scrap metal for casting gongs, trolley wheels, journal bearings and car fittings of every description. Up to this time the company has limited the runs to the amount of scrap metal accumulated, but later it is expected that all new fittings will be made here.

The furnace is fired up every two weeks. The moulding sand is kept, when not in use, in a large bin located at one side of the shops. The patterns are made in the carpenter shop and are stored in cabinets in the paint shop. The mould-

Car House and Shops at Knoxville—Exterior View, Showing Saw-tooth Roof.

room is provided for storing and repairing the entire number of cars owned by the company. The space occupied by the shops and the car repair shops is 178 feet 4 inches by 95 feet 6 inches in area. The first bay, 27 feet wide, on the west side of the structure is set off for the blacksmith and machine shops and the armature, wash and store rooms.

ing work is superintended by a moulder, who at times when not engaged in his regular work acts as helper to the blacksmith. The furnace used in heating babbitt for journal bearings is also shown in one of the illustrations.

In making its bearings this company has obtained very satisfactory results from the babbling device furnished by

the Frank Ridlon Company which, it is claimed, imparts a desirable temper to the wearing surface of the babbitt and does away with the necessity of reaming out the metal after it has been cast.

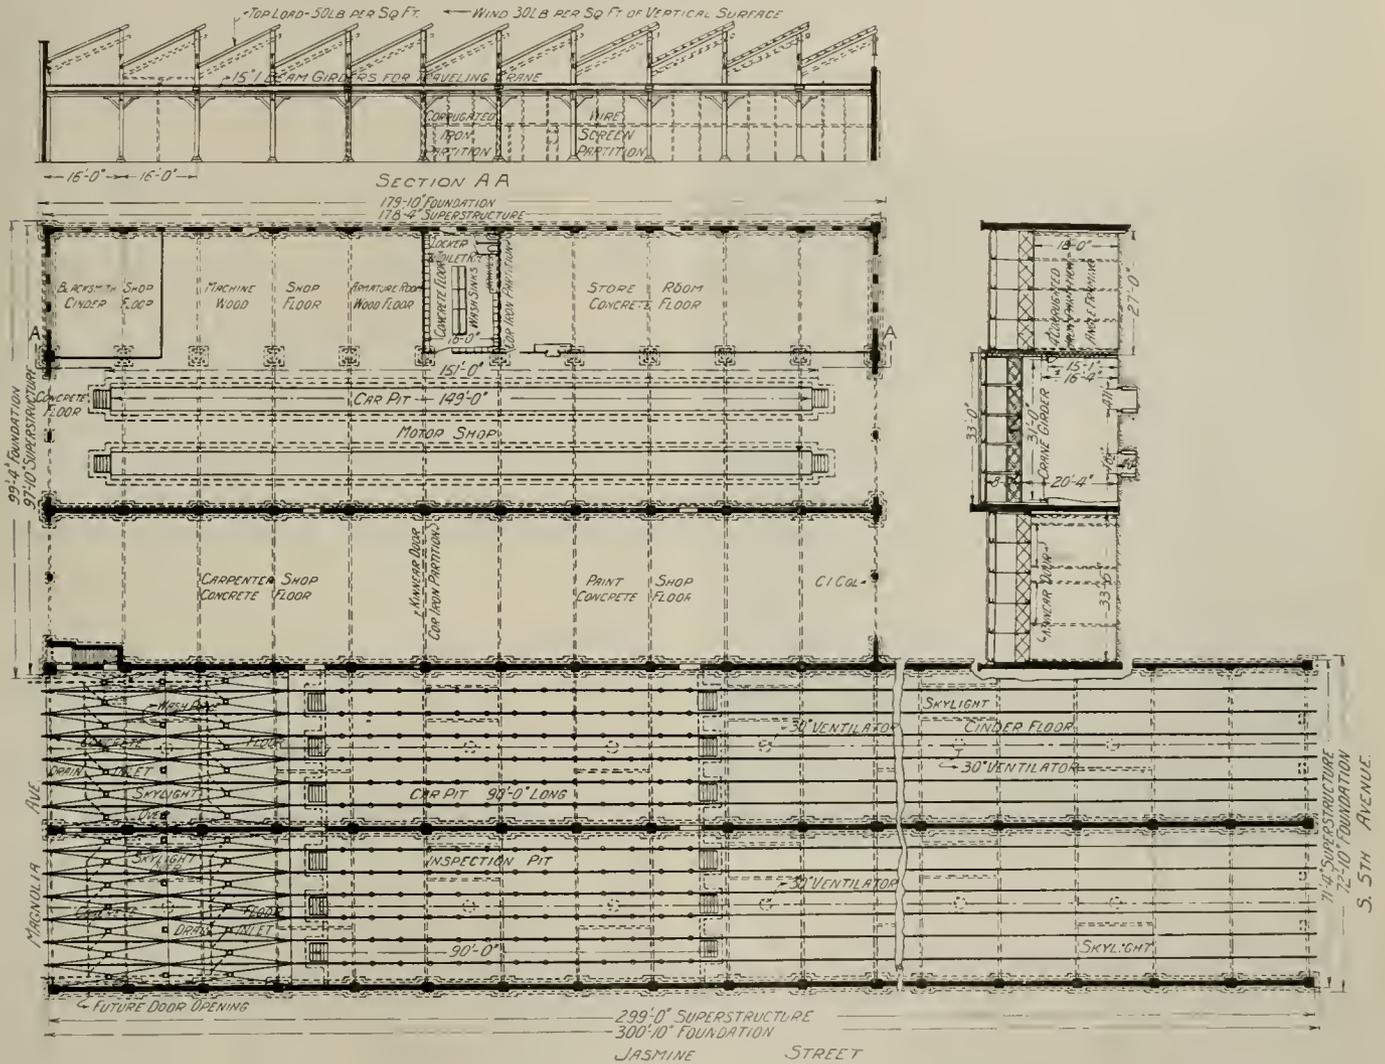

Machine Shop and Tools.

A space 27 by 40 feet is set aside for the tools in the machine shop, located just north of the blacksmith shop. The tools installed here are a 40-inch boring mill, 100-ton wheel press, 24-inch drill press, McCabe double lathe (24 and 40-inch swings), engine lathe with a 16-inch swing, a power saw, 18-inch shaper and an emery grinder. These tools are operated by line shafts driven by a 10-horsepower General Electric motor. In the armature winding room, adjoining the machine shop, is located a 22-inch lathe which is used in

copies the north wall of the room. The board is 6 by 8 feet in size and contains 220 incandescent lamps of 32 candle-power each. Switches located at the bottom of the board make it possible to cut in any resistance desired for testing purposes. In addition to these board switches there are located on a panel, stationed to the west of the test board, several knife-blade switches which are so connected with the feeder wires that the electricians can cut in as resistance all the lamps on the lighting circuit throughout the building. The test board as shown herewith is used in testing armatures, field coils and car wiring in the railway department and transformers in the lighting department.

Store Room.

The store room, 27 feet by 79 feet 6 inches in area, oc-

Car House and Shops at Knoxville—Plan of Car House.

banding armatures. The winding room is served by an overhead track on which triplex hoists are used.

The Knoxville Railway & Light Company operates 27 cars on its winter schedule and has in storage 30 other reserve and summer motor cars and 14 trailer cars. The armature winding is done at the shops, but the company has not found it advisable to make its own coils. Though it is believed this work can be done economically, nevertheless the number of motor equipments operated and the amount of motor troubles, are not sufficiently great to warrant the installation of the apparatus necessary to undertake this work. The armature winding is done by one man who also looks after the transformers and other apparatus for the electrical department.

A testing board with a capacity of over 200 amperes oc-

cupies the northwest corner of the shop, from which it is separated by a wire screen partition. The interior of this room is arranged conveniently with cabinets, boxes and drawers so that the various parts of like equipments can be kept in the same tier of shelves. In addition to four cabinets extending lengthwise of the room additional storage capacity is obtained on a mezzanine floor at the rear and on galleries arranged along the side walls. Supplies for both the railway and the lighting departments of the company are stored here. The office of the purchasing agent and storekeeper is located at the south end of the room. A shop employes' room, in which are located toilets, wash stands and lockers is situated between the store room and the armature winding room.

Motor and Pit Room.

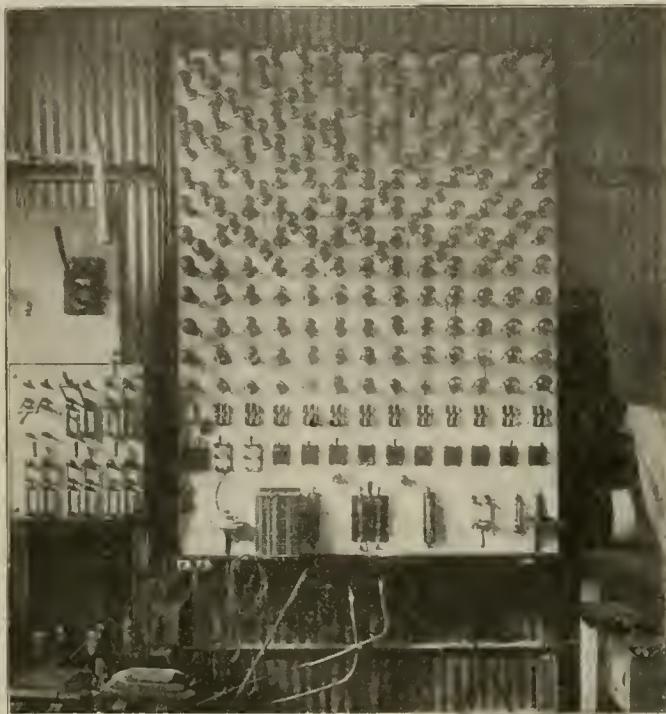

The motor and pit room which occupies the second bay

of the building has a frontage of 33 feet on Magnolia avenue and extends to the rear of the building. Two tracks with 14-foot centers pass through this bay. Pits 3 feet 11½ inches deep, starting at a point 13 feet from the front walls extend under each track a distance of 149 feet. Two traveling cranes each of 16,000 pounds lifting capacity have been installed in this department. The girders on which the cranes travel are composed of 15-inch I-beams which are supported by I-beam braces, steel angle knees and lattice steel columns.

The paint and carpenter shops occupy the third bay. These are respectively 33 feet 6 inches by 79½ feet and 36 by 95½ feet in area and are separated from the pit room on the west and from the car-storage house on the east by brick partition walls. The floor of this bay is of concrete. Both of these departments are conveniently arranged and are equipped for properly handling the repair work on the car bodies.

Car House.

The car house, divided longitudinally into two parts, has a floor space 64 feet 4 inches by 299 feet 4 inches. Three

Car House and Shops at Knoxville—Testing Board.

tracks enter each bay and a pit 90 feet long beginning at a point 22 feet from the front of the building is built under each track. The space at the front of the pits has a sloping concrete floor which is reinforced by strips of expanded metal. This part of the building is provided with drains leading to the sewer and serves as a car-washing floor. Back of the concrete construction a floor of cinders has been laid.

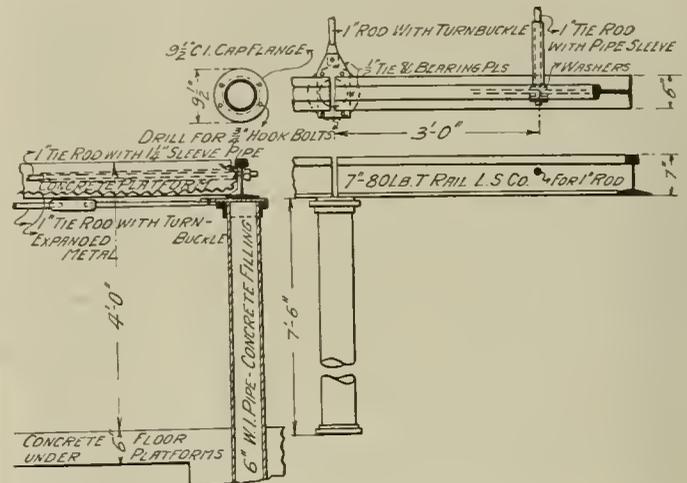

On the second floor and at the front of the car house building a conductors' and motormen's room 16 feet 10 inches by 32 feet 2 inches is provided. This room has lockers and other furnishings for the comfort of the trainmen.

Pit Details.

In developing the pit details for the shop and car house two kinds of construction were found advisable. In the shops where the heavy inspection work is performed concrete pillars spaced 8 feet apart and faced with channel-iron columns are used. The iron facings are grouted and also made secure by two anchor bolts which extend into the pillars. The columns are supported on 6 by 18 by ½-inch wrought-iron plates which rest on the concrete floor of the pits. On the tops of the iron columns are wrought-iron plates to which the rails

and the columns are bolted. In this way the center of each rail is directly over the center line of the supporting pillar. The pillars are designed to support safely a weight of 12,000 pounds each.

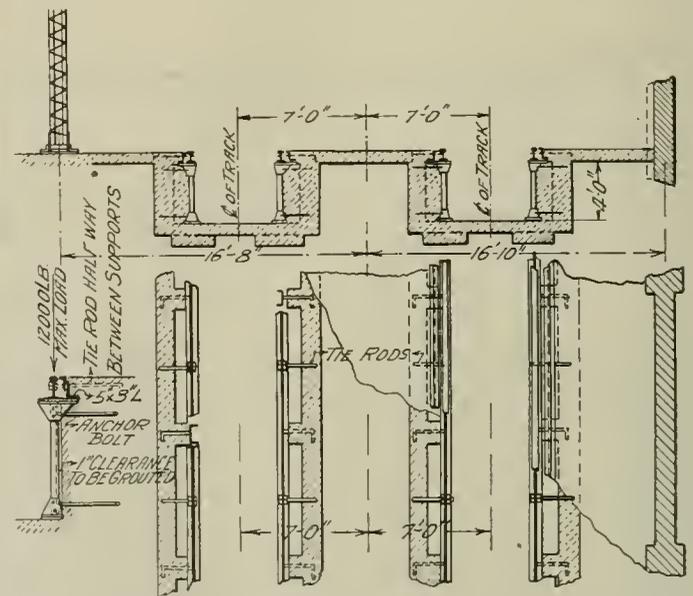

The method of laying the concrete floor where it joins the rails of the shop pits is novel. The concrete is only brought up to the base of the rail. The edges of the concrete

Car House and Shops at Knoxville—Details of Track Pits.

are faced with two single irons bolted together to make a Z-shaped retaining strip of sufficient height to reach the ball of the rail. These angle plates are bolted to the face of the plates on the tops of the wrought-iron columns. This type of construction is designed to allow for future renewal of the steel without interfering with the platform between the pits.

In the car house the rail supports under the pits are composed of 6-inch wrought-iron pipes set three feet deep in concrete and filled with concrete. The upper ends of the pipes

Car House and Shops at Knoxville—Plan and Section of Track Pits.

are capped by flange collars and rail-plates, through which bolts pass and anchor the rails to the pipes. The supports are spaced 6 feet apart and are anchored underneath the concrete platforms by 1-inch tie rods which are provided with turn-buckles to allow for future adjustment. No tie rods are provided in the pits. This form of pit construction has been used on several of the other southern car houses and shops, designed by Ford, Bacon & Davis.

The shops and offices throughout the buildings are heated by an Evans-Almirall hot-water heating system which re-

cently has been installed. The offices of the master mechanic and the train dispatcher are located in a brick structure near the car houses and shops.

Personnel.

The Knoxville Railway & Light Company is one of the companies whose stock is controlled by the American Cities Railway & Light Company. The officers of the Knoxville company are: C. H. Harvey, president and general manager; W. S. Shields, vice-president; Leon Fender, secretary; H. T. Bunn, treasurer and auditor; P. E. Mitchell, general superintendent; T. C. Kelly, superintendent; J. H. Drake, chief engineer; J. M. Kington, master mechanic. Ford, Bacon & Davis are engineers in charge of construction work, with J. H. Drake as resident engineer. The above work was constructed under the supervision of W. F. Kelly, formerly resident engineer at Knoxville, and now resident engineer for the same firm at Birmingham, Ala.

CLEVELAND ELECTRIC RAILWAY REJECTS HOLDING COMPANY PLAN.

A crucial moment in the long-standing controversy between the Cleveland Electric Railway Company and the city administration of Cleveland was reached on Friday morning, April 5, at a public meeting of the city council called for the purpose of receiving the reply of the company to the resolution of the council passed at the meeting on April 2, recommending that the company lease its property to the Municipal Traction Company on the basis of a value of \$60 per share for the stock. The reply of the Cleveland Electric company, after the council's proposition had been considered in two meetings of the directors on Wednesday and Thursday, was expressed in the form of a communication from the board of directors, in which they flatly refused to accept the council's offer and declined to consider any offer to lease the company's property to an "irresponsible lessee." The directors also took occasion to arraign Mayor Johnson and the city administration severely for their persecution of the company and to call attention to the unfairness of the municipal warfare which has been waged against the company.

The communication of the Cleveland Electric Railway to the city council was in part as follows:

The proposition, which we assume you make, acting upon the advice of the mayor, briefly stated, is this:

1. That we lease the property of the company to a so-called holding corporation, upon the agreement of such corporation to pay as rental, for the first year 3 per cent, the second year 4 per cent, the third year 5 per cent, and thereafter at the rate of 6 per cent per year, upon a valuation of the property of the company equal to \$60 per share of its present stock.

2. That you will grant a franchise to the company for 25 years, authorizing the rate of fare of seven tickets for 25 cents.

3. That the lease shall give to the city an option to buy the entire property of the company for a price equivalent to \$66 per share for its present stock.

4. Your proposition does not require the holding company to operate at three cents, and, under your offer, such holding company may charge the same rate of fare now charged by this company.

This offer we respectfully decline, and now decline to consider any offer to lease the property of this company to an irresponsible lessee; and it seems to the board of directors appropriate in this connection to state to you, and the citizens of Cleveland, its reason for so doing, and to call attention to the unfairness of the proposition and of the municipal warfare which, under the present mayor, has been waged against this investment of Cleveland capital for the past six years.

The communication then goes on to state that the property of the company is largely owned by citizens of Cleveland, that it has been an important factor in the development of the city, that its service is first-class, and that such an investment should receive from the city administration the same fair treatment and protection that are accorded to other investments of Cleveland citizens, but that for the past six years the company has been persecuted by the mayor, using the entire power of the city government, and the company's officers and directors have been criticized and maligned.

It has been charged that the company has been operating

under grants that authorized an unreasonable rate of fare and that its system could be operated at a 3-cent fare; and the mayor has caused to be organized and has become financially interested in a company which has offered to lease the property and operate it at a 3-cent fare. The Cleveland Electric company has at all times maintained that its system could not be operated for a 3-cent fare, and in 1904 made, at the solicitation of the mayor, a two weeks' practical test at that rate, which cost the company about \$25,000 and which showed practically no stimulation of traffic, as the mayor had claimed would result from low fare. The mayor has refused to acknowledge the fact publicly and has been insistent upon the holding company plan. The directors, to test the fairness of the mayor's pretensions, have entered into negotiations for the purpose of arriving at an agreed valuation of the company's property and have followed the basis fixed for determining the valuation laid down by Mr. du Pont. As soon as it became evident that the valuation would exceed the price publicly stated by Mr. Johnson as the maximum at which the holding company arrangement could be made, the methods prescribed by Mr. du Pont were repudiated and Mr. du Pont reported a valuation which could not be justified on the principles as laid down by him. The original offer of the holding company was to operate the system with a 3-cent fare, but when the Cleveland Electric proposed to incorporate such a requirement in the lease to the holding company, the mayor refused to agree, and had admitted that it was not proposed to operate the entire system at three cents, but to charge five cents beyond the city limits. At the last meeting of the city council the mayor was asked by President Andrews:

"Will you incorporate in your lease a provision that the rate of fare charged by the holding company shall be a 3-cent fare inside of the city and five cents out of it, and that, if it charges more than that, the franchise can revert to us?"

To which he replied that he did not think it was any of Mr. Andrews' or his company's business, and that, so far as he was concerned, he would not put it in.

In regard to the rate of fare upon which the property of the company can be operated the communication says that after conducting an experiment since January 1 with 5-cent cash fares and seven tickets for 25 cents, the company is entirely satisfied that the system cannot be operated and maintained and good service rendered, allowing reasonable interest upon the value of the physical property at a less rate, and that this is fully corroborated by a report made by a committee of the chamber of commerce after an impartial investigation and an examination of the books of the company. The company is willing to have a thorough investigation made at any time by impartial experts and will abide by the result obtained. Operation thus far under this rate of fare has shown a decrease in gross receipts approximating 20 per cent as compared with the rate of fare authorized by the company's franchises. However, the company has been anxious to meet more than half way any reasonable demand of the public, and, relying on the future growth of the city, has made to the council a proposition for a 20-year franchise at the present rate, namely, five cents cash and seven tickets for a quarter.

The reason heretofore given for refusing a franchise under these terms has been the mayor's offer to operate the property at a 3-cent fare and to pay a rental of 6 per cent, and now the mayor having made an arbitrary valuation, as the highest at which he thinks it can be operated at three cents, refuses to bind his holding company to operate at three cents.

To lease the company's property to an irresponsible company would give no assurance to the public that it would be better operated than now and, moreover, would put it in a position to be mismanaged and run down.

The company's proposition is to surrender its present franchises permitting a 5-cent fare and 11 tickets for 50 cents and to give the public at once the benefit of reduced fare in return for a new franchise which would amply protect the rights of the city. The company desires to meet the demands of the public for good service, and its offer includes an obligation to provide such service. To do so would require the expenditure of from \$3,000,000 to \$5,000,000 within the next two years and \$1,000,000 each year thereafter. Any company managing the property must be placed in a position to guarantee that such new money may be safely invested by its stockholders or others, and that such investment will receive such adequate return as will invite its being made by conservative investors, and it is not believed that the irresponsible holding company proposed can either itself adequately finance and develop the property to meet the city's needs or give to this company any assurance that will enable it to do so.

In conclusion the communication says:

"It is evident from the experience of the past few years

that this company cannot expect fair treatment in negotiation so long as the domination of the mayor is permitted to impose upon the council and the public his impossible suggestions. We are now offered the alternative of submitting to what is a virtual confiscation of a large part of our property or to further persecution and to disruption of the system which has taken years of patient endeavor and millions of money to develop, all that one man's political success may be obtained. The mayor forces this company into the position of having to return to the legal rate of fare, much as it regrets the necessity therefor.

"If there can be pointed out to us any legal way by which the city and ourselves can submit the rate of fare to be fixed in a franchise to us to impartial and experienced arbitrators, or any legal way in which a referendum concerning our proposition can be made that would be binding, we shall be very glad to take action along either of those lines.

No action was taken by the council. Mayor Johnson said that he would reply to the communication later, but attempted to explain his position on the proposition to include in the lease a provision for a reversion of the property to the old company in case the holding company failed to operate at a 3-cent fare in the city and a 5-cent fare outside the city.

"I'm entirely willing to recommend the limitation asked by the company if it be framed in reasonable words," he said, "that the lease should be forfeited to the company if the holding company raise the price over three cents within the city and five cents outside the city. I came here today prepared to yield if all other things were agreeable, and I will be entirely willing that the city put into the lease that the franchise shall be forfeited if a higher rate of fare be charged save under abnormal conditions."

Councilman Haserodt then asked Mr. Andrews if his company would be willing to consider the holding company plan with this stipulation in the lease or whether its reply was final.

"The answer of the communication is final," Mr. Andrews replied. "The rate of interest for the first five years is not satisfactory; the price is not satisfactory. The refusal to consider the holding company offer must be considered final."

Immediately following the close of the meeting the Cleveland Electric company issued an order stopping the sale of the seven-for-a-quarter tickets, and returned to the old rate of 5 cents cash and 11 tickets for 50 cents, except on the Central avenue and Quincy street lines, which are operated at a 3-cent fare under a special license.

Another public meeting of the council was held on Monday morning, April 8. The special council committee presented a communication in reply to the communication of the Cleveland Electric Railway, in which the charges of persecution by the city authorities are mildly denied, and it is stated that the council has never harassed the company but has always shown a disposition to deal fairly with it. The committee's conclusion is that the company's refusal is in reality based on a disagreement as to price, and it is ready to confer with the representatives of the company and will protect fully its legal rights; the council should continue to grant the right to construct necessary street railroads to those who will perform the public service required at the lowest cost and with the largest reservation of power in the hands of the council. The committee concludes by stating that the council has already expressed its willingness to submit the best offer of the company and the best proposition that can be got from any other company to a referendum vote, provided all parties could agree to be bound by the results.

From the general tone of the committee's communication it is evident that it does not consider the company's refusal as final.

Mayor Appeals to People.

Mayor Johnson, however, followed with a statement which indicates that he and the 3-cent fare interests recognize that a renewal of the fight is imminent. After a brief general reply to the Cleveland Electric communication, which he affected to consider as a personal attack, he concluded by a direct appeal for aid in financing the low-fare movement. He said that about \$10,000,000 would be required for building

the street railway system and he asked that it be subscribed by the people, promising 6 per cent interest on the investment. It is generally understood that the low-fare interests have failed in several efforts to enlist capital in their enterprise among financiers. The mayor announced that a committee would be organized to carry on the campaign and that plans would be made for a series of mass meetings, beginning about the last of this week.

At the regular meeting of the council on Monday night four ordinances were introduced, all having an important bearing on the controversy. The first seeks to establish a transfer point at Superior avenue and West Ninth street, and provides that the Cleveland Electric must exchange transfers with the Municipal Traction Company. In three ordinances the Low Fare Railway Company asks franchises over two lines now occupied by the Cleveland Electric under grants expiring next February, and over a crosstown line on which the Cleveland Electric's grant does not expire for several years.

Preliminary steps in the campaign for financing extensions of the low-fare system were taken on Tuesday afternoon, when the mayor and others interested in the movement met in the offices of the Municipal Traction Company and formulated plans. The mayor also made a public address on the subject that evening at a ward club, in which he announced that subscriptions to the stock of the Forest City Railway Company would be received in amounts from \$10 up.

An indication of the campaign methods the mayor intends to follow was given at a meeting of the Sycamore Club on Wednesday night, when the mayor made another speech asking for popular support for his company. As it was ladies' night at the club, he addressed his remarks especially to the ladies, saying that this new campaign is one in which they should take part. At this meeting Municipal Traction Company subscription blanks were publicly distributed for the first time. The form circulated contains an agreement to subscribe for a certain number of shares at par, for which the subscriber agrees to pay in weekly or monthly instalments.

H. J. Davies, secretary of the Cleveland Electric company, and A. B. du Pont, president of the Municipal Traction Company, agreed to hold a meeting on Thursday morning to take up the question of the sum which the Cleveland Electric owes the city for use of the Central and Quincy lines since the expiration of the franchises. Meetings of the Cleveland Electric directors were held on Wednesday and Thursday afternoons, but nothing was given out.

DENIES BRIBERY AT SAN FRANCISCO.

In his annual report as president of the United Railways Investment Company, which controls the United Railroads of San Francisco and the Philadelphia Company of Pittsburg, Ernst Thalmann makes the following denial regarding the charges of bribery at San Francisco:

Interests identified with the United Railways Investment Company state that they have the most positive assurance from the officials of the United Railroads of San Francisco that no bribery was resorted to in order to obtain the permit to replace their cable roads with overhead trolley. In connection with this, it is important to bear in mind that prior to the earthquake the Merchants' association of San Francisco had employed William Barclay Parsons to advise its members as to what form of motive power was best in the interests of the city of San Francisco.

Mr. Parsons reported strongly in favor of the overhead trolley system, and his report carried such weight that the directors of the Merchants' association, who had been bitterly opposed to overhead trolley operation, became practically unanimous in its favor. This action was followed by a practically unanimous vote of the real estate board, another important organization in San Francisco, and the action of these and other important associations had the effect of creating a public opinion, prior to the earthquake, decidedly in favor of the overhead trolley permit. It is claimed that even if no earthquake and fire had occurred, the permit would have been granted, as public opinion was greatly in its favor.

News of the Week

Iowa Associations to Meet in Convention.

Everything will be in readiness at Clinton, Ia., Tuesday night for the opening of the annual convention of the Iowa Electrical Association and the Iowa Street and Interurban Railway Association. The electrical association will convene Wednesday morning and have a continued session Thursday, and the railway association will convene Thursday and close Friday evening. Many of the manufacturers' exhibits have already been placed in the exhibit halls at the new Lafayette Inn, where the headquarters of the two associations have been established.

Michigan Strike Settled.

The strike of 200 employees of the Michigan United Railways on the city lines in Kalamazoo, Lansing and Battle Creek, Mich., as well as the interurban lines between those cities, was declared off on April 9, after the demands of the men and the offer of the company had been arbitrated by a committee of the Kalamazoo Commercial Club. The strike was declared on April 3 and the service was greatly demoralized, although some cars were run. The agreement was reached on a basis of 21, 22 and 23 cents an hour on city lines and 24 and 25 cents on the interurban lines, which was practically what the men had demanded, but with no recognition of the union. The company also agrees to establish a mutual grievance committee. The men formerly received 18, 19 and 20 cents an hour.

Ambassador Bryce on Municipal Ownership.

In addressing the Commercial Club of Chicago on April 6 Ambassador Bryce of Great Britain spoke of municipal ownership. He said in part:

"The precondition of municipal ownership of public utilities should be the presence in office of honest and capable public servants. We in England, where municipal ownership is sometimes found, do not experience the difficulties which might be found elsewhere. Our city administrations are uniformly honest and efficient. Politics, that is, specific party issues, enter very little into municipal elections. But in American cities I have noticed that the moral condition of municipal administrations is less stable and reliable.

"American cities seem to be subject at times to spasms of virtue in which the ill-intentioned are swept out of office, but those periods of reform are too often followed by relapses. Civic virtue is indispensable to the economic and efficient administration of the business of public service corporations."

Further Hearing on New York Central Wreck.

The New York state railroad commission on April 9 took further testimony in its investigation of the wreck which occurred on the New York Central electric division on February 16. The commission listened to an account of the experience of the motorman, Beale, who described the sensation experienced in going over the track on the train preceding the one that was wrecked. After this trip he had reported the track as very rough and needing attention. Mr. Beale said the engine made a lurch from one side to the other and then straightened up. He made a jump for the brake valve, but had no occasion to use it. At the close of the session the commission requested records regarding superelevation of the track at the curve, taken for as many years back as possible, and was informed that the company had compiled since the wreck statistics of this nature covering a period as far back as 1895, and had verified them. Mr. Hedges of the commission expressed the opinion that due to wear and weather conditions the regular superelevation of 4½ inches might settle to 4 inches unless carefully watched.

Growth of Electric Railways.

Charles N. Wilson, president of the American Engineering Company of Indianapolis has an article in The Tradesman for April 1 entitled "Electric Railway Construction in the Central States," which describes the wonderful progress of the electric railway industry in those states. Mr. Wilson points out that:

"On January 12, 10 years ago, the first electric car was operated in Indiana, and in the same month and year the first electric car was started in operation in Ohio; since that time 1,650 miles of modern electric railroads have been constructed and put in operation in Indiana, and 2,240 miles in Ohio. In addition to this there is now building in the two states 2,000 miles of new road and an equal mileage is being promoted.

"As soon as the gap of 30 miles is built between Crawfordsville, Ind., and Danville, Ill., and another small gap between Ft. Wayne, Ind., and Bryan, O., it will be possible to take a car at St. Louis, and by continuous electric road travel to Indianapolis, Louisville, Cincinnati, Dayton, Toledo, Detroit, Cleveland, Erie, Pa., and Buffalo, N. Y., and at no distant day to Pittsburg. All this will probably be a reality within another year."

In conclusion the writer points out that interurbans build up small towns, enhance the value of farm lands and agricultural products, increase the attractiveness of farm and suburban life, tend to solve the help problem in rural communities, etc.

Test in Connection with Woodlawn Wreck.

On April 4 the New York Central sent a test train over the electric zone, under conditions of weight and speed similar to that which was wrecked at Woodlawn on February 16. The train was made up of two electric locomotives and five old wooden coaches similar to those which were in the wreck. The train was in charge of W. C. Brown, senior vice-president, and on board were other local operating officers of the road. The state railroad com-

mission was represented by J. E. Hedges, counsel, and Charles Barnes, electrical expert. W. J. Wilgus represented the railroad's electric commission, W. E. Hoyt the American Locomotive Company and W. B. Potter the General Electric Company. E. R. Rogers, who operated the wrecked train, was in the cab of the test train directing the operation of the speed controllers so as to duplicate, as far as possible, the wreck conditions. A number of invited guests were on the train and the total weight required was supplied by bags of sand. The locomotives were provided with instruments for measuring and recording the speed and the usual electric meters. On the first run the train approached the Woodlawn curve at a speed of 56 miles per hour, went on the curve at 53 miles per hour, and was running 43 miles per hour at the apex. In the second run the curve was approached at 60 miles per hour and the apex was rounded at 56 miles per hour. The test was expected to throw some light on the cause of the wreck, but it failed to reveal any cause for the former train leaving the track.

Report on Pittsburg Subways.

The executive committee of the rapid transit commission of the Pittsburg city council on April 5 submitted its report in regard to the construction of a subway system for the city. The committee recommends that the subway be built by a private company and its recommendations are included in the provisions of an ordinance giving a franchise to the Pittsburg Subway Company, whose application has been pending before the council for several months.

The ordinance provides for a sub-surface line with a downtown loop; option of purchase by the city after 25 years; universal transfers; maximum fare of 5 cents and a graduated payment to the city for the franchise. It is provided that the franchise shall be limited to 50 years. After 25 years the city may purchase the subway by paying the original cost, plus 25 per cent, and giving the officials of the subway one year's notice. No charge is to be made for the franchise during the first five years. The second period of five years the city is to be paid 2 per cent of the gross receipts, this to be increased one-half of 1 per cent each period of five years, making for the last period 6 per cent. It is proposed that the subway shall carry cars of any other subway company and give transfers.

Considerable discussion arose over whether the committee should commit itself wholly to a subway, rather than an elevated, and a clause was inserted declaring public sentiment to be against elevated lines.

Overcapitalization is to be prevented by a clause which says that no dividend shall be paid exceeding 2 per cent of the price fixed at which the city may purchase the roads.

The commission decided to take final action on the report at its meeting on April 15.

Legislation Affecting Electric Railways.

Illinois.—The house on April 5 passed a bill limiting the hours of labor for street railway conductors to 10 hours a day, to be performed within 12 consecutive hours.—A bill was also passed on the same day which provides for modern air brakes and vestibules on all cars, and closed vestibules from November to March, inclusive; also for heating apparatus that will keep the temperature at a minimum of 50 degrees. The bill also provides that each car shall have center aisles and fenders and that all cars over 30 feet long shall be double-trucked. Side running boards are prohibited.

Iowa.—The bill now before the legislature in regard to vestibuling the front platforms of electric cars requires that the platforms be enclosed on all four sides, instead of on three sides, as reported in the Electric Railway Review of March 30, 1907. The present law requires that three sides be enclosed.

Michigan.—Senator Cady has introduced a bill which permits an electric railway company to acquire the property of another company on the consent of a majority of the stockholders of the company to be acquired, instead of two-thirds of the stockholders, as provided by the present law.

Minnesota.—The house has passed the bill introduced by O. F. Christensen of St. Paul placing the regulation of electric railways in the hands of the state railroad and warehouse commission. As amended by the committee on express, telegraph and electric lines the bill provides that it shall not take away any powers of regulation now vested in city councils, but shall give the commission power in cases where the city council does not act.

Montana.—The legislature has passed a law requiring street railway companies to equip their cars with closed vestibules for the protection of the motormen, between November 1 and April 1. The law goes into effect on November 1 of this year.

New York.—Senator Saxe has introduced a bill to amend the rapid transit act, Section 36, by changing the word "weeks" to "months," so that the contracts for the new subways must be advertised for three months instead of three weeks. The rapid transit commission has already begun advertising the Lexington avenue and Seventh and Eighth avenue subway lines and it is feared that these most important subways will be gone before the public utilities law is in effect unless such a bill as this is passed. Senator Saxe said in explanation of the bill: "Friends of the public utilities bill are of the opinion that if contracts for the new subways in Manhattan are permitted to be consummated before the enactment of the proposed public service commission law, the new commission for the city of New York, to be appointed by the governor, will be seriously hampered in planning a comprehensive rapid transit system for the city. Frankly, the object of the proposed bill is to extend the time for the advertising of contracts now offered by present rapid transit commission so that the new commission will have a chance to consider such proposals in connection with a general plan of improvement of the service."

Pennsylvania.—The house on April 4 passed by a unanimous

vote the Homsher bill, conferring on electric railway companies the right to carry light freight and express matter. Local authorities are empowered to make reasonable regulations for this traffic; questions of reasonableness to be decided by the common pleas courts. An amendment to make the carrying of freight mandatory was defeated.—The Fahey bill, which requires companies proposing to build new lines or extensions to file with the secretary of state copies of all franchises and right of way grants before a charter shall be granted, was defeated in the house on April 9.—A bill introduced by Representative Kennedy prohibits a fare of more than 5 cents for a ride within the limits of a municipality.—The Homsher eminent domain bill has passed the second reading in the house, with an amendment which provides that all companies availing themselves of the act shall be common carriers.—Governor Stuart is to give a public hearing to the trades organizations of Philadelphia opposed to the plan of the Retail Merchants' Association for giving the city representation on the board of directors of the Philadelphia Rapid Transit Company, before signing the McNichol-Fahey bill, which is intended to make the plan legal.

Wisconsin.—The house has passed a bill limiting the time of service for street railway employes to 10 hours within 12 consecutive hours.

Municipal Street Railway for Berlin, Ont.—The citizens of Berlin, Ont., on April 4 decided by a vote of 863 to 114 to purchase the Berlin & Waterloo Street Railway, which operated about five miles of track. The town will pay \$75,200 for the property and \$1,000 for supplies on hand, and will operate the line.

Meeting of New York State Association.—The Street Railway Association of the state of New York has decided to hold its annual meeting at Bluff Point, on Lake Champlain, on June 25 and 26. Requests for hotel reservations should be made to E. S. Fassett, general manager United Traction Company, Albany, N. Y. J. H. Pardee, secretary, announces that no spring meeting will be held.

Address at Worcester Polytechnic Institute.—Dr. George R. Olshausen of Cornell University addressed the Worcester Polytechnic Institute branch of the American Institute of Electrical Engineers at the institute on March 25, his subject being "The Power Plant of the Omaha & Council Bluffs Street Railway Company." The lecture was illustrated by stereopticon views. Dr. Olshausen was the engineer of construction.

American Institute of Electrical Engineers.—The board of directors of the American Institute of Electrical Engineers has selected the following nominees for the forthcoming annual election: President, Henry G. Stott, New York; vice-presidents, L. A. Ferguson, Chicago, W. C. L. Eglin, Philadelphia, J. G. White, New York; managers, Percy H. Thomas, New York, B. G. Lamme, Pittsburgh, H. W. Buck, New York, Morgan Brooks, Urbana, Ill.; treasurer, George A. Hamilton, New York; secretary, Ralph W. Pope, New York.

Detroit Service Ordinance Passed.—The Detroit city council on April 9 passed Mayor Thompson's ordinance providing for increased service by the Detroit United Railway. The ordinance provides that the company shall furnish enough cars during rush hours so that no car shall carry a greater number of passengers than the seating capacity of the car, plus one-half. It is also provided that no car shall pass by passengers without stopping, unless there is another car following within a distance of 200 feet. These provisions are not to apply on lines where the cars are operated at a 20-second headway.

Express Company Contracts with Electric Lines.—What is considered the first really important alliance between steam and electric lines will become effective on May 1, when the Pacific Express Company will begin service on several electric lines in western Ohio. Contracts have been executed with the Dayton & Troy, the Springfield Troy & Piqua, the Western Ohio and the Toledo Urban & Interurban companies. This gives a continuous service through western Ohio on about 250 miles of new line for the Pacific Express, making a direct line from Toledo to Dayton and other important towns. Fostoria, Wapakoneta, Shelby, Bowling Green and Sidney being reached, in addition to those mentioned above.

Fire Destroys New York City Car Barns.—Fire broke out about 2:30 a. m. on April 8 in the plant of the New York City Railway Company at One Hundred and Forty-sixth street and Lenox avenue, Manhattan, used as a power house, car barn and repair shop, causing almost complete destruction, entailing a loss which Oren Root, general manager, estimates at \$1,500,000, and causing the death of a fire captain and injuries to seven others. The north and west wings of the plant, occupying the entire block between One Hundred and Forty-sixth and One Hundred and Forty-seventh streets, Lenox and Seventh avenues, with the exception of a 100-foot strip on Seventh avenue, were completely wrecked, with their contents, including about 300 cars used on Lenox avenue and Broadway divisions of the system. The fire is believed by officials of the company to have been started by an electric light wire having defective insulation. The fire started in the pits where men were engaged in repairing cars and which covered 14 tracks. The floors above were used for storage, carpenter and paint shop. South of this was the converting station, with six converters, where alternating current from the Kingsbridge station was converted into direct current for surface cars north of One Hundred and Twenty-fifth street. The partition wall, of vitrified brick, crumbled, and, though the power plant was not destroyed, it was deemed advisable to shut off the current. It is stated that the fire will cause only a brief delay and the company has a considerable surplus of equipment.

Construction News

FRANCHISES.

Buffalo, N. Y.—Mayor Adam has approved the Elmwood avenue franchise recently granted to the International Railway Company, after an agreement by President H. J. Pierce to discontinue certiorari proceedings to secure a reduction of \$51,000 in the company's franchise tax assessment. President Pierce has announced that work will begin on the new line as soon as the rails can be secured.

Cicero, Ill.—The town board on April 8 granted the Metropolitan West Side Elevated Railroad the right to extend its Garfield Park branch through the limits of Cicero.

Frankfort, Ind.—The Frankfort Delphi & Northern Traction Company has been granted a franchise to construct and operate an interurban line through Frankfort, the road to connect with Delphi on the north, passing through Rossville. The franchise is for 35 years and the road is to be completed and in operation by January 1, 1909. While the franchise is granted to W. H. Cohee and others of Frankfort, it is known that Indianapolis parties are back of the proposed road and it is claimed that the line has already been financed and that the work of construction will begin at once on the right of way that was secured some time ago.

Index, Wash.—The Puget Sound Skyhomish & Eastern Railway, which is building an interurban line between Index and Galena, Wash., about 10 miles, has secured a franchise to build its line from Index to a point about 1½ miles from that place. Work must begin within 30 days and be completed within six months.

Kansas City, Mo.—The application of the Metropolitan Street Railway to extend its Prospect avenue line to Thirty-ninth street before next December has been granted by the upper house of the council. During 1908 the line is to be extended to connect with the Swope park car line.

Lincoln, Neb.—The Citizens' Railway has been granted a franchise to build its line on Holdrege street, from Nineteenth to Twenty-seventh streets. It is stated that preparations are being made for its immediate construction. A question had arisen as to the validity of the grant because of the fact that franchises previously had been granted to other companies. As these include the Home Street Railway, North Lincoln Street Railway, Lincoln Electric Company, Capital Heights Company and the Lincoln Rapid Transit Company, whose franchises had reverted to the city when the properties of these companies were seized to satisfy judgments for taxes, the opinion is now held that the present grant unquestionably is valid.

Laurens, S. C.—A 50-year franchise has been granted to N. B. Dial of Laurens, S. C., to build an electric railway in and around Laurens. Work must begin within one year and be completed within 18 months from the date of the franchise. It is stated that a company soon will be organized with a capital stock of \$50,000.

Mt. Vernon, O.—A 25-year renewal of its franchise was granted to the Mt. Vernon Electric Railway on April 2. This provides for additional extensions on High and other streets of the city.

Morrisville, Pa.—The borough council has granted permission to the New Jersey & Pennsylvania Traction Company to extend its tracks west on Bridge street to Fallsington, about four miles. A condition of the franchise is that the company shall build a wagon and foot bridge over the canal and pave Bridge street, the cost to be about \$25,000. It is stated that the employes of the Pennsylvania Railroad will use the line in going to and from their work at the West Morrisville yards.

Nauvoo, Ill.—The Mississippi Valley Electric Railway Company, which proposes to build an electric interurban line from Nauvoo to Carthage, Ill., 22 miles, and to Keokuk, Ia., 14 miles, has been granted a franchise in this city. The site for a power house in Nauvoo also is included in the franchise, and the city is to take \$5,000 in bonds for every mile of road built between Nauvoo and Niota, about 12 miles. With the completion of this section the line will be extended to Carthage and later to Beardstown, Ill. Another route will extend to Keokuk, Ia. W. A. Calhoun, chief engineer, Buffalo.

Sandusky, O.—The Lake Shore Electric Railway has been granted permission to lay a double-track line on Water street from Columbus avenue to Jackson and from Fulton to Lawrence streets in order to care for the increased traffic which it is expected will be handled by the company this summer. The street between Jackson and Fulton will have only a single-track line. It is stated that work on this improvement will begin at once.

St. Louis, Mo.—The bill recently passed by the house of delegates authorizing the St. Louis Electric Terminal Railway to operate a line from its bridge across the Mississippi river to Salisbury street, has been signed by the mayor. The line will run from the foot of Salisbury street, west to Ninth street, over a private right of way between Farrar and Salisbury streets, south on Ninth street to Branch street, west to Twelfth street and south on Twelfth street to Lucas avenue, where the terminus of the road will be located. It is stated that contracts for the construction of the bridge, stations and terminal properties are under consideration. Under the franchise granted by the municipal assembly of St. Louis the road must carry express at freight rates and must reduce the prevailing freight charges 40 per cent. A 5-cent fare across its bridge to Granite City will be charged, with a 3-cent fare for foot

passengers. The city is to receive \$5,000 annually for the first five years of the franchise, \$7,500 annually for the next 10 years and \$10,000 annually for the remaining 35 years of the grant.

Winona, Minn.—The 50-year amended franchise of the La Crosse Water & Power Company, which has been under consideration for some time, has been granted by the city council. An electric line from Winona by way of La Crosse to Galesville, Wis., must be built at once by the company. A. V. Schroeder, La Crosse, Wis., is general manager.

RECENT INCORPORATIONS.

Abilene (Tex.) Street Railway.—Incorporated in Texas to build an electric street railway system in Abilene. Capital stock, \$100,000. Incorporators: J. M. Wagstaff, Austin; George L. Paxton, W. C. Swenson, E. S. Hughes and J. M. Cunningham.

Chicago Hammond & Gary Electric Railroad.—Incorporated in Indiana to build from Hammond to Gary. Capital stock, \$100,000. Incorporators: L. C. James, T. A. Carstensen and H. L. Underwood of Chicago and A. V. Barton of Elgin, Ill.

Denton Interurban Railway & Power Plant Company.—Incorporated in Texas with a capital stock of \$100,000. Incorporators: H. M. Griffin, W. W. Wilson, R. J. Wilson and Newt M. Lee.

Denver & South Platte Railroad.—Incorporated in Colorado to build an interurban line from Englewood to Roxborough park, a point in the foothills about three miles south of Platte canyon. This park will be developed as a resort and plans for a large hotel to be built next season are being considered. The line will be 21 miles long and by its connection with the Englewood car line will make Denver accessible by about an hour's ride. An order for 575 tons of steel has been placed with the Colorado Fuel & Iron Company and it is stated that grading will begin within 10 days. Right of way has been secured for its entire length and financial arrangements made for its construction. Incorporators: Thomas Doan, W. W. Borst and Daniel Prescott, Denver; Walter Lyon and Jacob T. Keil, Allegheny, Pa.

Elkins Electric Railway.—Incorporated in West Virginia to build an electric street railway in Elkins. Capital stock, \$50,000. Incorporators: J. C. McSpadden and H. F. Berkebile, Rockwood; W. J. Taylor, Pittsburg; J. E. Morgan and C. W. Maxwell, Elkins, W. Va.

Macon Americus & Albany Electric Railway.—Incorporated in Georgia to build an electric line from Macon to Albany, through Bibb, Crawford, Houston, Macon, Sumter, Lee and Dougherty counties, touching the towns of Byron, Fort Valley, Marshallville, Montezuma, Oglethorpe, Andersonville, Americus, Sumter, Smithville and Leesburg. The line will be 199 miles long, with the principal office of the company at Macon. Capital stock, \$200,000. Incorporators: W. J. Masee, M. Felton Hatcher, J. T. Moore, M. H. Masee, M. J. Hatcher, J. N. Neel and D. W. Davis of Macon; N. J. Cruger, Albany; J. C. Walker, Marshallville, and A. C. Riley, Ft. Valley. N. J. Cruger of Albany, Ga., is president.

Oklahoma City El Reno & Southwestern Electric Railway.—Incorporated in Oklahoma to build an electric interurban line from Oklahoma City to El Reno, Chickasha, Anadarko, Hobart, Lawton and intermediate towns; also from El Reno to Kingfisher, Hennessey, Enid and Medford, and from Kingfisher to Okeene by way of Kiel, a total of 275 miles. Capital stock, \$10,000,000. Incorporators: Fred Ehler, J. W. Smith, C. C. Smith and E. B. Cockrell of Hennessey, and W. R. Blackburn of Kingfisher.

Oklahoma City Rapid Transit Railway.—Incorporated in Oklahoma to build an interurban railway between Oklahoma City and Tecumseh, through the counties of Oklahoma, Cleveland and Pottawatomie, with headquarters at Oklahoma City. Capital stock, \$2,000,000. Incorporators: D. D. Klapp, E. W. Millburn, G. M. Sissna, J. H. Surber, Henry Lopp, G. A. Ruggles, M. H. Tension, C. B. Connor, S. B. Mitchell and W. E. Powell, Tecumseh, and Mr. Silsby, Saginaw, Mich.

Perkiomen Traction Company.—This company, which proposes to build an electric line 11½ miles long, will, on April 22, file an application for incorporation. It is stated that the road will use the Perkiomen turnpike part of the way and extend through the borough of Green Lane to a terminus at the intersection of the Perkiomen turnpike with the Sumneytown turnpike. Irvin H. Bartman, Schwenkville; Henry T. Hunsicker, Ironbridge; Samuel E. Hughes, George Dunn and John H. Dager, Norristown, Pa., are interested.

San Joaquin Valley Western Railroad.—Incorporated in California to build a line from Fresno westward to Watsonville, connecting at the latter point with the Ocean Shore Railway, now under construction south from San Francisco. Capital stock, \$6,000,000, of which \$225,000 has been subscribed. Incorporators: C. G. McBride of San Jose, Phillip McRae of Armona, James Shaw Robertson of Hanford, J. O. Hickman of Hanford, A. P. May of Coalinga, W. M. Graham, general manager of the California Oil Fields, Ltd.; Senator Thomas Flint of San Juan; Truman G. Hart of Fresno, and J. A. McClurg, Jr., of Fresno. The company is closely associated with the Ocean Shore Railway and J. B. Rogers of San Francisco is chief engineer of both companies.

Scioto Construction Company.—Incorporated in Ohio to build the extensions of the Columbus Magnetic Springs & Northern Traction Company from Magnetic Springs to Richwood and Larue, O., and the Columbus Urbana & Western Railway north from Columbus. Capital stock, \$25,000. Incorporators: Barton Griffith, F. H. Heywood, W. H. Ogan of Indianapolis, C. B. Howard, E. E. Bryan and J. A. Vandegrift of Philadelphia.

TRACK AND ROADWAY.

Alton Jacksonville & Peoria Railway.—J. M. Rhoads, secretary, Jerseyville, Ill., writes that this company proposes to build a line from Alton to Jacksonville, Ill., 65 miles, through Jerseyville, Carrollton, Whitehall, Roodhouse and Murrayville. The line has been surveyed and three miles of track, from Alton to North Alton, has been laid this year. Grading and overhead work have been completed from Alton to Godfrey, 5 miles. A. O. Auten of Jerseyville, president; Robert Curdie of Alton, vice-president; W. R. Heagler of Jerseyville, chief engineer. Headquarters, Jerseyville.

Bayou Teche Railway & Light Company.—This company, incorporated last year to build a system of electric railways radiating from New Iberia, La., has given orders for beginning surveys some time this week. Paul M. Schneidau, president, New Orleans, La.

Birmingham, Ala.—The Alabama Land & Improvement Company is interested in an electric line which it is proposed to build between Chattanooga, Tenn., and Birmingham, Ala. Right of way is being secured and grading is in progress at several points.

Carlyle & St. Louis Electric Railroad.—A mass meeting was held at Breese, Ill., last week by citizens of Carlyle, Beckmeyer, Breese, Aviston, Trenton and Summerfield, to consider plans for building an electric road through those towns to Lebanon, Ill., and St. Louis, Mo. It was decided to incorporate under the above name, with a capital stock of \$5,000, and a committee of 12 was appointed to effect an organization. T. E. Ford of Carlyle is chairman of the committee.

Cartersville, Ga.—It is reported that a route has been surveyed and partially graded for a line from Cartersville to Atlanta, Ga., and that a dam is to be constructed across the Etowah river, three miles from Cartersville, to furnish power for the line.

Chicago & Elgin Electric Railroad.—It is reported that this company will begin construction work this summer on its line, which is to connect Elgin, Bartlett, Bloomingdale, Addison, Elmhurst, Melrose Park, Maywood and River Forest. The line when completed will be 26 miles long. The capital stock is \$10,000. F. W. Kobusch is president; E. W. Fischer, vice-president; J. H. Roehler, secretary, and Charles F. Strauschild, treasurer. Office, Bloomingdale, Ill.

Chicago & Western Indiana Traction Company.—E. H. Barrows, general manager, Indianapolis, Ind., writes that the American Engineering Company of Indianapolis, which recently acquired this company, incorporated to build from Chicago to Louisville, 332 miles, via Valparaiso, Lafayette, Crawfordsville, Greencastle, Bloomington, and New Albany, now proposes to build the section between Greencastle and Lafayette, 57 miles, connecting at Crawfordsville with the line of the Indianapolis Crawfordsville & Western Traction Company, from Indianapolis, which is now nearly completed. This line, according to Mr. Barrows, will probably be acquired by the Indianapolis Crawfordsville & Western, which proposes to extend from Crawfordsville to Kankakee, Ill., making connection with the Chicago & Southern Traction Company, under construction between Chicago and Kankakee. The Greencastle-Lafayette line is now being surveyed, although the date of beginning construction has not been decided. Power will be taken from the power house of the Indianapolis Crawfordsville & Western at Crawfordsville. C. W. Wilson, president of the American Engineering Company, is also president of the Chicago & Western Indiana, and W. L. Eckhouse is chief engineer, with offices at 610 Traction Terminal building, Indianapolis.

Chicago City Railway.—This company has ordered 5,000 tons of 129-pound grooved rails, of the type described in last week's issue of the Electric Railway Review, page 457, from the Lorain Steel Company. Under the general plan of rehabilitation of the property, as provided in the city ordinances passed on April 2, these rails are to be used to replace the old ones now in use. H. B. Fleming, chief engineer.

Chicago Kenosha Milwaukee & Lake Geneva Railroad.—Roger C. Kimball, 210 Wisconsin street, Kenosha, Wis., writes that this company proposes to build from Kenosha to Lake Geneva, 40 miles, and from Kenosha to Waukegan, 16 miles. The line has been surveyed and a right of way 100 feet wide has been purchased from Waukegan to Kenosha. Franchise applications are now pending in both Waukegan and Kenosha. The company will condemn a route through Kenosha if a franchise cannot be obtained. Construction will begin as soon as terminal franchises are obtained. The Illinois portion of the road will be built under the name of the Chicago Waukegan & North Shore Railway. George Wilcox, Chicago, president; Frank R. Grover, Unity building, Chicago, vice-president; R. I. Douglas, Waukegan, local manager.

Chicago Union Traction Company.—This company has ordered 10,000 tons of 129-pound grooved rails from the Lorain Steel Company. These are the standard rails prescribed in the city ordinances, described in last week's issue of the Electric Railway Review.

Cleveland Alliance & Mahoning Valley Railway.—Announcement is made that all of the right of way has been purchased between Newton Falls and Warren, O., for the proposed electric railroad between Warren and Ravenna. The old Baltimore & Ohio line will be used between Ravenna and Newton Falls. This part of the road is financed and work will be begun within a week. J. W. Holcomb of Cleveland is one of the promoters.

Columbus Magnetic Springs & Northern Traction Company.—This company, which has acquired the Columbus Urbana & Western Electric Railway, has established offices in Columbus and will

at once begin securing right of way for an extension up the east bank of the Scioto river to Dublin. W. H. Ogan, general manager.

Columbus Urbana & Western Electric Railway, Columbus, O.—It is reported that the work of relaying the tracks on Spring and Water streets in Columbus will begin as soon as the city starts to improve the streets. Several carloads of grooved rails have been received.

Connersville, Ind.—A street railway system is being promoted in Connersville, together with a branch extending to Milton, six miles south. A franchise for the system has been granted to local capitalists, who brought an agent from the General Electric Company to Connersville to prepare the plans and estimates for the construction of the system and the equipment thereof.

Denton, Tex.—Ties have been ordered and 60-pound rails have been contracted for with the Carnegie Steel Company for delivery in July, for use on the street railway system for which N. M. Lee recently secured a franchise. The company has applied for a charter and has elected the following officers: President, H. M. Griffin; vice-president, R. J. Wilson; treasurer, C. M. Simmons; secretary, Newton M. Lee.

Duluth Street Railway.—Preparatory to the construction of its new line on Twenty-fourth avenue east, from Superior to Fourth street, this company will begin within the next 60 days to replace the "Y" at Eighth avenue west and Superior street, with a loop on which all the East End, Lakeside, Hunter's Park and East and West Fourth street cars will be turned back. The material has been ordered and the work of taking out the "Y" and of constructing the loop will begin as soon as the steel arrives. J. Carson, Duluth, Minn., chief engineer.

Eastern Pennsylvania Railways, Lansford, Pa.—This company has begun work on the construction of an extension from Tamaqua to Middletown, Pa.

Fargo, N. D.—It is stated that Fargo capitalists, including L. B. Hanna, are interested in a plan to build an electric line about two miles long, connecting Wahpeton and Breckenridge, N. D., although the plans have not yet taken definite shape.

Ft. Wayne & Springfield Railway.—This company has placed a large construction force on the Decatur-Portland division, with a view of a speedy completion of the extension between Decatur and Portland, Ind. When this road is completed to Portland it will make connection with the Muncie & Portland line and will thereby constitute a third through line between Ft. Wayne and Indianapolis.

Franklin & Towamensing Street Railway.—A. P. Berlin of Statton, Pa., states that preliminary surveys will be made this month for the company's proposed line to connect North Weissport and Milport, Pa., about 10 miles, and that the road will be built this summer.

Girard Coal Belt Electric Railway.—The engineers have completed the survey for this company's proposed line from Girard to Mulberry, Kan., and construction is to begin in about a week. The line passes through a rich coal territory. L. H. Phillips, secretary, writes the company's offices are located at Girard, Kan., instead of at Pittsburg, Kan., as reported. James McFarland is president.

Grand Central Traction Company.—This company, recently incorporated, has issued a prospectus announcing its plans for building a line from Indianapolis to Evansville, Ind., 172 miles, with a branch through Saline City, Patrickburg and Spencer, to Terre Haute, 66 miles, and city systems in Bedford and Bloomington. It is estimated that the line will cost \$7,000,000. Surveys have been started and the right of way is being secured. The capital stock has been increased to \$5,000,000 and it is proposed to issue \$7,000,000 bonds. The officers are: President, W. D. Whitney, Muncie, Ind.; vice-president and general manager, Ora W. Blickenstaff, Lafayette; secretary and general counsel, David H. Morgan, Brazil; treasurer, Nathan P. Carter, Indianapolis; chief engineer, Will Duncan, Bedford; chief electrician, Horatio A. Morgan, Brazil. The company has general offices in room 304 State Life building, Indianapolis.

Illinois & Indiana Traction Company.—E. E. Barclay, representing J. H. Fertig & Co. of New York, states that this company has been organized to build an electric line from Quincy, Ill., to Terre Haute, Ind., via Hannibal, Pittsfield, Roodhouse, Virden, Clarksdale, Taylorville, Assumption, Windsor, Neoga and Casey, and that a franchise will be applied for in Taylorville in a few days. According to Mr. Barclay surveyors will begin at once to locate the line and right of way will be secured.

Indiana Columbus & Eastern Traction Company.—It is announced that the route of the extension from Lima to Bellefontaine, O., will be via Huntsville, Lakeview, Lewistown and Waynesfield.

Jacksonville (Fla.) Terminal Company.—Bids will be received until April 20 for the construction of a double-track subway, about 470 feet long, including approaches. J. W. Richardson, engineer, Jacksonville, Fla.

Johnstown (Pa.) Passenger Railway.—It is reported that this company proposes to expend about \$140,000 in improvements in Johnstown this summer. Work has already been started on the double-tracking of the line through the Eighth ward out to Luna park, at a cost of \$36,000. Other improvements are as follows: Complete rebuilding and double-tracking of the road through the Fourth and Seventh wards and Dale borough to Walnut grove, at a cost of \$40,000; the reconstruction of the lines in Broad street, Fifteenth and Sixteenth wards, at an estimated cost of \$34,000; the purchase of 12 new open cars for summer use, the cost being \$13,000. These cars will be delivered on April 20. Improvements about

the car barns will cost \$7,000 and the installation of new machinery in the Baumer street power house will cost \$13,000.

Junction City (Kan.) Electric Railway Light & Ice Company.—This company has let a contract to Cook & Devine for grading an extension 8,000 feet long to the military reservation near Junction City. The work involves about 40,000 cubic feet of grading.

Kent Traction Company.—It is reported that this company will soon begin construction on its line from Tolchester to Chestertown, Md., via Fairlee, 11 miles. A. A. Lamkin of Baltimore, president.

Lancaster & Eastern Railway.—H. W. Crawford, Lancaster, Pa., chief engineer, writes that this company, which is operated by the Conestoga Traction Company of Lancaster, Pa., proposes to build an extension from Christiana to Coatesville, Pa., 10.3 miles, via Parkesburg, which is now being surveyed and upon which grading will begin as soon as the right of way is secured. The overhead construction will be of the span type. The company now has a line in operation from Lancaster to Christiana, 20 miles. W. W. Greist, Lancaster, is president.

Lima & Toledo Traction Company.—The work on the construction of the extension from Leipsic to Toledo, 47 miles, for which J. C. Carland of Toledo has the contract, has been progressing rapidly during the past two weeks. Grading is now practically completed between Leipsic and Deshlar and 100 teams and 125 men are now engaged on the grading between Leipsic and the Maumee river. From Deshlar the route is via Weston and Tontogany to Maumee, 11 miles from Toledo. From Maumee the route has not yet been announced. The Maumee river, 5 miles south of Maumee, is to be crossed by a large bridge. It is estimated that the construction of this line will cost about \$35,000 per mile. F. T. Hepburn of Lima, O., is general manager.

Litchfield & Torrington Street Railway.—It is reported that construction will begin this summer on this company's line from Torrington via Lake Bantam to Litchfield, Conn., 10 miles. W. F. Dowd of Litchfield, president.

Louisville & Northern Railway & Lighting Company.—The interurban line between New Albany, Ind., and Louisville, Ky., known as the "Daisy Line," which has been leased by the Louisville & Northern Railway & Lighting Company from the Kentucky & Indiana Bridge Company, will be extended to the business center of New Albany, Ind., within a short time, according to representatives of the company. Since the line was established, nearly 20 years ago, its terminus has been near the end of the Kentucky & Indiana bridge on Vincennes street. Under the new system passengers will not be required to change to city cars. The company has selected a route for its line from New Albany to Corydon and French Lick and West Baden Springs, and the first four miles is to be built at once.

Ludington Southern Railway.—It is stated that the right of way has been secured for this road from Ludington to Grand Rapids, Mich., and that construction will begin shortly. N. W. Gifford of Chicago is interested. Thomas J. David, Fremont, Mich., is chief engineer.

Macon (Ga.) Railway & Light Company.—As soon as material that has been ordered by the company reaches the city work will begin upon many changes in the present street railway system in Macon. Council has granted permission to the company to make several changes in the tracks. Some of the streets are to be double-tracked, several new switches are to be placed and a loop around the Brown house is to be placed. J. T. Nyham, general manager.

Minneapolis Rochester & Dubuque Traction Company.—William P. Mason of Minneapolis, secretary and general manager, writes that this company will build a third-rail line from Minneapolis to Dubuque, 246 miles, of which 165 are in Minnesota. Bids for the construction of the first 90 miles are to be advertised for at once. Officers have recently been elected as follows: President, M. W. Savage; vice-president, W. D. Boutell; treasurer, E. W. Murphy; secretary, William P. Mason, all of Minneapolis. Robert Baldwin of Minneapolis is chief engineer.

New York & Long Island Traction Company.—This company has organized by electing the following officers: President, George A. Stanley of Cleveland; vice-president, C. S. Thrasher of Cleveland; treasurer, Joseph Nutt of Cleveland; secretary, J. A. MacElhinney, 120 Broadway, New York. The company plans to build first to connect Mineola, Roslyn and Port Washington, N. Y. Later from Roslyn a line will be built to Manhasset and Great Neck, and eventually to the New York city line at Little Neck. All franchises have been secured and there are on deposit a bond for \$5,000 and \$5,000 in cash to insure the construction of the line. The contract for building has been placed with the Cleveland Construction Company and work will be begun at once. The plan is to rush construction and it is hoped to have the Mineola, Roslyn and Port Washington line, 10 miles long, completed and in operation by September 1. The company has arranged with the Nassau Electric Light & Power Company for securing power from that company's plant at Glen Cove.

Oakland (Cal.) Traction Company.—It is stated that this company will build 40 miles of various extensions this season.

Omaha & Nebraska Central Railroad.—Secretary J. H. Rodgers has announced that grading on the proposed line from Omaha to Hastings, Neb., will begin on May 1, at the Hastings end. W. H. Fuller, chief engineer, will begin this week placing the grade stakes.

Pacific Electric Railway, Los Angeles, Cal.—This company is

now making surveys for a line from Los Angeles to Huntington Beach, Cal.

Portland Railway Light & Power Company.—F. I. Fuller, vice-president, writes that this company proposes to expend about \$1,000,000 the coming season in extensions, reconstruction, new special work, new equipment, etc. The company's standard rail for residence city sections is a 6-inch, 72-pound high T-rail. On hard surfaces this rail is laid on a 6-inch gravel ballast, with concrete between the ties. A stone block pavement is laid between the rails and for one foot outside, on a 1-inch sand cushion. The filling between the rails is sometimes cement grouted and at other times hot paving pitch is poured in. On main city streets a 7-inch grooved rail is used. On suburban lines 60 and 70 pound standard T-rails are used for ordinary construction.

San Jose (Cal.) Railway.—This company, it is reported, proposes to rebuild about 16 miles of track this year.

Shore Line Electric Railway.—A. William Sperry, engineer of this company, which proposes to build from Stony Creek to Saybrook, Conn., states that rails have been ordered and contracts for the power house equipment have been placed with the Westinghouse company. Twelve miles of the right of way, from Essex to Westbrook, have been purchased. P. B. Learned of New London, Conn., is president.

South Dakota Gas-Electric Railway.—This company, of which Mayor J. A. Cleaver of Huron, S. D., is president, is making surveys for a line from the Northwestern depot to the state fair grounds, in Huron. This portion of the line is to be opened on September 1 and several extensions are planned. Each car will carry a 250-horsepower motor.

Springfield Clear Lake & Rochester Interurban Railway.—J. E. Melick, president and chief engineer, writes that this company, which is now building a line from Springfield to Clear Lake and Rochester, Ill., about 18 miles, also proposes to build a line to Hillsboro, 53 miles, and is making surveys for an extensive system connecting Springfield with various surrounding towns under the name of the Sangamon Valley Electric Railway. The United States Construction Company of Springfield, which is affiliated with the Springfield Clear Lake & Rochester and the Sangamon Valley companies, is doing the construction work. The line to Clear Lake has been completed for four miles out of the center of Springfield and cars were operated over this line on March 11. The cars will enter the city over the tracks of the Springfield Consolidated Railway and power will be rented from that company. Grading on the line to Hillsboro is to begin about June 1.

Tacoma Railway & Power Company.—Bids have been asked for the construction of four 200-foot bridges for the Puyallup line. Rails for the line have been delivered and one mile of track has been laid. Rapid progress is being made on the grading. Arrangements are being made for an extension of the American Lake line to Murray. 2½ miles.

Terre Haute & Western Railroad.—It is reported that a large force of men is now at work near Sandford, Ill., on the grading for this proposed line from Terre Haute, Ind., to Paris, Ill. James Stewart, Paris, Ill., is interested.

Texas Traction Company, Dallas, Tex.—Several additional grading outfits are to be employed on the Sherman-Dallas interurban line and the construction of the line pushed to completion at an earlier date than was originally contemplated. President J. F. Strickland said on April 6: "Arrangements have been made for a large force to begin grading just north of Dallas next week. We shall also more than double the force on construction within the next 30 days. The factories inform us that they are going to be able to deliver our material considerably earlier than they thought they could at the time we placed our contracts with them, and it is now conservative to say that the road will be completed before the end of the year. With the exception of the Cotton Belt at Plano, we shall have either overhead or underground crossings of all steam tracks intersecting our route. We shall cross the Frisco overhead just outside of Sherman, run under the Houston & Texas Central at Caruth's Switch and go above the Katy at a point from which we will connect with the Bryan street line of the Dallas Consolidated Electric Railway Company."

Toledo Wabash & St. Louis Railroad.—C. D. Whitney of Toledo, O., president, writes that this company proposes to build an electric line from Toledo to St. Louis, via Defiance, O., and Ft. Wayne, Indianapolis and Terre Haute, Ind. Surveys have been completed from Toledo to Ft. Wayne, 95 miles, and a power house at Miami, O., has been purchased. George G. Metzger, vice-president; J. P. McAfee, treasurer; S. L. McAfee, secretary, all of Toledo.

United Railways, Portland, Ore.—It is stated that rapid progress is being made in this company's lines in Portland. The rails are being laid on reinforced concrete stringers with steel ties. Twenty carloads of rails are being shipped. L. B. Wickersham, chief engineer.

Wausau (Wis.) Street Railway.—Work on the street railway line in Wausau was resumed last week. Last year three miles of track was laid and this year it is proposed to lay several more. The line is to be extended north to Brokaw, five miles, and possibly to Merrill. Neal Brown of Wausau, president.

POWER HOUSES AND SUBSTATIONS.

Black Hills Traction Company.—It is announced that tests have just been completed on the hydraulic power installation in the power house of this company, located at Redwater, about 10 miles

from Spearfish, S. D. The tests are reported to be highly satisfactory to the officials of the company, as well as the manufacturers. The generating capacity, which is 1,500 horsepower, is said to be the largest in the Black Hills.

Bristol & Plainville Tramway, Bristol, Conn.—This company has purchased a 250-horsepower boiler, to be installed in the new extension to the boiler room, to be built shortly.

Consolidated Railway.—This company, it is reported, will build a new brick substation at Middletown, Conn., about 36 by 70 feet.

Cumberland & Westernport Electric Railway.—It is reported that this company has begun construction of a power house at Claryville, Md., which will be of brick, concrete and steel construction, 30 by 90 feet, in which will be installed a 550-kilowatt generator and 650-horsepower boiler. J. E. Taylor of Frostburg, Md., is superintendent, and Daniel Shumm electrical engineer.

Evansville Princeton & Vincennes Interurban Railway.—It is announced that this company will enlarge the reservoir at the Ft. Branch (Ind.) power house to permit operating the station during dry seasons. The reservoir will be about 300 feet long, 200 feet wide and about 12 feet deep, which is expected to furnish a capacity sufficient for all emergencies.

Hudson Valley Railway Company.—It has been officially announced that the work of constructing the power plant to be erected on the property recently purchased by the Delaware & Hudson Company on the bank of the Hudson river, just south of Mechanicsville, will be begun at once by the Hudson Valley Construction Company, to whom the contract has been awarded. It is proposed to build a steam turbine power plant for generating electric power for the Hudson Valley Railway Company, including large buildings and an elaborate system of tracks, trestles and coal storage grounds. Spurs from the main line of the Delaware & Hudson Company will run to the property from both north and south, and according to the plans prepared by the architects, J. G. White & Co., the power station will be erected about 1,000 feet north of the dam of the Hudson River Electric Power Company. The engineers of the Hudson Valley Construction Company have been making measurements at the property and the company will begin soon to make excavations for building and intake canal from the river through the site of the big power station. This canal will be 480 feet long and 12 feet wide and will furnish water for the condensing plant. The engine room to be constructed will be about 180 by 70 feet and the boiler room about 180 by 75 feet. The Delaware & Hudson Company will expend between \$500,000 and \$600,000 in the construction of the plant. It is expected to have a part of it ready for operation in August of this year. A. Eckstrom is consulting electrical engineer, Delaware & Hudson Company, Albany; Charles P. Boland is general manager of the Hudson Valley Construction Company, Times building, Troy.

Lexington & Interurban Railway, Lexington, Ky.—It is reported that this company will erect its central power house at Valley View, Madison county, Kentucky, on the Kentucky river.

Mahoning & Shenango Valley Railway & Light Company.—It is reported that this company will install a complete coal and ash handling conveyor in its North avenue power station. When this work has been completed and other improvements and extensions which are now under way are completed the plant at West Federal street and at Niles and Edenburg, Pa., will be abandoned and dismantled.

Milwaukee Electric Railway & Light Company.—One of the 300-kilowatt direct-current generators at the Commerce street power house of this company was burned out on Monday evening, April 8, 1907. The accident caused a delay to traffic for about half an hour and necessitated switching the current from one line to another in order to keep all the lines in operation.

San Francisco Gas & Electric Company.—The power station of the San Francisco Gas & Electric Company, which supplies current to several of the interurban roads radiating from San Francisco, Cal., was severely damaged by fire last week, the loss being estimated at \$2,500,000.

Seattle Electric Company.—It is announced that the 3,000-kilowatt turbine ordered by this company has been shipped from the General Electric works at Schenectady, N. Y., and will soon be in operation. This is the first unit to be installed and will be immediately followed by an 8,000-kilowatt turbine, which will make the total capacity of the plant about 17,000 horsepower. The boilers and piping for the new unit are being rapidly erected and it is expected that they will be complete by the time the turbines are installed.

Utah Light & Railway Company.—It is reported that J. H. Babcock, supervising electrical engineer of all the Harriman railroad lines, is in Salt Lake conferring with W. H. Bancroft, president of the Utah Light & Railway Company, regarding the details of the plans now being prepared for a 15,000-horsepower railway station, to be erected at Salt Lake. The new power house, which when completed will have cost approximately \$1,000,000, will be of sufficient capacity to furnish all the power required for the electric car service should the water-power plant break down. No details of the construction have as yet been completed, but it is definitely announced that work is being rushed and operations will be commenced as soon as plans can be completed.

Winnipeg Street Railway.—This company has ordered all machinery and electrical equipment for the Winnipeg Selkirk & Lake Winnipeg Railway, which will be installed as rapidly as possible, and there will also be two booster substations along the route to compensate for the drop which would otherwise occur on such a long line.

Personal Mention

Mr. J. A. Pierce has resigned as superintendent of traffic of the Mexico Electric Tramways, Limited.

Mr. H. E. Chubbuck, general manager of the Illinois Valley Railway, has removed his office from La Salle to Ottawa, Ill.

Mr. R. C. Thurston has been appointed supervisor of electric service of the Erie Railroad, with headquarters at Avon, N. Y.

Mr. Fred Ikes of Rushville, Ind., has been appointed chief engineer of the Indianapolis & Louisville Traction Company at Scottsburg, Ind.

Mr. Alexander McIver has resigned as master mechanic of the Chicago & Milwaukee Electric Railroad, effective on April 12, to join the staff of the New York City Railway.

Mr. Morris Hacker of Washington, D. C., has been appointed principal assistant engineer of the Schoepf syndicate lines and will have headquarters at Lima, O., in charge of the construction work between Lima and Bellefontaine.

Mr. J. H. Bennett, formerly auditor of the Northern Electric Company, Chico, Cal., has been appointed general passenger and freight agent of its interurban lines, with headquarters at Chico, effective on April 8. Mr. H. L. Gibson will succeed Mr. Bennett as auditor.

Mr. R. E. Danforth, heretofore vice-president and general manager of the Rochester Railway, Rochester, N. Y., as announced in the Electric Railway Review of March 30, 1907, has been appointed general manager of the street railway department of the Public Service Corporation of New Jersey, to succeed Mr. A. H. Stanley, resigned.

R. E. Danforth.

Mr. Danforth, whose portrait is presented herewith, was born at Buffalo, N. Y., in 1868, and was educated at Cornell University. In 1891 he entered the service of the Buffalo Railway Company, in the mechanical department. From 1891 to 1901 he held various positions, including that of superintendent. In 1901 he was made general manager of the Lake Shore Electric Railway Company at Cleveland, O., and on April 1, 1902, resigned to become assistant general manager of the Rochester Railway. In December, 1903, he was made general manager of the Rochester Railway Company and in December, 1906, was given the additional title of vice-president. Mr. Danforth will assume charge as general manager of the Public Service Corporation on May 1. Mr. Danforth was president of the Street Railway Association of the State of New York during the year 1905-1906.

Mr. P. P. Crafts, general manager of the Iowa & Illinois Railway at Clinton, Ia., who was recently appointed manager of the electrical department of the Ft. Dodge Des Moines & Southern Electric Railway, Des Moines, Ia., has decided not to accept the new position, but will retain his position at Clinton.

Mr. F. W. Casler, superintendent of the Manchester street power station of the Rhode Island Company, Providence, R. I., has resigned to take charge of the Lincoln street power station of the Boston Elevated Railway, Boston, Mass. Mr. G. W. Hawley of Providence has been appointed to succeed Mr. Casler.

Mr. C. S. Young, who has been chief engineer of the New Orleans & Baton Rouge Electric Railway, with office at New Orleans, since that company was acquired by Stone & Webster of Boston, Mass., has been appointed general superintendent of construction of the Stone & Webster lines in Texas, with offices at Dallas.

Mr. F. L. Fuller, vice-president and general manager of the New York & Queens County Railway and the Long Island Electric Railway, was elected president of the former company at a meeting of the directors held in New York city on April 3, succeeding Mr. Arthur Turnbull, who is at present in Europe. Mr. Fuller has been connected with the New York properties since 1903. Prior to 1893 he had charge of the St. Paul (Minn.) street railways, resigning his position there to become assistant superintendent and later general superintendent of the West Chicago Street Railroad Company. In 1899 he was offered and accepted the position of president and general manager of the Interstate Railway Company, Philadelphia, where he remained until 1903, when he resigned to become vice-president and general manager of the New York & Queens County Railway, which position he has held until his present appointment.
